The vital problems of business, multiplied by post-war and industrial developments, will be discussed at a national conference to be held in Chicago on Sept. 8 and 9 under the auspices of the Illinois Manufacturers' Association. The sessions will be at the Congress Hotel.

Trade and industrial associations in every line have been invited to appoint delegates, and to participate in what is believed will be a meeting of moment, inasmuch as it will enable business to present concretely its attitude on some of the questions now before the lawmakers at Washington and some of the proposals of a revolutionary nature that have been presented from various sources in the past few months.

Representation is to be given at the conference not only to business, but to the farming interests, since it is pointed out that agriculture, after all, is one of the greatest businesses of the country. The farmer has his capital invested in land, he is an employer of labor and he is concerned with the maintenance of conditions which will permit him to obtain a fair return upon his investment and his management of his enterprise.

Leaders of organized labor have also been invited to state where the demands of workers are going to stop.

Some of the subjects which it has been suggested be discussed at the conference are the following:

Participation in private business on the part of the Federal Government.

Nationalization of industry.

Influence of exports on prices and production.

Possibilities of increasing production.

The relation of the United States to the rehabilitation of industry in Europe.

Stabilization and guarantee of contracts.

Definition of profiteering.

The attitude of employing farmers and manufacturers to labor.

Adjustment between property rights and community interests.

Participation of labor in the management of industry.

Increasing the purchasing power of the dollar.

Distribution of the war debt.

Governmental price fixing.

The Plumb plan.

The solidarity of farming and business interests.

Use of Industrial Electric Trucks and Tractors in Warehouses

Advantages of this Class of Apparatus in Storage Buildings and Warehouses of All Sorts — Difficulties Encountered in Application — Analysis of Handling Operations—Special Advantages for Utility Service

By BERNARD J. DILLON

THIS is the third of a series of articles dealing with the application of industrial electric trucks and tractors in representative industries. In this the application of such equipment to the handling problems of warehouses and storage places of all types is described. The particular advantages which their introduction for this work offers and the more common difficulties encountered are pointed out and the handling operations of this industry are carefully analyzed. In addition the article calls attention to the use of this apparatus for general utility work in such places.

WAREHOUSES of all sorts, including storage, cold storage, wholesale houses, etc., are generally considered as offering one of the best fields for the application of the electric industrial truck and tractor. This is due to the nature of this business and the conditions that exist in it.

The function of such places, as far as this article is concerned is one of receiving, storing and delivery or distribution. This involves several handling operations, unloading from a carrier into the warehouse, locating it in the warehouse and loading it again onto a carrier to be transferred to its destination. To these may be added, as in the case of wholesale or jobbing houses, other packing, assembly, or similar minor manufacturing operations.

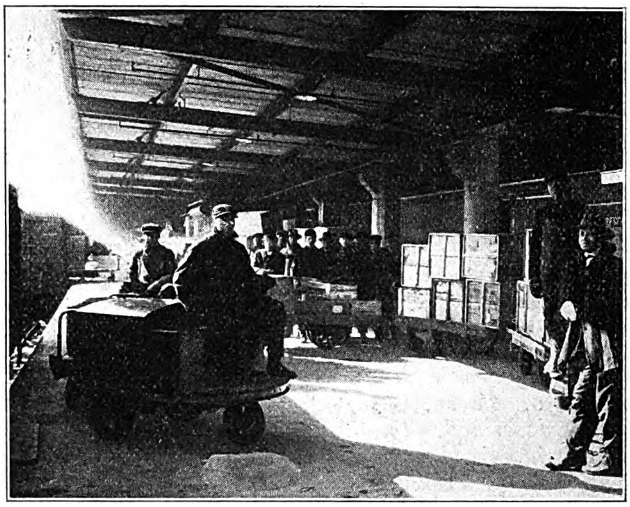
Handling the goods is of course one of principal items entering into the cost of conducting a warehousing or storage business. Not that the cost of this operation is any greater in this business than in others but it does constitute a greater percentage of the total expense, and any saving that can be affected in it therefore, is much more readily appreciated. For example, a 50% reduction in the cost of handling in a warehouse may effect a 20% reduction in the total operating expenses, whereas, a similar saving in handling in an industrial will only result in a saving of perhaps 2% in the total expense. Furthermore, handling is about the only major operation in warehousing that lends itself readily to improvement by the application of efficiency methods—the other items, investment, insurance, overhead, light, heat and power, being either fixed or largely controlled from outside sources.

The labor problem is also a factor that adds to the value of electric apparatus for such work at the present time. Unskilled labor, such as is used in

The 9th Street Terminal Warehouse in Cleveland, Ohio, Uses an Electric Lift Truck to Good Advantage in Handling Goods of All Kinds.

this work, is scarcer now than ever before, demands much higher wages than formerly and is hard to keep.

Another advantage which the electric truck or tractor offers is due to the frequent occurrence of peak periods in such work. Such peaks usually occur at certain times of the day or on certain days



The Electric Tractor Can be Used to Advantage in Unloading from Cars into the Warehouse.

with the arrival of boats, trains or a number of street trucks. During these periods the material must be handled with all possible speed in order to free the boat, cars or trucks and relieve congestion. At such times if the trucking is done by hand an extra large number of men are required. During the intervals between these periods, however, very little work is done which means a considerable loss of time. On the other hand if electric trucking apparatus is used, the work during the peak period is greatly facilitated, the congestion relieved and the time lost during the off-peak hours is greatly reduced.

Difficulties Encountered in Application.

In spite of these apparently promising and simple conditions the problem of applying electric industrial trucks and tractors to warehouse work is a difficult one and requires a great deal of care and thought before it can be successfully accomplished.

Perhaps the most common difficulty encountered arises from the design and construction of many warehouse buildings. Such buildings are usually located on either railroad or water frontages or in some similar place where the facilities for outside transportation are favorable. As such property is valuable the desired floor space is secured by constructing buildings many stories in height rather than to spread them out over a large territory and only a few stories high. In addition, such construction, before the introduction of electric industrial trucking apparatus offered one of the best means of increasing handling efficiency, for it decreased the hauling distance and permitted the use of elevators to advantage. This building construction problem is increased by the fire prevention ruling that requires fire walls to be erected segregating such buildings into small areas.

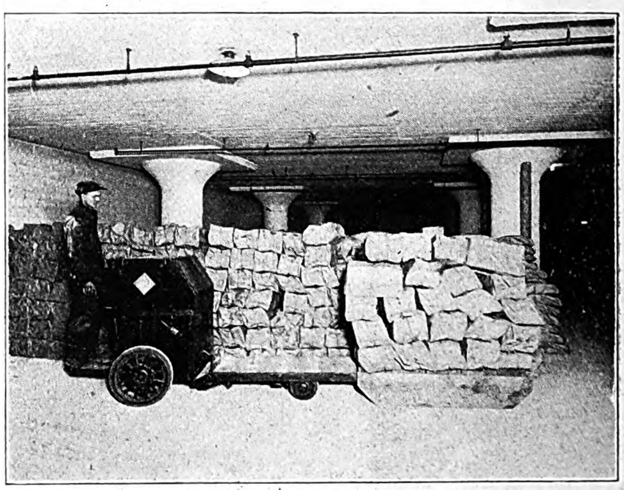
The size and type of goods handled and the methods of distributing are also important factors to be considered. Where the goods are received or shipped in lots stored in one place and are of approximately the same size or type this is a comparatively simple matter. But where the goods are handled in lots consisting of a varied assortment of all sizes and stored in various parts of the building the problem is a very complicated one.

In order to more clearly analyze the handling problem in warehouses it is divided in this article into four operations: Unloading or receiving from an outside carrier into the warehouse; distribution within the warehouse; picking and taking from storage to the shipping room; delivering or shipping from the warehouse to another carrier. In practice these operations often overlap each other to a considerable extent, for example, where the goods are taken directly from a receiving carrier to the storage place, and in addition, the problems which they present are common in many respects. In this analysis the operations in a distributing warehouse are particularly considered, that is a warehouse that receives the goods in large shipments and distributes in the same or smaller ones composed of miscellaneous items. In some warehouses this operation is reversed and for these the order and the subjects must also be reversed.

Use of Electric Industrial Apparatus in Receiving.

Receiving and unloading incoming goods offers perhaps the greatest opportunity for the application of electric apparatus. Shipments are usually received in large quantities from cars or boats and are stored in one certain part of the building. These cars or boats cannot be spotted or placed in the most advantageous unloading positions on account of their size which of course complicates the handling problem. In addition it is essential that they be unloaded as quickly as possible in order to free them for further use. As the material must be hauled over a certain level distance the greater speed and capacity of the electric are very desirable.

The value of the electric in this operation is not generally appreciated, however, due to the fact that with manual labor the goods in unloading are only taken a short distance from the unloading point which of course results in congestion that apparently prohibits the use of the electric to advantage. As a matter of fact with the electric, the material could be taken directly to the elevator or storage space at once or at least far enough removed from the platform to relieve the congestion and permit their operation.



The Electric Lift Truck Can Also Be Used in Distributing Within the Warehouse if the Material Can Be Loaded on Skids.

Where this operation is conducted independently of the other handling operations the electrical industrial tractor is perhaps better suited than any other type. In using the tractor, suitable trailers can be loaded directly from the car or in the ship and picked up and hauled away in trains to their desired location by the tractor. This of course greatly facilitates the operation and permits a more efficient application of the electric apparatus for no time is lost in loading or unloading it and several trailers can be hauled at once.

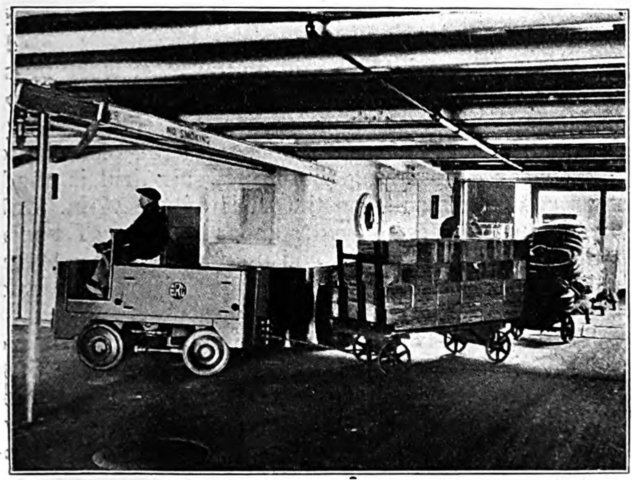
Where the unloading is combined with the other handling and the electric lift truck or some other type is found more suitable for this second operation it is usually desirable to use the other type in unloading also.

Distribution Within the Warehouse and Picking Orders.

In those warehouses that cover a large ground area and are only a few stories high the problem of applying electric apparatus to distribution within the building is a simple one. If the goods handled are mostly of uniform size so that they can be loaded on low skids to be picked up by an electric lift truck and taken to their storage space and left on the skids to facilitate removal this type of apparatus is preferable. It is also well to provide such skids with small wheels or casters so that they can be easily moved short distances by hand. If, however, the material handled consists of a varied assortment of goods of all sizes and weights an electric tractor with trailers will afford the best method of handling. In some places the electric utility truck or one equipped with a gantry crane attachment will be most desirable.

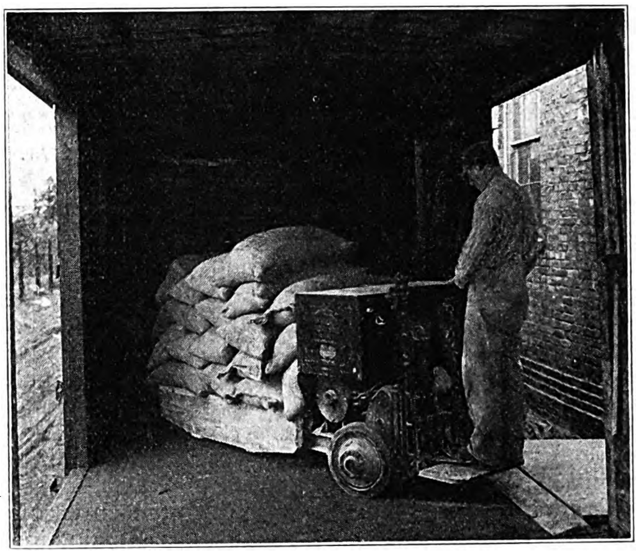
In the taller warehouses where numerous elevators or lifts are used the problem is a much more difficult one. Electric tractors cannot be used to advantage above the unloading floor as the elevators are seldom large enough or have sufficient capacity to accommodate both the tractor and a trailer at the same time. Furthermore elevators are usually located so that the distance over which the goods must be hauled on each floor is very short.

If the material is such that it can be handled by a lift truck however, this type of machine can be easily applied to distributing. As the machine itself occupies but little more space than the load it can easily be carried with the load on an elevator or the load can be quickly placed on the elevator and taken off on another floor by another lift truck. Moreover, they can be easily operated in the dead end passages or aisles such as are encountered in storage buildings.



The Electric Industrial Tractor in Use on the San Francisco Waterfront.

Picking or filling orders in distributing warehouses requires a large amount of trucking and offers a good field for the application of electric apparatus. Orders are usually composed of a number of different items located in various parts of the warehouse which must be collected, assembled, marked, or packed for shipment. All this, with the exception of the packing, is usually done by one man or several men as a crew, unless the number of commodities handled is very great. In such cases sections or departments are formed and the work in each department is done separately.



In Close Quarters Such as This, the Lift Truck Offers Many Advantages.

In one large warehouse where the commodity handled is nearly all packed in bags electric lift trucks are used in this work and each truck replaces the work of six men. In this warehouse a crew consisting of two men with a lift truck collects the order, marks it and takes the completed order to the shipping room where it is left on the skids until called for. The truck then picks up the skid with its load and delivers it to the gravity conveyor from which it is loaded. The bags weigh about 100 lb. each and as many as 40 are carried at one time.

The 9th Street Terminal Warehouse in Cleveland, Ohio, which handles a much larger variety of merchandise composed of barrels, boxes and packages of all sizes and weights also uses the electric lift truck to considerable advantage not only in order filling but in loading and unloading as well.

Under certain conditions the electric tractor can also be applied to this operation but its success will depend largely upon the type of warehouse and the material handled. It is especially adapted to places where the orders received and the quantity of the different items are too large to be carried on skids.

Delivering Merchandise from the Warehouse.

In delivering or loading goods from the warehouse the problem is similar in many ways to that of receiving into the building. The opportunities for the application of electric industrial apparatus for this work in distributing warehouses, however, are not as great as they are in receiving, due to the fact that the orders are usually loaded onto street vehicles which can be placed in the most advantageous position to receive them. Nor are the peak periods as frequent or marked as occur in receiving for the goods can be placed in position for delivery beforehand and the arrival of the trucks can be more easily regulated. Very often however these conditions are reversed and the problem of delivery becomes a much more difficult one than that of receiving and the application of electric apparatus is more desirable in the former than in the latter.

Special Advantages of Electric Industrial Apparatus in Warehouses.

For practically every branch of warehouse work the electric industrial truck or tractor offers special advantages in addition to the regular handling work, that adds greatly to its value. In cold storage warehouses, for example, the greater speed with which the commodities can be transferred from the warehouse to a refrigerator car are particularly desirable. Many of the items handled spoil if allowed to melt in the open air and any unnecessary exposure to normal temperatures must of course be avoided. In addition the goods can be taken in or out of the refrigerating room much more quickly which enables the temperatures of these rooms to be maintained more easily.

The general utility features of the electric are also a decided advantage in warehouses. These places are seldom equipped with power devices for handling exceptionally heavy work. The performance of such work by hand labor not only tires the men quickly but makes them dissatisfied with their jobs and they often quit rather than continue to do it. By using the electric apparatus to assist in this work it can often be accomplished very easily.

The value of the electric tractor for such work was illustrated in a large department store warehouse recently. At that time a large shipment, about 40 carloads, of burlap was received, packed in bales weighing about 2000 lbs. each. Each car was loaded to capacity, there being only about 6-in. headroom between the top of the bales and the roof of the car. The men absolutely refused to unload the shipment even though an extra wage was offered for the work. By using a block and tackle and attaching the cable end to an electric tractor used in the building the cars were unloaded without any extra effort on the part of the workmen and in a much shorter time than would be required if the car had contained lighter material and hand labor used.

Spotting freight cars is another duty which adds to the advantage of electric apparatus for warehouse work. Very few warehouses maintain switch engines for their own work and when a car is to be moved, even although the distance is only a few feet, they are forced to wait until an engine comes from the railroad or accomplish the moving by slow tiresome manual effort. If an electric tractor is used the car can be easily moved by attaching it to the tractor with a cable of sufficient strength.

ADVANTAGES OF ELECTRICITY FOR OPERATING PORTABLE DRILLS SHOWN.

A Comparison of Costs and Efficiencies Between Electric Power and Compressed Air for This Work.

During the past few years remarkable developments have been made in the design and construction of electrically operated portable drills which permits their application for all sorts of drilling work. The greater efficiency and lower operating costs of this apparatus over compressed air drills are not generally realized and for this reason a comparison of these methods has been made by the engineering department of the Van Dorn Electric Tool Co., Cleveland, Ohio. This comparison is of interest to the production manager and factory superintendent in deciding either of two questions: Will it pay to replace air equipment with electric equipment, or will new installations be pneumatic or electric? The three factors to be considered are: Source of power, distribution, and performance. Cost is a function of all three of these factors.

Usually electric power is available, either central-station service or from a private plant. In such cases the source of power item can be dismissed. Where electric power is not available, the choice is between generating it or compressing air. It requires about 22 b.-hp. to deliver 100 cu. ft. of free air per min. at 90 lbs. pressure. This same 22 b.-hp. will deliver 14 kw. driving a generator with 85% efficiency.

The question of distribution must then be considered. The distribution of electric power is flexible, permanent, efficient and much cheaper. The maximum allowance that need be made for loss is 10%. Assuming a 14-kw. source, there will be therefore 12.6 kw. at the tools.

An air line is costly to install, inflexible, subject to freezing, leaks and generally high cost of upkeep. Furthermore, the allowable loss of pressure by friction is 10%, offsetting the electrical distribution loss. It is impossible to prevent leakage, even with constant replacements of hose and repair of joints, and the cost of this item may be tremendous. To illustrate, the amount of leak for very small holes in a 90-lb. system will be:

Size hole.	Amount of leak in cu. ft. per min.
1/16 in.	6.0
1/32 in.	1.5

The leakage, however, is a very uncertain item that may reach almost any figure if the system is not carefully maintained and it is safe to assume that this loss is also 10%. There will be therefore about 90 cu. ft. of air at the tool to operate it under about 80 lbs. pressure.

The question of which will do the most work must then be considered. The efficiency of an electric motor is constant throughout its life, but the efficiency of an air motor falls continuously as the piston and valves wear. Assuming that a new air drill is used, let us compare results on the basis of the ½-in. tool. The manufacturers of two standard makes of pneumatic tools give the air consumption of the ½-in. drill as 15 cu. ft. for the 4-cylinder piston type and 20 cu. ft. for the rotary piston type.

This air supply would therefore take care of five or six ½-in. pneumatic drills. It is safe to state that a ½-in. electric drill with 550 watts input will outdrill the air tool and at this consumption the 12.6-kw. available electric power supply will operate 23 electric drills.

In addition the efficiency of the tool in the hands of the operator is affected by weight, balance and vibration. The advantage of weight obtained in some sizes of air tools is more than offset by the better balance and lack of vibration in the electric tool which enables the operator to handle it much more comfortably and efficiently.

The Newer Aspects of Advertising by Central Stations

A Review and Analysis of the Policies of Leading Utilities with Concrete Recommendations for Improved Practice

By L. D. GIBBS

Superintendent Advertising Dept., Boston Edison Co.

[This interesting comment, which was submitted by Mr. Gibbs, formed the basis of a paper which he presented before the recent convention of central-station salesmanagers at the recent convention of central-station sales managers at a discussion on the Economics of Advertising, by R. S. Hale, also of the Boston Edison Co., which will be presented in a later issue.]

CENTRAL-STATION advertising men in common with advertising men in all other fields were confronted when we went into the war by the problem, "what can we do?" The advertising profession was conspicuously one that had to develop its mission and its field of work. As one man it rose to the occasion. Never before has advertising exerted so great a force for good; never before has it had so wonderful an opportunity in every one of the broad fields of endeavor. Wherever our government discovered a need to be met or a gap to be filled advertising rose to the situation. Our millions of people were "sold" to an ideal, and for that ideal they gave their money, their clothes, their food and their lives. Thus was proved, so every man could see, what advertising can do.

Now, therefore, is our time and opportunity. Our controlling business men have a higher appreciation of the value of advertising service than they ever had before, an appreciation which they never would have gotten—in the central-station business at least—from anything we could have said or done in the ordinary way. It is not too much to assume that they are waiting now for us to make good in our business field as we all made good in the patriotic field. They are not, however, going to hand us advertising appropriations for the indiscriminate exploiting of ideals. They have got to be "shown."

How Representative Central Stations Consider Advertising.

A study of a questionnaire received from a number of central-station sales managers shows:

(1.) That the annual expenditures for all forms of advertising have been modest.

(2.) That, although most of the companies report definite budgets, their advertising expenses have really been, for the most part, contingent upon what the managements felt were the exigencies of the situation, and the expenditures have, for the most part, become "budgets" only after they were placed upon the ledgers at the close of the year in which they were made.

(3.) That consistent campaigns based on appropriations have been running only comparatively a few years out of the relatively long existence of most of the corporations as public service companies. The notable exceptions are the large companies. It has been interesting to note in looking over this review of advertising that usually the starting of advertising campaigns has been coincident with some climax in antagonism on the part of the public, or the discovery of some near-critical state of the central-station's finances.

(4.) The distribution of the advertising charges upon the accounts of the departments most obviously interested appears to be general. One company of the 12 reporting makes its advertising expenditures stand by themselves—apparently, a general operating expense; another, divides these expenses between new business and a "publicity" account. These methods of charging are perhaps as indicative as any of the appreciation of advertising.

It shows that in those companies they have reached the point of admitting advertising to the ranks of the constructive activities of their companies. Most of us have not yet gotten away from the notion that somehow or other anything spent for advertising must be charged into the cost of getting new customers or selling appliances.

(5.) Six of the 12 companies have advertising departments, and 6 conduct the advertising under the direct supervision of the sales departments. Of the 3 companies that had not reported when this was written 2 have advertising departments. This indicates a growing appreciation of the importance of putting the advertising work on its own basis. It is the only proper way; although, of course, any advertising department is expected to work in complete harmony with every other branch of the business.

(6.) Only 2 companies of the 12 have conference or advisory committees, which discuss sales and appliance campaigns well in advance of the time when they will become active, and pass, in a general way, upon the advertising copy.

(7.) Only in a few instances is it reported that campaigns along special lines have been conducted for any extended period. This shows a failure to get the most out of advertising expenditures.

(8.) Eight out of 12 have used street-car card advertising; 5 have used illuminated billboards; 3 have used advertising on the backs of their monthly bills; 2 use stickers attached to their bills; 1 makes enclosures with bills; all have used so-called "follow-up or direct-by-mail" advertising; and all have used newspaper advertising. Only 2 report the use of "house organs" at the present time, but probably most of the companies have at one time or another used this medium.

(9.) Only 2 report that their advertising programs are laid out a year in advance; 1 reports that an effort is made to conform to this plan, and the others, for the most part, report no policy. Copy is apparently prepared by practically all of the companies just previous to its use.

(10.) None of the companies attempt to check advertising results except on "follow-up."

(11.) Five of the 12 use advertising agencies to handle their newspaper advertising; only 1 reports employment of an advisor, and with 4 of the 5 companies the agencies do their work for the commissions they receive from the newspapers.

(12.) Four companies would use any possible extra appropriation entirely in advertising; 4 would divide the appropriation as needed; 1 would divide the appropriation 1/3 for increasing the sales force and 2/3 for extra advertising; another would give 2/3 to increase the sales force and 1/3 to extra advertising: 1 would use the appropriation for increasing the sales force.

The answers to Question 12 are so significant of the appreciation of the value of advertising as to warrant their reproduction here.

The question was: "If you could have an extra appropriation to spend in new business development, how would you prefer to spend it—in increasing your sales force or in advertising?"

Views on How to Spend Appropriation.

The replies are as follows:

A. As far as the new-business work is concerned both solicitation and advertising are important, and one is vital to the other. Industrial work requires considerable more personal solicitation and engineering work, but should be followed continuously by advertising, both newspaper and direct mail. For residential new business, a great amount of advertising followed by personal solicitation is required; such solicitation should be divided into districts and prospects thoroughly canvassed. Both advertising and solicitation will have to be increased to obtain the business that the central stations deserve, and this work must be continuous and persistent to get results.

B. I would increase advertising and sales force. Advertising is absolutely necessary to the success of the selling force. We have found that the most experienced salesman cannot go into a cold field and get as much business as an inexperienced salesman in a field that has been warmed up with advertising.

C. Two-thirds in advertising and one-third in increasing the sales force—under present conditions.

D. It would depend upon the branch of the new-business work to be developed and whether or not we had a full complement of sales people.

If it were power business to be developed and we did not have a complete sales force we should prefer to spend the money for salesmen. If we did have a complete power sales force we would spend the money for advertising.

If it were lighting or appliance business to be developed and we had a complete sales force we should prefer to spend the money for advertising. Even if we did not have a complete sales force it is likely we would spend the money for advertising and put on an additional sales force on a straight commission basis.

E. An extra appropriation to be spent for new business would undoubtedly be entirely spent for advertising rather than for an increase in sales force.

F. At the present time in more men.

G. 60% sales force—40% advertising.

H. In advertising.

I. Just at present, owing to a very radical reduction which was made in our sales organization at the beginning of the war, we need additional sales force. We are also planning some special advertising booklets—the first one being a booklet on Electrical Heat Applications for Commercial Purposes such as electric furnace for melting, heat treating, enameling, japanning, baking, etc. Material is now being prepared to get out this booklet the cost of this having been included in our annual budget made up nearly a year ago.

Our reply to this question, therefore, is that additional expenditure in the sales department would be for both salesmen and advertising.

J. I would say that under our conditions I would much prefer increasing our sales force rather than advertising, but if we were seeking to build up a residence business (which is not necessary here, as the residence business is so developed), I should certainly spend money on advertising.

K. Both. Advertising to disseminate the word broad-cast and stimulate—Additional salesmen to make the actual sales.

These answers clearly show an appropriation of the value of advertising for special drives such as any extra appropriation would probably be used for, and that appreciation must be predicated upon results secured from regular advertising.

Further development of central-station advertising can only come with a clearer understanding of what we want to gain so that the campaigns can be effectively directed.

How to Sell the Advertising Idea.

If we are to sell the advertising idea we must show that we are able to adapt the idea to the needs of our companies. We must learn first where the advertising can be applied, prove that we can get the results when and where they should be secured, and develop our work in its scientific application.

There is no reason why we cannot do this. We have struggled with it, sometimes we have produced results that could be shown, but too often the outcome has been intangible.

Down deep in their hearts, the executives of central stations, the boards of directors and the leading stockholders believe in the power of advertising. When a big emergency arises, where the public must be informed quickly, they turn without a moment's hesitation to publicity and it is spread with a lavish hand. The campaigns are at once big with influence and ring with the truth of conviction. When the emergency passes the inclination to stop expense very naturally comes to the front.

Continuous publicity explaining the growth, stability, kinds of service, reductions in rates, comparisons of costs of electric service with other kinds, business policies, etc., should be kept up. Executives are not yet ready to adopt this policy; deterred possibly by memories of the costs of special campaigns along these lines, and fearful that the cost of continuous campaigns would be proportionately greater.

There is no reason why this kind of publicity should be charged against the operating expenses of a sales department, and usually a sales manager joins with his superiors in opposing such campaigns if he must pay for them. We can, however, push the advertising for building up business in certain localities, and promoting sales of appliances, in the hope that the favorable impressions resulting from successful work along these lines will reflect favorably upon the larger ideals.

Advertising Should Be Laid Out in Conference.

The conference method of laying out advertising campaigns for at least a year in advance will be the quickest way to accomplish results. This is the common sense method; it takes our advertising out of the class of intangibles, forces the advertising man to argue his case and defend his suggestions; brings new ideas to the minds of other officials around the conference table, and in general, tends to clarify the whole situation. Men cannot regularly get together in conference and not come to appreciate one another's view-point. It is perfectly possible to plan our advertising policies a long ways ahead, certainly as far ahead as one year.

Continuous Advertising Pays Best.

The absence of any advertising campaigns extending continuously over a period of years further discloses our haphazard methods. We appear to be all the time dealing in special campaigns, special sales and drives, when a moment's reference to the returns resulting from a continuous campaign on one line running for two or three years shows what could be accomplished if we focused attention on a particular line of sales effort year in and year out. Nearly every central station nowadays follows consistently the new building field, getting on the job before the foundations are laid even for small dwellings. A number of companies have followed well-defined policies in securing the wiring of old houses. Isolated plants are vanishing before consistent and persistent attacks. But these policies must become general so that the results will be definite and tangible from every point of investigation, if we expect to really prove up on advertising.

The kinds of advertising and the mediums used must be proved up. It is a strange mixture that shows central stations using the newspapers, miscellaneous follow-up schemes, street-car-card advertising, illuminated billboard advertising, stickers on bills, enclosures with bills, and house organs in most cases for only short periods at a time—not long enough to get real results. Where are the data to show the value of these mediums? Why do we jump from one thing to another? We seem to have settled on the newspapers as a regular medium, but not one of the central stations represented in this convention makes any attempt to check the results.

How Good Will of Newspapers Is Acquired.

An erroneous belief still seems to exist that a few columns of paid advertising will influence a newspaper to treat us kindly, which some people still think means leaving us alone. Long experience in the newspaper business, and a wide acquaintance with newspaper publishers, editors and reporters has proved to me that the paper that has a tangible influence will not be swerved by a little advertising. What really does happen is that as a result of the personal acquaintanceships developed in the course of business, central-station men and newspaper men are brought together. Each side finds the other human. The newspaper men find there is no mystery about the central-station business, and mutual understanding promotes good fellowship—the really satisfactory basis of all business relations. But let us try some of the other mediums more continuously and efficiently; give attention to the checking of results; practice some "follow-up" on ourselves.

Central stations seem in their appliance business to be always bargaining, dickering, restlessly shifting from one thing to another, campaigns on this article; campaigns on that article; and when a manufacturer comes along with something new, or some new model of something old, we jump to start a special sale on it. Business houses use special sales for cleaning-up time, they put their goods on the shelves and handle them on a regular merchandising plan. If for any reason the stock fails to move, then it is dumped through special sales. I wonder if the public does not get the impression that the central stations are all the time dumping something.

Arriving at a Fair Appropriation.

Department stores of recognized standing and reputation do not plan to spend more than 2% of their gross receipts in any one year in advertising. Businesses that are building up must spend as high as 5%. Some lines in which the merchandiser depends on so-called class and distinction spend 7%. In other lines where special appeal is made to style and exclusiveness retailers spend as little as 1%, but the manufacturers from whom they buy spend in national advertising what would be equivalent to 2 or 3% more for the local dealer in his field. The dealers in electrical appliances are in the class of the retailers, whose merchandise has class and distinction, and have extensive co-operation through the national advertising of the manufacturers. We have thus far exerted too little effort to co-operate. Too frequently we fail to realize that the manufacturer is giving us a service of inestimable value. We forget that the manufacturers are making not only their appliances but electric service household words.

If central stations will intelligently apply only 1% of their annual gross receipts to advertising they can take advantage of every form of co-operative help to the fullest extent, and put themselves in the strongest possible position.

NEW GERMAN LOW-POWER LAMP DEVELOPED.

The British Government Review of the Foreign Press (Technical Supplement) contains particulars of a new German low-power lamp which was described in the *Electrotechnische Zeitschrift* for April 24. The lamp depends on the discharge of electricity in an atmosphere of neon. The lamp is made for 220-volt circuits, and has a consumption of 1 to 5 watts. It is suitable for use as a signal lamp, or in places where inflammable gases are met with, as it is immediately extinguished if the bulb is damaged. They may be used as polarity testers, insulation testers, and rectifiers. The glass bulb contains a mixture of neon and helium at a pressure of 8 to 10 mm. The cathode is of large area and hemispherical shape, and the anode, in the form of a wire, reaches to such a small distance from the edge of the cathode that a brush discharge starts, without external aid, at 220 volts. The voltage of the lamp sinks, when the discharge begins, to about 190 volts, and the remaining 30 volts are absorbed in an external resistance. The cathode may be made of various metals, but iron is preferred, owing to its easy production in the form of thin sheet, its small capacity for absorbing gas, and slight tendency to volatilize. The orange color of the neon light is corrected by mercury vapor, and a pinkish-white color is thus obtained. With direct current the lamp must be connected with correct polarity to the mains, and with alternating current the anode should not be too small in area and thickness relatively to the cathode. A 210-volt lamp with iron electrodes gives 0.44 Heffner candlepower at 19.2 milliamperes, with 186 volts across the lamp terminals, thus taking 4.03 watts from the line, and 9.2 watts per Heffner candlepower.

Central-Station Rates in Theory and Practice

Eighth Article—General Discussion of the Price of Service —Three Principles on Which Price or Rate Systems May Be Based—Cost, Maximum Earnings and Value of Service

By H. E. EISENMENGER

This is the eighth article of this series, which began in the issue of July 12 following a general preliminary outline of the entire series in the July 5 issue. The first seven articles have considered the cost of electric service, a knowledge of which is necessary before any system of rates can be determined on, because the income of any central station must in any case exceed the costs of rendering its service. In the present article is begun the discussion of the principles governing the selection of a rate system, more particularly the general policies underlying the questions of what amount of profit shall be desired and in what proportion shall the different classes of customers contribute to that profit. These articles will be continued throughout practically the entire volume.

PART II—THE PRICE OF ELECTRIC SERVICE.

1. General Remarks About the Three Principles of Establishing the Profit Over Cost.

SECTION 62. The price is cost plus profit; in other words, the price is made by adding a certain percentage of profit to the cost. This percentage may be constant for all units of the commodity[1] and consequently for all customers so that the prices or charges to every customer are proportional to the cost. Or the percentage of profit may be varied between the different units of the commodity sold, in an endeavor to make the customers pay a larger percentage of profit for those units which they value more highly and for which they are therefore willing and able to pay higher prices than for those units which have a smaller monetary equivalent and which possibly would not be bought at all at higher prices. In this case we will charge to different customers prices involving different profits for the same service[2] and, on the other hand, we will charge the same customer prices involving different profits for different kinds of service. For instance, we may charge him a different percentage of profit for heating current and for lighting current.

63. These two differentiations—kind of service and customer—go together and intermingle. If, therefore, in the following theoretical discussions sometimes, for the sake of brevity, only the differentiation between customers is mentioned, it must be understood that this always includes differentiation between classes or kinds of service, unless a remark is made to the contrary.

64. The first one of the two principles mentioned above (that of collecting the same percentage of profit from all customers) is called the *"cost-of-service principle,"* because the price is based on the average cost of the service (see Section 3). The second method of price calculation may be embodied either in the principle which is effectively designated as *"charging what the traffic will bear"* ("maximum-earnings principle") or in the so-called *"value-of-service principle."*

65. The term "What the traffic will bear" means: Collect from every customer and for every kind of the service prices as high as the customer is willing and able to pay[3], and not lower, but refuse to sell service in all cases where the prices sought are so low that they do not cover the cost (more exactly speaking, that they reduce the earnings, see Section 72), so that the earnings of the vendor reach a maximum; in other words, extort from the public as much profit as you possibly can.

The lengthy term "what-the-traffic-will-bear principle" will in the following be replaced mostly by the shorter term, "maximum-earnings principle."

66. The "value-of-service principle" differs from this inasmuch as its aim is not primarily a maximum of profit to the vendor, but it attempts to bring the greatest good—in the form of good and price-worthy service—to the public and to let the greatest number of people partake of the benefit of the respective service. The value-of-service principle charges higher prices for those kinds or classes of the service for which the respective customers are willing and able to pay such prices without reducing their consumption, but it differs from the "what-the-traffic-will-bear" policy inasmuch as it uses the excess income from these higher prices to reduce the prices to those who would otherwise use less service or who would not be customers at all, for instance, to the poorer people.

Under the "maximum-earnings" principle (see Section 65) the earnings can never be high enough. Under the "value-of-service" principle, if the earnings become abnormally high, lower rates are offered. either mainly to the profitable customers, or to the unprofitable ones who heretofore had not been served. or to both groups. We can thus either (a) give to the profitable customers the advantage of lower rates,

[1]This means in case of electric service it is constant for all kilowatt-hours where an energy charge is made and constant for all kilowatts wherever a demand charge is made and also constant for every customer as far as a customer charge is concerned.

[2]Restricting ourselves, from here on, for the sake of convenience of expression to such commodities as are services, although th same deductions apply to all commodities.

[3]Each consumer has, consciously or unconsciously, established certain limiting prices which he is willing to pay for the various parts of the service, even though the line beyond which he is not willing to buy the service may be a more or less hazy one. If he is charged more than this limit for any part of the service, he will forego the use of that part and restrict himself to the remaining parts of the service until, with increasing prices, he will finally drop out as a customer entirely. Thus with an increase of electric lighting rates a customer will refrain from burning certain lamps at certain hours.

or (b) extend the benefits of the service to new customers, or (c) we can combine the two advantages, each one in a lesser degree than under (a) and (b), respectively; that is, we grant a lesser degree of the rate reduction to the profitable customers and extend at the same time the service in a lesser degree to new customers (see Sections 88-93 in a later installment).

The value-of-service principle "discriminates," so to speak, between customers by charging different percentages of profit from them, whereas the cost-of-service principle "discriminates" between customers by charging different percentages of the prices which their valuation of the service would prompt them to pay. The discrimination of the value-of-service principle is of the same order as the discrimination of an income-tax system which does not collect the same sum of money from everybody objectively, but endeavors to make each one bear the same financial burden, measured subjectively at what money is worth to the respective person.

67. With the possible exception of such cases where the valuation of the respective parts of the service is determined by the price of a competitive service of equal quality, we can never hope to have more than a roughly approximated and hazy knowledge of that valuation. Nevertheless, the discussions hereafter of a few theoretical questions in this connection may be of interest and usefulness, although they start from the assumption that the valuations by the customers of the various parts of the service are exactly known in dollars and cents.

In the same manner the theory of structural strength of materials is useful as giving us an exact insight into the conditions, although in practical application to engineering structures invisible and unknown irregularities or defects in the interior of the material and other factors introduce such an element of uncertainty and haziness into the calculations that we have to choose a large factor of safety in practice and cannot go far towards exact application of our theory. Likewise in figuring the voltage drop in transmission and distribution lines we possess very elaborate theories but if we apply them in practice we find that the basis of the computation, the load to be expected, is generally known only very approximately, mostly even only from guesswork. Yet nobody will deny that these theories are useful, because they show us in what way various factors influence the result.

II. The Principle of Charging What the Traffic Will Bear (Maximum-Earnings Principle).

68. The principle of charging what the traffic will bear ("maximum-earnings principle") takes care of the interests of the producer only, in an entirely one-sided way, to the detriment of the other party concerned; that is, of the consumer who, especially in the case of public service corporations, represents the general public. This principle is therefore unethical and its further examination might be dispensed with if it were not for the fact that the "value-of-service principle" is a development of the maximum-earnings principle with certain corrections to take care of the consumer's interests and, as it is thus based on the maximum-earnings principle, we will have to investigate the latter as an introduction to the study of the value-of-service principle.

69. The sum of the total charges collected from all the customers is the *gross revenue* or *gross income*. Deducting the cost of production from the gross revenue, we get the *net revenue* or *net income*.

In the case where the capital is to bear a fixed percentage of interest (bonds, see Section 2) we will require from the point of view represented by the "what-the-traffic-will-bear" principle that the *net income* becomes a *maximum*. If, however, the percentage of return on the capital is variable (stock dividend), we are not interested in a maximum of the net income, but *in a maximum of return* on the capital.[4]

70. The maximum "earnings" to which the "what-the-traffic-will-bear" principle aspires may therefore either be a maximum net income or a maximum rate of net return (dividend). The term "earnings" will hereafter be used to embrace the meanings of both "net income" and "rate of return" and for the sake of generality the meaning "gross income" will be included also.

71. The requirements of a maximum net income and of a maximum return are not fulfilled by the same conditions. A change of prices may, for instance, increase the net income, but it may at the same time increase the necessary capital in a greater measure[5] so that the rate of return is reduced. (Compare Section 4 of Insert IX.)

72. If we want the earnings to become a maximum, we must arrange the rates according to the following two principles: (1) We must attempt to charge for every unit of the commodity just the maximum limit at which it can still be sold under the circumstances and not less, and (2) we must refuse to sell

---

[4]The last sentence is in general subject to a certain correction: If the enterprise is prosperous, it will for the following reason be of advantage to grant a reduction of prices within certain limits, even though this will be connected with a reduction of the rate of return. The reduction of prices will result in an increase of the demand for the commodity, a larger amount of the commodity will have to be produced and this requires an increase of the capital invested. If the price reduction remains within certain limits it must of necessity result in an increase of the net income (as proved in Section 4 of Insert IX). If now the additional ("increment") net income is large enough in comparison to the additional ("increment") capital, the additional investment will be profitable in itself without any reference to original investment. If we have for instance, prices which produce 50% net return on a capital of one million and if a reduction of prices will reduce the net return to 40% but at the same time make the investment of another half million necessary for increasing the producing facilities (in case of a central station), we will prefer 40% of 1½ million to 50% of one million, the more so, if the money can be raised by bonds. The additional half million will bear

$$\frac{0.40 \times 1{,}500{,}000 - 0.50 \times 1{,}000{,}000}{500{,}000} = 20\%,$$

which is so handsome and attractive a net rate of return that we would not hesitate to reduce the price still further in order to obtain the opportunity for the investment of further capital at a lower percentage than 20%. The rate of return on the additional capital decreases with every price reduction and we will continue the price reduction until the return on the increment capital ceases to be attractive.

By induction from this example we can say: The most desirable price from the point of view of the producer (central station) is found if, starting from the price which furnishes a maximum rate of return, we lower the price so long—and not longer—until a further very small price reduction will furnish an increment income barely large enough to yield a rate of return on the increment capital, which is just at the limit of being attractive to new capital. The total (or "average") net return on the capital is then smaller than the maximum possible net return but larger than the rate of return which is still just attractive to new capital. Likewise, it can be easily seen that the most desirable price is lower than the price which furnishes a maximum rate of return but higher than the price which furnishes a net return barely at the limit of being attractive to new capital. At the same time this price can, of course, never reach down as low as to the price p_n (which furnishes a maximum of the net income n) because the increment net income at that price is zero and therefore the (gross) rate of return on the increment capital will also be zero which after deduction of depreciation and other fixed capital charges would make the net return (dividend) on the increment capital not only not attractive but even negative. (Compare Section 18.)

Wherever the most desirable price is situated, we are safe in the statement that at least as long as a reduction of the price results in an increase of the net return this reduction is advisable from the producer's standpoint. With this understanding the following investigations will assume that the most desirable price is that which brings about a maximum net return, although it is actually lower and situated between the price which produces a maximum net return and that price which produces a maximum net income.

[5]By increasing the quantity of the commodity which can be sold and which therefore is to be produced.

any unit of the commodity at a price which reduces the earnings.

73. The first one of these two points implies that we have not only to make different charges for the same service to different individual customers—or at least to classes of customers—but also to charge the same customer differently for different kinds of service, for instance, for heating and lighting current. We have even to go further than that; we must charge different units (for instance, different kilowatt-hours) of the same service differently to the same customer, as the following example will make clear. A certain customer may use 100 kw-hr. per month for his lighting if he has to pay an energy charge of 6 cents per kw-hr. If he gets a cheaper price, he will generally use more current for his lighting by increasing his illumination, or his burning hours, or by using indirect lighting methods, etc. The additional kilowatt-hours are worth less to him than the original ones; they have more the character of a luxury, as is plainly demonstrated by the fact that he is not willing to buy them if he has to pay 6 cents, whereas he does buy the first 100 kw-hr. at that price. Let us assume that the number of kilowatt-hours he is willing to purchase per month at various unit prices of the kilowatt-hour with a given constant demand charge is given by curve[6] *m*

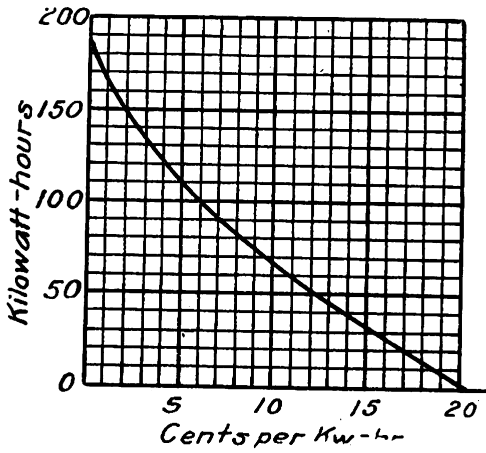


Fig. 2.—Customer's Sales Curve.

in Fig. 2, which shows that at 6 cents per kw-hr. he will use 100 kw-hr. and if the charge is lowered to, let us say, 4 cents per kw-hr., his consumption will rise to 125 kw-hr. If we want to sell that latter amount to him, we need not lower the unit price for the first 100 kw-hr. per month because the customer is willing to pay 6 cents for every one of them, but we must lower the unit price to 4 cents per kw-hr. for each one of the next 25 kw-hr.[7] In pursuance of this same method of reasoning we find from the curve that (choosing unit prices stepped off by whole cents) we ought to charge a price of 3 cents per kw-hr. for the next 13 kw-hr. (i. e., from the 125th to the 138th), etc., until we reach the limit mentioned in the following section (74).

Extending the same principle to the other (right) side of the curve we will find that instead of charging 6 cents per kw-hr. for the first 100 kw-hr. we should rather charge the customer 20 cents per kw-hr. for his first 2 kw-hr., 19 cents for each of the next 5 (3rd to 7th), 18 cents for the next 6 (8th to 13th), and so on, until we arrive at a unit charge of 7 cents for all kilowatt-hours from the 81st to the 90th and of 6 cents from the 91st to the 100th kw-hr. To be quite exact, we would have to deal with steps smaller than 1 kw-hr. and smaller than 1 cent; strictly speaking, the steps should be of infinitesimal size.

74. The second one of the two points in paragraph 72, that under the maximum earnings principle we must refuse to sell any unit of the commodity at a price which reduces the earnings, obviously means the following:

(a) If we aim at a maximum *gross income* it is evident that every sale will increase the same. There is no price above zero in existence which reduces the gross income.

(b) If we aim at a maximum *net income* we must avoid any sales of which the gross income does not reach at least the increment cost over the cost of all the commodities already produced before[8], that is, only such sales must be made of which the *increment net income is positive.* If the increment net income is positive, the *rate of return of the increments* must of necessity be positive also, and *vice versa*; we are designating by this term the rate of return which the increment net income provides for the increment capital.

(c) If we aim at a maximum *rate of return* it is not enough that a positive "rate of return of the increments" result from the respective sale, but it must be *greater than the rate of return* produced by all of the other sales which have been made before the addition of the respective sale.

75. We can also express the contents of Section 74 in the following manner: Under the maximum-earnings principle we must refuse to make any sales at prices which are lower than the cost increment per unit[9], the term "cost" being defined in each case as those portions of the expenses (see Section 2) with which the respective kind of "earnings" (gross income, net income and rate of return, respectively) is concerned in the following way: *Gross income* is not concerned with the cost at all, inasmuch as cost does not play any part in the makeup of the gross income and we have to set the cost in this case = 0; as the cost is therefore constant, the cost increment is also = 0 and the lowest price which is permissible under the maximum-earnings system in order to obtain a maximum gross income is zero, that is, any sale, however low the price obtained, will swell the gross income

---

[6]To be called "sales-curve" of the customer, compare Section 1 of Insert IX.

[7]The first 125 kw-hr. cost then a total of 600 + 100 = 700 cents, or an average of 700/125 = 5.6 cents per kw-hr. It might seem on superficial observation that the effect is the same if we charged 5.6 cents per kw-hr. uniformly for every kilowatt-hour throughout, from the first to the 125th. It must not be lost sight of, however, that if we charge uniformly 5.6 cents per kw-hr. the customer will not use 125 kw-hr. but a lower number (somewhere between 100 and 125 kw-hr): according to the curve he will use only about 105 kw-hr. with a resulting revenue of only 105 × 5.6 = 588 cents instead of 700. On the other hand, if we attempt to make the customer use the whole amount of 125 kw-hr. under a uniform price for every kilowatt-hour he will have to go down as low as 4 cents per kw-hr., which will reduce the income to 500 cents.

[8]See Section 3 of the first of this series of articles and the footnote to Section 25 of Insert IX. The increment cost depends not only on the amount of the commodity added but also on the amount of the commodity produced before the addition of the incremental amount of the commodity. The increment cost from 100 to 200 units will generally be greater than the increment cost from 1100 to 1200 and greater than the increment cost from 10,100 to 10,200 units. The same applies to the increment capital.

[9]Note the difference between the meanings of the following three terms: (a) increment of (total) cost or cost increment; (b) increment of unit cost and (c) cost increment per unit.

If, for illustration, it costs $500 to produce the first 100 units of a certain commodity (for instance castings) and $600 to produce the first 150 units, we will get the numerical values for the above three terms for an increase of the production from 100 to 150 units as follows:

(a) The cost increment is $600 — $500 = $100.

(b) The increment of the unit cost = unit cost for a production of 150 units minus the unit cost for a production of 100 units = $600/150 — $500/100 = —$1. The increment of the unit cost is therefore a negative amount and it would in this case be more convenient to use the term "decrement of the unit cost."

(c) The cost increment per unit = $100 / (150—100) = $2.

Net income is affected by the cost of labor, material, etc., as explained in Section 2, but it is entirely independent of the capital charges, such as interest, depreciation, etc., and we will therefore define the term "cost" in this case as excluding the capital expenses. Where we are interested in the *rate of return* (dividend) the term "cost" must be understood to include the capital expenses on the increment capital[10] figured at the same rate of interest which all the other aggregate sales yield on the aggregate capital.

We see that, with exception of the case dealing with a maximum of the gross income (which has no practical importance), the question whether or not a certain sale is desirable under the maximum-earnings principle can be answered only if we take into account the sales already made before the addition of the respective sale, because the increment cost and the increment capital depends on the number of units produced. In case we consider the rate of return, the profitability of the other sales has also an important bearing on the question; for instance, a certain sale netting a rate of return of 15% on the increment capital will be desirable, if the other sales together produce an average return of 10%, but it must be avoided if the rate of return of the other sales averages to 20%.

76. If we consider not one single sale but ask which ones of all the possible sales shall be accepted and which ones refused to get a maximum of earnings, we will first pick out those which produce a maximum gross income per unit because they will produce a greater increment net income and "rate of return of the increments," respectively, than any other sales, regardless of the way in which the increment cost and the increment capital, respectively, are figured. This means we start with the sales which bring higher unit prices than any other ones; then we add gradually sales with lower and lower prices until we arrive at prices which begin to reduce the earnings (either a negative increment net income or a "rate of return of the increments" smaller than the average rate of return resulting from the sales considered heretofore).

77. We see from the foregoing *that the average cost per unit has no influence on the price of a certain unit* under the maximum-earnings principle. The price of a certain unit which is sold profitably may be higher or lower than the average cost. The same applies for the value-of-service principle.

[10]The increment capital to be figured in the same way as the increment cost; see the preceding footnote of this Section.

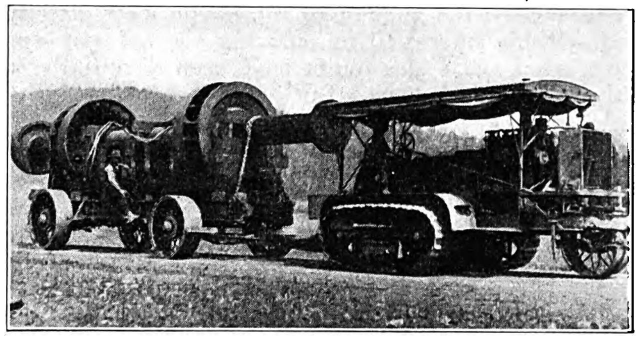
(To be continued.)

HEAVY POWER-PLANT MACHINERY HAULED BY TRACTORS.

Caterpillar Tractor Used to Move Hydroelectric Machinery to Long Lake Water-Power Plant.

An interesting example of the utilization of caterpillar tractors and trucks for hauling heavy machinery this summer was that made by the Washington Water Power Co., Spokane, Wash., in transporting to Long Lake the equipment required for the installation of its new hydroelectric unit in its existing plant. This required a haul of eight miles from the nearest railroad to the plant, over the earth bed of an old railroad grade.

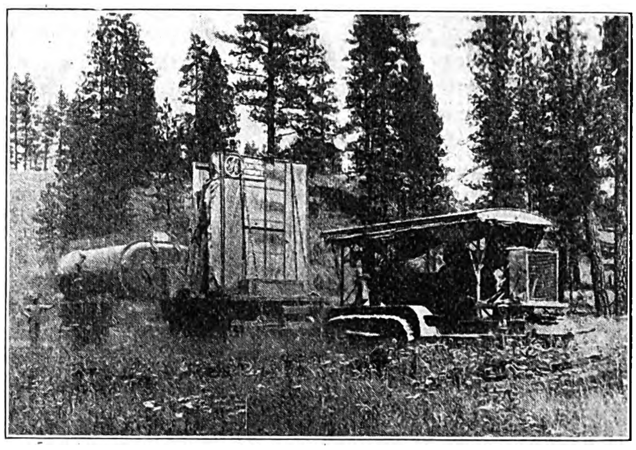
The heaviest load, illustrated herewith, consisted of the turbine runners and shaft which weighed 38½ tons. This was hauled upon a Holt 30-ton wagon, and was drawn by a Holt 45-ton tractor. The axles of



Holt Caterpillar Tractor Pulling 38½-ton Load Consisting of Turbine Runners and Shaft.

the wagon were strengthened so they would support the load. The generator parts in three pieces, similarly transported, weighed 15 to 16 tons each. The lightest load of the trip was 20 tons, for which four three-wheel logging trucks were used. In the latter operations two 10-ton trucks were pulled by one caterpillar. In one of the illustrations there are shown two trucks, one bearing a transformer element and the other a tank, drawn by a tractor.

Incidentally, it may be said, that the penstock of a length of 239 ft. for the new unit at this plant is



Transformer Element and Tank Being Hauled on 10-ton Trucks by a Holt Caterpillar Tractor.

complete, and that the installation of the turbine, generator and other equipment will be completed by Nov. 1, 1919.

PSYCHOLOGY IN CAR FARES CRITICISED.

Apparent Advocacy of Home Rule Criticised by H. S. Cooper, Well Known Consulting Engineer of Texas.

To the Editor:

I have read with much interest the editorial in the August 16 issue of the ELECTRICAL REVIEW and have also read with equal interest the similar views of Secretary Baker, those others of like opinion who have testified their beliefs and experiences before the Federal Electric Railways Commission and the many who are putting similar opinions into print in newspapers, magazines and special publications. "Boiled down to clear syrup," the idea is that all increases in fares should be submitted entirely to local decision, that outside or extraneous authority, such as State Public Utility Commissions, should be debarred from any authority or control in the matter. If such an idea had been offered by one or many who did not have cognizance of the facts or by those who were directly and selfishly interested in retaining the old fare—or lowering it—that idea might have been dismissed for either of those reasons. But when men of authority in, and supposed knowledge of, local electrical transportation operation give vent to such ideas and when such magazines as the ELECTRICAL REVIEW give them currency and echo them, then it seems time to put in a most urgent protest.

Outside of the fact that the last two years have pretty conclusively proved that not 1% of the municipalities will allow any increase in their street-railway fares if it can possibly be prevented, lies the further fact that in this matter, as in other matters relating to their public utilities, no community is capable of equity and justice in its communal decisions where those who actually make these decisions are directly and financially interested individually in but one phase of the matter—that which will be of advantage to each one without reference to what disadvantage it may cause to others.

Further, consider the case as it stands when those in the community who will be affected by a certain condition on which their decision will be the last and only one, are made the final arbiters. Is it in human nature as at present constituted to take the side which is the equitable and just one and to do so knowing that that decision will bring financial loss or increase of living expense? That is too much to ask of fallible human beings except in such dire emergencies as occurred during the late war—and it would seem from the many "investigations" now being made that even the stress of war times did not rid certain classes of taking advantage of any opportunity to better themselves, no matter how low or selfish the motive.

Outside of the known and acknowledged fact that "home rule" of the local utilities by their communities always means an admixture of politics and demagoguery in the settlement of any question in which the utilities are interested, lies the further present fact that such decisions as are now made in these matters are never made by the responsible element in the community. Before the advent of the automobile, when the street car was the necessity vehicle of every class, any question with reference to it was a common and universal topic of interest among all citizens. At the present time, outside of such laws or ordinances which restrict reckless or careless driving and which are an outcome of street-railway traffic, or outside of parking restrictions on streets which have street-railway tracks on them, the automobile owners and users have only an academic interest in the street railway and little or none in the matter of its fares. Except to oblige a friend, to settle a grudge or to carry out a theory, no automobile owner or user will exert himself to vote or otherwise affect the decision of the community. Those who do so vote, or shout, are either those whose daily expenditure will be measurably increased by an increase of street-car fare, those who have an axe to grind—politically or financially—those infested with municipal ownership or other socialistic isms and ologies and those who are "ag'in all corporations."

Beyond all this is the fact that to allow any community to be the court of last and only resort for its local utilities is to upset all our ideas of equity and justice, and the fact that this has been permitted in the past and is being urged and condoned at the present time does not alter the ethics of the case. What would be thought in equity and law of any trial in which one party was plaintiff, prosecuting attorney, jury and judge all rolled into one and all having a selfish personal and individual interest in but one verdict and sentence? And yet that is exactly the case in "municipal home rule" when it is calmly and dispassionately analyzed. Here is a portion of the community—the portion which always votes in matters which indirectly or directly affect it in any individually selfish manner—permitted, nay, even urged, by those who should know better, to make a decision, a final decision, a just and equitable decision, on a matter which touches their pocketbooks. Could not anyone tell long beforehand what that decision would be? Let those who know the deciders put themselves in their places—would *they* care whether the stockholders had a "reasonable return" on their investment if *they* owned no stock? Would *they* care whether the crippling of the local utility injured outlying property or investments if they were not personally interested in such? Would anything move *them* in such a case and under their personal environment except individual benefit and selfishness? Of course they would not. Outside of a few bankers, real-estate owners and others largely and directly interested in the growth and facilities of any community, what individuals in the community realize the danger of laming or killing the local utilities, recognize and realize that danger sufficiently fully and strongly to make them decide against their personal and individual selfish interests?

If there is any "psychology" in the matter it is the psychology of personal selfish interest and if that is to be the guide in matters of utility service and emoluments and if that is to be limited to those businesses alone then it is a pretty poor prospect for them. "Lord, defend me from my friends, I can take care of my enemies." Mr. Tripp stated before the same commission that "we had all been living in a fool's paradise" and when electric transportation men and journals advocate the continuation of the very ills which "home rule" injected into the local utility business years ago and from which the business has only been at all cleared by state commissions, it would seem that a lot of us still remain in Mr. Tripp's Elysium and that we would get better and more practical results if we descended to the plains of common sense and justice.

H. S. COOPER.

Dallas, Texas, August 20, 1919.

STREET - RAILWAY SITUATION OF NATIONAL CONCERN.

The New York *Times* said recently: "Any idea that the troubles of the electric railway companies are local merely because they mostly do a local business and are subject to local regulation cannot survive the evidence now being offered to the Federal investigators whose appointment was approved by the President when he was at Paris. The operation of a thousand miles of track has been abandoned. Sixty companies have actually dismantled and junked their properties. Sixty-two companies operating 6000 miles are in the hands of receivers. The net income in 1917 was $41,800,394, and in 1918 $10,712,726. It appears to be clear that fares must be increased, or many riders must walk. Last year there were eleven billions of electric railway passengers."

This statement by one of the leading newspapers of the country shows that it has investigated this problem carefully and in an unbiased manner, and therefore in striking contrast to so many other newspapers that have shown the most violent hostility to the street-railway companies.

Editorial Comment

Electric Trucks and Tractors in Warehouses

INDUSTRIAL electric trucks and tractors offer one of the best means of solving the handling problems of storage warehouses and similar places as pointed out elsewhere in this issue. In their application for this work, however, considerable difficulty is encountered due to the design and construction of the buildings which, to a certain extent, prevents their introduction.

To entirely overcome such difficulties in existing buildings is of course impractical, but they can be avoided in future construction by a little co-operation from the rest of the electrical industry. There are very few such buildings designed where some branch of the electrical industry is not called in to act in an advisory capacity. At such times if the advantages offered by this apparatus are pointed out the design of the building can readily be modified to permit their satisfactory and efficient application.

Individuality in Daylight Saving

PASSAGE of the law repealing daylight saving over the veto of the President brings to an end after October 26 the nationally legalized practice of turning the clock an hour ahead during the summer months and thereby making available for general usefulness and recreation an hour of daylight that would ordinarily pass before the working day for most of us commenced

America is so far as we know the only country reverting to the old order of things. France, Great Britain and other countries adopting Benjamin Franklin's suggestion of saving daylight as a necessary step in economy created by the war, are adhering to a practice that proved its worth in helping to win the war. America is a backslider, not because we do not need to save coal, not because we are not desirous if not anxious to reduce our summer lighting bill by a million or more dollars, not because we do not need more time for recreation, but because a certain element or elements have created an impression that their will is the will of the majority. It is known that those farmers employing help are the ones that have opposed the daylight saving. It has also been claimed that some of the lighting utilities have opposed the same law, though no evidence was offered to verify this. But we do know that that extra hour of daylight is a boon to the city dweller and its *raison d'etre* is sound from every economic aspect.

However, it is only the compulsory observance of daylight saving that is denied us. We still have the privilege of voluntarily adhering to it or of obtaining the same benefits in other ways. It was advocated in these columns long before daylight saving became a law that the stringent custom of starting and ceasing work during the summer months during certain very narrow limits be extended and modified and in so doing reduce the unpleasantness, the delays, the dangers and the high cost of transportation. That can still be done and should be done.

We shall all gain if the employer of labor permits his employes to change their hours of commencing and ceasing work during the summer months. The employer, likewise, will gain, because his employes will be more efficient and therefore do better work. The demand upon the traction systems will be spread out over a longer period. For the power companies the summer peak will be different, less capacity will have to stand ready for service and less coal will be consumed for banked fires and peak loads.

We humans are habit-forming animals, and often our habits are not the wisest. Now that saving for usefulness that additional hour of daylight will be a matter of choice instead of necessity in the summers to come, it is hoped that the individuality in us will assert itself and that many of us will adopt our own daylight-saving habits when the summer comes back each year.

The Contractor-Dealer in the Scheme of Things

INTO almost every phase of the electric utility industry one hears mention of the contractor-dealer.

At the recent meeting of the Executive Committee of the National Electric Light Association in New York two of the matters that came up call for special reference. One of these was that of publicity, the other that of the contractor-dealer.

The N. E. L. A. is now taking up in earnest the education and assistance of the small contractor-dealer as to the sale of current-consuming appliances and merchandising methods. The contractor-dealer is part of the scheme of things, a link in that long chain of electric supply, that has come more and more interwoven into the fabric of our national life with every year. In the past, many central stations have failed to appreciate the function of the contractor-dealer or their responsibility toward him. Things are changing, have changed rapidly of late, and we look forward to the close harmony and mutual understanding between the utilities and the contractor-dealers that should exist for the welfare of both, the central-station industry as a whole, and the public whom they both serve.

Good Will and Psychology in Car Fare Increase

GOOD WILL is a very important, though intangible, asset in any business, be it mercantile, industrial or public utility. In public utility valuation the element of good will is frequently denied, on the assumption that any business which is more or less of a monopoly cannot suffer from ill will and the public *must* patronize it willy-nilly. The fallacy of making this belief general has often been exposed. Especially when severe exactions have been imposed on a utility company that could not list (often through no fault of its own) the good will of the public among its assets has the reality and value of public good will been made clear.

Probably at no time has it been more desirable to have the public good will on the side of the utilties than right now when so many of them, especially electric railways, are compelled to seek higher rates to meet rising operating costs or face bankruptcy. Through the public service commissions, which happily are now established in nearly all our states, the utilities can in most cases find at least temporary relief for the desperate conditions confronting them. In many states, however, the commissions have not been in existence long enough for the general public to fully understand their function and authority. Formerly nearly all rate cases before commissions involved rate changes downward, whereas, now when the commissions in all fairness find that rates must be raised the public does not readily grasp that the commissions are obligated to adjust rates down or up as conditions may require. Thus arises one of the chief causes for renewal of home-rule agitation, demands for curtailment or extinction of commission authority and bitter resentment at the higher rates.

We believe, and many authorities on public utility service agree on this, that the agitation for home rule and the resentment at higher rates would be largely overcome by a judicious effort of the utilities to place their case frankly before the public so "that the people may know," in the words of Mr. Henry L. Doherty, the merits of the case before it is formally brought before the commission or other body authorized to act on it. Failure to provide the preliminary publicity gives opportunity to those demagoguic interests in the community who usually are waiting for just such a chance to allege that the matter is being railroaded through some remote commission and others without thinking quickly accept this assertion of conspiracy. Thus the good will or at least fair attitude of the public that could have been gained by a candid presentation of the actual facts is replaced by the ill will toward the utility corporations that many politicians and professional agitators do their utmost to foment for their own ulterior motives.

These ideas were briefly set forth in an editorial entitled "Psychology and Car Fares" that we published in our issue of August 16. We endorsed a certain statement by Secretary of War Baker along these lines. In a letter that we publish elsewhere in this issue, Mr. H. S. Cooper of Dallas, Texas, well known as the secretary of the Southwestern Gas and Electric Association for many years, takes spirited exception to the editorial in question. It may be that on account of the discomforts of a torrid day the idea aimed at was not presented very clearly, but Mr. Cooper reads into it much more than was intended, especially when he accuses us of favoring home rule and attacking commission regulation of public utilities. As other readers may have misunderstood our stand on the question, we take this opportunity to make it clear.

The ELECTRICAL REVIEW has for over ten years been a sincere and consistent advocate of commission regulation and has on countless occasions shown the fallacy of arguments seeking to have home rule of utilities restored. The evils so commonly connected with home rule, especially that of keeping utility questions in politics, have been repeatedly exposed, as have also the common shortcomings of municipal ownership. Instead of attacking commission regulation, we have warmly advocated its extension so as to give a single state commission full power to solve even the labor problems of the utilities. We have no apologies to make for this steadfast attitude toward utility regulation and pride ourselves that among our constant readers there are not a few who have commended us for taking a stand on this question in advance of current practice.

Utility commissions, like the courts, are not publicity mediums. Their function is to weigh the merits of the case and render a decision thereon which is made public, usually with a review of the salient features of the case. But a very small percentage of the public studies the decision and the evidence on which it is based. The time for publicity in a public utility case is chiefly before the case is presented in detail to the commission so that the public may have a grasp of the essential facts at issue before the decision is rendered and therefore will be prepared to see the wisdom thereof. Several electric railway companies have through newspaper advertising or pamphlets distributed among their patrons presented simple and clear statements of the facts and figures of increased costs and thereby gained the good will of the patrons toward the increased fares that were inevitable in spite of all possible economies.

In Illinois the central station, gas, electric railway and telephone utility associations have formed a mutual Committee on Public Utility Information and the National Electric Light Association is right now considering the creation of similar publicity committees in the other states. This shows that the idea of more extended and persistent utility publicity is gaining ground. It is bound to increase the good will of the public toward the utilities.

Current Events

Report of Michigan Meeting — Plans for Pennsylvania Convention — N. E. L. A. Activities — Electrical Shows

MICHIGAN SECTION, N. E. L. A., HOLDS BIG CONVENTION.

Many Subjects of Central-Station Interest Discussed at Largely Attended Meeting at Ottawa Beach, August 26-28.

The first meeting in three years of the Michigan Section, National Electric Light Association, proved a very successful affair on Tuesday, Wednesday and Thursday of this week. It was the sixth annual convention and was held at the Hotel Ottawa, Ottawa Beach, Mich. An unusually large number of members and guests was present.

The first session opened Tuesday morning with the presentation of the address of President Thomas Chandler, Sault Ste. Marie. Mr. Chandler was in active service as a captain of engineers during the late war and during the summer of 1918 he went to France with the 56th Engineers, an anti-aircraft searchlight organization. In his address he referred to the excellent manner in which the association's affairs had been conducted during his absence. He then discussed important topics of the day, dwelling on daylight saving, the great demand for house wiring and electrical appliances, the need for greater economies and higher rates to meet increased costs, more careful consideration of the subject of rates, training and education of employes, the new Michigan Utilities Commission, and association matters in general.

After the appointment of some committees, a paper on "Courtesy" was presented by John Swanson, Consumers Power Co. This pointed out the importance of courteous treatment of patrons by all utility employes who come in contact with them, whether directly or by means of the telephone. The subject was discussed by Herbert Silvester, F. A. Newton and R. A. Gordon. These speakers pointed out that courtesy can do a great deal to develop the good will of the public.

A paper on "Electrical Merchandising" was presented by A. H. Touscany, Detroit Edison Co. This reviewed especially the work that is being done in Detroit and nearby cities in the sale of cleaners, washing and ironing machines, electric sewing machines and other appliances. Many important points were brought out. This paper will be treated at greater length in an early issue.

Discussion of the subject was opened by Mr. Johnson, of Jackson. The sale of merchandise by the Consumers Power Co. of that city amounted last year to $15 for each meter installed. This compares favorably with the revenue received from lighting accounts. The sale of appliances has also been the means of increasing the load-factor. The discussion turned to the question of whether it is undignified for a central station to push the sale of appliances by house-to-house canvass. Mr. Touscany thought that it was not proper for the central-station company to do this. Mr. Johnson stated that in one of the Ohio cities a list was made up of central-station customers who did not have any electrical appliances. The list was divided into groups of 20 names which were given to separate salesmen with 20 flatirons each. Results showed that 18 to 19 of these 20 patrons bought the irons. H. H. Koelbel said that it was a bad thing to permit department stores to sell cheap heating appliances as it has a tendency to injure the appliance business.

"The Central Station and the Contractor-Dealer" was the subject of a very interesting paper by R. A. Gordon, Houghton County Electric Co. In this paper the relationship of these two branches of the industry was discussed and the conscientious efforts being made by both to come together on a common ground and co-operate were shown. The author is strongly in favor of this movement and stated that the task of forming or promoting joint co-operative organizations wherein all branches of the industry would be represented should be the task of the central stations and they should welcome the opportunity to perform this service. He explained the great need for co-operation in the electrical industry at the present time and the attitude of other organizations, particularly the National Association of Electrical Contractors and Dealers, towards such a movement. He also gave several valuable merchandising suggestions and pointed out the advantages of a proper merchandising policy.

On Tuesday evening William A. Durgin, Commonwealth Edison Co., Chicago, presented an illustrated lecture and demonstration on industrial lighting, using a special model for effectively showing the very superior results obtained when a good system of general illumination is installed.

H. J. Burton, Consumers Power Co., in his paper entitled, "Working Safely on High-Tension Lines," discussed the hazards of working on power lines, taking up the dangers due to induction, lightning, falling objects as well as those due to electric shock from a live circuit itself. The selection of men for the work, construction of lines and the importance of training men were taken up, after which Mr. Burton discussed individually insulating tools and appliances, rubber gloves, shields and protectors, linemen's spurs, safety belts, boots, coats and similar equipment. He described special tools necessary to permit insulators to be changed with safety on live lines and the precautions that should be observed in work of this kind.

The evening session was concluded with the showing of a two-reel educational film, "The Queen of the Waves." This showed the wonderful progress being made of the use of electricity in navigation.

On Wednesday morning the first paper presented was by Robert Davey, of the Consumers Power Co., entitled "Accounting for Plant Investment of Public Utilities." This paper discussed the various methods used in making the yearly budget and accounting of same.

James V. Oxtoby, a prominent attorney of Detroit, then made an address on "The New Public Utilities Law." He briefly explained that the new Public

Utilities Commission created by the last Legislature has replaced the former Michigan Railroad Commission and has all the powers of the former body. It also has the power to make rates. All new rate schedules proposed must be sent to the Commission but are not effective until approved by it. F. A. Newton, Consumers Power Co., who was formerly associated with the Wisconsin Railroad Commission, urged that a committee be appointed to help the members keep informed as to the activities of the Commission. Rates should be made so that each class of service makes a fair profit. He strongly advocated getting and keeping records of costs and income so that new rates can be made which are proper for each class of service.

On Wednesday evening was held the annual banquet at which the principal speaker was F. G. R. Gordon, of Haverhill, Mass., who delivered a very instructive address on "The Trend and Menace of State Socialism in America." This was followed by an entertainment program. A report of the concluding sessions of the convention will be given in our next issue.

LARGE ATTENDANCE EXPECTED AT PENNSYLVANIA CONVENTION.

Program Includes Many Noteworthy Speakers and Elaborate Entertainment Features.

The approaching convention of the Pennsylvania Electric Association, to be held at Bedford Springs, Pa., Sept. 3 to 6, inclusive, is confidently expected to be the best of the many successful and enthusiastic gatherings of this association.

Among the guests of honor who will deliver addresses are included the Hon. Wm. C. Sproul, Governor of the Commonwealth of Pennsylvania; the Hon. Wm. D. B. Ainey, chairman of the Public Service Commission, and Walter H. Johnson, vice-president of the National Electric Light Association.

The papers to be presented at this convention form a well balanced group, covering those phases of the industry which are uppermost in the minds of those responsible for the success of the central station.

A condensed outline of the program follows:

Thursday, 10 a. m.—President Sproule's address; reports of officers and committees; appointment of committees.

Thursday, 8:30 p. m.—Address by Gov. Wm. C. Sproul of Pennsylvania; address by Wm. D. B. Ainey, chairman, Public Service Commission; address by W. H. Johnson, vice-president, N. E. L. A.

Friday, 10 a. m.—Paper, "The Effect of the War on Boiler-Room Practice," by John A. Barnard, combustion engineer, Philadelphia Electric Co.; "Economical Boiler-Room Practice for Medium-Sized Plants," by H. B. Bryans, engineer, Counties Gas & Electric Co., Norristown, Pa.; "Selecting a Switchboard for a Plant of Moderate Size," by G. E. Wandle, assistant general manager, Lycoming Edison Co., Williamsport, Pa.; "Management and Men," by H. P. Weaver, general manager, Independence Bureau, Philadelphia.

Friday, 2:30 p. m.—Paper, "Increasing Capacities of Existing Lines and Cables," by E. C. Stone, system operator, Duquesne Light Co., Pittsburgh; "The Story of Insulations," by C. E. Skinner, Research Division, Westinghouse Electric & Manufacturing Co.; "Meter Department Practice in a Large Scattered Territory," by E. H. Tyson, superintendent meter department, Lehigh Valley Light & Power Co., Allentown.

Saturday, 10 a. m.—Paper, "Isolated Plant Costs as Influenced by the War," by John Meyer, Philadelphia Electric Co.; "Power-Factor Correction by Means of the Static Condenser," by O. C. Roff, General Electric Co.; reports of committees, election of officers.

A novel feature of the convention will be an exhibition by some 30 manufacturers, the displays being made in a large tent that will include a club section.

The return of the social features of the convention will be welcomed by all as affording the opportunity for renewing that goodfellowship which always characterized the "pre-war" conventions of this association.

ATLANTIC DIVISION SUPPLY JOBBERS TO MEET.

Next Meeting of Supply Jobbers to Be Held Sept. 17 in Philadelphia.

The Atlantic Division of the Electrical Supply Jobbers' Association will hold its next meeting at the Bellevue-Stratford hotel, Philadelphia, on Sept. 17. The meeting will be held in two sessions, both of which will be open. The first meeting will be called at 10:30 a. m.

A special effort will be made at the hotel to provide jobbers and manufacturers with information as to the names of those representatives who are present at this meeting. For this reason all attendants are requested to register upon their arrival when they will be provided with an identification badge.

According to present indications, a large number will attend this meeting and an interesting meeting is anticipated. Those expecting to be present or represented should notify the secretary, E. Donald Tolles, 52 Broadway, New York City, as early as possible.

AIMS OF THE GEOGRAPHIC SECTIONS OF N. E. L. A.

[Responding to a request for his ideas in relation to the scope and objects of the Geographic Sections, President R. H. Ballard, of the National Electric Light Association, transmitted to President Thomas Sproule of the Pennsylvania Electrical Association, the following in communication form in connection with a letter expressing regret at his inability to attend the convention of that organization which convenes at Bedford Springs, on Sept. 4.]

In the Geographic Section we provide the electrical industry with the intermediating link between the central station, which is the unit of activity from which ideas naturally germinate, and the National Electric Light Association, which is transcontinental in its policies and its aims.

In the Geographic Section the greatest opportunity is offered for personal contact and interchange of ideas between executives and employes of the companies and all others interested in the electrical industry within the territory where conditions are frequently identical and usually similar.

In the Geographic Section the results of progress made and new ideas demonstrated by one company, may be quickly conveyed to other companies in the same territory.

In the Geographic Section opportunity is afforded men to think in broader terms and to apply their reasoning along sectional lines. This is the logical sequence of development—company to section; section to nation.

The natural foundation for this line of progress is the company sections, and its importance is inestimable.

In the Geographic Section the maximum opportunity is presented for cementing all branches of the industry into one harmonious whole; of increasing the sphere of influence exercised by those engaged in our profession, and in eventually creating a better understanding between the public served and those whose duty it is to serve the public.

In the Geographic Section a complete understanding should be reached between central stations, manufacturers, jobbers and contractor-dealers, as to the rightful place in the industry occupied by each group and in establishing the relations of one branch of the industry to the others.

In the Geographic Section we have a place where misunderstandings, frictions, petty jealousies and fancied injuries can be ironed out and adjusted by bringing about a full and complete realization by all members of the section of the responsibility of service to the public and the joy of working out practical accomplishments of the ideal.

In the Geographic Section can best be worked out a definite plan by which the public may be kept informed on the true status of utility service in the district served.

In the Geographic Section there is ample opportunity for constructive initiative, and the opportunities for its exercise could be amplified indefinitely the scope of achievement having no limitation but brains and ability.

In the Geographic Section we have the medium of crystallization; demonstrating and applying locally when local, and making universal when universal all of the constructive creative forces that exist in the minds of the great membership of the National Electric Light Association.

SITE FOR NEXT N. E. L. A. CONVENTION TO BE SELECTED IN SEPTEMBER.

All Southern California Cities Are Eager for Meeting—Executive Committee to Decide Next Month.

Already there is an interesting rivalry among the cities of Southern California for the honor of being selected as the place of holding the 1920 convention of the National Electric Light Association. The news that the next convention of the national organization was to be held somewhere in the southwest was well rated by the committees of city councils and chambers of commerce of the larger cities of the southwest, and President R. H. Ballard is in receipt of a number of invitations which he will submit to the Executive Committee at its meeting in September. A selection will no doubt be made at this meeting, after which the first preliminary work for the session will be put under way.

Los Angeles, the metropolis of the southwest, with a national reputation as a convention city and rated for the hospitality it extends to those who visit it as representatives of important organizations, is eager to secure the convention. Its magnificent hotel accommodations, its central location, its proximity to the chain of beach resorts and its wonderful roadways and interurban electric lines, radiating in all directions, have much to commend it.

Pasadena, the Crown City of the San Gabriel valley, under the shadow of Mt. Wilson and in the center of some of the most beautiful scenery in Southern California, and only nine miles from Los Angeles, would be an ideal place for the session.

Riverside, in the center of the great orange and lemon belt with superb scenery on every hand and close to some of the great hydro-electric plants, desires to be considered.

San Diego, on one of the most remarkable natural harbors in the world, with magnificent hotels and all of the attractions that eastern visitors enjoy, has presented its claims.

Santa Barbara, the romantic and historic city by the sea, with its lore of other days, its wonderful old mission, some of the best hotels in the west and excellent facilities for entertaining, has also put in a request for the coveted honor.

President Ballard says he will try to present all of these requests to the members of the Executive Committee in as impartial a manner as possible, requesting the members to make the selection, as he feels those who reside in other sections of the country should be best qualified to choose the place that would best suit the visitors to Southern California.

EXECUTIVE COMMITTEE, N. E. L. A., HOLDS MEETING IN NEW YORK.

August Meeting Hears Reports and Plans for the Year's Work by Sections and Committees.

A meeting of the Executive Committee of the National Electric Light Association was held at the headquarters in New York City on August 14, attended by 17 men. In the absence of President Ballard, Vice-President Martin J. Insull presided. Treasurer H. C. Abell submitted a budget for the year ending June 30, 1920.

In connection with a discussion concerning the necessary reprinting of the Salesman's Handbook and the Overhead Line Construction Handbook, the general question of the method of distribution of these and other handbooks to the membership was brought up and was referred to a special committee which will report at the next meeting of the Executive Committee. John G. Learned was appointed chairman of this committee, of which the other members are the chairman of the Membership Committee, the chairman of the Company Sections Committee, the treasurer, and the chairmen of all national sections issuing handbooks.

Chairman Perry presented the report of the Exhibition Committee, reviewing the work done in advance of the convention scheduled for Atlantic City in 1917 and the work accomplished this year. He reported that prizes of $150, $100 and $50 for the best papers describing the exhibit as a whole had been awarded, that there were 85 exhibitors this year, the largest from the standpoint of number and square feet of space in the history of the association, and that 25 exhibitors had to be refused on account of their late applications. Mr. Perry also reported the list of officers and members of the Executive Committee elected for the year 1919-1920, which was given in the ELECTRICAL REVIEW, May 24, 1919.

Acting-secretary Sewall presented numerous applications for membership, the applicants being elected as follows: Class A 6, Class B 199, Class C 1, Class D 7, Class E 4, foreign 1; total 218. Mr. Sewall also presented the membership report as of July 31 showing a membership of 10,202 divided as follows: Class

A, 1059; Class B, 7812; Class C, 91; Class D, 273; Class E, 923; foreign, 44. This total of 10,202 compares with 11,209 on July 31, 1918, and means a net loss of 1007.

Mr. Insull read a letter from E. W. Lloyd which stated the Committee on Insurance Matters appointed at the last Executive Committee meeting felt that the interests of the N. E. L. A. with regard to insurance questions—such as the relative rating of electrical apparatus and other properties, and keeping in touch with the laws of the different states as to the possible liabilities of central-station companies as to fires and accidents caused by wiring beyond their control, etc.—should be under the control of the association working through a committee composed of members of the Technical and Commercial Sections. It was voted that the question of a committee on this subject be referred to President Ballard.

Vice-president Insull reported that John F. Gilchrist had accepted appointment as chairman of the Publicity Committee, and Mr. Insull read a letter from Mr. Gilchrist outlining his plans, which provide for the establishment in each state of a committee on public utility information similar to that already organized in Illinois, which committees will finance themselves and will furnish news bulletins to their members; the chairmen of the state committees are to form the personnel of Mr. Gilchrist's main committee. Mr. Gilchrist felt that it would be desirable to include the railway, gas and telephone interests, and that this would probably mean that in some cases the chairmen of the state committees would not be electrical men, but he did not feel there was any objection to this.

Mr. Insull also read a letter from President Ballard outlining his plans for his September trip East, stating that he planned to call a meeting of the Executive Committee during his visit, and suggesting the advisability of holding a national conference at that time and also a meeting of the Public Policy Committee. The question of a conference was discussed and it was felt that such should be held under the direction of the Public Policy Committee.

Vice-president Smith reported that he had asked Arthur Williams to serve as chairman of the Bulletin Committee; this appointment was confirmed. Mr. Smith also suggested that the personnel of this committee should include S. A. Sewall, Walter Neumuller, S. H. Giellerip, and the chairmen of the National Special Sections.

Mr. Insull reported that John F. Gilchrist and John G. Learned had represented the association at the convention of the National Association of Electrical Contractors and Dealers in Milwaukee in July. The principal subject discussed was a plan for educating the small dealers and contractors in selling appliances. The manufacturers agreed to raise a certain sum provided the other interests would recommend the plan. Mr. Gilchrist had advised Mr. Insull to recommend to the N. E. L. A. that its members approve the plan and endorse it, but he felt that no steps should be taken until the plan had been worked out more in detail.

Mr. Learned added that the only action the association could take would be to recommend to the members that they support the plan. The money will be raised locally and will be spent locally. He suggested that when it is decided to take any action, a letter should be sent to Class A member companies. He also called attention to the fact that in the Commercial Section a new committee has been appointed on relations between contractors, dealers, jobbers and manufacturers. On motion it was voted to refer this matter to the Commercial Section to report at the next meeting.

Chairman Foster of the Electric Vehicle Section reported progress and stated that all of the committees are actively at work, with the exception of the Insurance Committee whose work will be held in abeyance until a decision has been reached on the suggestion that a general committee on insurance be appointed.

Mr. Foster also reported that it had been brought to his attention that the municipal authorities of New York City were investigating the broad subject of harbor, steamship and railroad terminal facilities, including the transportation of freight over the city streets to such terminals and the handling of materials in the terminals. As the street transportation phase of this investigation is closely associated with the electric vehicle, Mr. Foster thought that efforts should be made to bring to the attention of the commission investigating this matter the merits of electric transportation. While this, of course, is purely a local situation, the recognition of the electric vehicle in solving this problem is of national importance, and therefore the co-operation of everyone concerned, particularly the central-station interests in and about New York City, is very essential.

For the Commercial Section Chairman Learned reported that a two-day meeting had been held at Association Island during the first week in August, at which time the bureaus and committees were appointed.

ELECTRICAL EXPOSITION WILL REOPEN GRAND CENTRAL PALACE.

Famous Exhibition Building Being Reconverted from Gigantic Army Hospital.

Having done its bit by serving effectively as an Army hospital, Grand Central Palace, New York City's largest exhibition building, is about to resume its normal peace-time status. Its return to the field of industrial exhibitions will be signalized on Sept. 24 next when the Electrical Exposition opens there for its customary run of 10 days. Excepting last year when the great electrical industry was too busy helping win the war to take time to show its latest inventions to the public, this exposition has been held annually in New York since 1907.

A large force of skilled workmen is now busily engaged in restoring the exhibition floors of Grand Central Palace to their original state. Already the numerous partitions built in making hospital wards have been removed, as well as the big theater constructed on the main floor for the entertainment of patients. An idea of the extent of this interior reconstruction is had from the fact that as many as 3700 bed patients have been there at one time, and besides the wards there were offices, reception rooms, operating and dressing rooms, mess halls, kitchens, store rooms, etc.

One hospital feature will remain as a part of the electrical exposition. This will be an electric therapeutic exhibit by the Medical department of the Army. It will serve to train doctors in the many new uses of electricity in the theraputic field and to enlighten the public on the benefits possible therefrom. As a whole this year's Electrical Show will be more varied and interesting than heretofore because this time it will disclose two full years of developments in the electrical field.

BIG ELECTRIC SHOW TO BE HELD IN BUFFALO.

All Branches of Industry Co-operating for Success of Show to Be Held Oct. 16 to 25.

Plans are being rapidly completed for the Buffalo Electrical Show to be held in Buffalo, N. Y., Oct. 16 to 25. This is the first show of its kind to be held in that city since 1914 and according to present indications will surpass all previous shows in every respect. Although the show is to be conducted under the auspices of the Buffalo Electric Show, Inc., of which Edmund D. McCarthy is chairman, all the electrical interests of Buffalo are taking an actual part in the arrangements by representation on the various committees through the officers and members of the Buffalo Electric Club.

The Broadway Auditorium, where the show will be held, is the largest hall in Buffalo for such purposes. It is centrally located, being accessible by direct car lines from all sections of the city and within easy walking distance of the principal hotels. A large portion of the available exhibit space has already been purchased by prominent manufacturers and this feature promises to be especially interesting.

The decorations and color scheme are elaborate and designed to make the most artistic and pleasing impression upon the public on entering the hall. An artistic and spectacular illumination is assured by the fact that W. D'Arcy Ryan, illuminating engineer of the General Electric Co., has been consulted and the arrangement of the exhibits will be governed by the illumination plan for the inside of the hall. Broadway, from Lafayette Square at Main street to the Auditorium, will be generously illuminated.

The program of the show will be an attractive souvenir filled with interesting articles on the history of the art and descriptive of the electrical development on the Niagara frontier as well as that brought about by the war and the use of the wireless telephone and aeronautics.

GREATER POSSIBILITIES FOR SOCIETY FOR ELECTRICAL DEVELOPMENT.

Letter to Members Outlines Present Activities and Urges That Duplication of Effort Cease.

The following letter has been sent to all the members of the Society for Electrical Development by J. M. Wakeman, general manager, and gives an interesting and timely resume of the important work that is being carried on:

It is evident that the Society for Electrical Development should "get its story across" to more men in the industry.

Do you realize what it does?

For the past five years this society has been getting the finest kind of publicity for the industry in the best magazines and newspapers of the country. The list of publications using stories, articles and material supplied by the society has been printed and sent out over and over again.

The statistical development of this society has more information filed and available covering applications of electricity to the various manufacturing industries than has any other organization.

This society has for 5 years been supplying member contractor-dealers, jobbers, manufacturers and central stations with sales ideas, writing advertising copy, laying out sales campaigns, supplying cuts, mats and other material without charge.

The "Special Service" department is under constant pressure responding to the calls for information, suggestions, articles, etc., from the general public, the industry, the trade press, popular magazines and newspapers.

And yet, in spite of all this, every now and then someone suggests that some association ought to render such services to its members, convince the public of the advantages of electricity, gather statistics, help the dealer with sales ideas, write advertising copy, etc. Generally, the meeting at which such suggestions are made receives them with enthusiasm and decides to go ahead. A great shout goes up that real co-operation is assured!

For other organizations to duplicate the work of the society is wasted effort; it would not be attempted if everyone knew what this society does. There is plenty of work to be done without duplication.

Won't you as a member of this society help to "get the story across"? Printed matter alone won't do it. The assistance of our members is needed to tell it. The staff tells it but the number they can reach is comparatively small. If all our members would tell it, the society's activities would quickly become known and efforts at duplication cease.

PLANS FOR MEETING OF MINING AND METALLURGICAL ENGINEERS.

Chicago Meeting in September to Include Inspection Trips in Addition to Over 150 Papers.

In view of the large number of coal mines centered about Chicago, it is planned to make the Chicago meeting of the American Institute of Mining and Metallurgical Engineers to be held at the Congress Hotel Sept. 22 to 26, of especial interest to the coal industry. A large proportion of the 150 technical papers prepared for discussion will be on subjects related to coal, coal mining and coke. Among these is a carefully prepared symposium on sulphur in coal. Excursions have been arranged during the meeting that will be particularly attractive to the coal man; on Thursday the trip to La Salle will include the inspection of operating coal mines in the district, and late Thursday night a party will leave for the mines in Franklin and McCoupin counties, where some novel and ingenious ideas in plant design and methods of operation have been adopted and proven practicable. The trip to the Gary steel mills on Tuesday will include an inspection of the immense coke ovens and by-product plant.

Metallurgists and electrical engineers will be much interested in the demonstration to be made of the production of metallic tungsten and molybdenum at the plant of the Fansteel Products Co., North Chicago, on Tuesday, Sept. 26. As a part of the program for the Chicago meeting, an excursion has been arranged to Milwaukee, to visit the various mining machinery plants in the vicinity, and a stop will be made en route at the Fansteel plant. The entire metallurgical process will be shown, from the preparation and purification of the commercial concentrates, and including sintering the pulvurent metal obtained into homogeneous billets by the use of currents of enormously high amperage.

The National Exhibit of Chemical Industries is being held at the Coliseum, Chicago, the same week as the Institute meeting.

Commercial Practice

Line Extensions in Small Communities—Central-Station Employes Buy Government Food—Detroit Operating Costs

LINE EXTENSIONS IN MEDIUM AND SMALL SIZED COMMUNITIES.

Important Problem Discussed in Paper Read Before Southwestern Gas and Electric Association.

By B. F. Cherry,
Weatherford Water, Light & Ice Co.

When first assuming the management of our plant a little more than eight years ago, I found no set rule for making electric extensions. The price of line material was, at this time, very reasonable, so we decided in making line extensions to set one pole and run one span of wires for each new customer who would agree to use our electric service for at least twelve months. We tried this plan and to a certain degree it was a success. We received many orders for extensions and had a large increase in the number of customers.

When the price of line material of all kinds began to advance, my knowledge and experience began to advance also. We soon saw that the original plan must be discontinued and a new one established. To make this change we decided to set only one pole as an extension for every two customers who would agree to use electricity for lighting and other purposes for a period of at least twelve months.

After using the above mentioned plan for about two years we stopped, and after reviewing the new customers whom we had secured during these two years by our extensions, we decided that our plan was a failure. The plan was a failure for many reasons, but I will mention only two here. First, not more than 50% of our new customers carried out their agreement as to the length of time that they would use the service; secondly, the more we gave, the more they expected and demanded. They expected too much, and so it was a very difficult matter to satisfy them.

The next move was to study out a better plan and to try to correct the mistakes that had been made. It is an easy matter to make an error but a most arduous task to correct one. That was my experience in this instance.

What I had experienced and observed during these two years as manager of a central station in a small town led me to believe that a man who had heretofore neglected having his home wired for electricity and who had not had the pleasure of using electric lights and other electric conveniences, when he did start using these and began to enjoy the full 100% of service that we, or any other central station in a medium sized or small town should give, that man really got more out of the service than so much per kilowatt-hour.

Going on the theory that "That which costs the most is appreciated the most," we decided to check up a little on soliciting new customers and making new extensions and to adopt a plan whereby the would-be customer must pay for something more than merely the wiring of his house. Now, man to man, it is nothing but just and right that he should.

For any and all new extensions we would stand half of the expense, while the person, or persons, desiring the extension must pay the other half; the line was to be our property, we, of course, to maintain the same; or, if the person, or persons, desiring the extension preferred, they could stand the entire expense of the extension and we would pay back to them in monthly payments the entire cost of same at the rate of 50% of their monthly electric bill for current consumed. We would, of course, advise and talk up the plan of equal division of expense, arguing that with this plan there would be no unfinished business to bother with or possibly have trouble over, and, with the exception of a few extensions for motor service, this plan was favorably received and was, or is, a great success.

Occasionally we would be confronted with the argument that we should stand the entire expense of the extension, for the reason that they would have to pay us for all current consumed. This can be answered in many ways, but we always referred them to the fact that an electric line running to, or by, their home would enhance the value of the same more than the entire extension cost, to say nothing about the fact that we stood half the cost and when it was necessary.

A few times we have had to meet the argument that we should make an extension free of charge for the reason that the party desiring same had to pay the high city tax. To this we frankly assured them that they did not have to pay one cent of the city tax on account of the electric light plant being located or doing business within the city limits. In every instance, in connection with an extension, we make, or try to make, the party feel and know that in his getting the extension and our electric service, he is favored just as much as the central station and that we were under no more obligation to him than he was to us, on account of the deal.

One other thing that has been a great help to us in the way of extensions is the fact that we wire houses. In almost 50% of the cases where a party desires electric line extended to his home or property, he will simply ask what it will cost to put electric lights in his home, and then, of course, we would figure the line extension, house wiring, etc., and give him the total cost in a lump sum, and since we do house wiring at practically cost of time and material, he could get electric lights in his home for a less amount that he would if we had stood the entire cost of the extension and if he had to have gotten an independent contractor to have wired his house. And when it becomes necessary to close the deal for an extension, we explain and make this fact plain to them.

After eight years of just such experience, my advice to any and all central-station managements in medium-sized or small towns is, first, to get ready to deliver the goods, give good service, full one hundred percent, and then put into the minds of the people that you serve, or may serve, that while you are their servants you are not beggars but instead give full value for everything received. Above all, don't beg too hard for new business or extensions. This may work in the cities, but will not in small towns, or that has been my experience. I would rather have one new customer who applied to me for the extension, or service, than to have two or three whom we would beg into taking the same, for one satisfied customer is worth more to any central station than two or three, or even more, disgruntled customers.

I feel sure that our plan of extension will be adversely criticized, for the reason that we do not go minutely into the cost of and the probable return that we might expect from same, and without due consideration and study it would seemingly be a just criticism. However, our experience has been when a man is willing to dig down into his pocket and pay for one half the cost of the extension or pay all of it to get it returned to him in small bits, he is interested enough to make a good customer and the return from such an investment is, in almost every instance, satisfactory.

So far we have had no one to try to force us to make an extension, and have made estimates on a number that did not go through. If extreme care is taken to explain in detail all the matters in connection with an extension, I hardly think there would be any trouble over an extension where a system similar to ours is used.

CENTRAL STATION ASSISTS EMPLOYES IN PURCHASING FOOD.

Commonwealth Edison Co. Buys Food at Government Rates for Distribution Among Employes.

In order to make it more convenient for the employes of the Commonwealth Edison Co., Chicago, to take advantage of the government rates on surplus army and navy food, notices were sent out during the sale advising the various departments that orders for canned goods could be given through the Commonwealth Edison Section of the National Electric Light Association. This organization had arranged to purchase a large supply of this food from the Government. Any employe with the company for three months was eligible, and the order was not to exceed 25% of any employe's monthly salary.

All orders were accepted up to noon, Aug. 21. Cash accompanied them when convenient, but if the employe so elected, the company advanced the money. This money to be refunded by the employe by Oct. 15, $10 to be taken on the first pay day after placing the order, and the remainder at the rate of $10 each semi-monthly pay day. The orders will be filled by the Stores department and delivered just as soon as the supply is delivered by the Government.

COAL CLAUSES SHOULD BE ABOLISHED.

In connection with a decision in a rate case brought by the Slate Belt Electric Co. against the Pennsylvania Utilities Co., of Easton, Pa., in favor of the latter, which furnishes energy for the operation of the Slate Belt Company's electric railway lines, the Pennsylvania Public Service Commission points out the fallacy of coal clauses in contracts for electric power, saying as follows:

"The total clauses were brought about by the war with its rapid fluctuations of prices for fuel and were perfectly proper in the emergency. With the return of price stability, however, they have almost passed out of tariff structures, and while the Commission does not view them as illegal, there no longer appears a reason for their retention, and they should be superceded by more definite rates carried into tariff schedules and calculated to produce the required revenue."

The present rates of the Pennsylvania Utilities Co. are pronounced as "just and reasonable."

EFFECT OF MATERIALS AND LABOR COST UPON COST OF OPERATION.

Data for Twelve Months Applies to Detroit Edison Co.'s Connors Creek Station.

The accompanying figures, compiled by the statistical department of the Detroit Edison Co., showing details of comparative kilowatt-hour costs covering various twelve months' periods, are very illuminating, showing, as they do, the actual results in operating following the fluctuating of materials and labor.

Operating Practice

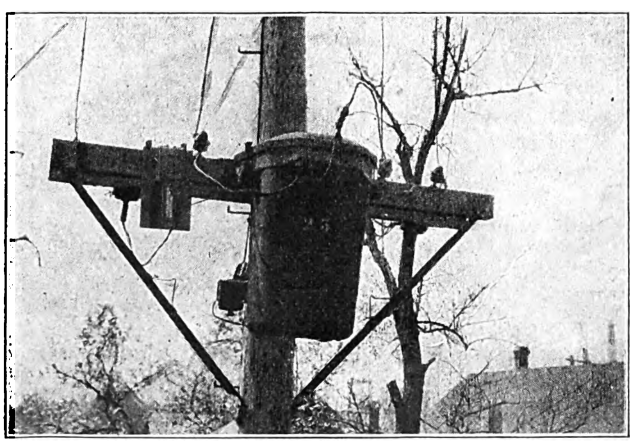
Measuring Distributing Transformer Demand—Insulating Outdoor Wires—Furnace Loads—Eliminating Harmonic

MEASUREMENT OF LOAD ON DISTRIBUTING TRANSFORMERS.

Considerations Involved in Measuring Demand—Practice of Commonwealth Edison Co.

It is frequently necessary and often desirable to know the actual or approximate load which is carried by a distributing transformer. In working up data, such as the load-factor of a certain class of business, the exact load carried by the transformer must be determined. If the estimated load on a transformer of 15 kw. or larger is near 100%, it is advisable to make tests of the actual load before connecting any new customers having a relatively large demand. For economical distribution the transformer size should be adapted to the load, with a reasonable allowance, of course, for future business. An over-sized transformer requires heavier supporting equipment and is also less efficient than a transformer nearer the size of the load. An overloaded transformer is a hazard. Due to excessive transformer drop, the voltage will be below normal. It may burn out any time with resultant interruption to service and may possibly open the primary circuit.

There are several sources for selecting transformers which are to be measured. The record of connected load or local conditions might indicate that the actual load is close to the transformer rating. If through voltage tests made in a pressure survey on account of a complaint of poor service it is found that the voltage at the transformer is low when the primary pressure is known to be normal, the transformer is likely to be overloaded. The repeated blowing of primary fuses may be due to a heavy overload. If the average demand factor for all transformers on a circuit, as determined by the ratio of the maximum kv-a. indicated by station instruments to the connected kv-a. transformer capacity, is near 100%, it is reasonably certain that some of the transformers are overloaded. The selection of transformers suspected of being overloaded will then have to be made by one or more of the methods mentioned.



Maximum Demand Meter Installed Upon Pole for Measuring Demand on 25-Kw. Transformer.

The simplest and easiest way to determine the maximum load carried by a transformer is by means of a Wright demand meter connected in the primary side. A method of installing the meter is shown in the accompanying illustration. A Wright demand meter is mounted on a board which is fitted with hangers so that it can be hung from a crossarm. Rubber-covered leads from the meter are connected to a wooden plug which is made exactly like the primary porcelain fuse plug. For convenience in handling this special plug is fitted with a large handle through which the leads are passed. The primary fuse plug on the neutral side of the transformer to be measured is removed and the wooden plug is substituted. This makes an inexpensive equipment which is entirely satisfactory for measuring transformers to 40 or even 50 kw. For measuring larger transformers it is advantageous to use a recording ammeter and split-ring current transformer. The chart will show the characteristics of the load, which will allow one to take into account diversity when determining if new load can be connected. The ammeter must be mounted in a weatherproof box which can be hung from a crossarm. A split rubber hose should be slipped over the lead to be measured before the split-ring transformer is clamped on, and the transformer should then be covered with a waterproof cloth. If quick and approximate results are wanted the measurement can be made with a split-ring transformer and indicating ammeter at the time when it is thought that the maximum demand occurs.

It must be borne in mind that these tests must be made at the time of the year when the transformer is carrying the heaviest load, otherwise due allowance must be made for the seasonable increase in load.

The illustration shows a Wright demand meter as installed by the Commonwealth Edison Co. for metering the maximum demand on a 25-kw. transformer.

CONSENSUS OF OPINION FAVORS WEATHERPROOF WIRES FOR 4400 VOLTS.

A circular letter sent out by a committee appointed by the Hydro-Electric Power Commission of Canada to determine the sentiment for and against weatherproof covering for conductors carrying high-potential currents has brought out some very interesting information as to the opinions of practical men engaged in the construction and maintenance of overhead lines. R. H. Martindale was chairman of this committee.

The questions submitted in this questionnaire were as follows:

(1) Considered from the standpoint of safety to life, is weatherproof line wire safer than bare wire for general distribution on voltages over 750?

(2) If so, at what voltage is a covering of no value?

(3) Is weatherproof wire any advantage from

an operating standpoint, as regards crosses, grounds, or freedom from foreign wire troubles?

(4) Are you in favor of it being abolished entirely for line work for voltages over 750?

As "safety to life" and "continuity of service" are possibly the two most important factors from a practical man's standpoint, the question, it will be noticed, covered these points only.

In all, 128 inquiries were sent out and a total of 65 answers received. The replies have been tabulated as follows: From Hydro municipalities, 45; from other municipalities, 9; other public service corporations, 11.

(1) In favor of weatherproof insulation from safety of life standpoint: Hydro, 39; municipal, 5; company, 11; total, 55, out of 65.

Not in favor of weatherproof: Hydro, 6; municipal, 4; total, 10, out of 65.

(2) Voltage limit for weatherproof: 750 volts, 7; 1100 volt, 3; 2200 volt, 21; 4400 volt, 17; total 48.

(3) Advantage of weatherproof from operating standpoint is covered by question No. 1.

(4) In favor of abolishing weatherproof for voltages over 750: 10.

It will be noticed that of the eleven companies that have reported, none are in favor of the bare.

CONSIDERATIONS INVOLVING EQUIPMENT FOR ELECTRIC FURNACE LOADS.

Wide Range of Current Necessitates Choice of Apparatus Accordingly.

By M. A. Montague.

The usual characteristics of the electric furnace load are such that the current fluctuates between about half rated load as a minimum and 250% of full load as a maximum. This latter occurs as swings and is rarely sustained for any length of time. It is important that the above-mentioned current fluctuations be borne in mind when deciding upon the cross section and layout of conductors and the capacity behind the furnace, otherwise rate of melting may be cut down because of poor voltage regulation and high line loss, the former due to both copper loss and induction.

The choice of instruments is also influenced by the wide current variations that usually occur. Instruments should be so chosen that their range will not be exceeded during the heavy current swings on the one hand, nor yet operate too low on the scale during normal operation. Sensitive instruments are not ordinarily required for electric furnace installations. Sensitive instruments are more subject to damage due to short circuits than the less sensitive instruments, and are more likely to become deranged due to their smaller air-gap by dirt such as abounds around foundries.

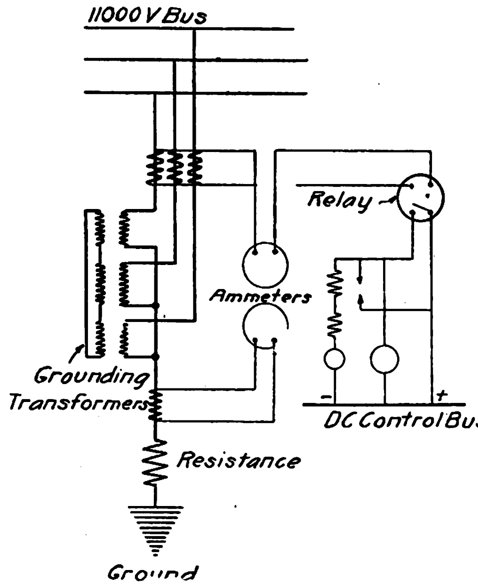
In choosing an integrating wattmeter for electric furnace loads, one having full-load capacity equivalent to about 125% furnace rating will be found to give an accurate load record and answer the purpose best. If maximum demand meters are to be employed for giving indications of what an electric furnace is actually doing in the way of demand upon the utility's circuits, a fifteen-minute period has been found to be satisfactory. For this service a graphic meter is recommended. Special provision should be made that all instruments located in close proximity to the furnace are well protected against dust entering the case.

DELTA-CONNECTED TRANSFORMERS TO BY-PASS THIRD HARMONIC NEUTRAL CURRENT.

Interesting Connection of Transformers Used by Duquesne Light Co.

The Duquesne Light Co. of comparatively recent date adopted the practice of grounding the neutral of its high-tension transmission system. As this company's system operates at 60 cycles, it was advisable to take steps to reduce as much as possible, if not prevent entirely the flow of the triple-frequency current, or third harmonic in the neurtal, as this current would create havoc with telephone and telegraph circuits in proximity.

The elimination of the third harmonic from the neutral or ground circuit was performed in a very simple manner with standard apparatus, as shown in the accompanying illustration. Instead of directly grounding the neutral of the star-connected generator bus, a grounding bank of transformers is used, these being connected to the generator neutral bus at the Brunots Island generating station. These transformers are connected in star on the bus side, the neutral or middle point of the star connection being connected



Connections by Which Third Harmonic Is Eliminated.

through a bank of resistance grids to earth. The secondary windings of these transformers are connected in closed delta, which acts as a short circuit for the free circulation of the triple-frequency current, thus eliminating it from the earth circuit and preventing inductive interference with neighboring telephone and telegraph circuits. The resistance value adopted is such as to limit the current rush to earth during times of trouble to such limit as will enable the relays to function yet without being excessive.

It will be seen from the sketch that two ammeters are installed to measure the current that passes to earth through the grounded neutral connection. The current transformers operating these ammeters have different ratios so that the one ammeter indicates 500 amperes for full scale deflection, the other 200 amperes full scale deflection, the former indicating heavy grounds such as occur during breakdowns, etc., while the latter indicates light grounds. The resistance inserted in the neutral limits the neutral current to 500 amperes.

Contracting-Construction

Valuable Suggestions for Contractors — Interesting House Organ — Powerful Screw Driver — Proposed Legislation

SELLING ELECTRIC SERVICE RATHER THAN A WIRING JOB.

Recent Paper by R. A. Gordon Contains Valuable Suggestions for Contractors and Dealers.

In a paper read at the recent convention of the Michigan Section of the National Electric Light Association, R. A. Gordon of the Houghton County Electric Light Co. submitted several valuable suggestions for subjects of co-operative effort between central stations and contractor-dealers. These suggestions are especially worthy of consideration by electrical contractors and dealers for they point out the ways in which they can assist in improving conditions in the industry, rendering better service to the public and at the same time increase their own profits.

These suggestions are as follows:

"1. The contractor-dealer should cease selling a wiring job and sell electric service.—Central stations have spent millions of dollars to create a demand for electric service by educating the public to an appreciation of the fact that electric lighting is better than any other form of lighting, and that electric service is sure, safe and economical. The general public is fast realizing these truths, and when they go to the contractor-dealer for an estimate on wiring their homes, stores and factories for electric service, they are not thinking in terms of wire, knobs and tubes, but in terms of convenience and comfort. It is, therefore, the duty as well as the opportunity of the contractor-dealer to sell the customer not a wiring job, but an electrical service, which combines utility with safety, convenience and comfort. This kind of service demands that the contractor-dealer sell to the customer the convenience of better meter locations, additional baseboard and sidewall outlets, the comforts of numerous switches properly located, and the economy of additional capacity of the wiring at the time of the original installation to take care of future requirements of electric cooking and heating appliances.

"2. Quality electrical work will enable a customer to enjoy his service long after its cost is forgotten.—Such quality electrical service as suggested above will make a permanent and satisfied customer of the average consumer of electric service to the mutual benefit of the central station and contractor-dealer.

"3. Do not wait for the manufacturer—Standardize on uniform plugs and receptacles in your own community.—The many advantages of uniform plugs and receptacles are so apparent that it is hard to understand why the manufacturers and jobbers have not been able to come to an understanding on this important subject. This deplorable condition can easily be worked out in each individual community if the different interests will co-operate to that end.

"4. Contractor-dealers should make up a merchandising schedule and co-ordinate their advertising.—Electrical supplies and appliances are fortunately not seasonable merchandise. However, it goes without question that the public naturally buys fans in the summer and heating pads in the winter. If the central station and contractor-dealer would make up a merchandising schedule and co-ordinate their advertising, they could soon educate the public to the many uses of the fan in winter, and of the many applications of the electric heating pad as an all-the-year-around appliance. The two appliances in question are perhaps the best examples of those which hitherto were considered seasonable, yet are now gradually being recognized as articles useful throughout the year.

"5. Adopt a uniform 'Cost to Operate' schedule.—Every central station commercial man knows what a task it is to satisfactorily adjust a customer's complaint of a high bill when he finds the cost of such high bill was the use of an electric heater, which the customer was told when purchasing, would use only about one-third or one-half the amount of current it would actually use. Two different dealers could give to the same customer a different 'Cost to Operate' charge and both be correct, because one might base his figures on the maximum use of such appliance, and the other base his figure on the average use. A uniform 'Cost to Operate Schedule' based on fair averages and adopted by all would eliminate many complaints of excessive bills for current and result in more sales of electric appliances by all.

"6. Co-operate to the end that electric service will be recognized as the most valuable commodity in the community.—Proper co-operation on the part of the central station and the contractor-dealer will make it possible for them to make electric service the most universally liked and most valuable commodity in their community.

NEW YORK CONTRACTOR DISTRIBUTES INTERESTING HOUSE ORGAN.

Monthly Pamphlet, "Cut-Outs," Being Published by Wm. J. Shore.

A very clever and interesting pamphlet is being distributed monthly by Wm. J. Shore, an electrical contractor-dealer and engineer, located at 1123 Broadway, New York City. It is entitled "Cut-Outs" and its purpose is to help business men electrify their business.

A radical departure from the usual run of such publications like this consists chiefly of pointed business paragraphs and humorous short sayings, many of which are original and the remainder chosen to fit a purpose from noted authorities. These add greatly to the interest of the pamphlet and it is almost impossible when once one starts to read it, not to continue to the end. And all through it there runs the idea that electric service is the best for all business and Shore is the man to do it.

A few of the more pertinent paragraphs of the last issue follow:

"It was in 1752 that Ben Franklin first demonstrated that lightning and electricity were one and the same. And yet there are still manufacturers who don't know what electricity will do for *their* business.

"The man who waits for prices to drop may not be able to get his work done at *any price*. Better have me in *now*—tennyrate, let's talk it over. Consultation sans obligation.

"Are you going to keep pace with times or be pinched for blocking business traffic? Do it electrically. Install motors, replace old, shop-worn power equipment, improve, repair, rebuild, if necessary, but Do It Now. Shore Service really SERVES.

"When a competitor damns you put him on your payroll."

PROPOSED LEGISLATION THAT AFFECTS CONSTRUCTION WORK.

Attention of Construction Industry Called to Bills Now Pending in Congress.

The National Federation of Construction Industries, Drexel building, Philadelphia, an organization composed of building material manufacturers and others interested in construction work, is sending out a letter to its members calling attention to proposed Federal Legislation covering matters of vital interest to the construction industry as a whole. Among these matters are two bills now pending in Congress that are especially worthy of support by the electrical contracting fraternity.

The first of these bills, S. 1469, H. R. 5514 and H. R. 7597 is designed to aid in financing the construction of homes. The second, H. R. 7014, is designed to establish in the Department of Labor a Bureau of Housing. The association in its letter approves both of these bills and urges their passage, modified as may seem desirable, as a valuable aid to the construction of homes throughout the country, and as an agency in the development of thrift on the part of house owners and better housing conditions.

ST. JOSEPH, MO., ELECTRIC PLANT TO BE ENLARGED.

W. J. Squire, proprietor of the Squire Electric Co., Kansas City, Mo., has received the engineering contract, and is preparing plans and specifications for the municipal plant improvements at St. Joseph, Mo., to be made under a bond issue of $500,000. The improvements include remodeling of building, installation of new machinery, the revision of the street lighting system throughout, and some commercial and power lighting incidentals. The new plan will probably have two 3000-kv-a. turbines and three 500-hp. watertube boilers. The new plant will be equipped with stokers, economizers, and other up-to-date items.

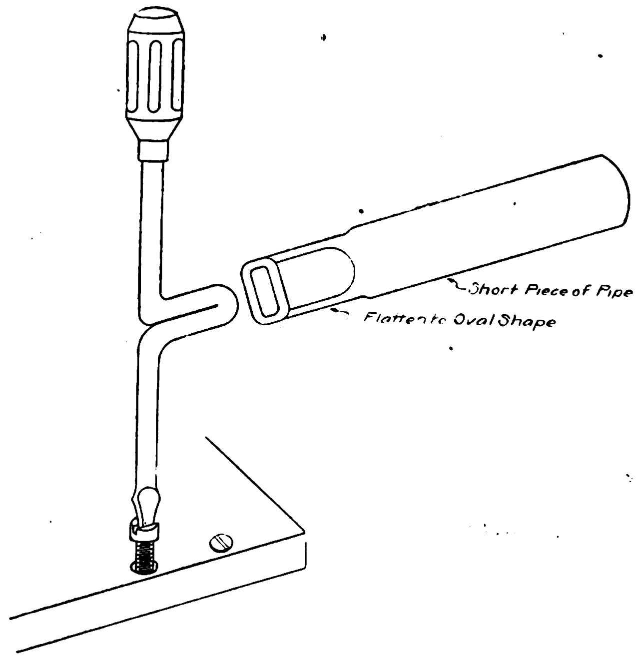
The street lighting system will be equipped with tungsten lamps and there will be probably 300 ornamental lamp posts. The rest of the lighting will be suspended over street corners.

A POWERFUL HOMEMADE SCREW DRIVER.

By Charles H. Willey.

The electrician or plant maintenance man in his daily work is often required to remove screws from machine and motors parts that are stuck or rusted in place so tightly that they cannot be removed with an ordinary screw driver. In order to remove such screws the writer uses the handy homemade device shown in the accompanying sketch.

In making this device the blade of a long bladed screw driver is heated and bent into a crank shape as



A Handy Method of Applying Extra Power to an Ordinary Screw Driver.

shown. A short piece of pipe is then flattened at one end into an oval shape that will fit over the bent part of blade. By using this pipe as a lever a very powerful force can be applied to the screw driver that will suffice to loosen all ordinary screws. A monkey wrench can be used instead of the pipe if desirable and the same results will be obtained.

REVISED RULES FOR GENERATING AND SUBSTATIONS.

The Bureau of Standards, Washington, D. C., is getting out in tentative form the changes proposed for Part 1 of the National Electrical Safety Code which covers rules for the installation and maintenance of electrical supply stations and equipment. These changes are not radical in character but are intended to cover points which were omitted in the previous editions of the Code or which seemed to need clarification.

The principal changes suggested as well as the entire scope of the new rules will be discussed more fully in an early issue.

OKLAHOMA CITY SETS NEW RECORD IN BUILDING HOMES.

During a period of 80 days recently the residents of Oklahoma City, Okla., took out building permits for more than $2,000,000 in new residences. This is the result of "build your own home" campaign, which has been in progress for several months. More homes have been built in Oklahoma City during the campaigns than in any other similar campaign for the same period of time. All the local electrical interests co-operated in this campaign and were in a large measure responsible for its great success.

New Appliances

Improvements in Remote-Control Oil Switches — Willys Light Plant—New Bell Ringers—Compartment Condenser

Developments in Oil Switches for Remote Control of Outdoor Lighting Circuits.

Control of outdoor lighting circuits can be effected by switching at the power house when the circuits extend thereto, but in case they do not it has until a few years ago been necessary to send out a patrolman or lineman to turn on or off the switch of the circuit desired wherever it might be; an alternative was to install a time switch at this place, but the latter required attention periodically and was somewhat costly in the outdoor type. To meet the evident need for power-house control of distant circuits there was developed a line of oil switches known as the R. C. O. C. type that was described in our columns some three years ago. These switches were the product of the South Bend Current Control Co., South Bend, Ind.

In the intervening years this line of switches has been further developed along lines based on the experience gained in large numbers of installations, the result being improvements in the construction of the switches, new combined types thereof and many additional uses to which they have been found well adapted. All of the switches have contacts breaking under oil of high dielectric properties and all are inclosed in iron cases closely resembling the standard distributing transformer.

Fig. 1 shows one of the improved pole type switches with case partly broken away to show the mechanism. The latter is carried by a frame of carefully kiln-dried maple that is boiled in oil, thus giving high mechanical and insulating strength. Each switch is tested to 10,000 volts, or several times normal voltage. All switches are solenoid-operated, the solenoid being energized over any convenient circuit already installed. Fig. 2 shows a typical subway or manhole type switch. Both subway and pole type switches are made in the two-in-one special type where it is necessary to conserve either space or weight.

Seven types of the R. C. O. C. switches are now made: Form AN is for all-night lamps where these are to run for the same hours as the solenoid control circuit. Form MN is especially for lamps operated until midnight and is controlled by a special locking device shown in Fig 3 which alternately opens and closes at the will of the power-house operator, who has merely to "wink" the control circuit. Form MNS is a modification of the MN especially adapted for cutting off part of a series circuit at midnight or other hour differing from the main series circuit. There are three forms of two-in-one switches, one comprising two AN switches, another two MN switches, and a third an AN and an MN switch; these are used only for 440 volts or less. Finally there is a special line of double-throw switches built to particular specifications. Fig. 3 shows not only the special locking device above referred to, but also the fluctuation compensator consisting of two strong springs that allow a considerable vertical movement of the U-shaped floating solenoid armature without opening the contacts of the controlled or load circuit; this takes care of 60% fluctuation in the solenoid control circuit without affecting the load controlled.

These switches and switch combinations make possible solving a large number of control problems on both series and multiple circuits remotely located, and involving all-night or short operation of lamps; motor circuits and other power, lighting or heating circuits may also be controlled successfully at a distance. Diagrams have been worked out for some 60 different control problems that can now be successfully handled by the R. C. O. C. system.

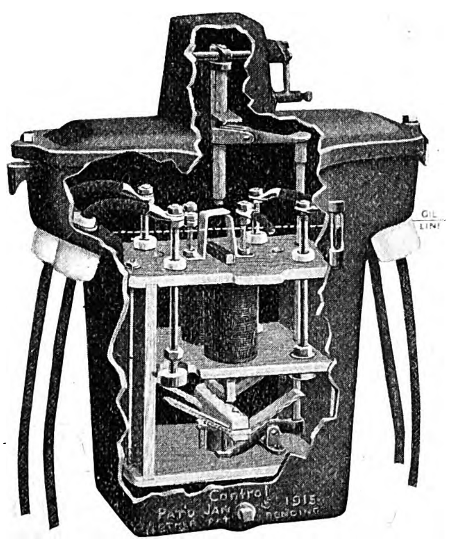


Fig. 1.—Pole Type R. C. O. C. Switch with Case Partly Broken to Show Interior.

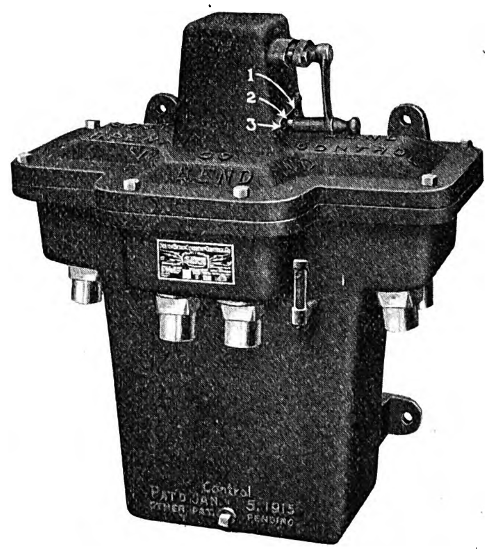

Fig. 2.—Subway Type R. C. O. C. Switch.

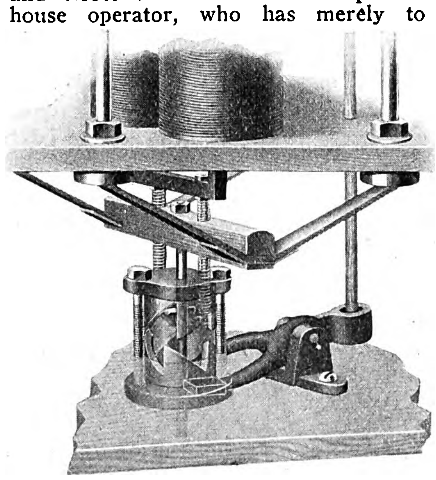

Fig. 3.—Contact Mechanism With Fluctuation Compensator and Special Locking Device.

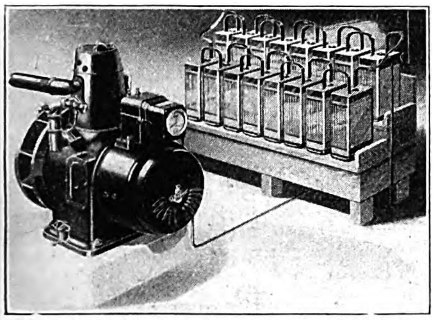
Specifications of Willys Light Plant.

In our issue of July 19, 1919, we published a general description of the new self-contained electric light plant recently placed on the market by the Willys Light Division of the Electric Auto-

Lite Corporation, Toledo, Ohio. It has the backing of John N. Willys of automobile fame and is known as the "Willys Light" plant. We have now secured a photograph of the new outfit, which we reproduce herewith, and a



The Willys Light and Power Plant.

condensed set of its specifications, from which the following facts are of special interest.

The rating of the plant in 20-watt lamp equivalents operating for 8 hours intermittently is 83 lamps when both generator and battery are carrying the load, and 45 lamps when the battery alone is supplying the service. The battery is of the lead type, of Exide or U. S. L. make, and contains 16 cells. A 2-hp. Willys-Knight engine is used that can burn either gasoline, kerosene, distillate or gas; it is started electrically by the generator acting as a motor fed from the battery. The drive to the generator is direct and the generator is a 32-volt shunt machine of ¾ kw. rating. Control of the whole set is semi-automatic.

New Line of Bell-Ringing Transformers.

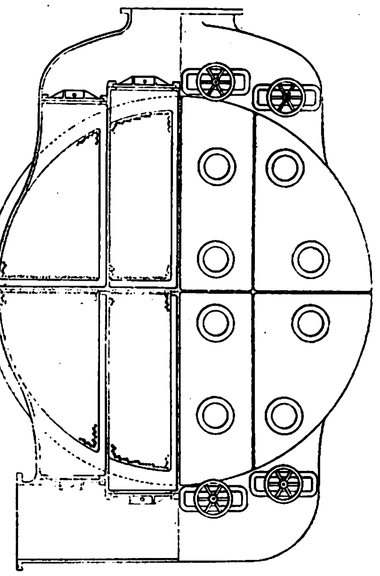
Bell-ringing transformers are coming into extensive use because of their many advantages over wet or dry cells or storage cells for ordinary signaling circuits. This accounts for the increasing demand and for the development of new types to meet it. Among these is an entirely new line just placed on the market by the Standard Transformer Co., of Warren, Ohio. This company was recently incorporated and has already taken over the bell-ringing transformer business of the Packard Electric Co., of Warren, to which it is adding its own designs to cover various requirements.

Its entire line is clad in blue-glazed porcelain cases. It offers the residence type of 15-watt capacity for operating the front, rear and table bells and for other signal service found in any home. This type is made for 100-230 volts and for 25, 40, 50 and 60-cycle circuits. The bell side of the transformer has 11 volts on open circuit or under no-load conditions and is inductively wound so that a short circuit on the low-voltage side maintained indefinitely will not destroy the transformer. This type is approved by the Underwriters' Laboratories, Inc., and listed as a National Electrical Code standard. The heavy-duty types for apartments, school houses, factories are 50-watt capacity with 6-12 and 18 volts on the bell side. This lends a flexibility to this type for operating both short and long bell circuits from the same instrument. This condition is frequently met in this class of service, but never on residence bell circuits. Formerly, this type was made with a cast iron case which has now been replaced with a blue glazed porcelain cover. The company claims the porcelain clad types have advantages over the iron box or metal case types as the porcelain will not rust or corrode, is an excellent insulator, non-resilient, hence muffles the hum or buzz inherent to alternating current devices, and as applied to its transformer is pleasing in appearance, light in weight and mechanically rugged. The cores on both the residence and heavy-duty sizes are made of silicon-alloy steel, the coils are thoroughly impregnated and the cases are compound filled which makes the transformers weatherproof, hence are not injured by being installed in a damp basement or other places where they may be exposed to moisture.

Compartment Condenser Permits Cleaning in Service.

A new and valuable development in steam surface condensers is announced by the Wheeler Condenser & Engrg. Co., Carteret, N. J. It is a patented "compartment condenser" that can be cleaned while in service without shutting down the turbine.

This is a timely development in view of the persistent claims made by well known fuel authorities that the price of fuel is not likely to go down for some time if at all. This condenser will enable the chief engineer to constantly maintain clean condensers, hence a constantly high



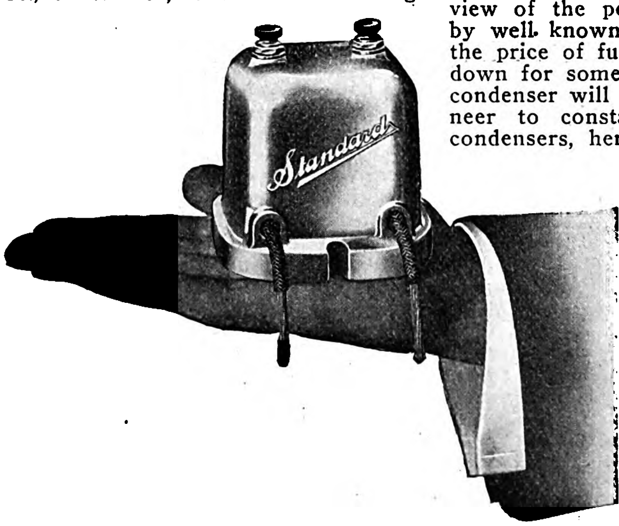
New Type of Wheeler Surface Condenser That Permits of Sectionalization for Cleaning Purposes.

vacuum. All engineers of experience know that in addition to increasing output a high vacuum means low fuel consumption and a considerable saving in money year in and year out.

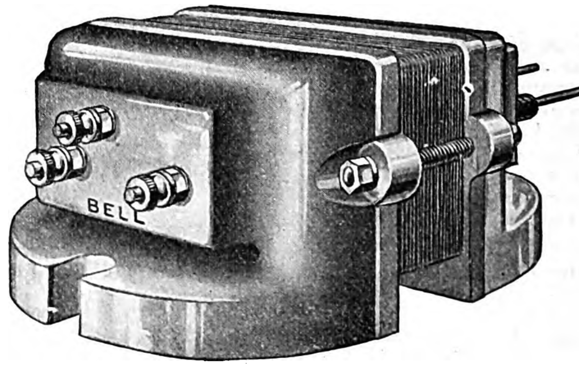
Also upon installation of this condenser there need be no interference with the operation of the turbine. At the present time, in many important power stations, even where water conditions are regarded as good, it is necessary to occasionally shut down the turbine for a period sufficiently long to clean the condenser.

To clean the average condenser is not a difficult task, but it is time-consuming, and for that reason the engineer is tempted to put cleaning off.

The illustration shows clearly how the compartments are arranged. The condenser shown is divided into four compartments, each compartment being equipped with a set of valves to control the circulating water. To clean the condenser while the turbine is delivering full power, the operator simply shuts off the water from one compartment, removes the cover, cleans the tubes, replaces the cover, turns on the water again, and then passes on to the next compartment repeating the operation until the four compartments of the entire condenser are clean. Thus, while one compartment is being cleaned, the other compartments are in full operation, temporarily taking over the entire turbine load.



Household Size of Standard Bell Ringer, Showing Compactness and Light Weight.



Heavy-Duty Type Bell-Ringing Transformer with Three Secondary Voltages.

Trade Activities

E. C. Atkins & Co. to Be Represented in Australia — Standard Transformer Incorporates — Special Literature

Sullivan Machinery Co. announces the appointment of R. S. Weiner as district manager of El Paso, Tex., succeeding Don M. Sutor. Mr. Sutor has been transferred to the St. Louis office of the company as district manager for Missouri, eastern Texas, Oklahoma, Kansas, western Kentucky and western Tennessee.

Celite Products Co., New York City, has appointed Charles P. Derleth to represent its interests in order that the increasing demands for Celite products (Sil-O-Cel for heat insulation and Filter-Cel for filtration) may be properly cared for. Previous to his enlistment 14 months ago in the Chemical Warfare Service, Mr. Derleth was affiliated with the J. B. Ford Co., Wyandotte, Mich., as sales representative. He is a graduate of the University of Illinois.

The American Steam Conveyor Corp., Chicago, announces the appointment of Morton McI. Dukehart & Co., as its representative in Baltimore, and the surrounding territory, which includes all of Maryland, and the District of Columbia, and a few counties in Pennsylvania, Delaware, West Virginia and Virginia. This concern consists of Mr. Dukehart, and E. S. Denise—both power plant engineers of long standing, and sales engineers of considerable ability. They have an enviable reputation and their service undoubtedly will considerably strengthen the sales force of the American Steam Conveyor Corp.

The Bleadon-Dun Co., Chicago, has issued a book of 52 pages dealing with violet rays as applied with the Violetta. The book first reviews the development of electricity as a curative agent and the discovery of the violet ray machine, or as it is known technically, the high frequency generator by Nikola Tesla, and also presents the phenomena produced by violet rays. This high frequency generator is generally recognized as one of the most amazing developments of electricity and many startling results have been secured by its application to almost every known ailment. The application of violet rays with the Violetta to many ailments is depicted and various types of Violetta outfits, electrodes and supplies are illustrated and described. Some ten pages are devoted to testimonial letters from sanitariums, physicians, beauty specialists, home users, and others who have used this device with complete satisfaction.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has recently issued a new descriptive leaflet on the C-H hospital call switch, which shows the method of installing this device in the wall adjacent to the patient's bed. The switch is made for use on silent call and other systems such as used in the modern hospitals. Another of the new leaflets illustrates the Cutler-Hammer 7720 duplex receptacle, which provides two outlets in the space required for one. The principal illustration on this leaflet shows a typical ironing scene with the iron cord attached to one outlet, while an electric fan is connected to the other. The small blueprint which accompanies the duplex receptacle leaflet indicates the location of a number of duplex receptacles in the floor plan of a typical modern home and suggests the many electrical appliances which may be used when sufficient convenient outlet receptacles are provided.

E. C. Atkins & Co., Indianapolis, Ind., manufacturer of Atkins silver steel saws, which in the last three years have enjoyed a steady growth in Australia amounting to over 50%, have appointed James N. Mackin to represent their interests in that country. He is superintendent of the Australian division and has established headquarters at 5 Australasia Chambers, Martin Place, Sydney, N. S. W., Australia. During the war Mr. Mackin represented the Atkins company at Washington, D. C., and made hosts of friends both for himself and for this firm. His thorough knowledge of every detail concerning saws, as well as his wide experience in selling and his pleasing personality, make him popular with everyone who is in the least acquainted with the Atkins service. Before becoming associated with the Atkins company, Mr. Mackin traveled extensively throughout the world, becoming thoroughly conversant with business conditions in foreign lands.

James N. Mackin.

Standard Transformer Co., Warren, Ohio, has been incorporated under the state laws of Ohio for the purpose of manufacturing a complete line of bell ringing transformers. It has consummated an agreement with the Packard Electric Co., of Warren, Ohio, whereby it will in the future manufacture the bell transformers placed on the market by the Packard company about six years ago. These transformers, which embody new improvements in construction, are described in detail in another section of this issue.

Diamond Power Specialty Co. literature has always been distinguished by its direct appeal to the engineering knowledge and sound business judgment of its readers. This is particularly true of bulletin No. 132, "Profits that Get Away Through Your Boiler Room," just issued by the company. This bulletin, which is an attractive, well written book of 24 pages, deals first with the importance of exercising business-like supervision over the boiler room; the effect of soot on boiler efficiency; and in its concluding pages describes Diamond soot blowers for horizontal return tubular boilers. The book is well illustrated with charts, graphs and ledger sheets showing actual improvements affected, and should be in the hands of every operator of horizontal return tubular boilers. Copies may be had on application to the Detroit office of the company.

South Bend Current Control Co., South Bend, Ind., has issued an engineers' reference book on the R. C. O. C. system of remote control. This book gives not only a description of the company's oil switches for remote control of lighting and other circuits, by means of any convenient circuit that is used as a control circuit operated from the power house, but also gives the results of several years of experience in solving the problems of remote control that distribution engineers are confronted with in operating outdoor lighting and similar systems. This is shown in 17 of some 60 circuit diagrams, showing various problems that formerly were inclined to be impossible of solution. These circuits are shown by means of large blueprint diagrams. A list is given of a very large number of users of these switches as well as typical letters from such users and a number of installation views of the switches in use and of lighting circuits controlled thereby.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Laconia, N. H.—Scott & Williams have commenced the erection of a new boiler plant at their works to cost about $20,000. Lockwood, Greene & Co., 60 Federal street, Boston, Mass., are engineers.

Portsmouth, N. H.—The Bureau of Yards and Docks, Navy Department, Washington, D. C., plans the installation of a 1000-kw. turbogenerator at the local navy yard to cost about $17,000. (Specification 4017).

Cambridge, Mass.—Electrical and mechanical equipment will be installed in the new seven-story and basement cold storage plant to be erected by John P. Squire & Co., 165 Gore street. The structure is estimated to cost about $200,000.

Southwick, Mass.—An election will soon be held to vote on $15,000 for the establishment of an electric plant to furnish electricity for lighting, power and heat.

Worcester, Mass.—In connection with the erection of an addition to their plant for increased output, James Smith & Sons, 99 Hope street, will build a new boiler plant for factory operation.

Worcester, Mass.—American Steel & Wire Co. will erect a building, 24x440 ft. at the North Works, and will install new electric galvanizing equipment.

Hartford, Conn.—Hartford Electric Co. is having plans prepared by Stone & Webster, Boston, Mass., for its proposed electric generating plant in the Colt Meadows district. The plant will have an initial capacity of about 100,000 kw.; it will be designed for oil fuel operation. The company is now operating a plant at Dutch Point.

Middletown, Conn.—In connection with a new factory addition for increased capacity, the Russell Manufacturing Co., manufacturer of webbing, etc., will build a complete new power plant for works operation. The plant will include turbine department, engine room, pumping chamber and boiler plant.

Binghamton, N. Y.—Binghamton Light, Heat & Power Co. has commenced the installation of a new 2500-kw. generator at its power plant, with auxiliary operating apparatus. The company has commenced the construction of a new power line to the shoe manufacturing plant of the Endicott-Johnson Corp., Endicott, N. Y. A load of about 1500 to 2000 kw. will be carried at the plant, in addition to the present power supply. The new lines will be tied in with the system running to the company's plant at Johnson City, allowing for an interchange of service as desired.

Buffalo, N. Y.—Donner-Union Coke Corp., Abbott Road, has filed plans for the erection of a new electric substation at its plant to cost about $11,400. The company will also build a number of other structures in which mechanical and electrical equipment will be used to cost about $85,000.

Canandaigua, N. Y.—Lisk Manufacturing Co. is having plans prepared for the construction of a one-story plant, 63x87 ft., to be used for works operation.

New York, N. Y.—Transit Construction Commissioner John H. Delaney has received and opened bids for the construction of tracks in the section of the Culver Rapid Transit Railroad extending along Shell road and West 6th street from Avenue X to Sheepshead Bay road, Coney Island, N. Y. The lowest bid was that of the Slattery Engineering & Contracting Co., at $58,513.70. It is expected that an award will be made in the near future. The time for completion is four months.

New York, N. Y.—Long Island Electric Railway is arranging to institute proceedings for a dissolution of the corporation, and the appointment of a receiver. The company operates a system from Grant street, Brooklyn, to Belmont Park, and in the Jamaica and Far Rockaway sections. It was organized about 25 years ago, and has a capitalization of $600,000. W. O. Wood is vice-president and general manager.

Oswego, N. Y.—The water service commission will establish a new municipal light plant. Address town clerk.

Rochester, N. Y.—North East Electric Co., 348 Whitney street, manufacturer of electrical specialties, has awarded a contract to C. W. Hoffman, 120 Railroad street, for the erection of its proposed two-story plant, 86x198 ft., on Lyell avenue, to cost about $60,000.

Rochester, N. Y.—The Municipal hospital is having plans prepared for the construction of a new boiler plant at the institution. The Board of Contract and Supply is in charge of the work. Gordon & Kaelber, Sibley building, are architects.

Syracuse, N. Y. — Considerable electrical and mechanical equipment will be installed in the new five-story cold storage plant to be erected by the Merrell-Soule Co. The structure will be 61x90 ft., and is estimated to cost $90,000. The Turner Construction Co., 241 Madison avenue, New York, has the building contract.

Bloomfield, N. J.—Sprague Electric Works of the General Electric Co., have awarded a contract to Salmond Brothers, 568 Elm street, Arlington, N. J., for the erection of an addition to its plant on Lawrence street to cost about $15,000.

Bloomingdale, N. J.—The Borough Council has authorized the installation of new arc lights on the Carmonton Road. The service will be furnished by the municipal electric plant at Butler.

Newark, N. J.—New York Telephone Co., 15 Dey street, New York, is planning for a total expenditure of about $3,270,000 for line improvements and extensions in the Northern New Jersey district during the present year. Edmund W. Wollmuth is district manager.

Newark, N. J.—Lux Manufacturing Co., 121-33 East Kinney street, manufacturer of high-grade tungsten lamps, has arranged for a stock issue of $100,000 for proposed expansion. The company has acquired property adjoining its works and plans for the construction of an addition for increased capacity at a later date. A. T. Baldwin is treasurer.

Newark, N. J.—Economic Electric Co. has filed notice of organization to operate a works at 232 West Kinney street, for the manufacture of electrical supplies. Isidor Eglowstein, 140 West Kinney street, heads the company.

Newark, N. J.—A large power plant for works operation will be erected by the Cocoanut Oil Co., in connection with the construction of its new plant at Passaic avenue, near Chapel street. The entire project is estimated to cost about $300,000. John Lowry, Jr., 8 West 40th street, New York, has the building contract.

Newark, N. J.—Stengle & Rothchild, Main street, have awarded a building contract to the Becker Construction Co., 361 Grove street, for the construction of the proposed new one-story boiler plant at their leather works to cost about $16,000.

Newark, N. J.—Rainbow Electric Co. has filed notice of organization to operate a plant for electrical work at 258 Chadwick avenue. Samuel Rubinstein heads the company.

Phillipsburg, N. J.—Electrical and mechanical equipment will be installed in the proposed sewerage disposal plant to be constructed by the city officials. The plant will be of three unit size, each unit with capacity of 1,000,000 gallons, and is estimated to cost $125,000. City Engineer Tilton will prepare plans and specifications.

Beaver Falls, Pa.—Electric Service Co., manufacturer of electrical equipment, and operating a local repair works, has commenced the removal of its plant to 700 Third avenue, to provide for increased capacity. C. J. Freund is president.

Allentown, Pa.—Electric Bond & Share Co., 71 Broadway, New York, has inaugurated construction work on new transmission lines and power plant extensions in the Lehigh Valley section to cost about $500,000.

Bethlehem, Pa.—A one-story power plant for works operation will be erected by the Traveler Tire & Rubber Co., 819 North Broad street, Philadelphia, in connection with its new manufacturing plant at Traveler avenue and Auburn street, Bethlehem. The entire works will cost about $125,000. J. Osborne Hunt, 114 North Montgomery street, Trenton, N. J., is architect.

Chester, Pa.—A large power plant will be erected by the Chester Hospital in connection with the construction of a new surgical pavilion at the institution. The project is estimated to cost about $250,000.

Easton, Pa.—Pennsylvania Utilities Co. is planning for the immediate installation of three new boilers at its Dock street plant, to increase the present capacity.

Emaus, Pa.—The contract with the Lehigh Valley Light & Power Co., for street lighting and local power service expires on April 1, 1920, and during the remaining period, the Borough Council will investigate the possibilities of the operation of a municipal electric power plant in conjunction with the present city owned waterworks. The present service charges for lighting for the municipality aggregate about $4200.

Harrisburg, Pa.—Public Service Commission has inaugurated work on its proposed investigation of the existing telephone rates throughout the state. The financial condition and cost of operation of the Bell Telephone system will be ascertained. The company is continuing the increase in rates as arranged under Government control pending the outcome of the investigation, allowed for a period of four months by the commission.

Northumberland, Pa.—Northumberland County Gas & Electric Co. has filed notice with the Public Service Commission for an increase in light and power rates, effective Sept. 15.

Philadelphia, Pa.—A boiler plant for works service will be erected by the A. Schoenhut Co., Amber and Venango streets, in connection with the construction of an addition to its woodworking plant to cost about $44,000.

Philadelphia, Pa.—Wirt Co., Armat and Lena streets, manufacturer of electrical products, has filed plans for the erection of a new two-story plant, 62x158 ft., at Greene street and Queen Lane, to cost about $60,000. Charles Wirt is president.

Baltimore, Md.—Chesapeake & Potomac Telephone Co. has made application to the city for permission to install a new underground conduit system under the Harford Road, from a point near Montebello Terrace to its Hamilton Exchange.

Crownsville, Md. — Crownsville State Hospital is having plans prepared for the erection of a new power plant at the institution, with initial capacity of about 6000 hp. C. L. Reeder, Park avenue and Saratoga street, Baltimore, is construction engineer.

DATES AHEAD.

Pennsylvania Electric Association. Annual convention, Bedford Springs, Pa., Sept. 3-6. Secretary, H. M. Stine, 211 Locust street, Harrisburg.

Washington State Association of Electrical Contractors and Dealers. Annual convention, Seattle, Sept. 11. Secretary, Forrest E. Smith, 205 Boston Block, Seattle.

Association of Edison Illuminating Companies. Annual meeting, New London, Conn., Sept. 16-18. Secretary, H. T. Edgar, Stone & Webster, Boston, Mass.

Southeastern Section, N. E. L. A. Annual convention, Asheville, N. C., Sept. 17-19. Secretary-treasurer, T. W. Peters, Columbus, Ga.

Iowa State Association of Electrical Contractors and Dealers. Annual convention, Sioux City, Iowa, Sept. 22 and 23. Secretary, F. Bernick, Jr., Oskaloosa, Iowa.

New England Section, N. E. L. A. Annual convention, New London, Conn., Sept. 22-24. Headquarters, Hotel Griswold. Secretary, Miss O. A. Bursiel, Boston, Mass.

Association of Iron and Steel Electrical Engineers. Annual convention, St. Louis, Mo., Sept. 22-26. Secretary, John F. Kelly, Empire building, Pittsburgh, Pa.

American Electrochemical Society. Fall meeting, Chicago, Sept. 23-26. Headquarters, Congress Hotel. Secretary, Prof. Joseph W. Richards, Lehigh University, Bethlehem, Pa.

International Association of Municipal Electricians. Annual convention, Chicago, Sept. 23-26. Secretary, Clarence R. George, Houston, Tex.

Empire State Gas and Electric Association. Annual meeting, New York City, Oct. 9. Secretary, Charles H. B. Chapin, 29 West 38th street, New York City.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Warren, Md.—Warren Manufacturing Co. has under consideration the building of a new power plant in connection with the proposed addition to its work, which is estimated to cost about $250,000. The cost of the power plant is to be $35,000.

Elkton, Va.—The Janney & Burroughs tannery which supplied electric light was destroyed by fire.

Clarksburg, W. Va.—Baltimore & Ohio Railroad is said to be planning for the electrification of its lines in the vicinity of Keyser in Mineral county. The road has a 17-mile grade in this section, and proposes to haul freight trains over the grade under motor operation.

New Cumberland, W. Va.—West Virginia-Pittsburgh Coal Co., Pittsburgh, Pa., is planning for the erection of a new electric power plant at its LaBelle mine. With extensions of rail system at the properties, the plant is estimated to cost about $100,000.

Wellsburg, W. Va. — Wellsburg Electric Light Co. is planning for the erection of a new local two-story electric substation. J. S. Jenks is vice-president.

Riversville, W. Va.—Monongahela Valley Traction Co. is in the market and will purchase and install immediately two more 10,000-kw. turbines which will double the present capacity and assure plenty of power for the next few years. Address E. B. Moore, general manager, Fairmont, W. Va.

Sumter, S. C.—City Council is planning for extensions and improvements in the municipal electric lighting plant to cost about $90,000. The work will include the installation of a new 1000-kw. turbogenerator, surface condenser, with new water-tube boiler, boiler-feed pumps and other operating equipment.

Arlington, Ga. — Baker County Power Co. is planning for a new hydroelectric power plant on a site in Baker county, to cost with electric transmission system about $640,000. W. E. Saunders is president.

Pensacola, Fla.—A series of about 20 electrically operated centrifugal pumps will be installed by the Bruce Dry Dock Co., in connection with its proposed dry dock and ship repair plant. The plant is estimated to cost $450,000. Address secretary of Bruce Dock Co.

Perry, Fla.—Perry & Gulf Coast Traction Co. will build a railway between Perry and Warrior Beach, distance of 15 miles. Ellis Bartholomew, Palm Grove, Fla.

West Palm Beach, Fla.—Bell Telephone & Telegraph Co., has purchased the system of the West Palm Beach Telephone Co., and will rebuild at a cost of about $200,000.

NORTH CENTRAL STATES.

Cincinnati, Ohio.—Improved street car facilities for both the new courthouse and the Central Union Railway station are to be provided. Address W. C. Culkins.

Lima, Ohio.—A new lighting system will be placed in the Central Church of Christ on West North street. Rev. J. A. Canby, pastor.

Lima, Ohio.—Ohio Steel Foundry Co. will erect an additional building, estimated cost $200,000. The plans call for the installation of a machine-charged furnace which will increase the output of the plant 15%. An overhead crane, electrically operated with a span of 100 ft. and a traveling range of 2600 ft. is to be included in the new improvements.

Fort Wayne, Ind. — Fort Wayne Builders' Supply Co. has begun the erection of a brick and stone storage house for the Rub-No-More Co., to cost $4000.

Fort Wayne, Ind.—General Electric Co. plans to increase its working force by approximately 1000 employes. During recent months business has constantly increased until now the company is deeply feeling the need of more men.

Indianapolis, Ind.—Robert H. Hassler Co. will build one-story factory, brick, steel and glass, 100x120 ft., to cost $30,000.

Indianapolis, Ind.—United States Corrugated Fiber Box Co. will erect a new building, two stories high, 100 x160 ft., fireproof. The company will build a second story to one of the older buildings, 83x160 ft.

Muncie, Ind.—Big Four Railway Co. will erect a modern freight house to cost $30,000. The company will also build a belt line around the city of Muncie.

Warsaw, Ind.—The Indiana Public Service Commission has issued an order for the Winona Electric Light & Water Co. to construct a new pumping station and to lay new mains.

Carbondale, Ill.—Surveyors for the proposed electric railway from Davenport, Iowa, to Metropolis, Ill., are making surveys near this city. The company will make a specialty of transporting coal from the extensive coal fields of Southern Illinois.

Carbondale, Ill.—Peroxide Chemical Co., St. Louis and Chicago, will erect a $20,000 factory building, 90 x100 ft., brick, one-story, containing 9000 sq. ft. of floor space. Charles B. Gautheir, a chemical engineer with the company, will be in charge of the plant. The plan will be to manufacture chemicals used for bleaching purposes in practically every phase of the bleaching business.

Champaign, Ill.—Cushman Auto Tool Co. has purchased the plant and equipment of the D. F. Boyer Handle Co., and the Danville Handle Co., at Danville, Ill., and will operate them as branches of the Champaign plant.

Galesburg, Ill.—An ordinance for the installation of an ornamental lighting system on Chambers, Losey, Willard and Bateman streets, at an estimated cost of $20,279.29, for the pavement of Mathews street at an estimated cost of $5,972.99, was passed by the city council.

Rock Island, Ill.—Root & VanDevoort Engineering Co. will install a complete electrical dynamometer testing laboratory, under the supervision of Charles P. Grimes, development engineer. This will be the fourth laboratory of this type to be installed by Mr. Grimes. It is expected that the information made available in the new laboratory in the Root & Van-Dervoort Engineering Co.'s plant will enable engineers in charge of motor and automobile designing to make much progress in the development of the company's products.

Springfield, Ill. — Davenport, Springfield & Southern Railway Co. has applied to the Illinois Public Utilities Commission for a certificate of convenience and necessity to construct and operate an electric interurban railroad from Davenport, Iowa, to Metropolis. The company also plans to build a branch line from Pinckneyville, Ill., to East St. Louis, Ill., and to construct other spurs as well, such as from Pinckneyville to Coulterville; Belleville to East St. Louis; Decatur to Litchfield and Edwardsville, and Benton to Marion. The company expects to do a heavy railroad business especially, making a special business of handling coal from the Southern Illinois coal fields.

Urbana, Ill.—Board of local improvements has awarded contract for ornamental lighting system to Freeman Sweet Co., Chicago, for $5850.

Benton Harbor, Mich.—Austin & Shamblain, 731 J. M. S. building, South Bend, have prepared plans for two-story box factory for George E. Thayer. The specifications call for motors and electrical equipment.

St. Paul, Minn.—Northern States Power Co. has closed a contract with the new Union Depot for its electric light and power requirements, the connected load amounting to about 1500 kw. Steam for heating will also be furnished under this contract. When completed the depot will be one of the most modern in the United States, costing, with its accompanying yards and track rearrangement, about $11,000,000.

Albany, Wis. — Engineer W. G. Kirchoffer, Vroman Block, Madison, Wis., has prepared plans for improving the power dam.

Black River Falls, Wis.—Plans have been prepared for municipal electric light plant for city. Architects Meade & Seastone have prepared plans. Address Albert Knutson, city clerk.

Chippewa Falls, Wis. — E. S. Schneider, president of Apple River Milling Co., has planned construction of dam, power house and canal near the quarry at Colfax.

Janesville, Wis.—Architect F. D. Chase, 645 North Michigan avenue, Chicago, has prepared plans and will let contracts for $40,000 power house for the General Motor Co. Specifications include motors.

Davenport, Iowa. — First unit of new four-story factory building of the Linograph Co. has been commenced. The building will cost $105,000.

Davenport, Iowa.—Voss Manufacturing Co. will build four-story addition 50x150 ft. to its plant. It will be connected to the main factory by an overhead "L" and tunnel. The company has booked one order alone for 10 carloads of washing machines from a Pittsburgh concern.

Terrill, Iowa.—The extension and improvements of improving electric lighting is under consideration. Address town clerk.

Independence, Mo.—A special election will be held Sept. 16, to vote on the proposal to issue $65,000 in bonds to add a new unit to the municipal electric light plant.

Mountain Grove, Mo.—J. Fred Ellis, J. A. Chase and L. H. Williams, of Mountain Grove, are organizing a company for the purpose of erecting an electric light and power plant at the Double Grove Springs in Ozark county, 34 miles from Mountain Grove. A dam and power plant will be erected. Engineers have estimated that the spring can furnish 1000 hp.

Versailles, Mo. — The municipal light plant at Versailles has been bought by Henry Moser, who will overhaul the plant and add $15,000 of new equipment.

Arlington, Kans.—Election carried for electric lights, bonds for $20,000 having been voted. At the same time election was held to vote the same amount of bonds for lights at Partridge. Both towns will get their light from Hutchinson.

Bendena, Kans. — Electric lights are soon to be installed here.

Chanute, Kans.—The election to vote on the proposition of issuing $75,000 in bonds for enlargement and improvement to the electric light plant, carried.

Courtland, Kans.—A special election will be held Sept. 16 to vote on the issuing of $45,000 bonds for the installation of a modern waterworks system.

Eldorado, Kans.—The contract between the city of Eldorado and the Kansas Gas & Electric Co., has been formally signed, 100 candle power lights will be installed for all street lighting as well as the ornamental lamps for the white way.

Erie, Kans.—A new electric light plant is contemplated.

Guide Rock, Kans.—Plans are being made for an electric light system.

Hiawatha, Kans. — Transmission lines will probably be established from Hiawatha to Willis and Bendena.

Kinsley, Kans.—Plans are being made for the installation of a white way.

Larned, Kans.—Plans are being made to bring electric current from the Hutchinson power plant through high-power transmission lines.

Willis, Kans.—Plans are being made to determine the cost of a high power transmission line from Horton to Willis. As soon as the price is determined, an election will be called to vote bonds for the line.

Mulvane, Kans.—Bonds have been voted for taking over the electric light plant.

Omaha, Neb.—Union Power & Light Co. has been given authority to issue $119,000 on preferred stock.

Oshkosh, Neb.—The election for $9750 bonds for electric lighting system carried. Address town clerk.

Watertown, S. D.—Engineer Lewis C. Larson, 18 Hendon avenue, St. Paul, Minn., is preparing plans for an electric light and power plant, estimated cost $175,000. Brown Mathier, city auditor.

SOUTH CENTRAL STATES.

Louisville, Ky.—Commercial department of the Louisville Gas & Electric Co., during the week ended Aug. 9, secured 51 new electric light and power customers with 37 kw. for lighting and 603 hp. in motors, and accepted contracts for wiring 11 already built houses. New business connected to the company's lines includes 30 customers with 23 kw. of lighting. There was a temporary loss of 42 hp. in motors. Electric energy output shows a gain of 11% over the corresponding week a year ago.

Delight, Ark.—J. F. Rhyne, Delight, is planning for the erection of an electric power plant at Okolona, Ark., for local light and power service. A similar station will also be erected in the vicinity of Delight.

Fargo, Okla.—Election was held

Aug. 11 to vote $26,000 in bonds for the construction and equipment of an electric light plant and waterworks system. A. C. Brauch, city clerk.

Hobart, Okla.—Engineers C. V. Long & Co., 1300 Colcord building, have prepared plans for $135,000 electric light plant to be erected here. Address J. J. Hunt, mayor.

Hooker, Okla.—Plans are being made for a new light plant to cost $40,000.

Albany, Tex.—The Common Council is considering a bond issue of $40,000 for the erection of a municipal electric power plant and ice plant.

Brownwood, Tex.—Further extension of the high-power lines from the Texas Power & Light Co., from this point is to be made in the near future. A line will be built from Dublin to De Leon and Gorman and a line from Dublin to Stephenville.

Denton, Tex.—E. P. Turner of Dallas, and associates, are promoting the construction of an interurban electric railway between Fort Worth and Denton and between Fort Worth and Irving. Each line will be about thirty miles long. The commissioners' court of Tarrant county, of which Fort Worth is the county seat, has granted a franchise for the construction of the proposed roads across and over the county roads. It is stated by Mr. Turner that financial arrangements for the fulfilment of the project have been made. He is also at the head of the Dallas & Southwestern Interurban Railway Co., and the Dallas & Northwestern Interurban Railway Co. The former plans to construct an interurban line from Dallas to Glen Rose, and the latter from Dallas to Denton. Mr. Turner and associates also hold franchises for the construction of an interurban railway between Fort Worth and Abilene, via Mineral Wells and Brackenridge.

Mexia, Tex.—City Council is planning for the establishment of a municipal electric light and power plant to cost $100,000. Address mayor.

Ripley, Tex.—Citizens have approved a bond issue of $150,000 for the establishment of a municipal power plant, with ice manufacturing department.

Wichita Falls, Tex.—Preliminary work looking toward construction of an interurban electric railway between Wichita Falls and Dallas is making rapid progress. Men of large financial means of both Wichita Falls and Dallas are behind the project and its fulfilment is said to be assured. Two routes into Dallas have been surveyed and the selection of the one to be followed will be made soon, it is announced by Fred A. Jones of Dallas, who is in charge of the work. The line will be about 150 miles long. It will pass through a number of thriving towns and give a new transportation outlet to one of the most populous sections of Texas. Electric power stations will be built at Dallas and Wichita Falls. There will not be a crossing at grade on the line and a maximum grade of one per cent will be obtained, according to Mr. Jones.

Wichita Falls, Tex.—Within a short time practically all of the oil well and pipe line pumping plants in the Burkburnett oil field, including the Northwest extension pool, will be operated by electric power. Already the new transmission line which the Wichita Falls Electric Co. constructed from its central station here to the Burkburnett field is providing power for a number of oil well pumps. The capacity of the company's plant is being greatly enlarged by the installation of a turbine engine of 5000 hp. and other equipment. When the improvements that are now being made are finished the plant will be more than double its present capacity, it is stated. It is asserted by oil operators that the use of electric power for operating the pumping plants will lessen the cost of production considerably. Fuel is high in price and difficult to obtain, on account of the congested traffic conditions upon the railroads.

WESTERN STATES.

Phoenix, Ariz.—The Water Users' Association plans to construct a $500,000 electric power plant to furnish power to every ranch of the valley. Project manager, W. R. Elliott.

Buhl, Idaho.—R. B. King, district manager of the Idaho Power Co., announces that his company will increase the generating power of the plant at Thousand Springs from 6000 to 8000 hp.

Uncon, Idaho.—Utah Power & Light Co. is extending its distribution system to the eastern part of this town to take care of customers in that section.

Libby, Mont.—About $240,000 will be spent for the construction of a 200-ton concentrator and power plant and other buildings by the Lukens-Hazel Mining Co., Libby. A pipe line will be installed from Granite, which will develop about 500 hp.

Seattle, Wash.—A large quantity of electrical equipment will be required in connection with the construction of the proposed 18,000,000-ton dry dock at the plant of the Ames shipbuilding & Dry Dock Co., including complete electrically operated pumping apparatus, motors, etc.

Seattle, Wash.—The Board of Public Works was directed by the city council to prepare plans for the Gorge Creek plant of the Skagit River power project. Bids are to be called for as soon as the plans are ready. This action was taken by the Utilities committee after consideration of a report from the City Engineer, A. H. Dimock, showing the construction of a high dam in the vicinity of Ruby Creek.

Marshfield, Ore.—Mountain States Power Co. will supply electric energy amounting to 40 hp. for the operation of a refrigerating machine for the Coos Bay Ice & Cold Storage Co. Negotiations are under way for the electric requirements of a veneer plant recently completed and a new sawmill at Marshfield.

Silverton, Ore. — Portland-Southeastern Electric Railway was granted a franchise at the meeting of the city council for a 50 year period. Address general manager.

Pittsburgh, Cal.—Several bonding propositions are to be submitted. Among these will be the installation of an electrolier lighting system.

FOREIGN TRADE

[*Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.*]

Electrical Supplies (30,206).—An American firm whose South American manager is leaving shortly for Brazil and Argentina desires to secure agencies for the sale in those countries of hardware and electrical supplies. References.

Motors, Dynamos, Transformers (30,212).—A commercial agent in Belgium desires to secure an agency on commission for the sale of complete equipment for electrical illuminating motors and dynamos, alternators, 25 and 50 cycles usual, transformers, and complete equipment for transformers of electric current. Correspondence should be in French. Reference.

Copper Wire, Cable, Lamp Cord, Motors (30,366). — Catalogs, price lists, and samples of all sorts of bare and insulated copper wire, stranded cable, all sorts of lamp cord, marine motors and equipment, and automobiles and accessories, are desired by a firm in Norway. Reference.

Iron Plates for Electrical Machinery, Wire (30,361).—Iron plates for electrical machinery, asbestos, asbestos cardboard, insulating bands, tinned steel wire, oiled gauze, mica, tubular soldering or welding, string, etc., are required by a company in Belgium. Quotations should be given c. i. f. Antwerp. Correspondence may be in English. References.

Wire (30,394).—An agency is desired by a man in Italy for the sale of agricultural machinery and parts, iron and steel products, rails, tubing, electric wire railroad material (narrow gauge), coal, and writing materials. Correspondence may be in English. References.

Lighting Systems (30,395).—The director of agriculture of a Government of Europe desires to have manufacturers forward catalogs and other information relative to meteorological instruments, hydrometric instruments, leveling and surveying instruments, agricultural instruments, flour-milling machinery, dairying equipment, sanitary water-supply and sewage systems, hydraulic motors, town and village lighting systems, sounding and boring machinery; and lumbermen's machinery. He also requests the names of standard books on rural engineering and hydraulics.

Electrical Apparatus and Equipment (30,399).—A merchant in France desires to secure an agency for the sale of electrical apparatus and equipment, such as bells, electric light accessories, telephone equipment, and switchboards. Correspondence should be in French. References.

Lighting Plants, Fans, Turbines

(30,404).—Iron and steel sheets (plain black, corrugated black, plain galvanized, corrugated galvanized); hydraulic tobacco baling presses suitable for baling tobacco for export; electric lighting plants, electric fans (table, wall and ceiling), especially single-phase, 3-cycle, 115-volt ceiling fans; and hydraulic turbines, are required by a firm in India. Quotations should be given f. o. b. New York. Payment, telegraphic transfer on New York with order. Reference.

Condensers and Coolers, Pumps (30,410).—An engineer in Belgium desires to secure the representation of firms exporting absorption towers, air compressors, autoclaves, beet-sugar machinery, blowers, centrifugal separators, and grain separators, centrifugal nitrators, surface condensers and coolers, jaw crushers; roll, ball, and tube crushers and grinders; rotary cutters, driers (especially vacuum driers); vacuum separators, filters and filter presses; rotary heating furnaces; pumps of all types for industrial purposes; belts, chains, and other conveyors; and hoists and cranes. Correspondence may be in English.

Electric Tools, Etc. (30,411). — A firm in Spain desires to purchase screw-cutting engine lathes, back geared power feed milling machines, machine tools of every description, small engineering tools, steel split pulleys, balata and leather belting, wood split pulleys, shafts for transmission of power, electric and pneumatic tools, and grease cups and valves of every description. Correspondence may be in English. References.

Motors (30,425).—A company in Belgium seeks the representation of a firm manufacturing electrical installations, electric motors, and accessories. Correspondence should be in French. References.

Electrical Equipment (30,430). — A merchant in Algeria wishes to secure an agency for the sale of electrical equipment, motors and accessories, and dynamos. Quotations should be given c. i. f. Algeria. Correspondence should be in French. Reference.

Electrical Appliances (30,444). — A Scandinavian firm desires to secure an agency for the sale of tools, motors, motor boats, electrical appliances, glass and construction materials. Correspondence may be in English. Reference.

Electrical Appliances (30,448).—A firm in New Zealand desires to secure an agency for the sale of hardware, novelties, fancy goods, electrical appliances, telephone (manual and automatic) accessories, etc. Quotations should be given c. i. f. New Zealand or f. o. b. some port of shipment. Terms, cash against documents. References.

PROPOSALS

Electrical Fixtures.—Bids will be received by R. L. Brown, 605 Union Trust building, Parkersburg, W. Va., to install electrical fixtures in $60,000 moving picture theatre.

Street Lighting Equipment.—Bids will be received Sept. 2 at Cloquet, Minn., for installing street lighting equipment. Address J. A. Parks, city clerk.

Street Lighting System.—Bids will be received at Dell Rapids, S. D., on Sept. 9, for installing a street lighting system.

Electric Light Plant.—The Department of Interior Office of Indian Affairs, Washington, D. C., will receive bids Sept. 18 for an electric lighting plant at the Standing Rock School, N. D. Address Commissioner Cato Sells, Department of the Interior Office of Indian Affairs, Washington, D. C.

Electric Passenger Elevator.—Bids will be received at Chicago Sept. 12 for remodeling an electric passenger elevator in the United States Marine Hospital in accordance with plans at the office of the custodian, Chicago. Address James A. Wetmore, Washington, D. C.

Generators, Lighting Fixtures, Etc.—Bids will be received until 8 p. m., Sept. 4, at Hollandale, Miss., for furnishing materials, equipment and supplies and constructing certain water and light plant improvements for the town, in accordance with plans and specifications on file at the office of the board of aldermen, Hollandale, Miss. The work includes furnishing cast-iron and galvanized pipe and fittings, fire hydrants, valves and boxes, oil engine and deep well pumping set, electric generators, switchboard and street lighting fixtures. J. A. McAlpin, mayor; Xavier A. Kramer, consulting engineer, Magnolia, Miss.

Pump.—The Treasury Department, supervising architect's office, Washington, D. C., will receive bids until Sept. 12, for motor-driven triplex pump in the United States Postoffice at New Haven, Conn. Specifications are on file in the office of the architect and of custodian at New Haven.

Boiler and Transmission Equipment.—Bids will be received by the Consolidated Creamery Co., Fultonville, N. Y., for replacing engine, boiler and transmission equipment which was recently destroyed by fire.

Generator and Equipment.—Bids will be received by the city of Ashtabula, Ohio, until Sept. 10, for installing a 1000-kw. generator and equipment in the electric light plant, at an estimated cost of $50,000. Morris-Knowles, Jones Law building, Pittsburgh, engineer.

INCORPORATIONS

New York, N. Y.—J. S. Lawson & Co., Inc. Capital, $10,000. To manufacture electrical devices. Incorporators: John A. Potter, Allen D. Stanton and John S. Lawson, Briarcliff Manor, N. Y.

New York, N. Y.—Monroe Electric Supply Co. Capital, $10,000. To manufacture flashlights and electrical novelties. Incorporators: Samuel Feiner, Joseph A. Herman and Jacob Weiner, 5521 56th street, Brooklyn.

New York, N. Y. — L. Sence & Sons, Inc. Capital, $20,000. To manufacture electrical specialties. Incorporators: A. L. Naze, A. E. Bringle and A. McMahon, 1400 Broadway.

Hoboken, N. J.—Hudson Electrical Supply & Equipment Co. Capital, $50,000. To operate as electrical engineers, manufacture electrical equipment, etc. Incorporators: A. T. Pupke, Hoboken; W. E. Stanton and W. J. Coleman, Jersey City.

Jersey City, N. J.—British-American Rotary Valve Co. Incorporated in Delaware with capital of $1,500,000. To manufacture engines, etc. Incorporators: Edward Eriksen, Sr., and Jr., and Harry Eriksen, all of Jersey City.

Delray, Fla.—Delray Utility Co. Capital, $10,000. To operate a local electric light and power system. D. K. Carter, principal incorporator.

Wilmington, N. C.—J. W. Blake Electrical Co. Capital, $50,000. To manufacture electrical supplies. Incorporators: J. W. Blake and C. F. Jones.

Elkhart, Ind.—Mann Electric Co. has been incorporated with capital of $10,000 by Vernon V. Mann, Fred Lemon and W. W. Long.

Evansville, Ind.—Gilmore M. Haynie & Co. has been incorporated with capital of $20,000 to manufacture and install motor driven power and lights plants and systems. The directors are Gilmore M. Haynie, Isidor Kahn and M. S. Haynie.

Leopolis, Wis.—Leopolis Electric Light & Power Co. has incorporated with a capital of $5000. Incorporators: Rudolph Kucksdorf, James Cervey and others.

Middlesboro, Ky.—Davis Electrical Repair & Sales Co. Capital, $10,000. To operate a local plant for the repair of electrical appliances, etc. J. H. Martin is the principal incorporator.

St. Louis, Mo.—Western Battery & Manufacturing Co. Capital, $5,000. To manufacture electric batteries and kindred specialties. Fred A. Andreas is the principal incorporator.

New York, N. Y.—A. S. Elliott Co., Inc. Capital, $40,000. To manufacture electric and gas fixtures, etc. Incorporators: S. Elliott and A. G. and S. Lichtenstein, 138 East 11th street.

Sisterville, W. Va.—West Virginia Light, Heat & Power Co. Capital, $75,000. To operate a local light, heat and power plant. Incorporators: T. C. Davidson, A. R. Ten Broeck, and A. D. Lord, New York.

Loretto, Mich.—Loretto Light & Power Co. has incorporated with a capital of $10,000, producing and supplying electricity for light, power. Incorporators, C. H. Baxter, A. R. Parkett and others.

Detroit, Mich.—Detroit Transmission Co. Incorporated under Delaware laws with a capital of $10,500,000. Incorporators: Charles L. Marshall, Charles W. Kuehl, and James I. Butcher, Detroit.

East Liberty, Ohio—Peoples' Light & Power Co. has incorporated with a capital of $20,000. L. E. Traul.

Personal

H. M. Giles New Superintendent of South Philadelphia Works, Westinghouse Co. — D. R. Smith Promoted

A. H. Nickerson, formerly connected with the Adapti Co., has been appointed representative of the Pierce Fuse Corp., with offices located at 310 Lennox building, Cleveland, Ohio.

C. B. Lord, has resigned as general superintendent of the Wagner Electric Mfg. Co., St. Louis, to become consulting mechanical engineer for the company.

E. B. Smith, auditor of the Muskogee Gas & Electric Co., Muskogee, Okla., has been transferred to the Oklahoma City office of the Oklahoma Gas & Electric Co., and will be succeeded by George H. Richardson of the Oklahoma company.

R. Timmerman, formerly division manager for the Utah Power & Light Co., Bingham, Utah, has returned after two years' service as a lieutenant in the Navy, and will have charge of the Provo Division of the company, succeeding A. P. Merrill, who has been transferred to the Ogden Division.

James R. Kearney, for the past 14 years connected with W. N. Matthews & Brother, is now western manager of the line material division of that company, with headquarters at Chicago. He will cover all of the territory west of Pittsburgh, and Canada from Winnipeg west, supervising the line-material division sales and take charge of all salesmen covering that territory.

C. H. Grove, who was recently discharged from the Navy, has been appointed Toledo representative for the Commercial Electric Supply Co., Detroit, Mich. Mr. Grove is a graduate of the 1911 class of the University of Illinois, and has been employed by the Westinghouse Electric & Manufacturing Co. on its apprenticeship course and in its sales department at Chicago.

J. E. Davidson, vice-president and manager of the Nebraska Power Co., Omaha, Neb., is retiring from the office of president of the Nebraska Section of the National Electric Light Association, and will be succeeded by T. H. Fritts, of Grand Island, Neb. Mr. Davidson was formerly vice-president and general manager of the Pacific Power & Light Co., and well known to the men of the electrical industry in the West.

Edward N. Lake, recently elected president of the Lake Engineering Co., was formerly manager of the Krehbiel Co., consulting engineer, Chicago, and prior to that time was resident engineer with Stone & Webster. During the war Mr Lake was in service with the United States Army as a major in the construction division, Quartermaster's Corps. The major portion of his time in the army was devoted to the work of the construction division at the Scituate Proving Grounds, Scituate, Mass.

Leo Valentine, formerly chief electrician of the Oklahoma Gas & Electric Co., Oklahoma City, has been placed in charge of the electric department.

H. L. Coleman, formerly general manager of the Empire Gas & Electric Company, Geneva, N. Y., has resigned to become general manager of the Bloss Vein Coal Co., recently organized.

Louis E. Strothman, manager of the steam turbine and pumping engine department of the Allis-Chalmers Manufacturing Co., Milwaukee, has resigned to become associated with the Richardson-Phenix Co., Milwaukee, as vice-president and general manager.

Maj. J. R. Worth, Construction Division, U. S. A., is now stationed at Pittsburgh, Pa., % West Penn Power Co., Beedeedum Trees building, as Government constructing quartermaster for three steam-electric plants. He will probably remain about a year.

R. L. Peterman, superintendent of the Pennsylvania Utilities Co., a property under the management of the W. S. Barstow Management Association, has been appointed general manager of the Binghamton Light, Heat & Power Co., succeeding Robert N. Hodgson.

R. O. Bentley, formerly in charge of the Newark district of the Public Service Electric Co., Newark, N. J., has been appointed division superintendent of the Essex Division, formed by a combination of the Newark and Orange districts. Rudolph Burkhalter, formerly superintendent of the Orange district, has been made division superintendent of the Southern Division, succeeding J. Howard Sturge, who becomes Division Superintendent of the Bergen Division. William B. Hartshorne, heretofore in charge of the Bergen Division, has been appointed to a like position in the Central Division, succeeding Jacob T. Barron, who has recently been appointed superintendent of production, with office at Newark.

Dorsey R. Smith, for more than 15 years associated with the Consolidated Gas, Electric Light & Power Co., Baltimore, Md., has been appointed to head its merchandise and domestic sales department. Since entering the employ of the company he has successfully held various positions, the first being that of an outside salesman selling gas-consuming appliances. Upon the merger of the gas and electric companies Mr. Smith was placed in charge of the incandescent lamp department of the electric division. Six years ago when the company inaugurated a merchandising business of gas and electric appliances, table lamps and kindred products, he was appointed assistant to the manager of the merchandise department.

Robert N. Hodgson, general manager of the Binghamton (N. Y.) Light, Heat & Power Co., has tendered his resignation to accept the position of sales manager of the W. S. Barstow Management Association, which controls the Binghamton Light, Heat & Power Co. and 22 similar companies. Mr. Hodgson will make his headquarters in New York and will have charge of the commercial end of the association's business.

Harry M. Giles has been appointed general superintendent of the South Philadelphia Works of the Westinghouse Electric & Manufacturing Co. Mr. Giles, who succeeds the late Oscar Otto, has risen from the ranks in the Westinghouse organization. For a number of years past, he has been superintendent of marine erection, a position to which he was appointed by H. T. Herr, when the electric company absorbed the machine company. Mr. Giles was born in Boothby, Maine, March 23, 1869, and when a small boy his parents moved to Providence, R. I., where he received his education. Leaving high school, he went to work at an early age in the shops of the Corliss Steam Engine Co. While working he took a night course in the Rhode Island School of Design and later received private instruction in mechanics, kinematics and mathematics. His close application to work in the Corliss shops won him rapid promotion as a draughtsman but he irked to get into the actual work of machine construction. He accordingly apprenticed himself in the mechanical department. During his apprenticeship he worked on the very lathe on which had been turned the turret rings of the "Monitor," that tiny Federal mosquito that whipped the Confederate cruiser "Merrimac" at Hampton Roads during the Civil war. Upon the expiration of his apprenticeship, he began to forge ahead in machine construction until in 1900 he became superintendent of Corliss engines with the Westinghouse Machine Co., a position he held until the company became a part of the present organization.

Obituary.

Henry A. Reed, who was operator in the first telegraph office opened on the Harlem Railroad in 1850, died at the age of 90, Saturday, August 23, in his home at Newark, N. J. He was overcome by the heat on the Fourth of July and had been ill ever since. Mr. Reed was president of the Bishop Gutta Percha Co. of New York. When he was 18 years old Mr. Reed took up what was then the new science of electricity and was one of the earliest telegraph operators in this section of the country and a pioneer manufacturer of insulated wires and cables. He was an organizer of the Electric Club and of the Electric Trade Society of New York.

For the Readjustment Period—What?

L.

Stimulating Production Essential

Following the stressful times of war, many people are inclined to underestimate the difficulties of post-war problems and to desire a cessation of government interference with business. Serious-minded people think official control, based upon economically sound legislation, seems imperative until more normal conditions have been reached. The general checking of exports does not necessarily bring about reduced cost of living. Our supply of various staple products and manufactured goods is sufficient to serve the legitimate needs of consumers here and abroad. In case of inadequate supplies, export embargoes—total or in part—should be promptly considered for the protection of the American consumer.

Above all, co-operation between labor and capital is necessary to bring about deflation. The problem cannot be solved by labor accusing capital of universal profiteering or by capital, in turn, decrying the demands of labor for higher wages. Stimulation of production is essential. Strikes only hamper the nation's power to produce, with disastrous consequences for all concerned. Investigations now being made by authorities will tend to establish a clear distinction between real and so-called profiteering; and, to put a stop to the hoarding of supplies, severe measures are predicted to reduce prices from levels arbitrarily maintained by speculation.

The reduction of most commodity prices will have to be gradual, as sudden reductions by the establishment of official maximum prices might cause undeserved losses to capital, which can only result in capital being withdrawn to the detriment of production.

NATIONAL PARK BANK OF NEW YORK

This essentially fair and clear-cut statement by one of the most progressive—yet conservative—banks of the country, is one which summarizes present needs better than any that has thus far come to our attention. For the electrical industries it has special significance.

C. A. TUPPER *Presiden*
INTERNATIONAL TRADE PRESS, INC., CHICAGO

Financial News

Foreign Credit Plan Vital.

Charges in a letter from Senator Owen of Oklahoma, member of the senate banking committee, that the New York banks have opposed bills pending in congress intended to relieve the drop in the foreign exchange market and to promote the extension of foreign credits, because their passage would deprive the banks of the opportunity to speculate in foreign exchange, were denied by local bankers. "The statement in Senator Owen's letter to the President is unfair," said E. D. Hulbert, president of the Merchant's Loan & Trust Co. "Bills now pending on the subject," continued Mr. Hulbert, "might, if enacted, take away from the banks their foreign exchange business and vest it in some one or more of the various organizations or governmental agencies proposed in the bills. It is for this reason that pending bills are generally opposed by bankers."

There was a general concurrence of opinion among bankers in Senator Owen's statement in the letter to the President, that unless immediate steps are taken to extend credits to cover European purchases in this country a serious business reaction will take place here, cutting off a large part of our foreign market.

"We are in the unique position of having nearly all of the world's money, as well as large stores of goods that are absolutely necessary to Europe," said Mr. Hulbert, "and the only way we can aid Europe is to extend credit for the purchase of our goods. Such action on our part would be beneficial to us in that it would aid us in getting rid of surplus manufactures and would unquestionably stabilize foreign exchange. The Davidson plan, a practical, workable plan that would have accomplished this result, was submitted before the situation developed its present acute form, and since it has been rejected by the administration no adequate substitute has been offered therefor."

Standard Gas & Electric Liquidates Back Dividend.

Directors of Standard Gas & Electric Co. in meeting yesterday declared the regular quarterly 2% cash dividend on the preferred stock payable Sept. 15 to stockholders of record Aug. 30, and passed a resolution providing for the payment of 13% cumulated dividends on the preferred payable in common stock of the company at par.

The operating statement for the first six months of 1919 shows the full 4% for the preferred and 3.52% on the common shares, including the increased common stock due to payment of the accumulated dividends on the preferred. This is at a yearly rate of 8% for the preferred and over 7% for the common, without taking into consideration any earnings from the Shaffer Oil & Refining Co., which company, the directors state, is progressing most satisfactorily.

Earnings statement of Standard Gas & Electric Co. for the first six months of 1919 is as follows:

Earnings after deduction of operating expenses and estimated Federal taxes	$1,377,011.04
Interest charges	486,645.73
Balance	$ 890,365.31
Preferred dividends	443,961.12
Balance for 6 months of 1919	$ 446,404.19

Oklahoma Company Redeems Bonds.

The Oklahoma Gas & Electric Co., through the Continental & Commercial Trust & Savings Bank, trustee, has called for all of its 6% debenture bonds, dated Oct. 1, 1912, outstanding. In accordance with the provisions of the trust deed, par and accrued interest as of Oct. 1, 1919, and a premium of 1% will be paid. Bonds and all interest coupons attached are to be presented at Continental & Commercial Trust & Savings Bank, Chicago, by Oct. 1, 1919, after which date interest on the bonds ceases. Of the original issue of $228,500 bonds, $102,000 are now outstanding.

Electric Companies in Big Merger.

W. S. Barstow & Co., New York, state that the Potomac Edison Co. has been incorporated to take over and to develop various properties in West Virginia and Maryland. This company will have a capitalization of $4,000,000 first mortgage bonds, $1,700,000 second mortgage bonds, $1,000,000 preferred stock and $3,500,000 common stock. It will take over the present properties of the Edison Electric Illuminating Co. of Cumberland, Cumberland Electric Railway Co., West Virginia Central Gas Co., West Virginia & Maryland Gas Co. of Maryland, West Virginia and Maryland Gas Co. of West Virginia, Maryland Gas Co., Hartland Power Co. and all of the electric light and power companies doing business in Grafton and vicinity.

Increased Valuation for West Virginia Utilities.

The State Board of Public Works, Charleston, W. Va., has issued a statement showing an increase of $3,802,989.77 in assessments of all public utility corporations in the state over the total of 1918. The aggregate assessments for the present year are $349,558,319.97. In the case of electric light and power interests, large increases have been made in the case of a number of prominent companies, as follows: Appalachian Power Co., from $1,450,000 to $2,500,000; Consolidated Light, Heat & Power Co., $800,000 to $1,100,000; Logan County Light & Power Co., $750,000 to $1,250,000; and the Virginian Power Co., from $2,000,000 to $2,250,000.

The Asia Banking Corp. announces the appointment of W. G. Avery as general manager of its Far Eastern branches, with headquarters at Shanghai. Mr. Avery, who was formerly assistant treasurer of the Guaranty Trust Co. of New York, left New York Aug. 19, and will sail from Vancouver on Sept. 4.

Southern California Edison Offers Stock.

The Southern California Edison Co. is offering to its stockholders 25,000 shares of common stock at $90 cash, or $91 payable $6 with subscription and $5 a month. Stock not subscribed will be offered publicly after Sept. 1. The company plans to expend $20,000,000 in hydroelectric developments in the next three years.

Dividends.

American Telephone & Telegraph Co. has declared a quarterly dividend of $2 a share, payable Oct. 15 to stock of record Sept. 20.

American Power & Light Co. has declared the quarterly dividend of 1%, payable Sept. 1 to stock of record Aug. 21.

El Paso Electric Co. has declared a quarterly dividend of $2.50 a share, payable Sept. 15 to stock of record Sept. 2.

A dividend of 1¾% on preferred stock has been declared by the Nebraska Power Co., payable Sept. 1 to stock of record Aug. 20.

Northern Texas Electric Co. has declared a quarterly dividend on common stock of 2%, also a dividend on preferred stock of 3%, payable Sept. 2 to stock of record Aug. 18.

Philadelphia Electric Co. has declared a quarterly dividend of 43¾ cents per share, payable Sept. 15 to stockholders of record Aug. 20.

The board of directors of the Rochester Railway & Light Co. has declared a quarterly dividend of 1¼% on preferred stock, also a quarterly dividend of 1¾% on series B preferred stock, both payable Sept. 2 to stock of record Aug. 25.

Night View in Machine Shop of an Automobile Manufacturing Plant—A Splendid Example of General Shop Lighting That Stimulates Efficiency of Employes and Increases Production.

What Better Industrial Lighting Can Do to Stimulate Production

Fight on High Cost of Living Calls for Increased and More Efficient Production—Modern Factory Lighting Was Important Aid to War Production and Can Materially Help Present and Impending Conditions

By F. H. BERNHARD

ONE of the most serious of the many economic, political and social problems of the readjustment period is the fight on the high cost of living. The latter is generally recognized as a principal cause of the prevailing labor unrest, while the strikes and lockouts developed therefrom are in turn responsible for further increases in the cost of living. Thus has resulted a vicious cycle of successive price increases of labor and commodities, these conditions having called for most careful consideration by national, state and local authorities.

NEED FOR INCREASED AND MORE EFFICIENT PRODUCTION.

The findings of the Council of National Defense in a special report on the subject indicate "that the high cost of living is primarily due to curtailment in the production of nearly all commodities except raw food products, to hoarding of storage food products, to profiteering, conscious and unconscious, and to inflation of circulating credit; and *that the situation may be most advantageously met by stimulated production,* the repression of hoarding and profiteering, the improvement and standardization of methods and facilities for distributing and marketing goods, and the perfecting of means of keeping the nation informed regarding probable national requirements and current production and stocks."

President Wilson in a recent statement said: "Only by keeping the cost of production on its present level, *by increasing production,* by rigid economy and saving on the part of the people can we hope for large decreases in the burdensome cost of living which now weighs us down."

All other authorities that have studied the question likewise are agreed that increase of production will in very large measure solve the situation and every group of remedies proposed includes it. Many careful students of the subject place it as the most essential and effective remedy, the other measures being in the nature of expedients to relieve the high costs temporarily.

When it is remembered that in nearly every country on the earth there has been disturbance of normal production for two to five years—underproduction of peace-time commodities almost everywhere, in so many countries aggravated by concentration of production upon war supplies and wholesale destruction of homes and factories and devastation of fields, forests, etc.—it is difficult to conceive how anything like normal supplies and prices of commodities can be restored without greatly stimulated production continued for several years at least. Nor does it seem probable or even possible for prices to come down rapidly. Even with special efforts to accelerate and facilitate production, the increased burden of taxation and the high wages will retard return to prewar prices for many years and such low prices may never return. There is, therefore, no legitimate cause for hesitancy on the part of producers.

Because of many uncertainties since the signing of the armistice much of the production has been at low economy because plants have been run on part time and in small sections, thus giving poor load-factor and low efficiency; intensified production should permit continuous and complete operation of entire plants and therefore result in some decrease of production cost. Corresponding decreases in prices should mean greater sales and these in turn permit further increase of production.

Increase of production will furnish greater relief if it is definitely accompanied by greater efficiency of production. As a rule, improved efficiency usually results from full-time operation with continuous processes and large-quantity production, as just mentioned. The wage increases of the last few years and the tendency to shorten working hours call for still further efficiency, if possible, to offset the higher production costs caused thereby. In other words, if greater output per employe can be obtained, either through more extended use of machinery and improved processes or greater individual efficiency of the employe, the wage increase can be partly or wholly absorbed and the price may be brought back substantially to what it was before wages went up. In many cases this increased efficiency is possible and every effort should be made to realize it so that costs and prices, if not actually reduced, should at least be kept from rising further.

Efficiency in production is always desirable in every industry on the score of general economy, but at no time is it more essential than during periods of keen competition and during great emergencies, like the recent war and the present troublesome readjustment period. At present inefficiency is more inexcusable than ever before because it is a direct upholder of high costs and prices. Whatever is done to increase production efficiency now will not only be of great value in the present crisis but will prepare for the intense international competition that is bound to grow as the countries most actively engaged in the late war gradually get back on their feet, when every source of waste and low efficiency will have to be eliminated unless dependence is placed on uncertain artificial restraints on foreign trade.

How Lighting Affects the Efficiency and Amount of Production.

The writer believes that no facts can be presented to controvert the foregoing brief statement of the present and future need for increased and more efficient production. The question then arises, upon what factors does such production depend or how can it be attained? It may be briefly answered that the quantity of production depends primarily (1) on the extent of the facilities available in the way of buildings, machinery, and other equipment, and the number of employes, that is, on the size of the plant, and (2) on the joint efficiency of the entire plant, including that of the processes, machinery and equipment used, that of the management, and that of the employes in general.

As an outcome of the foregoing, it is obvious that the output of a plant can be increased by increasing its effective size, or by increasing its efficiency, or both, but the most economical method is that which secures the output increase at minimum increase of capital and minimum increase in the number of employes. This means that any improvement in efficiency of the men or of any other essential element of the plant is much more remunerative than a plant extension and the increased output thus obtained is probably secured at the lowest unit cost. At the present time the abnormal costs of building materials as well as the numerous strikes in the building trade make it doubly undesirable to make plant extensions if any alternative can be resorted to. The remainder of this article will attempt to show that improvement of lighting is one of these alternatives, that it makes for higher efficiency of the men and of the plant as a whole, and that it stimulates production, thus yielding beneficent results greatly beyond its modest cost.

During the war every effort was bent to making the so-called essential or war industries as productive and efficient as possible. The results are well known. If it had not been that American industry aroused itself and backed up the fighting men with munitions and supplies, the war might still be on.

Old plants were in many cases rehabilitated as to their lighting and other facilities so as to make it possible to double or triple the output at almost no additional capital expense by operating with two or three shifts per 24 hours. This is the most extraordinary way to increase output quickly and at almost no investment outlay. It practically doubles or even triples the return on the investment. Even if night work in some cases has involved slightly higher rates of pay to the employes, the greater continuity of processes and other economies to be mentioned below have offset this as well as the fixed charges, operating cost and maintenance of the lighting system. These total lighting costs amount to only a very small fraction of the entire labor cost. It must be remembered that a good, modern general lighting system can be installed at nearly the same, or in some cases at even less, cost than the inefficient system still so commonly in use.

Definite economies are commonly obtained by continued operation that eliminates the cooling down of furnaces, kilns, and in winter even of the buildings themselves between shifts; in many cases the quality of the product is improved by continuous processes, as in those involving chemical changes. The main fact in this connection that was demonstrated in many cases during the war was that a scientifically designed and efficient lighting system could permit ready increase of the output to two or three times through multiple-shift operation and could also permit utilizing intensively parts of the plant whose inadequacy of daylight or other lighting made them practically worthless, all at very little increase in the invested capital.

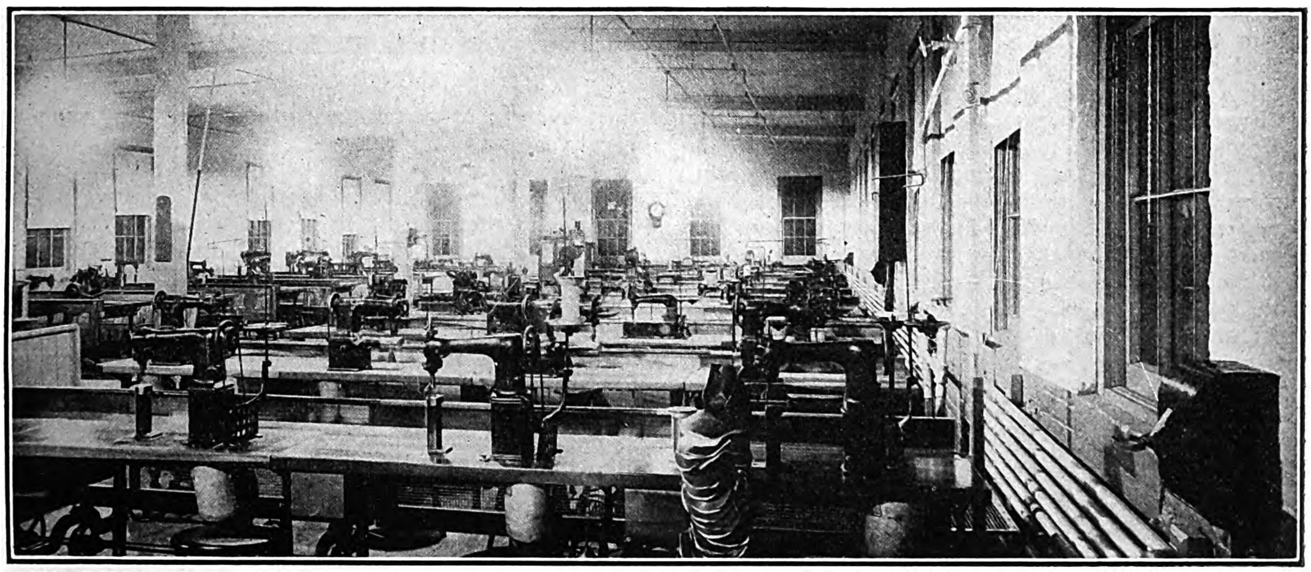
The great attention almost invariably given to lighting of the new plants built during the war also showed that generous windows and skylights, well placed or equipped so as to obviate the sun's glare, paid in the excellence of the daylight secured, and the similar generous, well placed and properly equipped electric lighting units installed also paid handsomely in the excellence of the artificial lighting that was ready at a moment to replace any deficiencies of the natural lighting and permit operation at any hour of the day with an efficiency equal to that of broad daylight. It was found that it was neither difficult nor costly to secure such lighting equipment as would enable this unimpaired efficiency to be maintained regardless of cloudy days, storms or other weather conditions, and of the darkness of the morning, evening or night hours. Thus in both old and new war plants lighting received probably the most extended recognition of its importance and value that has yet been accorded it. This importance was merited because of the very substantial increase it made possible in the general efficiency of the entire plant and in the personal efficiency of the employes.

Turning now to this question of personal efficiency we find in every poorly lighted plant that considerable time is lost by the employes' inability to see their work properly on cloudy days, during storms, and during the inadequate daylight of the early morning and late afternoon hours of fall and winter days, so that the output per employe for each of these dark hours is considerably lower than when daylight is plentiful. Several causes contribute to this, chiefly the impaired efficiency of the eye under inadequate or poor light, which causes one to take more time to do work requiring perception of detail than when the light is suitable; eye strain is a usual accompaniment of attempts to work under improper light and results in further loss of visual efficiency and time. Even where the resulting loss of time is only a few seconds or a fraction of a minute per operation, the total time lost for scores or hundreds of operations effected during the hours of inadequate lighting may amount to from half an hour to one or even more hours per day—an outright loss of useful time for which the employe is paid but is unable, through no fault of his, to render effective service.

Where the lighting is unsatisfactory the visual strain of attempted work leads most employes to let up on their usual pace or else do their work in a slipshod fashion that means much spoilage and work that must be done over. Moreover, poor lighting makes supervision of workrooms difficult so that lazy employes are apt to spend as much as an hour at a time in some obscure part of the plant merely "killing" time, if not actually asleep. In a well managed and properly lighted plant this could not happen, but it is surprising to what extent it does happen in poorly lighted factories.

All the various losses of time aggregate a considerable amount in the average ill lighted plant, as has been shown not only by direct observation but by the indirect proof of substantially increased output after the lighting has been rehabilitated to modern scientific standards. Increases of output from 2 to 25% or even more have been proven after the lighting was modernized, 10 to 15% being a common average. These increased outputs are the result chiefly of the improved visual efficiency, but another source of higher personal efficiency is the psychologically stimulating effect of bright and cheerful workrooms which produce alertness and keener application to duty, as well as dispel the depressing effect of gloomy surroundings.

Emphasis has been given in the foregoing only to those ways in which good lighting has a direct influence in increasing production, either through more intensive utilization of the plant or through improved efficiency of the workmen. It is known to have other beneficial effects also, most of which help indirectly to stimulate production. Thus it improves the quality of the product and reduces spoilage, it promotes order and neatness in the plant, it reduces accidents, lessens eye strain, makes more cheerful working environment, and promotes contentment of the employes. The four latter features have an immediate bearing upon the working conditions and thus also influence



Night View in Sewing Room of a Shoe Factory, Showing That Even the Exacting Work of Sewing Can Be Done Successfully Where Suitable and Yet Highly Efficient General Lighting Is Provided.

the personal efficiency of the men, while at the same time they tend to reduce labor turnover and diminish the likelihood of labor troubles.

Aside from the increase of production, which has been the subject of numerous tests and has been conclusively proven to average from 10 to 20% after putting in an up-to-date lighting system, the other benefits of good industrial lighting are somewhat intangible because so difficult to segregate and demonstrate quantitatively, or on a dollar-and-cents basis. They are not less real, however, nor to be ignored. In fact, in some industries they are of almost more importance than production increase alone. But they are such close accompaniments of the latter that their benefit is almost invariably added to that of stimulated production and therefore makes a modern lighting installation that much more valuable, so that in view of its low cost any obsolete lighting is entirely inexcusable.

Big Field for Further Factory Lighting Betterment.

It has been mentioned that considerable improvement in factory lighting was effected in the last two years in plants engaged upon war work where it was recognized that good lighting was an important means of stimulating production. The importance of improved factory lighting has also been recognized by the fact that in the last few years the number of states that have industrial lighting codes has been practically doubled. It must not be concluded from this, however, that a majority or even large percentage of factories really have lighting systems that meet the illuminating engineering requirements of the present day.

The truth is far from this. Most factories are still very poorly lighted. As a rule, natural lighting facilities (windows and skylights) are inadequate, poorly located and equipped, and poorly maintained. In some cases, artificial lighting is entirely unprovided for, thus making a very hazardous plant and one whose production is dependent largely on the weather and season. Where lighting systems are installed, they are in very many cases provided with obsolete and inefficient equipment, improperly placed and improperly maintained, so that the resultant illumination is inadequate, very poorly distributed and very often extremely glaring at many points while other places are in deep gloom. It is the common prevalence of such lighting conditions that has given rise to the factory lighting codes referred to.

Even in factories that have installed fairly modern equipment, it is not uncommon to find poor maintenance thereof. As an example, there was recently observed an installation of well built enameled-steel bowl reflectors designed for 100-watt vacuum type Mazda lamps; these were not kept clean and the lighting became inadequate, so the lamps were replaced with 200-watt gas-filled Mazda lamps. Since the reflectors were not designed for the latter lamps, there was a great deal of glare and uneven distribution. The higher efficiency of the new lamps merited discarding the reflectors and re-equipment of the units with reflectors of the latest type designed for these lamps. The progress of lighting developments is so rapid that it pays to overhaul the entire system at intervals of 3 to 5 years in order to take advantage of the advances of the art in making the lighting more effective and efficient, which means more productive.

Meanwhile there is the great mass of factory owners and managers who still have to be shown that the equipment that was thought to be satisfactory 10 to 15 or more years ago, because none other was then available, comes far from meeting present-day lighting requirements. On the other hand, modern ideas of factory management call for making the plant facilities conducive to the highest production efficiency and they recognize in the most up-to-date lighting equipment a most valuable and economical means for stimulating the production.

Supplementing the present article, the author has in preparation one on "What Better Industrial Lighting Can Do to Improve Working Conditions," in which it will be shown that it should aid in ameliorating the present industrial unrest. This article will appear in the issue of Sept. 20.

INTER-RELATION OF SCIENTIFIC LIGHTING AND INDUSTRIAL EFFICIENCY.

Leon Gaster, Honorary Secretary of British Illuminating Engineering Society, Lectures on Value of Good Shop Lighting.

In a lecture on "Scientific Lighting and Industrial Efficiency," at the British Scientific Products Exhibition, Central Hall, Westminster, London, Leon Gaster referred to the close relation existing between good industrial lighting and the health of workers, and gave many instances of accidents due to insufficient or badly arranged conditions of illumination. Light, he said, was a "tool," and it was absurd to install expensive machinery, and to pay highly skilled workmen, and then to neglect the relatively small expenditure on illumination necessary to the efficient performance of work. Instances were quoted showing that, as a result of improved lighting conditions, increases in output of 8 to 27% had been recorded. When the need to increase production was so great, and when the necessity of saving fuel was so evident, the application of scientific methods to factory lighting was of special importance. The Illuminating Engineering Society was in a good position, he said, to render assistance in making clear the essentials of good industrial lighting, by means of lectures and demonstrations.

INSPECTION AND LIFE TESTS OF INCANDESCENT LAMPS.

The total number of lamps offered for delivery to the Government purchasing authorities during the past fiscal year was over 5,000,000, of which about 600,000, or 12%, were rejected on the initial inspection at the factory, which covers the mechanical qualities of the lamps and their rating in regard to power consumption and efficiency. In this initial inspection samples are selected for the burning or so-called life tests. During the year nearly 3500 lamps were subjected to this life test; and with few exceptions the tungsten lamps, both vacuum and gas-filled, supplied under Government contracts, had a life considerably in excess of the 1000 hours of burning required by the standard specifications.

At the request of the General Supply Committee, tests were made in connection with bids of various manufacturers for the contract for the next fiscal year, and a considerable range in quality among the lamps submitted was indicated. It is probable that the information obtained by these tests alone repays the total cost of the lamp work for the year.

Electric Cooking Load as Developed by Detroit Edison Company

Local Factors Involved—City and Rural Business—Range Troubles and Voltage Regulation—Revenue Derived—Paper Before Michigan Section N.E.L.A.

By R. F. HOTTON
Detroit Edison Co.

THE Detroit Edison Co. has not encouraged the electric cooking business in its metropolitan district and has not sought the business in the rural communities which it serves. The reason for not developing this field are:

Its metropolitan district has a good and cheap gas supply, and electricity for cooking is not an actual need.

During the development stage of the cooking equipment, the high first cost and the heavy repair charges put this equipment out of competition with the well developed and cheap gas equipment.

Under the general living conditions of the metropolitan community, the heavy cooking is for the evening meal, and a cooking load, if such a load were developed, would be superimposed on the lighting load, and in accordance with the rate methods of the company, such business should be taxed for its share of fixed charges, and the consequent rate would be too high to secure business.

Except for the cost of repair on equipment, these conditions are modified in rural communities. Few rural communities have a gas supply, and there is a need for electricity for cooking. The important meal is generally cooked in the middle of the day, and the late afternoon demand is for a short period. These differences of use permitted the establishing of a cooking rate for the rural districts and the need for electric cooking was evidenced by an immediate demand for the service, which is constantly growing. The rate established was 3 cts. per kw-hr., and has been effective since 1916.

This paper deals with the cooking business as it has developed in one of The Detroit Edison Co. districts, serving a rural territory of sixteen communities, ranging in population from 200 to 10,000. There is a gas supply in only one city—that of Mt. Clemens, having a population of 10,000. The number of farm customers is about 650, approximately 10% of the customers in the district; and the number of ranges installed and used by farm customers is 10% of the 314 ranges installed, so that this data is representative of town and small city business, rather than farming districts.

An important fact forced to our attention in the early stages of this development was the changes necessary in our regular lighting distribution to take care of the load created by the connection of ranges to these circuits, but we did not begin immediately to keep track of the cost of these changes. To date we have records of cost on 31 installations, which we are quoting. Changes represented by these costs will accommodate many more stove connections if we sell stoves to customers in the vicinity, so that as the business increases, the average cost per stove should show a lower figure than the ones quoted. These figures do not include the cost of superintendence and engineering. On 23 installations changes were required in primary or secondary distribution or transformers—in some cases all three factors were affected. The average costs on these 23 installations were as follows:

Labor	$ 25.00
Material other than transformers	17.20
Transformers	61.40
Total	$103.60

On eight installations the only change required was increasing the service loop, at an average cost of $10.50, making the average cost on the 31 installations $93.11. These figures do not include any salvage on material returned, and it is doubtful that anything but junk value could be placed on it.

We have from the first and are continuing to furnish free repairs for stoves and have replaced units, standing the expense of renewals when the manufacturer did not do so. This service is an expensive one, and record of the cost has not been kept. Our greatest difficulties have arisen from mechanical rather than electrical defects, although each type of element developed different troubles with use.

Opinions on Range Troubles.

The first enclosed type does not stand line disturbances of a lightning storm, the construction of the oven unit making it even more susceptible than the surface unit to these disturbances. The surface units buckle and warp with use. The difficulties have been fairly well eliminated, but the light mechanical structure of the terminals continues to cause trouble with this type of unit. In the next type, the open coil type, the element difficulties were overcome, but the terminal connection is not much improved—the terminals having insufficient protection from the heat of the unit burn off at the junction point. The wiring used in the stoves is not heavy enough for the wattage of the units This latter trouble may be overcome by rewiring the stove with larger wire, which we do when trouble develops. Repeated reports of these defects to the manufacturer have not resulted in improvements. However, most of the ranges on our lines are of a later type having the molded block open coil. On a few of the first ranges, we discovered that the range wiring was unbalanced having approximately 75% of the load on one side. This condition caused a drop in pressure on a small transformer when only the heavy side was in use.

Another source of trouble with this range was the crystallizing of the oven terminals—this defect has been overcome by making the terminal connection on outside of the oven.

During 1917 and the early part of 1918, several customers in different locations in the district complained of the length of time it took to do their cooking on the electric range. When we would receive a complaint of this nature our first step would be to take a voltage test at the entrance point of the service and then at the range terminals with stove on and off. If the voltage at the terminals was below 2% of the rated voltage, we would try to increase this by means of moving the transformer closer to the entrance point and in some cases it was even necessary to boost the voltage on our primaries. In one particular installation something over $300.00 was spent without giving the customer satisfactory service. Finally, we installed a set of 105 volt units, this has proven successful in every case. We now specify 105 volt units with every range order.

In order to determine the terminal voltages at rated wattage and the actual wattage inputs of the electric range units, a series of tests were made May 12, 1919, by our research department. Because of general similarity of construction, all surface units now in use may be classified into two types, enclosed and open coil; the open coil can be subdivided into molded block and reflector. The following method of testing was used; two runs were made on each unit. First, the units of each type were numbered 1, 2 and 3. Each unit was tested at a time, starting with the unit at room temperature. The a-c. voltage was kept constant at 110 volts. The current flowing through the unit and the input in watts were observed every minute for five minutes and every five minutes thereafter until two successive observations were identical. If the data for the three units of each type agreed closely, the one nearest the average was used in the table. If the units showed a variation of 5% or more, the extreme high and low test was used.

A sheet metal frame was made up which held the surface units, bringing them as near actual range conditions as possible. The efficiency of the units was obtained in a simple manner as follows: Two quarts of distilled water at a temperature of 60° F. was placed in a cast aluminum kettle (with cover) upon a unit. Current at a constant potential of 110 volts was turned on the unit (beginning cold) until the water reached the boiling point, as registered by an open scale chemical thermometer. At the same time the energy consumption was recorded. The terminal voltage at rated wattage will be found in Table No. 1. On the average they keep within 5% above or below 110 volts, but with the enclosed type of unit they varied as much as 9% below 110 volts and 11% below 110 volts with the open coil reflector unit. Cases were found where the elements were improperly marked. Out of 13, 1500-watt enclosed units, 31% were found to have but a 1000-watt capacity at 110 volts. One out of three of the open coil (molded block) was marked 880 watts but actually had 1100-watt capacity at 110 volts.

TABLE I.

Type.	Size.	Watts.	Volts for rated wattage.		Wattage at rated voltage of 110.

The most important factor in the electric cooking service is to give good pressure and quick repairs. We make no charge for repairs unless it is apparent that trouble is result of carelessness on part of users of the stove. During 1918, we had 128 range trouble calls, which were as follows:

TABLE II.

Surface Units 1500 W.	Surface Units 880 W.	Surface Units 440 W.	Oven Units 1100 W.	Oven Units 1000 W.	Gridiron	Misc.

CHARACTERISTICS OF COOKING LOAD.

For the characteristics of the cooking load the following test was made during the period from December 25, 1918, to January 2, 1919, on a group of five ranges that are connected to one 25-kw. transformer. In addition to the ranges there are 15 lighting circuits connected to the transformer, which load could not be separated from the cooking load. Range services are all taken directly off the transformer pole, and all of the connections are within two sections of the transformer.

The load was recorded on two Bristol recording ampere meters, one located on each side of the neutral wire. The sum of the two readings at any time thus gives the total current output of the transformer at that time.

The readings for the six days December 25, 26, 27, 29 and January 1 and 2, were selected and the total load on the transformer for each hour of the day was obtained by adding the readings of the two meters. The curves shown were thus obtained, giving the characteristic average loads during the day and the maximum loads recorded during the period from each hour of the day, also the loads on the maximum day, that is the day on which the total kilowatt-hours consumed was the greatest.

It will be seen that the curves have similar characteristics at all essential points. They all show well defined peaks as might be expected, indicating the time of breakfast preparation, morning baking, dinner preparation, afternoon baking, supper preparation, etc. The fact that there is considerable lighting load in addition to range load probably affects the shape of the curves somewhat—especially in the early morning and in the evening. Also the fact that most of the residences have some other appliances such as vacuum cleaners, washing machines, etc., would affect the slope of the curve. Since the range load is large in comparison to the other devices, the curves may be considered fairly characteristic of range services.

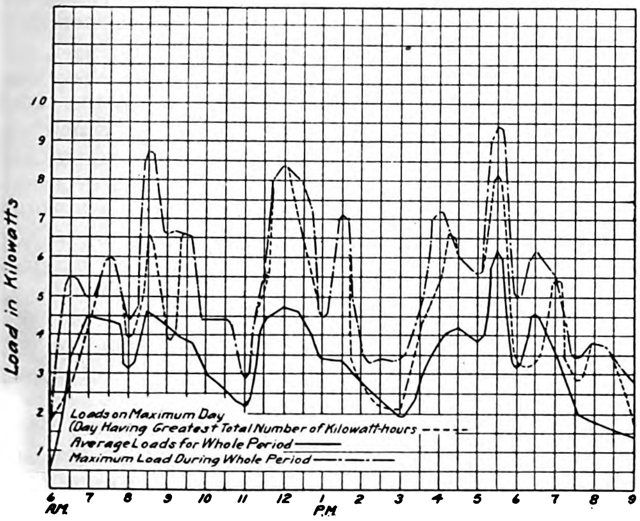
It is interesting to note how closely the curve for the maximum day follows that of maximum for the period, showing that, for the most part, the maximum for the period occurred on the maximum day. The average curve had most of the sharp peaks smoothed out and since its shape agrees closely with that of both the other curves, this is probably very nearly the typical variation throughout a day which we might expect to find under any similar condition, i. e. range load combined with lighting and appliance load.

The diversity factor of such loads is also illustrated. The maximum load for the whole period was less than

10 kw. The transformer installed, 25 kw., was sufficient to care for all five ranges together, but due to the diversity in use the actual load was never greater than 40%. A 10-kw. transformer would be sufficient. This diversity will vary with the number of ranges on one transformer. With a less number of connections, a greater proportion of the connected load must be provided in transformer capacity.

The following tabulation shows the average net revenue from a varying number of range customers for the year 1918. The reason for the higher average during the summer months may be attributed to the summer homes, which are closed in September for the winter. Another reason is that some customers use coal or wood ranges in the kitchen during the cold months for heating as well as for cooking.

1918 Month	Number of Customers	Total Kw-hr.	Total Revenue	Average Net Bills
January	119	12,161	$346.64	$2.91
February	127	11,325	323.44	2.54
March	128	10,957	317.04	2.31
April	128	15,117	412.80	3.22
May	133	16,397	467.31	3.55
June	148	19,862	543.77	3.67
July	178	29,747	807.24	4.53
August	195	32,665	889.08	4.55
September	204	31,305	856.65	4.19
October	202	23,882	659.19	3.26
November	202	22,002	611.18	3.02
December	201	18,669	513.88	2.55



Curves Showing Characteristics of Average Daily Load and Maximum Loads.

There is one point at least that should be emphatically stated; that is, that electric cooking is strictly scientific, and, therefore, possesses a great advantage over all others. The scientific feature associated with electric cooking is its exactitude. Electric heat provides a fixed temperature for each particular type of cooking and thus illustrates the main feature of the new system. It is exact, and therefore, the products of it are more reliable than by other means. This is what is meant by its being more scientific. Since there is no flame in an electric range, there is no combustion and consequently no possibility of poisonous fumes escaping to contaminate the atmosphere and the food which is kept in the kitchen or pantry. The air in the kitchen will remain so pure that even delicate flowers may be kept near the stove without fear of withering. The elimination of matches and the fact that there is no flame which means absolute protection from fire, no danger of explosions, no smoke, fumes or discolored walls. All of this is done away with. The electric range is especially desirable in the warm summer months, there being no radiation of heat in the room. These features have undoubtedly helped the more extensive sale of ranges. Electric lighting was accepted by the public years ago because it has advantages that other systems of lighting did not have, therefore, if one system of cooking has an advantage over others, there is every reason to expect its final acceptance by the public.

Looking over this paper, the question arises in our minds: "Do the earnings warrant this investment?" However we cannot stop a landslide. Cooking by wire has come to stay. The best and only solution will be to build up the business to the point where we can serve several customers from one transformer. In conclusion, we might add that the electric range business ties our customers more securely to us than the electric lighting and in this way makes them more dependent and more appreciative of our service.

THE ELECTRICIAN'S TABLE OF ELECTRICITY UNDERTAKINGS.

The latest issue of the "*Electrician's* Tables of Electricity Undertakings" has just been received in this country. This is published annually by Benn Bros., Ltd., London, also publishers of *The Electrician*. It contains a list of the central stations operating in the United Kingdom, the British colonies and some foreign countries, and also considerable information concerning them. Among the latter are the engineer's name, a brief description of the systems of generating and distribution, number and types of public lamps served, total motor load, maximum recorded load, maximum traction load, capacity, the number and size of generating sets, fuel used, prices charged for service, number of showrooms, and the names of the purchasers of current for traction purposes, also the prices paid for such service. The list and information contained pertaining to the British and colonial undertakings is very complete but that of the foreign countries is limited to the larger concerns.

ENGINEERING SOCIETIES ADOPT RESOLUTIONS ON CARNEGIE.

Andrew Carnegie's death August 11, 1919, at Lenox, Mass., brought to its close a career which greatly advanced all the engineering arts and sciences. By the introduction into the United States of the Bessemer process for the production of steel and by the establishment and development of steel plants, which became the greatest in the world, he made available for engineers the most useful modern material for engineering construction. His munificence provided large funds for the building of a home for the great national engineering societies in New York and many associate societies. He was an honorary member of the American Institute of Mining and Metallurgical Engineers and American Society of Mechanical Engineers. In view of these facts, the following resolution was recently adopted:

Resolved, That the American Societies of Civil, Mining, Metallurgical, Mechanical and Electrical Engineers, the United Engineering Society and the Engineers' Club, herein express to the family of Mr. Carnegie and record their sincere appreciation of the great contributions of Andrew Carnegie to the advancement of engineering, and of his friendly assistance in making possible beautiful homes for the Engineering Societies and the Engineers' Club, thus fostering the spirit of unity in the profession.

Central-Station Rates in Theory and Practice

Ninth Article—Comparison of Cost-of-Service and Value-of-Service Principles in Rate Making — Price Splitting — Analysis of Relations Between Selling Price and Earnings

By H. E. EISENMENGER

This is the ninth article of this series. A general outline of the series was published in the issue of July 5, and the first article in the issue of July 12. The first seven articles discussed the cost of rendering central-station service, a knowledge of the cost being necessary before rates can be intelligently considered. Last week's article introduced the subject of prices or rates and treated especially of the three general principles on which the amount of profit may be based. This subject is continued in the present article and a mathematical analysis of it is begun in Insert IX. On account of the length of this Insert, the next two articles will be devoted to it exclusively, the main text being resumed in the twelfth article (Sept. 27) and continued throughout practically the remainder of the volume.

PART II—THE PRICE OF ELECTRIC SERVICE—Continued.

III. THE VALUE-OF-SERVICE PRINCIPLE.

SECTION 78. In comparing the value-of-service principle with the two others previously mentioned as to their merits we could dismiss the "what-the-traffic-will-bear" principle (maximum earnings) from the outset as unethical and unfit for public service corporations. We would confine ourselves to a comparison between the cost-of-service principle and the value-of-service principle, but since the latter is nothing but an evolution of the maximum-earnings principle, we will have to pay attention to the latter principle also.

In order to determine the relative advantages of the cost-of-service and the value-of-service principle, both to the consumer and the producer, it is convenient to assume that we have been making our charges first on the cost-of-service basis, that is, we have been charging the same percentage of profit to every customer and for every particle of service. We assume further that the price has been regulated so that the earnings derived from that system of charging are just what is considered fair, neither more nor less.

Then we change over to charging on the value-of-service basis, in such a manner that the earnings (gross income, net income or net rate of return) of the producer remain unchanged, or at least are not reduced below what has been recognized as fair. The producer will therefore experience at least no damage as a consequence of the change-over. We will first investigate under what conditions it is possible to make such a change-over to the value-of-service principle in such a manner that the price is not increased to any consumer[1]. This means that we will begin our investigation with that part of the value-of-service principle which requires only a lowering of the price (namely, for those parts of the service for which the respective consumers are not willing or able to pay the original price), but we will leave out of consideration, for the beginning, an advance of the price for those parts of the service for which the customers would be willing and able to pay more than the original price. The value-of-service principle will then be of indisputable advantage to some of the parties concerned and of disadvantage to nobody. Then we will extend our investigation to the introduction of raised prices, where necessary.

79. The change from the cost-of-service principle to the value-of-service principle means that we will charge no longer one uniform price[2] throughout, but a number of prices in accordance with the valuation of the respective service or part of service by the respective customer, that is, in accordance with the customer's power and willingness to pay for the respective service. This process of judiciously raising or lowering the prices according to the valuation of the service will be called *"price splitting."* If price splitting comprises only price reduction and no increases it will be called *"price splitting downwards"* in contradistinction to *"price splitting upwards."* Of course, price splitting downwards and upwards can be combined, so that some prices are reduced, others raised with respect to the original price.

80. In Insert IX is given an analysis of the relations between prices and earnings, including an investigation of the conditions which bring about the possibility of increasing the earnings by splitting the prices downwards only, that is by lowering the prices of at least some parts of the service and to at least some customers, but raising them to nobody.

[Since the next Sections refer to Insert IX, their publication is deferred until Insert IX is completed.]

[1]If the prices are made lower to some customers than to others, the latter are liable to complain that they are "discriminated against" and to demand that the same prices be charged to every customer. This demand is prompted by a hazy feeling that in that case the resulting price will be the average between the prices charged previously to the various customers, or at any rate lower than the prices charged to the complaining customers, because, it is stated, "the minus of profit from the favored customers must be covered by a plus from the others."

In a well designed rate system this assumption is not justified. The price reduction to certain customers increases the aggregate consumption and therefore the production. A larger production results in a lower unit cost so that the central station can, as a next step, reduce the prices, for instance, to all customers alike by a certain constant percentage, without reducing its own profits below what they were originally. (In fact the profit of the central station may even be left higher than it had been before the first price reduction to the "favored" customers had been made.)

Thus the customer who is grumbling that he has to pay more than some other customer is actually paying less than he would have to pay if he were not "discriminated against."

This problem is treated in detail in the following Sections.

[2]Or, more accurately speaking, prices with a uniform percentage of profit.

Insert IX—Appendix to Section 80 et Seq.—Relations Between Selling Prices and Earnings.

(For readers who are familiar with mathematics.)

I. Prices Independent of the Customer's Valuation of the Commodity (Cost-of-Service Principle).

A. THE FOUR FUNDAMENTAL FACTS.

1. The deductions in this Insert are based on four facts which are partly so self-evident and partly so generally known that they need no proof and can be accepted as axioms. These four facts are:

Fact No. 1.—Although we do not know just how the quantity m sold of a certain commodity varies with varying unit prices, it is obvious that with increasing prices the quantity sold will steadily decrease—other conditions remaining equal—and vice versa.

Fact No. 2.—If the price p per unit is zero, the quantity m will not be infinity, and with rising prices the quantity m will become zero at a finite value of p.

From Nos. 1 and 2 follows: If we plot the unit prices p as abscissae and the quantities m as ordinates (heavy curve in Fig. A, compare also Fig. 2 of the main text) we will get a curve which will steadily fall from the left to the right, whatever its shape may be otherwise, and it will intersect the axes at finite distances from the origin O. This curve will be called hereafter the "sales curve."

Fact No. 3.—Let s designate the total cost of producing a certain quantity of the commodity per year including those capital charges which are, theoretically at least, independent of the earnings (bond interest, depreciation, etc.) but excluding the net return of the capital invested (dividend). Then s is a function—$f(m)$—of the quantity m produced; it is in general not simply proportional to m, but consists of a constant part and of a part which is approximately proportional to m, so that the increment cost per unit produced is approximately constant and $f(m)$ is a straight line. Stating the law of cost in more accurate terms, we will have to recognize that a large manufacturing enterprise (central station), on account of larger and more economical machinery and for other reasons, will be able to produce an incremental unit more cheaply than a small enterprise. The increment cost per unit is therefore not independent of the amount produced m, but it decreases continually with increasing m, from a maximum value for $m=0$ to a minimum value for $m=\infty$, this minimum being still positive. The curve of cost $s=f(m)$ plotted against m will therefore start from the axis of ordinates $(m=0)$ at a certain distance OS_0 from the origin O (see Fig. A[1]) so that OS_0 is the constant part of the cost and then the curve will steadily rise with increasing abscissae m, displaying a certain concavity towards the axis of m. If we want to go into further details, we can even say that the curvature of the line will decrease (radius of curvature increase) with increasing m because the increment of cost per unit produced converges towards a certain limit for $m=\infty$. The curve will asymptotically approach from below a straight line which is slanting upwards.

It is not essential for the investigations of this Insert to assume that the curve of cost $s=f(m)$, whether it be a straight line or a curved line with the concave side pointing downwards, intersects the axis of ordinates at a certain distance above the origin. The curve of cost may also pass through the origin, which is only a special case $(OS_0=0)$; it may, for instance, be a parabolic function of the amount m, of the form $s=\gamma m^n$.

From the left part of Fig. A we get the following two relations.

$$\text{Average cost per unit} = \frac{s}{m} = \frac{f(m)}{m} = \tan\sigma_0 \ldots\ldots\ldots (1)$$

$$\text{Increment cost per unit} = \frac{ds}{dm} = \frac{df(m)}{dm} = \tan\sigma \ldots\ldots (2)$$

Fact No. 4.—The curve $k=F(m)$ of the capital invested k plotted against the quantity sold (or rather produced) m, in the same manner as has just been shown for the cost s, has the same character as the curve $f(m)$ and everything said about the characteristics of the curve of cost applies to the curve of the capital also. See Fig. A curve $F(m)$, which is drawn to another scale than $f(m)$, that is a dollar per year in the s-curve is not represented by the same length as a dollar in the capital curve.

[1]As the quantity m is stepped off in Fig. A on the vertical axis of co-ordinates, the cost $f(m)$ must be stepped off in horizontal direction so that this axis of $f(m)$ coincides with the axis of p (except that in order to keep the diagram free from confusion it has been stepped off to the left of O whereas the axis of p runs to the right).

B. THE THREE SPECIES OF EARNINGS.

1. Gross Income.

2. We now assume first that we have only one product (no by-products) and a system of charging according to the cost-of-service principle, which means every unit is sold at the same price p as every other unit. The number of units sold is then m and the total gross income b is given by the product of the unit price and the quantity sold:

$$b = mp = \text{area } OMLP \text{ (Fig. A)} \ldots\ldots\ldots\ldots\ldots\ldots (3)$$

A certain gross income b will belong to every price p and if we step off the gross incomes b as ordinates over the abscissae p we get the curve b, which will intersect the axis of abscissae (p) in the origin of the system of co-ordinates because there one factor of the product mp is zero; on the other hand, for $p=p_{max}$, that is if the price has become so high that the last sales have just dropped out, the gross income will also become zero because then nothing will be sold $(m=0)$. The curve b must therefore necessarily have at least one maximum between these two points[2]. This maximum is b_{max} with the corresponding price* p_b as abscissa[3].

2. Net Income.

3. As regards the net income we have to deduct the cost s from the gross income b and in order to do this we have to transform the curve $s=f(m)$ (see left-hand portion of Fig. A) from the abscissae m to the abscissae p (right-hand portion of Fig. A) so that $s=\phi(p)$. A definite value

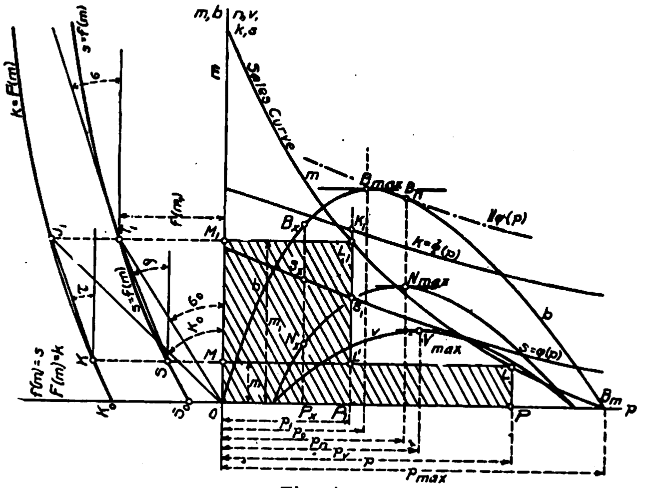


Fig. A.

of s corresponds to every price p. We can therefore construct the curve $s=\phi(p)$ with p as abscissa, as is done in the right-hand portion of Fig. A. For instance, for the abscissa $p_1=OP_1$, we find m_1 from the sales curve $=P_1L_1$ and read from the $f(m)$ curve the corresponding value $s_1=f(m_1)=M_1T_1$. If we step this off vertically upwards from the point P_1 we get the point S_1 as a point of the curve $s=\phi(p)$.

Deducting now the ordinates of the curve $s=\phi(p)$ from those of the curve b leaves the ordinates of the curve of the net income n. The ordinates of the area between the curves b and $s=\phi(p)$ (for instance S_xB_x) indicate by their length the net income n in dollars per year. These ordinates are also stepped off in Fig. A from the axis of abscissae upwards, as $P_xN_x=S_xB_x$, thus furnishing the curve of net income n. If we shift the curve $s=\phi(p)$ parallel to itself upwards until it just touches the curve b (at point B_n) the abscissa p_n of the tangential point gives the price for which the net income is a maximum; the corresponding ordinate of the area between the b and $\phi(p)$ curves gives the amount of this maximum N_{max} of the net income. Now curve $\phi(p)$ necessarily shows a steady decline with increasing abscissae[4]. The

[2]Whether we have one or more maxima depends on the shape of the sales curve. The footnote of Section 22 of this Insert gives a condition for this shape under which condition the gross-income curve can have only one maximum.

*Erratum: In Fig. A designated by mistake as p_0.

[3]The case that the income curve has more than one maximum is treated later in this Insert, Section 22 et seq.

[4]The slope of the curve $s=\phi(p)$ is given by the derivative ds/dp and this can be written in the form $ds/dm\ dm/dp$. Owing to fact No. 3 of Section 1 of this Insert, ds/dm is always positive, and owing to fact No. 1 the term dm/dp is always negative. Consequently ds/dp, being the product of the two, must always be negative; this means that the curve $s=\phi(p)$ must be continually sloping downwards with increasing abscissae p.

The same can be proven in exactly the same manner for the curve $k=\Phi(p)$, see Sections 4 and 6 of this Insert.

price p_n which furnishes a maximum of net income is therefore greater than that which furnishes a maximum of gross income because, owing to the slope of the $\phi(p)$ curve, the tangential point just mentioned must lie to the right of the point B_{max} which indicates the maximum of b-curve.

3. *Rate of Return.*

4. Proceeding to the rate of return (interest, dividend), we first enter the values of the capital invested as a function of the prices in the same manner as this has been shown above for the net income and thus get a curve $k=\Phi(p)$ which has a similar character as the $\phi(p)$ curve[5].

By entering for every single abscissa p the ratio n/k in per cent we get the curve of the rate of return v in Fig. A. This curve again has a maximum because its ordinates must be zero where the ordinates of n are zero. This maximum occurs at the point V_{max} and the abscissa p_v belonging to that point is the price which brings about the best rate of return under the assumed conditions.

By placing equal to zero the first derivative with respect to p of the term $v=\frac{n}{k}$ we arrive at the result that v becomes a maximum if $\frac{dn}{dk}=\frac{n}{k}$, that is, if $\frac{dn}{dp}=\frac{n}{k}\frac{dk}{dp}$. On the right side of this equation n and k are essentially positive values and dk/dp is essentially negative (see footnote to Section 3 of this Insert). If therefore v becomes a maximum, dn/dp is negative. This means that at that point the n-curve is already declining; it has gone through its maximum. *The price p_v which furnishes a maximum of the rate of return is therefore higher than that which furnishes a maximum of net income and the latter price,* as has been shown above, *is higher than the price which furnishes a maximum of gross income;* that is

$$p_v > p_n > p_b$$

4. *Summary.*

5. Each one of the three curves of "earnings" (gross income, net income and rate of return, see Section 70 of the main text) will therefore rise from zero value with increasing prices to at least one maximum and then drop to zero again. We thus have two branches of each curve, a rising left-hand one and a falling right-hand one. Consequently we can attain the same amount of earnings with at least two different prices, one on the left and the other one on the right branch. The former price is smaller than the price at which a maximum of the respective earnings is obtained and the latter larger. As long as we are on the left-hand branch an increase of the price will result in an increase of the earnings, whereas on the right side every increase of the price will reduce the earnings. If we cannot hit the price where the maximum earnings are obtained, we will of course generally prefer the price on the left branch of the curve to the corresponding price on the descending right-hand branch.

C. THE FINANCIAL EFFECT ON THE PRODUCER AND THE CONSUMER OF AN INCREASE (OR DECREASE) OF THE COST OF PRODUCTION.

6. The above methods of representing sales, cost and earnings give a good insight into the problem of finding to what extent the producer and the consumer relatively are the losers in case the cost of production is increased, for instance by taxation, a rise of the cost of labor or material, etc. The producer complains at such times about the high cost of production, whereas the consumer is liable to retort more or less hotly that the producer anyway simply loads the burden of increased cost on the consumer's shoulders, thus leaving his own profit unimpaired, if he does not use the increase of cost as a pretext for even raising the prices so high that his profit is increased. A little investigation into the situation may therefore be of interest.

If the unit cost is increased by a certain fixed amount, the total cost $s=f(m)$ is raised by an amount which is proportional to the quantity m; in other words, the curve s in the right-hand part of Fig. A will not only move higher up but it will also become steeper. The net income will become smaller than it was before for every price and consequently the maximum net income will also be reduced from its original value. Moreover, the maximum of the net income will take place at a higher price than before the cost was raised, because the point at which the s-curve, if shifted upwards parallel to itself (see Section 3 of this Insert), just touches the gross income curve, will lie more to the right than before on account of the greater slope of the s-curve.

The price we have to charge in order to obtain the maximum of the rate of return will also be higher than it was originally, as can be shown in the following way. If c_0 is the amount by which the unit cost has been raised, the total cost will be increased to $s+c_0m$ and the net income $b-s$ reduced to $b-s-c_0m$. The rate of return $v=\frac{b-s}{k}$ is reduced to $v_m=\frac{b-s-c_0m}{k}$. The slope of the curves v and v_m referred to the axis of abscissae p is determined by the first derivatives of v and v_m with respect to p:

$$\frac{dv}{dp}=\frac{k\left[\frac{db}{dp}-\frac{ds}{dp}\right]-\left[b-s\right]\frac{dk}{dp}}{k^2}$$

$$\frac{dv_m}{dp}=\frac{k\left[\frac{db}{dp}-\frac{ds}{dp}-c_0\frac{dm}{dp}\right]-\left[b-s-c_0m\right]\frac{dk}{dp}}{k^2}$$

If now we let $dv/dp=0$, that is, if we choose the abscissa p so that v becomes a maximum, we find, by substituting dv/dp from the first one of these two equations into the second one, the following special value for

$$\left(\frac{dv_m}{dp}\right)_{v=max}=\frac{-kc_0\frac{dm}{dp}+c_0m\frac{dk}{dp}}{k^2}=-c_0\frac{k\frac{dm}{dp}-m\frac{dk}{dp}}{k^2}$$

$$=-c_0\frac{d\left(\frac{m}{k}\right)}{dp}$$

$$=-c_0\frac{d\left(\frac{m}{k}\right)}{dm}\cdot\frac{dm}{dp}$$

Now k is a function $[F(m)]$ of m and m/k is the cotangent of the angle k_0 between the axis of abscissae and a straight line drawn from the origin of co-ordinates to a point on the curve $k=F(m)$, see left-hand portion of Fig. A. From the properties of the $F(m)$ curve (see fact No. 4 of Section 1 of this Insert) it follows that this angle k_0 is continuously decreasing for increasing m and therefore the cotangent of the angle $=m/k$ is continuously increasing. This means $\frac{d(m/k)}{dm}$ is necessarily always positive; dm/dp, on the other hand, owing to fact No. 1 of Section 1 of this Insert, is always negative so that $\left(\frac{dv_m}{dp}\right)_{v=max}=-c_0\frac{d\left(\frac{m}{k}\right)}{dm}\cdot\frac{dm}{dp}$ has necessarily the same sign as c_0. If c_0 is positive, that is, if the cost of manufacturing increases, then the term $\left(\frac{dv_m}{dp}\right)_{v=max}$ is also positive, which means that where v is a maximum the v_m-curve (plotted over the abscissae p) is sloping upwards, and it reaches its maximum at a higher price than v does.[6]

We see from this—using the term "profit" to include both net income and rate of return—the following to be true:

An increase in the cost of production will raise the price which produces a maximum of profit (and conversely a reduction will lower it). On the other hand, the value of the maximum itself is reduced by an increase in the cost of production (and conversely increased by a reduction), as can be easily understood from Fig. A.

A. Supposing now first that the producer have no other considerations to follow in determining his prices than to always obtain a maximum of profit, and supposing further that he had a full knowledge of the sales, cost, and capital-curves as given in Fig. A, then he will as a consequence of

[5]The capital invested depends on the selling price. If the selling price is lowered, a larger amount of the commodity (for instance, electrical energy) will be sold, therefore a larger amount must be manufactured. The manufacturing plant (central station, also transmission lines, etc.) must be extended and this requires in its turn an enlargement of the capital invested.

[6]A decrease of the quantity produced does not release any portion of the capital k tied up in the enterprise. The rate of return will therefore in this case change theoretically the same as the net return, since the capital will be constant. We can assume, however, at least in the central-station business with which we are chiefly concerned here, that the natural growth of the business will take up the decrease of the necessary capacity; in other words, that the effect of the increase of the cost of production, as far as the capacity is concerned, is simply a retardation of the growth of the capacity. If c_0 is negative, that is, if the cost of production is reduced, the above formulas for the rate of return apply without any restricting assumptions.

an increase of cost raise his unit price from the amount which resulted in a maximum profit under the original conditions of cost to the price which results in a maximum of profit under the new conditions of cost. The unpleasant effect of the advance of the cost of production will therefore be divided between the producer and the consumer in some ratio; the consumer will have to pay a higher price and the producer will get a lower profit. It is impossible for the producer to shift the entire burden of the increase of the cost onto the shoulders of the consumer. Moreover, the producer sees his chances reduced of investing new capital in his growing business. Conversely, if the cost of production is reduced, the producer cannot reap all the benefit alone, it is to his best interest to let the consumer participate by reducing the prices.

B. In practice the details of the shapes of the sales, cost, and capital-curves as represented in Fig. A are not known and we can make only rough guesses at the course these curves take. This and other reasons make it possible or even probable that the vendor (producer) has fixed the price not just at that amount which would yield him a maximum profit. Generally, as pointed out in the preceding section (5) the tendency will be to keep the price below that optimum value rather than above it. In that case it will be possible to shift a larger portion of the cost increase onto the shoulders of the consumer than under *A* above, and if the price has been sufficiently below the amount which resulted in a maximum it will be even possible for the producer to maintain his profit at the original level. It may even happen that the result is an increase of the profits. Owing to our ignorance of the details of the curves it will obviously always be a matter of chance which one of these three contingencies will take place.

C. If the price should have been higher than that which results in a maximum of profit from the beginning, it is possible that even after an increase of cost a price reduction remains advisable from the producer's standpoint so that both the producer and the consumer would be benefited by an intelligent downward revision of the price. But it should not be overlooked that this is the case not *on account of* the raise of the cost but *in spite of* it and that the benefit would have been greater to both parties if the increase of the cost of production had not occurred. Moreover, the raise of the cost of production will in no way reveal the fact that the price has been (and still is) too high. The remedy for the decrease of profit will be sought in an increase of the prices instead of in a reduction.

(To be continued.)

COMPLETE SAFETY EXHIBIT DURING SAFETY CONGRESS AT CLEVELAND.

Demonstration of Approved Shop Lighting to Be Made Among Exhibits of Safety Devices, Guards, Appliances, Etc., from October 1 to 4.

The most complete collection of commercial and non-commercial safety guards, appliances, devices and accident-prevention data ever arranged in the history of the National Safety Council will be shown at the exhibit to be held at Grays' Armory in Cleveland, Ohio, Oct. 1 to 4, inclusive, in conjunction with the eighth annual Safety Congress of the National Safety Council.

Every foot of space at the armory has been contracted for. There will be 70 booths in which will be shown types of safety equipment applicable to every industry. The exhibit will be given under the auspices of the National Safety Council and the Safety Institute of America, and 350,000 cards of admission to the exhibit will be distributed among the delegates to the Safety Congress and workmen of the plants in and around Cleveland.

An unusual shop-lighting exhibit will be conducted by the National Lamp Works, Nela Park, Cleveland, to which has been assigned the entire stage of the armory. This company will show a shop in operation, with three lighting installations, one poor, one mediocre and one ideal from the point of view of safety engineering. The light will be flashed on and off alternately, while the advantages and defects of the different systems will be explained. This exhibitor will also show a model office and model drafting room with indirect lighting installations.

There will be several safe clothing exhibits, including a special live model display of safe clothing for women and girls in industry. Sanitation and recreational facilities at industrial plants also will be shown. The round table and sectional meeting discussions at the last annual congress of the National Safety Council at St. Louis disclosed the need for a complete collection of the mechanical aids to safety work as an adjunct to the Safety Congress.

Gray's Armory at which the safety exhibit will be held in Cleveland is about two blocks from the Hotel Statler where the sessions of the congress will be held. The exhibit will be open from 11 o'clock in the morning to 11 o'clock at night, to make it possible for men and women who come to the Safety Congress to visit the exhibit without missing any of the sessions.

Among the other features to be shown for the first time in connection with a Safety Congress will be an Americanization exhibit, an industrial housing exhibit and a women in industry exhibit supplied by the United States Department of Labor, Women in Industry Service. The exhibit of the eighth annual Safety Congress will also be unique in the extensive display of non-patented or so-called home-made mechanical safety guards.

DETECTION OF OIL SOURCES CLAIMED BY ELECTRICAL MEANS.

Locating crude petroleum by means of an electrical device, no matter how far beneath the earth's surface the product may be, has been successfully done in the shallow field near Corsicana, Texas, during the last few weeks, according to reports, and Eugene Elkins, the inventor of the instrument, has gone to the outlying district around Burkburnett to make further practical tests of what is claimed to be a very remarkable invention. The oil industry may be revolutionized if oil pools can be located by means of so simple an instrument. The principle upon which it works is described by Mr. Elkins as follows:

"The system consists in forming an electrical circuit through the earth by dropping an insulated wire to the bottom of a dry water hole, valley or indentation and placing a series of batteries on top of the earth, to the positive pole of which is attached a land wire. This land wire is then taken out over the field in any direction and for any distance and all of the intermediate territory is combed thoroughly with electric currents flowing from the anode or positive pole to the cathode or negative pole. The earth being simply a huge inverted magnet, the electric currents travel from one to the other of the charged poles by the path of least resistance, much as does the return current of the telegraph system through its ground wires to the point of origin. That system also proves that the principle of earth conductivity of electricity is absolutely correct.

"Oil and its constituent components being the only minerals in the earth through which electricity cannot pass, it therefore follows that an oil pool in the path of the electric currents mentioned will offer a great resistance to the said currents, forcing them to go around the pool and also resulting in an appreciable loss of current through electrolysis, both of these factors registering these resistances on an extremely delicate meter in the hands of the operator on the surface of the earth."

Delivery of High-Tension Service to Large Consumers

General Considerations Involved—Relation of Cost to Station Capacity and Revenue—Choice of Equipment—Metering

By RAWSON COLLIER

Operating and Sales Manager, Georgia Railway & Power Co.

IT IS often difficult to decide whether the ideas of the sales department or the operating or engineering department should prevail when it comes to the delivery of certain types of service to the customers. Until recent years, the majority of the large consumers on the lines of our central stations were located in the congested districts of our cities, where they were supplied either from underground alternating-current or direct-current feeders, at low voltage, or from semi-high-tension distributing lines, through manhole or vault-type transformers. In these cases, the construction details were practically standard, following closely the rules for such service prescribed by the insurance underwriters. Usually, standard manhole type transformers were used, and the only engineering details that sometimes called for special study were those covering ventilation and drainage in the manhole or vault.

Metering was generally done at low voltage, and the practice generally was for the central station to furnish, install and maintain the necessary transformers, the rates quoted being supposed to cover all the various items entering into this type of service.

When the utilities began to build out from the cities, with their high-tension transmission lines, and delivery at the customers' premises was often made at from 6000 to 44,000 volts, new problems at once presented themselves to the sales manager as well as to the engineer.

In the case of large consumers, it was almost always the case that central-station energy had to compete with isolated steam plants, in production cost, and, as the larger the consumer the lower his isolated plant generating cost per kilowatt-hour, so the unit price of central-station energy had to be lowered and every inducement had to be offered to the prospective customer in order to get this business. It is certain that a careful study of many existing large contracts between manufacturers and central stations will show that the customer is buying current at less than its actual delivery cost to the central station, simply because the central station was too eager to obtain "big business" and failed to take into consideration the fact that the unit cost per kilowatt-hour on long distance transmission lines and step-down substations and the current loss in such transmissions and transformations should play an important part in deciding whether or not the rate obtained from the consumer was a profitable one.

I know of no case where current is delivered to ordinary wholesale commercial customers at a voltage exceeding 44,000 where the reduction to usable voltage is handled by the consumer. This is doubtless the limiting delivery voltage at present, as it is about the highest voltage for which standard high tension customers' transformers are being built in moderate sizes and it is practically the limiting voltage for standard moderately priced oilbreak and disconnecting switches and for customers' primary watt-hour metering outfits.

Generally, in serving a manufacturing center, if remote from the generating station, the central station finds it advisable to transmit at high voltage to a central point, where a line distributing bank of transformers is installed, from which the district is served through high tension customers' feeders, operating at voltages ranging from 19,000 to 44,000. Some companies operating in moderately populated territories have found it advantageous to operate lines at 38,000 to 44,000 volts of as much as 60 miles in length, the service being perfectly satisfactory for total connected loads as high as 6000 kv-a., with momentary demands of 4000 kv-a. Over such a line under ordinary circumstances, there will be delivered during the year approximately 10,000,000 kw-hr. The data from such a line in actual operation shows that the total cost of transformers and stations installed is approximately $100,000. Interest, depreciation and upkeep on these transformers represents approximately $20,000 per year. If the company had to own and operate these transformers, its delivery cost per kilowatt-hour to the customer, due to overhead and maintenance charges on transformer stations, would be increased approximately two cents.

The customer in figuring his isolated plant construction and operation cost should start with his coal bunkers and his coal pile, and figure the cost of his finished power from this point through to the point where it is used. Is it not correct, therefore, that in figuring the cost of purchased electric power to the same consumer, that he be expected to pay for and maintain everything from the high tension line (the crude power) to the point where the power is used? This would place the delivery to all wholesale customers, on the same basis and the customer would bear the expense of changing the current as received to any voltage that he might desire for his operation. The objection might be advanced that the average customer is not prepared to maintain and keep in repair a high tension transformer station, but this can easily be handled by the company furnishing free periodic inspection service on the customers' station, and the customer paying for all necessary work that the company does on the station, in order to keep it in first class condition.

At this time, I have been able to obtain the ruling of only one Public Service Commission on the subject of who should furnish the high tension station. It is in general, as follows: "In the opinion of the commission, a company attempting to serve the public with a particular kind or class of service should furnish all the instrumentalities for so doing. However, in view of the fact that the customer has it in his hands en-

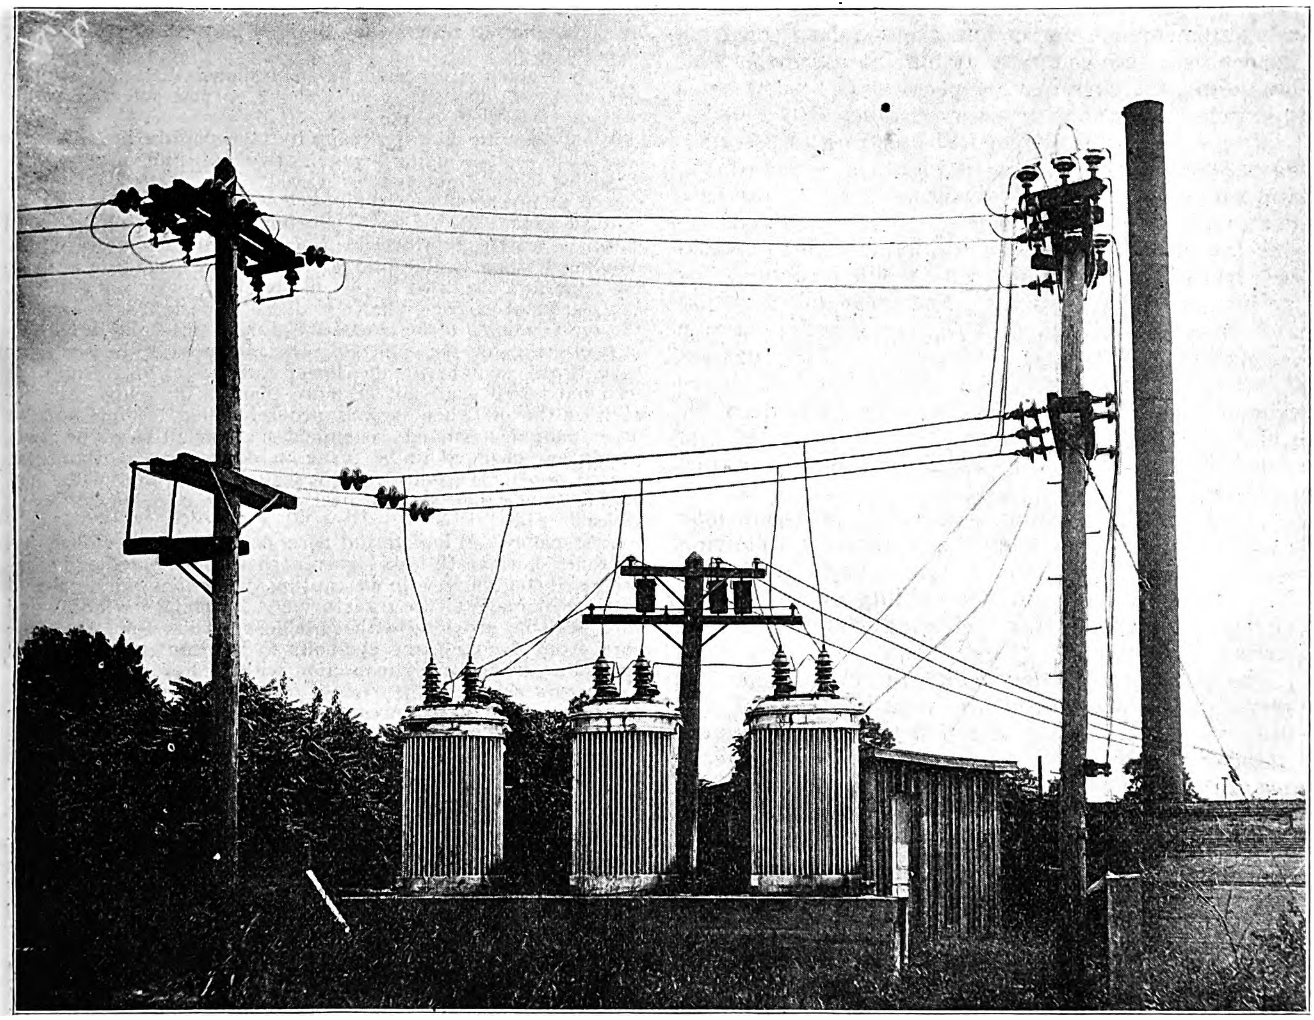

Fig. 1.—Early Type of Pole Structure for 600-Kv-a. Transformers, Transforming from 22,000 to 2300 Volts. Metering on 2300-Volt Side.

tirely as to the length of time that he (the customer) shall use the service of the company, and in order to protect the public from the company's making an unwise expenditure of money in furnishing a particular type of transformer to meet the peculiar needs of any individual customer, and such particular customers later deciding after a short trial to go back to isolated plant operation, the commission therefore holds that the customer should provide the transformers."

Fortunately for the sales department, where the customer is a large one and where the current sales rate of necessity must be low in order to obtain the business, it is found that the cost per kilovolt-ampere of transformer capacity, rapidly diminishes as the station grows larger, and the load-factor is generally higher for large than for small consumers. These two facts, therefore, tend to reduce the increase in the cost per kilowatt-hour to the large consumer where he owns the step-down transformer station and where he actually adds to the rate paid for electricity, the overhead and operating costs of his step-down transformer station. The following table illustrates the point.

Size of station.	Transformer cost.	Transformer cost per kv-a.	Total station cost per kv-a.	Yearly expense, station maintenance.	Yearly kw-hr.	Yearly maintenance expense per kw-hr.
45	$1215	$27.00	$36.00	$ 324	74,000	0.43c
150	1920	12.80	18.00	540	200,000	0.27c
1000	5100	5.10	14.76	2561	3,200,000	0.08c
2000	8200	4.10	12.50	4000	6,000,000	0.07c

If, therefore, the customer is to be expected to furnish the substation and if the upkeep and overhead costs of the station are to be charged by the customer against his power cost, the closest co-operation between the sales department and the engineering and operating departments will be needed, both in the design and in the operation of the station, as the yearly station overhead and maintenance expense must be kept down if the business is to be obtained and retained.

The best design for a customers' transformer station has been carefully studied by a number of the larger companies, during the past few years, the idea being to build the cheapest station possible consistent with first-class engineering practice. Early designs of stations show a leaning towards wooden pole structures, but it was soon found that this was unsatisfactory except for small unimportant stations. Repairs and upkeep on the wooden structures were frequent and it often became necessary to interrupt the customers' service in order to replace burned off pins or crossarms, or to replace poles. Naturally, therefore, the design drifted to a steel or iron structure and immediately the installation cost per kilovolt-ampere and consequently the unit kilowatt-hour cost covering interest and upkeep increased greatly. No standard substation design of moderate cost and of substantial and flexible construction has been brought out. There are several designs of "ready built" structures on the market, but as a general proposition they are comparatively expensive, and in many cases their design and equipment will not fit into the standard construction details of the company wishing to use them. This necessitates the carrying of special repair parts, such as switches, lightning arresters, etc., etc.

The photographs shown will illustrate to a certain degree the practice as carried out in some of the wholesaling companies. It will be seen from these photographs that the general practice is to build stations for installations up to 100 kv-a. with a wooden pole structure, using angle iron or pipe structures for stations above that capacity. The great difficulty that has been encountered is in designing a flexible station —a station that can be used for a medium size installation but later expanded cheaply and easily to accommodate additional capacity. Also it is desirable to have the steel work and bus work so designed that it need not be scrapped in case the station is enlarged or discarded.

The ideal high tension customers' substation may be said to be that substation that fulfills the following requirements: Low first cost, low upkeep cost, flexibility, safety in operation, accessibility of meters and switches, ability to adjust delivered voltage between commercial variations.

The main construction details of the average customers' station will be touched upon in a general way with a view of drawing attention to the three points that have a bearing, in so far as customers' substations are concerned, on the delivery of continuous and satisfactory service.

Transformers.

For moderate sized stations, oil-insulated, self-cooled transformers will prove most satisfactory. Such transformers may be specified to meet the standard A. I. E. E. specifications; some companies, however, are requiring special taps, special voltage tests, etc., etc. I quote as follows from a report made by one large company regarding their specifications: "We follow fairly closely the A. I. E. E. specifications except that the temperatures are based on 35° instead of 50° rise; voltage tests practically the same except on the secondary test, where we demand a higher voltage test. On the 110,000-volt transformers we have 2½% taps in steps from 110,000 to 74,000; on the 44,000-volt transformers we step down to 36,000 volts in drops of 1000 volts."

The specifications covering transformers of another wholesaling company are in part as follows:

General.

Use.—Transformers to be used on 38,000-volt "Y" grounded neutral, 22,000-volt and 11,000-volt circuits from substations connected to 110,000-volt transmission lines. Transformer will not be used in connection with choke coils. Transformer to be oil insulated, self cooled.

Tanks.

Fittings.—Shall consist of gauge glass, drain valve (located on nameplate side), sampling valve (located at bottom of tank and brought out opposite drain valve, size ½ in.), filtering valve (located at top of tank on side opposite drain valve, size ¾ in.). Globe valves to be used throughout, equipped with nickel steel seats and removable hand wheels.

Design.—Shall be such as will permit of convenient handling with jacks and rollers when transformer is assembled in case and case filled with oil. Base of tank shall be provided with lugs or recesses to permit the use of jack or pinch bar without requiring the use of wedges. Shall be provided with eye-bolts or other device for use in fastening slings or hooks with which to facilitate handling fully assembled transformers filled with oil by the use of hoisting or other equipment of like character. These devices shall have ample factor of safety. Base of tank shall be drilled and tapped for ⅝-in. cap screw on nameplate side to provide for ground connection.

Dry Air.—Shall be maintained by the use of anhydrous calcium chloride in proper container which shall be installed at factory on all transformers of 250 kv-a. and over.

Windings.

Over-potentials.—Shall be so designed that they may be operated continuously at 20% above normal potential rating with normal kv-a. output.

Taps.—Four 2.5% full capacity taps shall be provided for the 22,000-volt winding, making two 5% full-capacity taps available when connected for 11,000 volts. Taps shall not be placed in line ends of windings.

End-turn insulation.—The high-tension winding shall have a heavily reinforced insulation on each end of the winding leading to the line, this reinforced insulation extending back to a depth of 5% of the total turns of the winding.

Terminal board.—Shall be of such design as to permit the tap terminals to be placed in straight lines, the outer terminals being for the high voltages and moving the straps in toward the center for the lower voltages. All fittings on terminal board shall not be more than 12 in. below the surface of the oil when tank is properly filled. Wing nuts or other suitable terminal fastenings shall in all cases be used, permitting changes to be made in connections without the use of tools. Terminal board shall be provided with fiber edging strip which shall project above the edge of the board at least ½ in.

Assembly.—Winding and core shall be so assembled that 20 times normal full-load current may be momentarily impressed upon them without causing distortions which would result in damage to the transformer. Assembled winding and core shall be provided with suitable eye-bolts for lifting the core from the tank, the eye-bolts to be near enough the oil surface to be found by inspection without lowering the oil.

Temperatures.

Operating temperatures shall be determined in accordance with A. I. E. E. Standardization Rules, edition October, 1916.

Factory Tests.

Shall be made in accordance with A. I. E. E. requirements for this class of apparatus.

Oil.

Assembled transformers shall be filled with the proper amount of the best grade of transformer oil, this oil to be placed in the transformer case at a time in the assembly or final test of the transformer which is found to be productive of the best results in securing the maximum insulating value.

Transportation.

Transformer shall be shipped from factory with full amount of oil in transformer tank; equipped with calcium chloride container connected properly and filled with proper amount of calcium chloride; all necessary valves, thermometers and oil gauges installed and ready for service; with or without bushings as conditions may require; with proper protection from damage from handling during transit.

The manufacturer must guarantee the following condition of transformer upon its arrival at destination: Mechanical and electrical condition perfect, the oil to be free from moisture and of a dielectric strength equal to a test of 40,000 volts, frequency 60 cycles, between two ½-in. smooth disks with a separation of 0.2 in.

Purchaser agrees to draw ½ pint sample of oil from the bottom of each transformer tank as soon as it arrived at destination and forward to the manufacturer for test.

Foundations.

(For all except pole-type stations.)

Concrete foundations to extend well above any possible high water line. It is much cheaper to handle, test, change or filter a transformer if it is kept near the ground, therefore the placing of large transformer on steel or wooden structures high above the ground is to be discouraged.

Switches.

Disconnecting switches should be installed on the high-tension side of the transformers. Preferably these switches should be operated from the ground by suitable lever, which can be kept locked, if customer desires. By the use of these switches the customer can disconnect the station from the line when the station is not in use or when there is work to be done on it. The low-tension side should be equipped with suitable oil-break switch, equipped with overload and no-voltage release coils.

Lightning Arresters.

This item is extremely difficult to handle, especially if the station is placed in an isolated locality where competent help can not be obtained. Electrolytic lightning arresters are expensive and need daily attention, therefore are used on only the large and expensive stations. Horn-gap arresters, while of some assistance, do not afford perfect protection. There are a number of other types of arresters on the market but all seem to have faults, and trouble from lightning coming into the station from the line side seems to be always with us. To illustrate the different ideas now followed out by various stations, I will quote from several letters received by me.

A report from one operating company says: "Our lightning protection is left to the ground wire on the transmission system and choke coils at the substations." Another company reports: "We no longer place faith in fused horn-gap lightning arresters on 11,000 to 38,000-volt lines. We have bridged our fuse gaps with heavy copper wire and now treat the customers' substation as a part of the semi-high-tension distributing system. We find that we have fewer interruptions to the customers' service."

On the low-tension side, if necessary, lightning protection can be obtained by a number of well-known low-tension arresters.

Metering Equipments.

Metering seems to be almost universally done on the low-tension side of the transformers. Some companies established the rule of metering on the high-tension side at voltages ranging from 11,000 to 38,000 but later a few of those companies decided to stand the transformer losses and meter on the low-tension side of the transformers rather than pay the large difference in the cost of the high-tension metering outfits and chance the increase in maintenance cost, due to the high-tension outfit being destroyed by lightning.

The accompanying table shows the difference in cost to one operating company in high-tension and low-tension metering, the data covering four years' operating:

Kv-a. capacity of transformers.	Cost of meter installation, high-tension voltage. 11,000/22,000	Cost of meter installation, low-tension voltage. 550	Maintenance per yr., high tension.	Maintenance per yr., low tension.
100	$762	$225	$60	$3
500	762	225	60	3
1000	762	225	60	3
3000	762	225	60	3
3000*	1600	225	$400	$3

*22,000/38,000 volts.

Transformer Loss to Central Station by Metering on Low Side (Approximate).

11,000/22,000 volts.	Kw-hr. per year.
100	17,000
500	86,000
1000	173,000
3000	520,000
3000*	520,000

*22,000/38,000 volts.

Maximum Demand Meters.

A large number of companies now make a rate consisting of a charge per kilowatt of maximum demand, plus a charge per kilowatt-hour. To obtain the

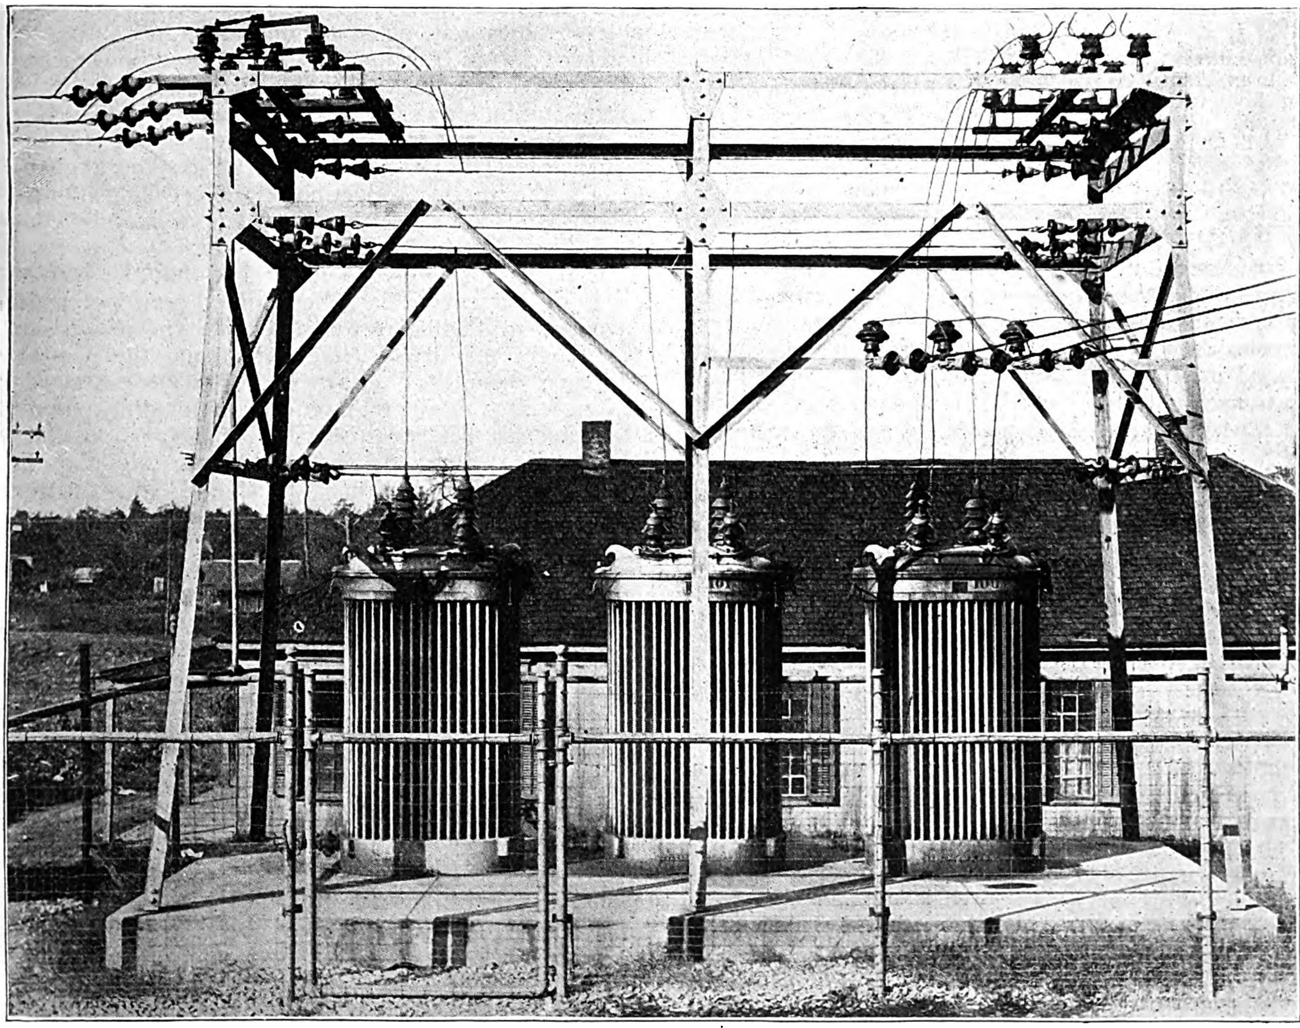

Fig. 2.—Modern Type of Outdoor Installation, Showing Three 150-Kv-a. Transformers With 2300-Volt Metering.

data for the maximum demand charge, a number of types of instruments are available. Curve-drawing instruments and those of the curve-drawing type are suitable only for mounting indoors and can therefore only be used where an indoor type station is used or where the instrument is mounted on the buss bars on the customers switch board. There are several types of indicating maximum demand instruments suitable for mounting out of doors in a weatherproof box and connected directly to the watthour instrument. These instruments are low in first cost and upkeep, and commercially accurate.

From time to time the question has been agitated by the customer and by rate experts, as to the effect of the varying lengths of time that should be allowed for registering the maximum demand. To determine the actual effect of the varying maximum demand time limit, tests were made on a number of customers, operating various types of manufacturing plants, the results being based upon observations taken from graphic recording wattmeter charts, comparing the result of the average of four 5-minute demands during any four days in the month, with one 15-minute demand, one 30-minute demand and one 60-minute demand. The results obtained, were as follows:

Type of industry	Number of customers	15-minute demand	30-minute demand	60-minute demand
		In percentage of four 5-minute demands		
Abbatoir	2	107	103	99
Barytes and Ochre Mines ..	5	101	98.5	96
Bed Mfgrs.	1	114	111	105
Chair Factory ..	1	107	101.5	97
Cotton Mills	4	102	101	99
Cotton Linters ..	1	110	107	100
Fertilizer Plants.	3	104.2	101.2	93.4
Iron Foundries..	2	99	95	85.5
Municipal Plants	5	107	104.5	100
Oil Mills	3	118	110	106
Oil Refinery	1	102	100	100
Stone Crushing..	3	110	104.2	101.5
Average	31	106.8	103.1	98.5

In passing, it may be mentioned that if metering is done at the transformer frame in weatherproof box, windows should be placed in the box so that the customer can read his watthour instrument and maximum demand instrument whenever he wishes. This allows him to keep accurate record of his power consumption, and tends to increase his confidence in the metering outfit.

In General.

The following suggestions are made with a view of calling attention to points that may aid in giving continuous and satisfactory service to your high-tension customers.

(a) Insist that transformers, lighting protection, and switches on the station, installed by the customer, shall conform to standard specifications as prescribed by your company. By so doing you will tend to eliminate any undue weakness in the station, that might cause a short circuit or ground and thus shut down your transmission line and cut off service to other customers.

(b) Standardize on one or two voltages for your power consumers, and insist that transformers and other apparatus conform to these voltages. In case of trouble to the customers' apparatus, you will then be in a position to make quicker repairs, or you can lend from your stock, transformers, motors, switches, etc., until the damaged apparatus can be repaired.

(c) Demand that the customer maintain as high power-factor as is consistent with first-class engineering and operating. If his type of machinery, or his operating methods tend to reduce the power-factor below that allowable for first-class operation, require the customer to install necessary machinery to rectify the trouble.

(d) Make periodic inspections, free, of the customers' transformer station and if trouble is found, notify him immediately and make repairs promptly, at his expense.

(e) Generally, the customer will desire that his transformer station be erected by your company. If so, design and build him the most economical station possible, taking into consideration, first class engineering and operating.

(f) If possible, do all work on your customer's station without interfering with his operation. If your company does not do live line work, try to make repairs or changes on Sundays, nights or holidays, first always getting permission from the customer in writing before taking the current off his station.

(g) Generally large manufacturing plants desire to know their power costs for each month. Try, therefore, to read the meter on the last day of each month, so that the bills rendered, will cover an actual month's service.

(h) Insist that your customer is furnished the correct voltage for his apparatus, and that the regulation is within commercial limits. Much of your wholesale business is obtained because of the fact that the amount of manufactured product is increased, due to the fact that electrical drive is steadier than the drive obtained from reciprocating engines or even most turbines. In some cotton mills, the output is increased as much as 10% with the same power consumption, due to the change from isolated plants to central-station power. If the voltage or frequency is low or the regulation is poor, this saving quickly disappears. If momentary interruptions occur, frequently, the loss in production or the breaking of machinery will soon cause the advantages gained by central-station electric drive, to disappear.

There is absolutely no doubt but that the wholesaling of current to large consumers can be made extremely profitable, if we give that type of service the thought that has been given during the past to your retail business. Let us therefore try to standardize our service to our high-tension customers, striving at all times to make such service as nearly as possible, free from interruptions and variations. No man in the central-station organization should know better than the sales manager what is necessary in the way of service and equipment, in order to have a satisfied customer. Therefore, only by the closest co-operation between engineering and operating departments and the sales department, can we hope eventually to work out and perfect a standard plan for properly and economically serving our high-tension customers.

The above paper was presented by Rawson Collier before the Sales Managers' Convention, held at Association Island, August 4, 5 and 6.

AIRPLANES PATROL PANAMA POLE LINES.

Airplanes are now being employed for hunting trouble and patrolling pole lines in the Panama Canal zone, according to advices from the Air Service. In one recent case a seaplane went from Balboa to San Carlos, repaired a line and returned in one hour and fifty minutes, whereas the trip through the jungle trail by horseback would have occupied not less than three days.

DEVELOPMENTS OF POULSEN WIRELESS SYSTEM SHOWN.

Expert Evidence for and Against the System Given at the British Marconi Inquiry.

During the hearing of the claim of the British Marconi Co. against the British Government for $35,000,000, some very interesting evidence, new to English minds probably owing to war-time restrictions on the circulation of wireless technical developments, was given respecting the Poulsen system.

Wm. Elwell, in the course of a detailed statement, said that he was employed by some San Francisco millionaires to investigate all the existing wireless systems and in 1909 he came to the conclusion that the most promising system was the Poulsen. After ascertaining that the rights were for sale, he went to Denmark and had the system demonstrated to him between Lyngby and Copenhagen. He made a contract with the owners to purchase the patent rights for America, and on returning to America he organized the Poulsen Wireless Telephone & Telegraph Co. with a capital of $5,000,000. This company in 1911 was merged into another company known as the Poulsen Wireless Corporation. It was a large company, and to avoid taxation in different states it was reorganized and operated under the name of the Federal Telegraph Co. with a nominal capital. The Federal company built many stations, starting from 5 and 12 kw. which he purchased in Denmark to demonstrate the system. After that date he manufactured arcs of increasing power—15, 30 and 60 kw. In 1912 he built a station in San Francisco and one in Honolulu, which he constructed with 30-kw. arcs, and inaugurated the system which had been spoken of in Lord Parker's report. Towards the end of 1912 he took a 30-kw. arc to Arlington, where he demonstrated to the American Navy that it was superior to the 100-kw. Fessenden spark. He was asked by the American Navy what he would recommend at a station, and his proposition was to put up three 600-ft. towers and install a 100-kw. arc. This contract was signed in April, 1913. That was at Darien, on the Panama Canal. During the demonstrations he showed that with an arc of 100 kw. reliable communication could be given over a distance of 2000 miles. In 1913 he became chief engineer of the Universal Radio Syndicate, who were then building the Danish design stations at Ballybunion and Newcastle, New Brunswick. These were destined for Transatlantic commercial work. He did not design these stations, but he was called in towards the end of 1914 with a view to making them work. He modified the design of the generator and satisfactory communication was carried out. In 1915 he was invited to Paris and for the French Government put up an arc on the Eiffel Tower. In 1916 he put up an arc generator at the Lyons station for the French Army, which has been in work with America, or about 4000 miles, for over two years. In 1917 he went to Rome and designed a plan for communicating direct from Rome to America, a distance of some 4200 miles. In 1918 he installed a still larger arc in the Lyons station. The largest arc he had worked was 405 kw., the communication being over some 3000 miles. He had no hesitation in saying he considered the Poulsen system the best wireless system in use today.

E. H. Shaughnessy, staff engineer to the British Post Office Engineering Department, and in charge of the wireless section, expressed the opinion that the Poulsen arc was at present the best known working system for wireless transmission. It became so at the middle of 1918. He said that the development of the Poulsen arc had been pretty rapid, and larger power arcs had been built in various parts of the world. The plan of the alternative receiving system which had been put in on behalf of the Post Office was perfectly free from any existing Marconi patent. It was quite as efficient as any other receiving system. The Poulsen arc generator for transmitting which was shown on the same plan was fully covered by expired Poulsen patents. An efficient working Poulsen generator could be made to deal with the requirements of the Imperial wireless chain without infringing.

Another witness, H. A. Madge, technical wireless expert to the British Admiralty, said he had been responsible for the general technical planning of over 500 Poulsen installations, mostly for small power, though a dozen were capable of communicating over 1000 to 1500 miles. He held that a Poulsen installation, if properly designed, was more efficient than any wireless spark known to or heard of by him. The largest Poulsen arc installation he had seen working was that at Nantes, of 200 kw. He could design a 200-kw. arc which would be a perfectly practical proposition and thoroughly satisfactory for long distance commercial wireless.

Other evidence was given by Capt. C. R. Payne, R. N., concerning satisfactory experience with the Poulsen system while on British battleships. He said that day and night communication was better by the Poulsen system than by the spark system. Commander J. F. Commerville, R. N., testified to very satisfactory accuracy of transmission and small interference, during practical experience in the war.

The Marconi company followed up the foregoing statements by calling evidence of a different kind from Emile Girardeau, radio officer engineer to the French Government, who said that the Poulsen arc system had not been a success in French stations and very little was left of the original design. He said that neither the French War Office nor the French Navy had been satisfied with the working of the system. He said further that none of the French stations was capable of conducting a regular commercial service, even with the improvements made.

UNITED STATES COAL PRODUCTION IN 1918.

The final figures of coal production for 1918, compiled from reports from all operators in the country, have just been completed by the Geological Survey. These official figures show for the year 1918 a total output of 579,386,000 net tons of bituminous coal, a figure less by 1.1% than the estimate published 8 months ago. The total production of coal, anthracite, bituminous and lignite, in 1918, was 678,212,000 net tons. Pennsylvania ranked first in output, with West Virginia second and Illinois a close third. The number of men employed in the production of bituminous coal in 1918 was 615,300, compared with 603,143 in 1917. The average number of days worked, the highest recorded, was 294, compared with 243 in 1917.

The total value of the production of the bituminous coal mined in 1918 was nearly $1,500,000,000 and of both bituminous and anthracite coal, $1,828,423,000. The average value per ton realized for bituminous coal was $2.58, compared with $2.56, the estimated weighted average of the established Government prices in effect throughout the year.

INTERESTING ELECTRICAL FEATURES OF THE BATTLESHIP NEW MEXICO.

Superdreadnought Flagship of the New Pacific Fleet Has Most Complete Electrical Equipment of Any Ship Afloat.

It is fitting that the superdreadnought *New Mexico,* probably the most modern of all battleships and the first capital ship of any nation to be operated entirely by electricity, should have been selected as the flagship of our new Pacific fleet now on our Pacific coast.

By many the *New Mexico* has been referred to as the only 100% electric ship, for there is hardly a device on board which does not operate electrically. The special features of her electrical propelling equipment were described in our issue of April 12, 1919. A very brief summary of this feature and some of the other interesting electrical features is given below:

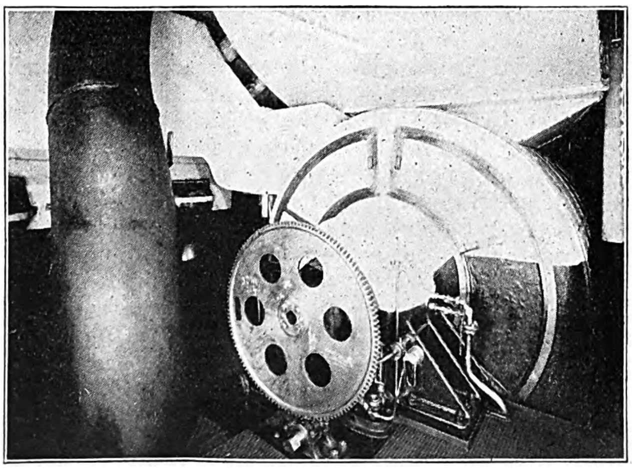
The *New Mexico* is propelled by four 7000-hp. polyphase induction motors each direct connected to a separate propeller shaft. Each motor is 12 ft. in diameter and can operate efficiently at several speeds. These four motors are supplied with current obtained from two special turbogenerators used only for this purpose. The propelling equipment is the product of the General Electric Co., Schenectady, N. Y., which developed it in conjunction with the Bureau of Steam Engineering of the Navy. A view of one of these big motors is shown on page 400.

There are six auxiliary turbogenerator sets located in different parts of the ship which produce the electricity that operates all of the many electrical devices, outside of the propulsion equipment, including power, lighting, heating and signaling apparatus.

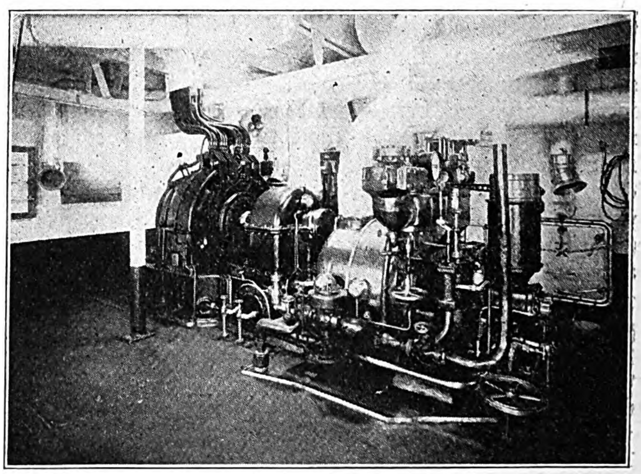
Some of the Motor Uses.

It has been estimated that there are about 300 motors on the *New Mexico,* and here is a partial list of some of the uses to which they are put:

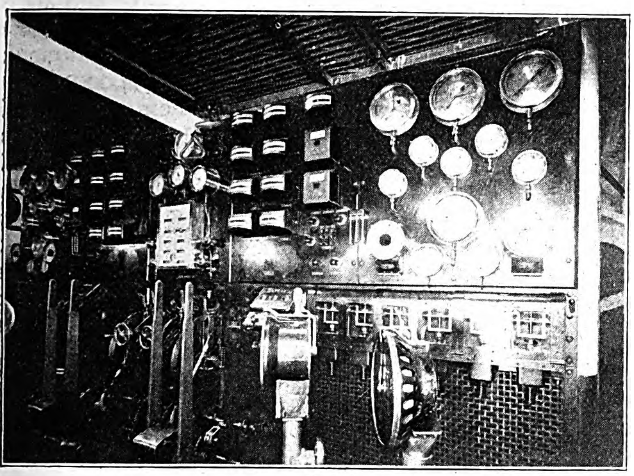
4 motors for steering gear;
2 motors for anchor windlass;
4 motors for boat cranes;
4 motors for deck winches;
1 motor for capstan;
8 turret-turning motors;
12 gun-elevating motors;
4 motors for ramming charges in turret guns;
24 ammunition-hoist motors;
4 smoke-ejector air-compressor motors;
2 torpedo air-compressor motors;
14 motors for operating sanitary, fresh water and drainage pumps;
4 motors for oil pumps;
4 shaft-turning motors;
2 motors for refrigerating system;
80 motors for ventilation fans;
8 motors in kitchen for potato peelers, dough mixers, meat grinders, dish washers, ice cream freezers, etc.
20 motor-generator sets for interior communication, telephone, gun firing, etc.;
6 motors in carpenter shop;
10 motors in machine shop;
7 portable motor-driven drills;



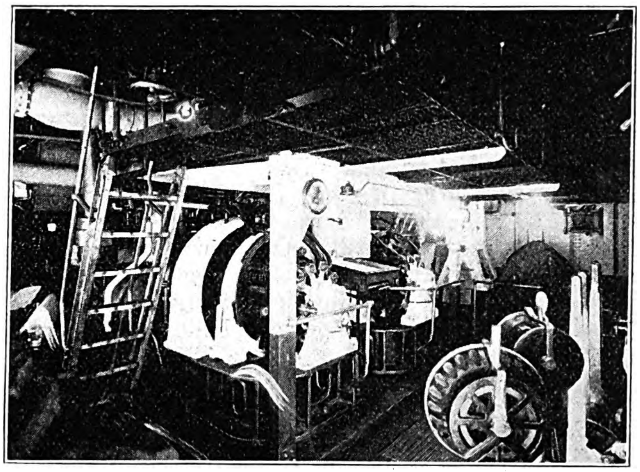
One of the Two Main Turbogenerators for Producing the Polyphase Current for the Propeller Motors.



One of Six Turbogenerator Sets for Supplying Lights, Fans, Cranes, Wireless, and Scores of Auxiliary Motors.



Main Switchboard and Control Apparatus Through Which Current Passes to the Propeller Motors.



Two Main Exciter Sets for Turbogenerators that Supply Current to the Propeller Motors.

6 motors in laundry;
4 motors in print shop.

It is interesting to note that most of the electric lights of the *New Mexico* are dependent on two sources of supply, first, the auxiliary turbogenerators already mentioned and, second, a set of storage batteries which are designed to be brought into service if for any reason the main source should fail.

Two electrically driven boat cranes used in hoisting and lowering the boats and loading supplies aboard the ship have a capacity of 4000 lb. each. The large-calibre guns are fired by electricity; ammunition is hoisted from the magazines by electric motors and some of the big guns are loaded by electricity.

The ponderous rudder is moved into any desired position by the simple turn of a controller on the navigating bridge, which sets in motion machinery in the hold of the vessel for this purpose. There are several steering stations located in various parts of the ship where this operation may be performed in case one station should be disabled. In all, there are five different ways of steering the *New Mexico,* one of which is the hand method, which requires the exertions of six men.

There is a complete equipment of motor-driven machines in the carpenter shop, machine shop, foundry, laundry, bakery and kitchen. In the bakery bread is baked in electrically heated ovens; in the laundry five electric dryers are used, and in the hospital quarters are several electrically heated sterilizers.

Space does not permit detailing all of the marvelous electrical devices of this ship, but among these are the following:

22 radiotelegraph sets;
12 searchlights;
2 Sperry master gyroscope compasses with numerous repeater compasses;
104 loud-speaking telephones;
176 ship service telephones;
170 fire-control telephones;
50 electric air heaters or radiators for warming exposed positions that cannot be economically heated by steam;
6 electric toasters;
15 electric flatirons;
6 electric soldering irons;
2 electric glue pots.

Other interesting facts about this powerful vessel are the following:

The *New Mexico* was built at the Brooklyn Navy Yard and launched in the summer of 1917.

She is 624 ft. over-all.

She has a 97 ft. 4½ in. beam.

She displaces 32,000 tons.

She draws 30 ft. of water.

At full speed she can make slightly in excess of 21 knots.

She can generate 28,000 hp. for propulsion.

Her crew numbers nearly 1200 men.

She burns oil instead of coal as fuel and has a total fuel capacity of 3400 tons, or about one million gallons.

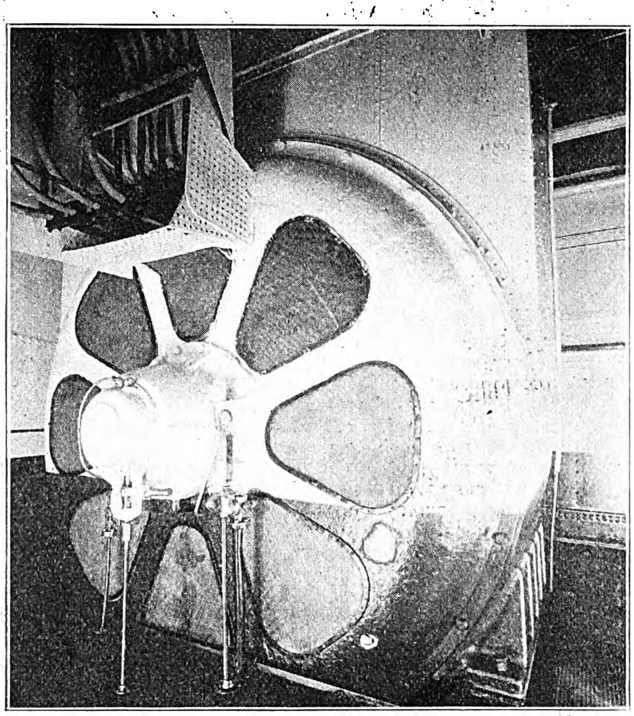
NEW JERSEY UTILITY BOARD ABROGATES ELECTRIC SURCHARGE.

War Surcharge of 25% Removed from Power Consumers, Except Wholesale Customers.

The Board of Public Utility Commissioners of New Jersey has handed down a decision abrogating the war surcharge of 25% for electric service furnished by the Public Service Electric Co. to customers under a uniform retail power rate and the elevator rate, effective Sept. 1. The surcharge will continue in force for the time being as applies to the charges for wholesale power. Unless the company



Forward End of One of the Four 7000-hp. Propeller Motors of Battleship New Mexico. Diameter of Motor is 12 ft.

accepts this modification of the surcharge order, the entire surcharge will be set aside pending further decision of the Board.

Following investigations, the Board finds that the war surcharge, excepting in the case of wholesale power, has produced a revenue in excess of that expected when the application was granted, and due largely to the great increase in business resulting from war activities rather than to any error in computation. In the company's application for increased rates, the added revenue was estimated at $1,800,000, whereas the actual business done was far in excess. In the case of wholesale power, the Commission finds that the rates are somewhat proportionately lower than for other classes of service, and less than the charges existing in other eastern metropolitan areas for the same classes of consumers.

The abrogating of the surcharge will affect about 10,000 consumers, or approximately 95% of the power-using patrons of the company, the other 5% comprising the wholesale consumers of the company. In connection with its decision in this case, the Board says:

"It is apparent that had the surcharge not been allowed, the company would have sustained a deficit of from $800,000 to $900,000, even taking into account the unanticipated increase in the business. The result to the company for the year 1918, over and above the amount needed to maintain its usual dividend rate and to lay aside for depreciation an amount deemed necessary, was a net gain of $594,000.

"It is generally recognized that the extent to which the industries, particularly those engaged in war work, will continue at the speed of operation under which they were maintained during the last year is problematical. How far this will affect the use of power is doubtful. It thus becomes a matter for the Board to determine a sound public policy rather than a determination of the accuracy of financial estimates in making modifications of existing rates. The prices for labor and supplies are still uncertain and will probably remain so for some time to come.

"In a period of readjustment, public policy requires that the greatest care be exercised: First, that the utility be not made the victim of too optimistic a forecast and its revenues so curtailed that, in the event of unforeseen conditions, it shall be so crippled as to preclude the performance of its proper functions; second, on the other hand, in a period of readjustment, the public should be protected against prohibitive war rates, particularly where it is disclosed that, from the results of operation thereunder, an excess amount has been earned by the utility.

"From the Board's analysis, based upon the results of operation under the rates now in effect, and consideration of the estimates of the company, due regard being had to possible contingencies during the period of readjustment, both as to cost of labor and materials as well as to the extent to which industries in the territory served by the company will continue operations, the Board is of the opinion that a readjustment of the rates should be made at this time. The surcharge heretofore allowed cannot be removed entirely, as to do so would result in an actual deficit of several hundred thousand dollars, dependent upon the readjustments now taking place in the industries.

"The Board is of the opinion that the removal of the surcharge entirely from the bills charged to the customers under the uniform retail power rate and the rate for elevator service, and the continuance thereof on the rates of the wholesale power customers, refrigerator rate and kilowatt-hour rate will result in a sufficient net revenue to the company to assure the continuation of safe, adequate and proper service to the public, and to enable it to properly market its securities and thereby finance the necessary extensions required by the growth of the business."

ANOTHER STRETCH OF ST. PAUL ELECTRIFICATION COMPLETED.

Harlowton-Seattle Line, Electrification, 885 Miles Long, to Be Completed Jan. 1.

President Calkins of the Chicago, Milwaukee & St. Paul Railroad recently announced that electric current would be turned on over another 110 miles of main line from Othello to Cle Elum, Wash., including a crossing of the Columbia river, in a very short time. By Jan. 1 the remaining 135-mile stretch of the road from Harlowton, Mont., to Seattle, will be completely electrified, 885 miles in all, or within 200 miles of half the entire length of the St. Paul-Seattle line.

The last stretch from Cle Elum to Seattle, 130 miles, will cost about $9,000,000, or 25% to 40% more, relatively, than preceding units, on account of higher prices of labor and material.

Editorial Comment

Stimulating Production by Up-to-Date Industrial Lighting

RAPIDLY shortening days again arouse general interest in lighting. This is the psychological time to put lighting campaigns into effect because now is commonly considered to be the most opportune time to rehabilitate lighting systems in offices, stores, factories and homes in readiness for long hours of usefulness during the autumn and winter. Lighting interests must decide on what lines of activity to give special emphasis without neglecting any. While this question will be decided differently in different localities, we believe that the nation as a whole will be most benefited by special attention to factory lighting in all industrial communities.

In an article in this issue is pointed out the peculiar timeliness of taking advantage of the stimulating effect on production resulting from improved industrial lighting. Of the various measures for combating the high cost of living, the most widely accepted and probably the most effective is increase of production. Much needed as it is, it has been retarded by the many economic and social uncertainties since signing of the armistice, but prospects of ratification of the peace treaties and truce in the relations of labor and capital, together with recognition of the unlikelihood that prices will fall very rapidly, should remove the principal uncertainties and permit replenishing of the world's supply of all useful commodities. Lighting is only one means of increasing production, but a potent one, as shown in the article. It is an essential factor in all production and when applied with intelligence has a marked stimulating effect upon production.

Aside from the stimulating effect of an up-to-date lighting system, there are special reasons why improvement in industrial lighting should be strongly advocated now. There are very many old plants that have reached the limit of their capacity as now arranged because large sections of the floor space cannot be effectively used due to the meagerness of their lighting. Provision of suitable lighting makes these areas useful and saves additional construction.

Moreover, an up-to-date lighting system makes it possible to operate with two or even three shifts per day, thus increasing the output two or three times at practically no investment expense. This possibility is especially valuable where real estate values, and therefore rents, are high and where there is a heavy investment in plant machinery and equipment. We believe there will be an undoubted tendency to utilize plant investment more intensively when manufacturers come to realize that multiple-shift operation is entirely practical with a good lighting system, and that it decreases the fixed charges per unit of output and offsets the higher wages and shorter hours that are now the order of the day.

Association of Iron and Steel Electrical Engineers

OF THE industries employing electricity, the steel industry is the largest single industrial consumer. Year by year the kilowatt-hours consumed in the steel industry have increased as the tonnage increased and as electric power supplanted hydraulic, steam and pneumatic power in divers ways. And then the electric furnace, that has made such healthy headway in steel mill and foundry, is also responsible for its quota of energy consumption, a form of load that will increase, the more so as preheating, annealing and tempering come to be carried out electrically.

The problems of electrification in the steel industry, while being basically similar to electrification in any other industry, have many peculiarities of their own. The applications of electric power are many, giving rise to an urgent demand for standardization. Reliability is paramount, because cessation of some one detail in the production of steel may cripple the day's output and ruin large masses of metal. Low cost is fundamental, which means efficiency of application of electricity. Having many problems of its own, and in view of the fact that electricity enters in so many different ways it is but natural that electrical engineers concerned with the application of electricity in the steel industry should tend to come more and more closely together and share their experiences for mutual gain. To do this is the function of the Association of Iron and Steel Electrical Engineers.

This young and growing association will hold its thirteenth annual convention in St. Louis the latter part of September, and the tentative program of papers indicates that the convention will be a very interesting one for the electrical industry in general. In addition to the various reports on such foremost matters as standardization, safety, education and electric furnaces, a series of joint papers on "Organization of the Electrical Department in the Steel Industry" should be found instructive to many other industries where electric drive is a prime factor in production. Electric welding will come in for its quota of discussion in seven papers by representative manufacturers. "Meter Equipments in Steel Mills," "High Temperature Furnaces," "Recent Improvements in Industrial Control," and a general discussion on the design and operation of electric cranes and lifting magnets are other topics that are to come up at the meeting.

The steel industry is an industry unto itself. And yet all of us are vitally concerned in its progress in some way or another; and the more we know about it and its problems the better it is for us and for the steel industry. Meanwhile the engineers in the iron and steel industry are tackling their problems with a vim deserving of success. To what extent they are responsible for the rapid development of electrical apparatus and its evolution in the steel industry we do not know. But that much credit is theirs must surely be a conservative statement and stinted praise.

Making Utility Strikes Oboslete

WE HAVE on numerous occasions pointed out the serious inconvenience and sometimes danger to the public of the recently frequent strikes of street-railway, telephone, railroad and other public utility employes, and we have advocated that such strikes be prohibited without curtailing the rights of the employes to have their desires heard and fairly considered. At a recent hearing before a Congressional committee Mr. Charles Piez, well known as a manufacturer and for his recent connection with the United States Shipping Board, laid special emphasis on the question of doing away with railroad strikes. Mr. Piez advocated the creation of a board of arbitration by the Interstate Commerce Commission to deal with all labor disputes, and he would give the public representation on that board. With the formation of this agency to investigate and give disinterested decisions, railroad workers would be required to waive the privilege of striking and the railroad managers would have to exercise similar self-restraint in the matter of lockouts.

In a bill dealing with the railroad question that was introduced in the United States Senate this week somewhat similar provisions are included. In an editorial, the *Chicago Daily News* says: "The soundness of the basic idea—that railroad strikes and lockouts should be prevented by law, which at the same time should effectively protect railroad workers from every form of injustice by careful scrutiny and timely revision of the wage scales and other conditions of service—is not open to serious question. Much confused thinking has been done on the subject and many wild assertions have been made in defense of the strike, but the fact remains that the public's interests are paramount, provided the public takes ample precautions to prevent injustice to those who serve it faithfully."

All these are good indications of rational consideration and solution of the subject and we hope that this provision of the railroad bill will be enacted and that similar measures will be passed with respect to other public utility employes.

Electric Cooking and A Large Utility

COOKING by wire is coming apace. In many instances electric cooking is gaining although the central station concerned does not energetically encourage it. In some instances the utility interested in supplying electric light and power also supplies gas, and effort is made to encourage cooking by gas. In other instances a low rate by a competing gas company is looked upon by the utility as a powerful deterrent and one the electric utility does not feel justified in seriously competing with when it comes to developing the electric cooking load. The fact that there may be a tendency for the cooking load peak to overlap with the evening winter peak is also an influencing factor no doubt. But there are many more utilities that have realized the possibilities of electric cooking load and are going after it seriously with good results.

The frank statements as to the policy of the Detroit Edison Co. toward electric cooking, as outlined in an article by Mr. R. F. Hotton appearing elsewhere in this issue, are of exceptional interest. In brief, one judges from Mr. Hotton's article, that the Detroit Edison Co. has allowed the electric cooking load to come to it in the city, but has not gone after it. In the rural communities this type of load has been encouraged.

In the largest cities, like New York, Chicago and a few more, it is true that the cooking load occurs during the time when the daily winter peak occurs, since cooking, lighting and power exist simultaneously. However, while in the largest cities it is a fact that the heaviest meal of the day occurs at night, it is also a fact that in the smaller cities, of 200,000 population and below, the heaviest meal occurs at noon. The reason for this is, of course, that in the largest cities, there is an exodus at evening to the suburbs where the family reunion is held over the dinner table, whereas in the smaller cities, people are able to go home to midday lunch.

The possibilities of the farmer and rural communities as markets for the electric range—and all electrical appliances—are probably not yet realized. What the Detroit Edison Co. has done, and it has probably as yet merely scraped the surface, can be done elsewhere. One fact brought out in Mr. Hotton's paper is that when one electric range is installed, it is particularly desirable to obtain similar installations in close proximity. It means more efficient utilization of investment, with an equitable gain to the consumer.

The importance of voltage regulation deserves special mention. Voltage drop interferes with the performance of the electric range—of any electrical appurtenance so far as that goes—lengthening the time required to cook, tending to injure the culinary achievement and sometimes jeopardizing the flavor of the product cooked. Even more serious is the effect of poor voltage regulation upon revenue, a fact that has been realized, but not perhaps appreciated to the full.

Current Events

Pennsylvania Meeting Opens—New England Section's Convention Program—Export Record—N.E.L.A. Activities

PENNSYLVANIA ELECTRIC CONVENTION OPENS AUSPICIOUSLY.

Large Attendance and Attractive Program Marks Opening of Twelfth Annual Convention of Pennsylvania Electric Association.

With delightful weather and an initial registration of 211, the twelfth annual convention of the Pennsylvania Electric Association opened at Bedford Springs, Pa., on Wednesday evening, Sept. 3, with a brilliant reception to the president of the association, Thomas Sproule, of Philadelphia, and Mrs. Sproule. It was followed by dancing. Every indication points to the convention being the largest in the history of the association. Large numbers of members and guests were expected to come on Thursday morning when the first business session was to open. An attractive exhibition is being made by a considerable number of manufacturers, the displays being arranged in a large tent adjacent to the hotel. A fine collection of prizes has been donated by various manufacturers and jobbers for the card games, golf, swimming and other contests on the entertainment program. Telegraphic advices at the time of going to press seem to bear out a close following of the technical program that was published in our last issue, but Gov. William C. Sproul of Pennsylvania will be present on Friday instead of Thursday. A report of the meeting will be given in our next issue.

NEW ENGLAND SECTION N. E. L. A. TO CONVENE.

Outline of Important Topics to Be Discussed at Annual Convention to Be Held at New London, Conn.

The eleventh annual convention of the New England Section of the National Electric Light Association will be held at the Hotel Griswold, New London, Conn., Sept. 22, 23 and 24. Plans have been made for seven interesting and helpful sessions, and it is expected that a large number will be in attendance. The afternoon session on Monday, Sept. 22, will be in charge of and assisted by members under forty years of age. F. A. Belden, Portsmouth, N. H., will be chairman of the meeting, assisted by Leavitt L. Edgar, of Boston. On Wednesday forenoon there will be an informal meeting for the discussion of subjects of general interest to accountants. The convention program may be summarized as follows:

Monday, Morning Session.—Address of the president George B. Leland, Stamford, Conn.; report of the treasurer, Bowen Tufts, Boston; report of the secretary, Miss O. A. Bursiel, Boston; reports of standing committees as follows: Advertising and Publicity, L. D. Gibbs, Boston, chairman; Accident Prevention, H. W. Moses, Boston, chairman; and Membership, Merle R. Griffeth, Boston, chairman. A paper will be presented by Perry Barker, fuel engineer, Boston, on "The Purchase of Coal." Also a paper entitled "High-Power Switching Apparatus Used in Connection with Large Systems," by Fred L. Hunt, Greenfield, Mass.

Monday, Afternoon Session.—The presentation of the following papers will be the feature of the afternoon session: "Courtesy and Goodwill," by Leavitt L. Edgar, Boston; "What a Manager Should Find in His Monthly Report," by H. A. Gidney, Boston; "Meter and Engineering Department Systems from the Standpoint of Service," by Frank W. Randall, Portsmouth, N. H. "The Cost of Serving the Small Lighting Customer," by Bowen Tufts, Boston; a talk on thrift and saving by Major William A. Atkinson, War Loan Organization, Boston, will be given.

Tuesday, Morning Session.—Report of Commercial Section Committee, of which C. E. Greenwood, of Boston, is chairman, will be presented.

Tuesday, Afternoon Session.—The commercial session will be continued in the afternoon and the following papers given: "Co-operative Features of a Central-Station Accounting Organization," by H. M. Edwards, New York City; "The Use of the Electric Range in a Small City," by E. F. Putnam, Greenwich, Conn., and "Electric Ranges and Water Heating," by M. C. Osborn, New Britain, Conn.

Tuesday, Evening Session.—The dinner will be held at 7 o'clock and will be followed by the Public Policy Session. Addresses will be made by R. H. Ballard, president of the National Electric Light Association, Los Angeles, Cal.; and F. G. R. Gordon, Boston, on "Municipal Ownership and Socialism."

Wednesday, Morning Session.—Following the presentation of papers by Wallace S. Clark, Schenectady, N. Y., on "High Tension Cables," and Nicholas Stahl, Providence, R. I., on "The Control and Improvement of Power Factor," discussions of these subjects by operating men will be engaged in. This will be ensued by a paper entitled "Planning for Power as Applied to New England," by Prof. Charles F. Scott, Sheffield Scientific School, New Haven, Conn.

Wednesday, Afternoon Session.—Reports of the following committees will be presented: Accounting Section Committee, Frederick E. Webster, Haverhill. Mass., chairman; Electric Vehicle Committee, Day Baker, Boston, chairman, and Heating Research Committee, G. F. Parsons, Boston, chairman. This part of the program will be succeeded by the annual meeting of Class A members and the election of officers.

A number of entertainment features have been provided for the convention, one of which is the dancing party on Monday evening in charge of Lieut.-Col. H. A. Gidney. This will immediately follow the reception and will be held in the ballroom of the Hotel Griswold. Attractive sports in the way of golf and tennis at the Country Club, adjoining the hotel, are offered to convention delegates, and prize contests in golf, as well as a tennis tournament, will be held during the three days of the convention.

NEW AND EXTRAORDINARY RECORDS IN ELECTRICAL EXPORTS.

Figures for June Over Double Those of a Year Ago—Fiscal Year Nearly 48% Better Than Last.

Astounding figures on the growth of our electrical export trade are disclosed in the monthly summary of the foreign commerce of the United States for last June, just issued by the Bureau of Foreign and Domestic Commerce, Washington, D. C. Electrical shipments for that month totaled over 100% above those of the corresponding month last year, and nearly 40% over the preceding monthly record established last March. The figures for June also complete the data for the fiscal year ended June 30, for which the extraordinary sum of over $80,700,000 was reported, this being nearly 48% over the preceding fiscal year and more than 34% above the highest twelve-month—the calendar year 1918, whose total was $59,982,526. All these figures would be still higher if they included electric locomotives; the latter are separately listed in the government reports; during the fiscal year these were shipped to the value of $327,947.

In the following table are given the comparative figures for last June, for June of 1918, and for the fiscal years ended June 30, 1919, and June 30, 1918:

Articles.	June 1919.	June 1918.	Fiscal year 1919.	Fiscal year 1918.
Batteries	$ 787,748	$ 272,316	$ 4,800,668	$ 3,351,838
Carbons	173,582	117,995	1,672,106	1,525,128
Dynamos or generators	760,546	133,549	4,269,103	2,688,169
Fans	130,817	164,486	1,297,017	818,338
Heating and cooking apparatus	192,551	49,185	1,222,886	533,988
Insulated wire and cables	1,420,699	340,138	8,683,304	5,730,766
Interior wiring supplies, including fixtures	280,631	138,805	1,926,177	1,532,309
Lamps—				
Arc	173	90	14,555	13,308
Carbon-filament	5,276	3,985	166,294	144,761
Metal-filament	530,085	475,768	4,465,075	3,182,516
Magnetos, spark plugs, etc.	219,826	167,710	3,020,610	3,167,325
Meters and measuring instruments	319,336	208,294	2,618,405	1,592,195
Motors	1,562,521	521,442	10,677,354	6,598,664
Rheostats and controllers	65,384	24,170	434,413	212,059
Switches and accessories	593,975	188,408	2,663,327	2,229,023
Telegraph apparatus, including wireless	92,220	11,659	765,011	294,297
Telephones	377,395	274,809	3,135,851	2,566,929
Transformers	438,483	464,195	4,423,007	2,343,968
All other	3,039,569	1,462,515	24,457,147	16,021,380
Total	$10,990,717	$5,019,519	$80,712,310	$54,546,961

In the following table are given the monthly totals of electrical shipments from the United States during the 12 months of the fiscal year ended June 30, 1919. This table shows that November, January, February, March and June in turn broke all preceding monthly records. These monthly figures also show that the extraordinary total for the fiscal year is due chiefly to the decided impetus to the foreign electrical trade since the signing of the armistice on Nov. 11, 1918.

Month.	Electrical exports.	Month.	Electrical exports.
July, 1918	$5,393,949	January, 1919	$6,722,524
August, 1918	5,340,110	February, 1919	7,566,089
September, 1918	5,146,077	March, 1919	7,876,353
October, 1918	4,860,392	April, 1919	7,709,138
November, 1918	6,177,252	May, 1919	7,717,518
December, 1918	5,187,931	June, 1919	10,990,717

The following table gives the totals for the last seven fiscal years.

Fiscal year.	Electrical exports.	Fiscal year.	Electrical exports.
1912-13	$26,772,816	1916-17	$51,903,823
1913-14	25,060,844	1917-18	54,546,961
1914-15	19,771,757	1918-19	80,712,310
1915-16	30,254,020		

This last table shows the effect of the world-wide depression just before breaking out of the World War, followed by the worse depression during its first year up to about the beginning of 1916 when both neutrals and belligerents began turning to the United States for their electrical supplies, since which time there has been steady growth of our foreign electrical shipment, especially since active fighting ceased last November.

CONCLUDING SESSIONS OF MICHIGAN SECTION N. E. L. A. TACKLE COMMERCIAL PROBLEMS.

Commercial Papers and Election of Officers Concludes Successful Meet.

The concluding session of the convention of the Michigan Section of the N. E. L. A., held Thursday morning, Aug. 28, was devoted to matters pertaining to electrical merchandising, electric ranges and cooking and fire insurance.

Three papers were presented, namely, "Electrical Merchandising" by A. H. Touscany, Detroit Edison Co.; "Electrical Ranges" by R. F. Hotton, Detroit Edison Co., and "Notes on Fire Insurance," by J. H. Lobben. In the absence of Mr. Lobben, his paper was read by S. L. Ferguson.

On the first two papers presented there was a general discussion, the main points being brought out on the paper dealing with electric ranges.

Mr. Johnson of the Consumers Power Co. opened this discussion in which he recommended making tests for the diversity factor; in this way an idea of the relation between the lighting load and that of the ranges can be readily obtained.

Mr. Cavanaugh of Benton Harbor spoke briefly as to his experience with electric ranges, covering 10 years experience. He pointed out that there was a big diversity factor in the electric range load so that the connected load could be far in excess of the transformer capacity serving electric range customers.

Following the open meeting of the morning, there was an executive session at which the following officers and Executive Committee were elected. The meeting then adjourned until the annual meeting next year.

W. M. Lewis, Muskegon, president.

Geo. E. Lewis, Ann Arbor, first vice-president.

John Swanson, Jackson, second vice-president.

Herbert Silvester, Ann Arbor, secretary-treasurer.

Executive Committee: Thos. Chandler, Sault Ste Marie; H. A. Fee, Adrian; John A. Cavanaugh, Benton Harbor; R. E. Keller, Kalamazoo; Earle L. Milliken, Houghton.

TWO NEW N. E. L. A. COMMITTEE CHAIRMEN ANNOUNCED.

J. F. Gilchrist and F. T. Griffith to Head Water-Power Development and Public Information Committees.

President R. H. Ballard, of the National Electric Light Association, announces the acceptance of John F. Gilchrist, vice-president of the Commonwealth Edison Co., of Chicago, Ill., as chairman of the Committee on Public Information, and also of Franklin T. Griffith, president of the Portland Railway, Light & Power Co., of Portland, Ore., as chairman of the Committee on Water Power Development. These important committees will have valuable and instructive reports to submit to the National convention of 1920, which will be held in Southern California.

The Committee on Public Information is a new committee and Mr. Gilchrist will organize it by establishing in each state or geographical section a local committee which will finance itself and furnish news bulletins to the press through member companies. Recommendations for appointment as members of the general committee, of men selected as chairmen of committees in various states, will be made by Mr. Gilchrist and will be submitted for approval to the president and to be acted upon by the Executive Committee.

This will be a very large committee but as its work will be largely devoted to states and geographical sections, it is unlikely that its entire membership will ever be called to meet. Thus its proportions will not be objectionable. Mr. Gilchrist was instrumental in starting a movement along these lines in Illinois which proved very successful. It is believed that to extend it to every state in which company members may desire assistance, will accelerate its effectiveness.

The work of the Committee on Water Power Development, which will be under the direction of Mr. Griffith and with which he will associate with himself prominent executives from all of the Pacific Coast companies and also some of the executives from eastern companies, has before it an enormous scope for its activities. The purpose of its organization is to investigate and encourage water-power development and it is the first general committee of the association to take up this most important feature of the electrical industry.

Both the Department of the Interior and the War Industry Board and other bodies have collected an enormous amount of data in relation to the problems of water-power development. Mr. Griffith's committee will not only collect and codify the information gathered by these bodies, putting it into workable shape for the use of geographical and central states, but will pursue when there seems to be necessity a line of original investigation. The necessity for conservation of the natural resources of the Nation, the impending shortage of both coal and fuel and the probability of large increases in the demand for electric energy by partial railroad electrification, make the work of this committee of paramount importance and its report will be of the greatest assistance in the large financing which extensive water development will involve.

EXECUTIVE COMMITTEE OF COMMERCIAL SECTION, N. E. L. A., HOLDS MEETING.

Plans for Work During Ensuing Year Presented and Approved at Recent Meeting.

The Executive Committee of the Commercial Section, National Electric Light Association, held a meeting recently at Association Island, N. Y. At this meeting the plans for the section work during the coming year were presented and discussed. John G. Learned, chairman of the section, presided at the meeting. The following officers and members were also in attendance: M. S. Seelman, Vice-Chairman; R. H. Tillman, Secretary; M. O. Dellplain, E. A. Edkins, F. H. Gale, L. D. Gibbs, R. S. Hale, O. R. Hogue, S. M. Kennedy, F. A. Ketcham, R. H. Knowlton, L. H. Lamont, C. L. Law, I. Lundgaard, F. D. Pembleton, A. A. Pope, Charles J. Russell and A. Jackson Marshall, Executive Representative; and by invitation Fred R. Jenkins, Walter Neumuller, C. K. Nichols and J. M. Wakeman.

At the first session Chairman Learned submitted a list of bureaus and committees, together with respective chairmen selected, as follows:

Bureaus.—Advertising and Publicity Service Bureau: L. D. Gibbs, Boston, chairman; Lighting Sales Bureau, Clarence L. Law, New York, chairman; Merchandise Sales Bureau, E. A. Edkins, Chicago, chairman; Power Sales Bureau, R. H. Knowlton, Philadelphia, chairman.

Committees.—Commercial Service and Relations with Customers Committee, R. F. Bonsall, Baltimore, chairman; Committee on Education, Fred R. Jenkins, Chicago, chairman; Committee on Relations with Contractors, Dealers and Jobbers, M. S. Seelman, Brooklyn, chairman; Committee on Compensation of Salesmen, Adolph Hertz, New York, chairman; Electrical Salesman's Handbook Committee, I. Lundgaard, Rochester, chairman; Finance Committee, M. S. Seelman, Brooklyn, chairman; Committee on the Sale of Company Securities to Customers and Resident Citizens, A. F. Hockenbeamer, San Francisco, chairman; Wiring Committee, R. S. Hale, Boston, chairman.

The appointment of A. Jackson Marshall as Executive Representative of the Commercial Section was confirmed.

In reporting for the Lighting Sales Bureau, Chairman Law presented a chart showing the organization of the bureau under which it is proposed to operate during the present year. The Executive Committee of the Lighting Sales Bureau will consist of representatives of the various geographic sections and company sections, appointed by the chairmen of these various sections; representative of the National Council of Lighting Fixture Manufacturers, a representative of National Association of Electrical Contractors and Dealers and the chairmen of the various divisions of the bureau. The chart also showed the channels through which the information collected by the various divisions of the bureau will be distributed. Through this organization it is proposed to keep closely in touch with all commercial subjects having reference to work of lighting sales.

The activities of the Lighting Sales Bureau will be substantially the same as in the past, with the addition, however, of activities necessary in co-operating with the various geographic sections, the company sections, and associations which will be affiliated with the bureau because of their relation to the general subject of lighting and its commercial aspects. Relative to the activities of the Lighting Sales Bureau at the 1920 convention, Mr. Law proposed to have a presentation of reports accompanied by demonstrations in all cases where possible. This is considered a good plan in view of the fact that it not only promotes interest in the report, but gives an opportunity to demonstrate practically the recommendations made by the committee.

In the discussion that followed it was the consensus of opinion that the organization plan evolved by Mr. Law would effectively connect the Commercial Section with the geographic sections, state organizations and company sections.

Consideration was then given to the matter of meetings of bureaus and committees and the Executive Committee of the Section during the administrative year.

Chairman R. H. Knowlton of the Power Sales Bureau made preliminary recommendations regarding divisional organization as follows: General power, industrial electric heating, electro chemical, isolated plant, electric steel furnace, current rate practices, special addresses for convention, and geographic sections. The recommendations were approved.

Chairman Edkins of the Merchandise Sales Bureau reported that this bureau was to be organized along two lines, dealing with "Research" and "Service," indicating that in his judgment the most important work which the bureau could undertake would be a thorough investigation as to the best methods of organizing merchandising activities, including how to improve present methods and how to secure more business. A tentative divisional organization outline of the Merchandise Sales Bureau was presented as follows: Household electric ranges, electrically equipped furniture, electric shop merchandise, merchandising service to central stations, merchandising statistics and economics and standardization and national testing. Some or all of these divisions will be further subdivided into groups.

Mr. Edkins also spoke of the desirability of representation of this bureau on the Advertising and Publicity Service Bureau, the Lighting Sales Bureau and the Power Sales Bureau, and any committees whose work may in any way be related to the development and sale of electric shop merchandise.

Chairman L. D. Gibbs of the Advertising and Publicity Service Bureau suggested that the bureau's work this year should be considerably broadened to the end that advertising and publicity service could be rendered the electrical industry, and that it should be the function of the bureau to impart information pertaining to Commercial Section activities to all branches of the industry and obtain the co-operation of all concerned. Chairman Gibbs recommended that the bureau be organized with two divisions and four groups: First, a Publications Division which would have charge of all booklets, circulars, etc., and a General Advertising Division with four groups: (a) co-ordinate advertising and sales campaign work; (b) illuminating engineering, co-operating with the Illuminating Engineering Society, Lighting Sales Bureau and other related activities; (c) co-operation with manufacturers of nationally advertised commodities; (d) more service outlets. There will be included in the personnel of this bureau at least one member from each state and liberal cross-membership with bureaus and committees of the Commercial Section.

Chairman R. S. Hale of the Wiring Committee recommended that the committee be permitted to prepare a lecture treating with wiring methods for the benefit of the contractors, etc., and advised that a sub-committee had been appointed to prepare a table of contents on the subjects which such lecture should cover. He also advised that it seemed desirable to prepare a lecture on wiring methods for the benefit of the householder, and that a subcommittee had been appointed to suggest a synopsis for this. Mr. Hale reported as to tests which the committee is conducting in the matter of wiring, which it is calculated will continue for a number of years with a view to ascertaining the behavior of different kinds of wire when employed under different conditions in actual practice.

Chairman I. Lundgaard of the Electrical Salesman's Handbook Committee reported that the supply of handbooks was entirely exhausted, and it would therefore be necessary to consider the publication of a new edition. A very extended discussion ensued regarding the form (loose leaf or bound volume) which the handbook should assume. The consensus of opinion favored the development of small bound volumes covering grouped subjects.

Chairman Fred R. Jenkins of the Committee on Education of Salesmen advised that he would attempt to organize this committee further along the general lines employed by the Lighting Sales Bureau. He emphasized the importance of educational courses, particularly at this time when central-station companies are rehabilitating their forces, depleted on account of the war, and asked the earnest co-operation of central-station commercial managers in this work, which would be emphasized this fall by an advertising campaign calculated to cause increased enrollment. In connection with the report consideration was given to the idea advanced by Chairman Jenkins that the committee be authorized to make available educational courses to other than N. E. L. A. members, and after discussion, Chairman Learned was requested to take this up with the National Executive Committee.

Chairman M. S. Seelman of the Committee on Relations with Contractors, Dealers and Jobbers advised that as this committee had been decided upon but recently, there had not been sufficient time to suggest personnel and to define its scope of activities. Mr. Seelman pointed out the desirability of close co-operation with other branches of the electrical industry, and suggested that the personnel of the committee might be formed of representatives of the jobbers association, contractor-dealers association, manufacturers association and representatives of the N. E. L. A.

S. M. Kennedy urged that the Committee on the Sales of Company Securities to Customers and Resident Citizens be continued, pointing out the growing tendency, at least in certain sections of the country, to sell central-station securities to the public, and stated that if such practice were continued the commercial men of central-station organizations were by temperament, experience and ability best qualified to merchandise them. A. H. Hockenbeamer, Pacific Gas & Electric Co., who has had considerable experience in the sale of securities to the public was appointed chairman of this committee.

L. A. McArthur, general manager of the Pacific Light & Power Co., Portland, Ore., was elected to fill the vacancy on the Executive Committee caused by the resignation of W. H. Hodge.

TRACTION LINES FORCED TO SHUT DOWN BECAUSE OF COST.

Two Lines in New York City Fail to Meet Operating Expenses for Years and Will Cease Operations.

The Public Service Commission for the First District, New York, has been informed that the Long Island Electric Railway Co., which operates as a trolley road from Jamaica to Far Rockaway, is ready to ask the courts, through a receivership, to discontinue operation, wind up its affairs and sell its rails and other property to the highest bidder. The company is owned jointly by the Interborough Rapid Transit Co. and by the Long Island Railroad Co., which have advanced numerous sums in recent years to provide its running expenses. The company has not paid interest on its bonds for many years and never has paid dividends on its stock. The parent company refused longer to advance moneys for maintenance and operation, and officials of the road declare they must shut down.

Commercial Practice

Merchandising Electrical Appliances—Economic Side of Central-Station Advertising—Continuous Service Ruling

OPPORTUNITIES AND DEVELOPMENTS IN ELECTRICAL MERCHANDISING.

Many Suggestions Contained in Paper Presented Before Sales Managers by Earnest A. Edkins.

At the recent meeting of central-station sales managers, a very interesting paper entitled "Merchandising Electrical Appliances" was presented by Earnest A. Edkins, general manager of the Electric Shops of the Commonwealth Edison Co., Chicago. In this paper Mr. Edkins gave many valuable suggestions on merchandising and building up sales which are of special interest to central-station men but are equally applicable and effective for any electrical retailing establishment and pointed out some of the present and impending opportunities and developments in the electrical merchandising field.

The basic principles and general methods of merchandising which have been pretty well thrashed out and standardized in other lines of retailing are just as applicable to the sale of electrical appliances. As these principles and methods have proven very successful in these other lines and also because the general public is accustomed to them they should be carefully studied by electrical merchants and applied to their business if the best results are to be obtained.

One of the most essential obligations laid upon the public service company is to render the very best possible service and this applies to merchandising by these firms as well as their other service. Real service, however, means giving the customer what he wants and in electrical merchandising it includes the selling of all goods associated with electricity. For example, a flashlight does not add any load to the central-station company's lines, but it should nevertheless be handled by the central-station retail shop as a mark of service. For to the average customer it is electrical and if he can not secure it at the electric shop he will go elsewhere for it and when in need of other electrical goods will go to the second place also. Under the heading of kindred merchandise comes such accessories as trays, creamers, sugar bowls, vacuum bottles, chafing dish sets, silk for lamp shades, parchment, automobile accessories, small electrical devices, etc. Such stock also averages up very profitably and is a big factor in increasing attendance, while without it the appeal of the electric shop is sharply limited.

Three plans for stimulating merchandise sales were also described in the paper—premiums, coupons and deferred payments. All these plans have proved satisfactory in many other lines and are employed with great success by Mr. Edkins in the Electric Shops.

The premium plan is looked upon in some quarters with considerable disfavor. However, it is based upon human nature and appeals to a universal weakness—the desire to get something for nothing, and as long as human nature remains what it is it will be an effective means of increasing sales.

The coupon plan has been tested by Mr. Edkins in the Electric Shops for three years and he has found that it increases attendance, multiplies good will and builds up all classes of sales. The coupons used by the electric shops are purchased from the Federal Profit Sharing Co. and are given to customers, one for each five-cent purchase. They are redeemable at the rate of 1000 coupons for each dollar of retail price for all sorts of electrical merchandise. The Electric Shops are reimbursed by the coupon company for the value of the merchandise so redeemed. These coupons are also sold by the Electric Shops to other merchants for distribution among their trade. During the first six months of this year 73,753,750 such coupons have been put out in the city of Chicago. Each of these coupons is an advertisement for the Electric Shops and every customer who becomes a collector also becomes a booster.

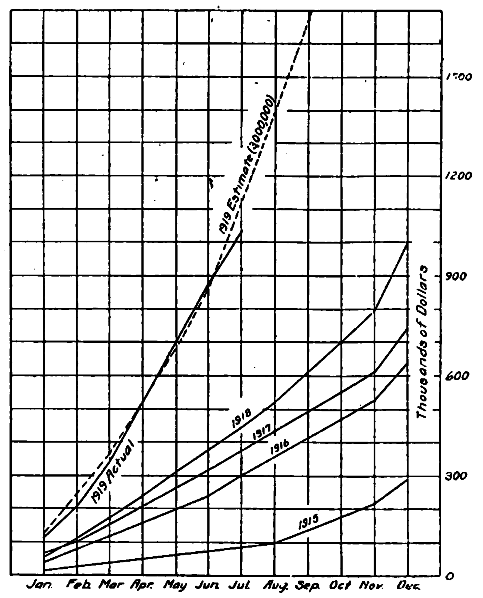


Chart Showing Increases in Merchandise Sales of Electric Shops of Commonwealth Edison Co., Chicago.

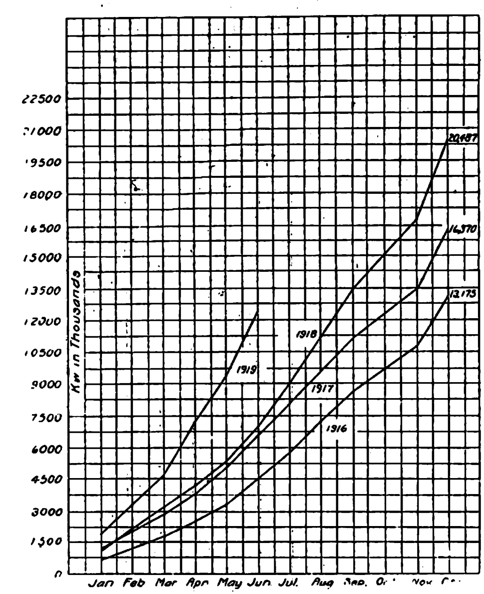
The tremendous value of the deferred-payment plan as a business builder is now recognized by the majority of central stations selling electrical merchandise. This plan is only another form of service and whether or not it is appreciated is perhaps best shown by the following figures. The success of this plan in other lines is shown by the following data compiled by the Chicago Association of Commerce covering a few of the articles sold in this city during 1918:

	Percentage of total sales sold on deferred payments.
Pianos	75%
Talking machines	90%
Refrigerators (over $50 each)	75%
Electric washers	80%

The following figures show the percentage in the Electric Shops on sales under different terms during the past five years during which the gross annual sales (not including lamps) have increased from $250,000, to approximately $3,000,000:

	Deferred payment.	Charge.	Cash.
1915	35%	40%	25%
1916	34%	30%	36%
1917	37%	27%	36%
1918 } 1919 }	47%	19%	34%

The specific opportunities for sales promotion offered by electric ironing machines, sewing machines, washers, suction sweepers, portable lamps and silk shades, seasonal sales, syndicating the sale of portable lamps and electric household conveniences were also fully described. Each of these appliances or methods offers a great field for activity which is especially favorable at the present time. The field for electric ironing machines, for example, has barely been touched yet it has been cultivated for many years by



Total Load Represented by Electrical Merchandise Sold by Electric Shops.

the sale of electric washing machines. The electric sewing machine is also especially desirable now for use in the small apartments in large cities.

The value of electrical appliances as load builders is now generally recognized. During the past few years when many central stations practically abandoned all efforts to secure new business that involved plant investment or line extensions this feature was especially desirable. The extent of the load thus secured by the Commonwealth Edison Co. through the appliance sales in its Electric Shops is shown by an accompanying chart.

It should also be remembered that the sale of appliances, backed up by painstaking service, constitutes one of the most valuable and effective means of creating good will toward the central station. So much comfort, convenience and labor-saving efficiency cannot be carried into the homes of its customers without inevitably causing them to feel kindly towards it in return.

The paper also called attention to the growing interest in and appreciation of the importance of style merchandise in electric shops. There is considerable room for improvement in the design of portable lamps, shades, electric appliances for table use, etc., but the manufacturers are now developing devices along this line and these developments should be watched with interest and be given practical support and encouragement.

Regarding the sales opportunities of electric ranges the paper included a number of figures showing the tremendous possibilities of this apparatus. In 100 towns now actively engaged in promoting ranges it was shown that only 0.22% of the population or 1% of the homes are now using electric ranges.

Another device that is just now beginning to appear on the market but offers a great opportunity for the electrical merchant is the electrically operated talking machine. The recent development of expensive cabinet types and period designs has made the projecting crank a very undesirable feature and the manufacturers are now squarely up against the necessity of producing electrically operated machines. When it is considered that about 4,500,000 of these machines are now produced every year the possibilities of this development for the electrical trade may readily be appreciated.

THE ECONOMICS OF CENTRAL-STATION ADVERTISING.

Abstract of Discussion Supplementing Paper by L. D. Gibbs at Recent Sales Managers' Convention.

By R. S. HALE,

Superintendent, Special Research Department, The Edison Electric Illuminating Co., Boston.

One great difficulty in analyzing advertising is that many things which are really advertising are not charged to advertising accounts, and also that the advertising department often does work and performs services which would have to be done anyway. There is no distinct line between the advertising account and many of the other accounts on the books.

In advertising, however, we may make a general division into:

1. Advertising that is a service for carrying on the business.
2. Advertising that is a promotion for increasing the business.

Though no sharp line can be drawn, yet, in the first class can be clearly placed such things as railway time-tables, or the sign over the door that directs people where to enter. The difference is that some advertising, like the railway time-table, really reduces the cost to the purchaser, while other advertising, such as advertising in the magazines, helps reduce the cost only if it increases the seller's output enough to enable him finally to reduce his price. This distinction becomes clearer if it is remembered that the purchaser of goods includes in his real costs not only the money he pays the seller, but his other expenses in making the purchase, such as freight and delivery charges, and also his own time, or the time of his purchasing agent in making the purchase. Anything, like a catalog, that saves the time of the purchasing agent really reduces the total cost to the purchaser, and, therefore, warrants the purchaser in paying a higher price to the seller, a price usually enough higher to pay for publishing the catalog. The catalog is then service rather than promotion. But, on the other hand, a beautiful large catalog sent out broadcast would be promotion advertising rather than service advertising.

This distinction between service advertising and promotion advertising is an important one. There is also another line of distinction which is a little different, and also very important. It depends on looking at the problem not only from a different angle, but from an entirely different viewpoint, and then this viewpoint brings out the reasons why advertising sometimes pays and sometimes does not pay.

The problem of advertising, as in all other problems, starts with some definite set of conditions, which may be described as the budget or plan for the next year and future years. Such a budget always exists in the mind of the executive, even if it is not put on paper.

When he considers the advertising problem, he considers what will be the effect if he spends, say, $10,000, for advertising in the daily newspapers. He figures that this will mean so many more kilowatt-hours sold, so much more coal, so much more labor, so much more expenditure for new service or plant, so much more interest or dividends on the new money, so much more income, and he finally decides what he had better do, as between the present budget based on no change in his orders, or the new budget based on a $10,000 expenditure.

He will also consider whether the particular advertising will stimulate existing customers or not, attract new ones, and so on. If on a central station each customer doubles the use, it is one thing. If on the other hand, the central station doubles the number of its customers, putting in no new lines, but only new services, it is another thing, while if a central station doubles by going into virgin territory, the case is still different.

It is true that ordinarily the increases in the business of a central station in different years are usually of much the same nature, and they usually involve a much greater increase in income than the increase in expenses. This is because a large portion of the increase in business comes on lines already built, and therefore, does not necessitate an extension. But this is not always true. An increase in business may involve a long line to reach a distant customer, or may just overload a turbine station and involve building a new station which will not be loaded for several years.

In the ordinary case the executive estimates that any increase in business will bring an increase in net profits, hence, he is willing to spend money in promotion advertising to get that business quicker. Even if he knows that the business will come anyway, say in five years, he may figure that spending one year's profits to get it all on his books in anything less than four years may show a profit.

On the other hand, in the case that is not ordinary, the reverse may happen. When it is a question of a long expensive line and a small increase in income, the net profits will probably be greater if the long line is postponed instead of hastened. In such cases advertising to increase the business would do harm. During the war, budgets without promotion advertising showed better results than the budgets that included promotion advertising, since the latter at that time involved a much greater investment than the expected increase in income.

The result of this analysis clearly points to the importance of directed advertising, that is, to the importance of advertising strenuously in some cases, and not advertising or promoting at all in other cases. As the matter is gone into further, the importance of directed advertising comes out even more clearly.

For example, in the electric business there is the off-peak business. We can usually afford to stimulate fan business, heating business and power business, since on the whole each kilowatt-hour thus used increases expenses less than kilowatt-hours used for lighting. Even if lower rates are made for this off-peak business, they are a form of promotion advertising, and the question is, will such advertising increase the net profits enough to warrant the expenditure? Off-peak rates might even be made so low that it would pay to stimulate peak business by advertising. Conditions differ in each case, but the problem always is:

What will happen if we go along without change?

What will happen if we make some change?

Finally, which is best of all the possibilities considered?

In central-station advertising a case might be made out for directing the advertising solely at customers adjacent to existing lines. This is seductive since a new customer who requires only a service is much more profitable than if an extension is required. If, however, the extension of lines goes along a street with many prospects, the general budget should include an allowance for the advertising power of the new line and customer. In my opinion 90% of the growth of the ordinary central station is the result of the talk of its existing customers. Therefore every customer, even if he is individually unprofitable, helps to get other profitable customers.

However, the fact that the new line may be worth while because of its effect in getting still more business does not lessen the importance of considering each case, and of directing the advertising. General advertising, it must be remembered, is also directed advertising in the sense that it is directed generally, and not at some particular feature. Obtaining the good will of the public, for example, is general advertising which is directed at the whole business. Such work is one job of the advertising department, though other departments should also obtain good will. The important point is the comparison of budgets and basing the final decision on a comparison that includes all the things that effect net profits.

Any advertising man who merely tries to increase the gross business of the company by advertising is neglectful of the company's interests and his own. He must consider the net results of each possible budget, campaign or plan. The advertising man should always be able to judge, approximately at least, the probable effect of his advertising on the gross business of the company; but that is not enough for the executive. He is concerned in the effect on the net profits. It is the probable final result that guides the executive in his decision as to which of several plans will be best. The executive will decide, but if the advertising man gets a clear idea of how his proposition will be judged, he will be able to present to the executive the propositions that will be the most attractive and most likely of acceptance.

MISSOURI COMMISSION RULES REGARDING CONTINUOUS SERVICE.

An interesting decision was made by the Public Service Commission of Missouri in the matter of the application of the Vandalia Electric Light Co., Vandalia, Mo., to discontinue service between 11 p. m. and 5 a. m. each day or increase its charges. The company had recently lost a large customer through the shutting down of the plant which prevented its rendering continuous service at a profit. The people of the town however were desirous of retaining such service but were of the opinion that the company should receive a fair rate for its services. The commission therefore ruled that the company should exact a surcharge of 10% on all bills except municipal accounts but that continuous service must be maintained.

Operating Practice

Metering Hydroelectric Auxiliaries—Transmission Line Practices and Precautions — Steam Operating Problems

METERING OF AUXILIARIES AIDS ECONOMY OF HYDROELECTRIC PLANT.

Conservation of Water Power Follows Regular or Periodic Use of Instruments.

By Marcus A. Stillson.

When the war created an unprecedented demand for power and fuel, the hydroelectric plants of industrial concerns and public utilities were forced to take steps to utilize all available energy by reducing wastes and eliminating needless uses. And it is surprising what a large amount of water may be needlessly wasted through carelessness and lack of appreciation of its magnitude.

One instance where water is frequently allowed to be wasted is in driving the auxiliaries, exciters and pumps, etc. The most economical distribution of a given excitation and the auxiliary loads of any hydroelectric plant between motor drive and water-wheel drive is obtained only after output-discharge curves have been plotted and it is then known when the auxiliaries should be driven direct by water power or by motor obtaining its energy from the generators.

The auxiliaries of hydroelectric plants consume about 1% of the high-flow station output, excluding the power required for generator excitation. Notwithstanding this, it is usually possible to bring about a measurable economy of water power by a careful study of the load requirements of each individual piece of apparatus without financial expenditure. During times of extreme low flow stages the 1% mentioned above may easily become 2, 3 and even 4%, since certain of the station auxiliaries are required irrespective of the energy output of the station.

In many hydroelectric power houses no provision is made in the original installation to permit measuring the electrical input to motor-driven auxiliaries. This is a pity, because it is well to know just what are the power requirements of each motor-driven auxiliary and to what extent this demand varies from time to time with the station output. Such data enables economies to be made by modifying the mode of operating as already outlined. However, if permanent installations of watthour meters is not feasible, because of cost, it is usually quite feasible to furnish a means by which such instruments can be quickly inserted in circuit for periodic investigations. This proposal can be carried out quite inexpensively by installing small panels beside each motor-driven unit, upon which jumpers are mounted so as to permit connecting measuring instruments in circuit at any time without interrupting the flow of current to the motor. In this way the initial investment can be kept down with very little loss in flexibility.

It might be stated that the readiness with which operating engineers carry out tests to improve the water economy of their stations depends very largely upon the case with which the tests may be made.

PRACTICES AND PRECAUTIONS IN WORKING ON LIVE TRANSMISSION LINES.

Linework Experiences and Policies of Consumers Power Company.

Several different methods are used by the Consumers Power Co. to test and change the insulators on their high-tension lines, the fundamental principle of them being that there is always a long insulating rod or other appliance between the man and the live part that is to be worked upon. In testing insulators on live lines advantage is taken of the fact that a difference of potential exists between the cap and pin of a disk insulator. A healthy, static spark is obtained if the insulator is good. If the insulator is poor, a weak spark or no spark at all results. The presence or absence of static on insulators can be readily determined and with proper tools an experienced man has no difficulty in picking out defective insulators. A line foreman standing on the ground 50 to 100 ft. from the pole or tower where the work is going on can clearly distinguish between a good and bad insulator by the noise made by the static spark.

The following is a brief description of one of the methods used to change defective insulators on high tension lines. The insulators are first tested and the defective ones are noted, a record being kept of the pole or tower and the position of the insulators. A crew, generally consisting of six men and the foreman, do the work of changing the insulators. Long insulating rods are first attached to the wire and the line is secured in position and held so it can not swing into the poles or towers. By means of rope blocks handled by men on the ground, the rods force the wire upward and outward from its regular position. This relieves the strain on the insulators and also holds the wire securely. The defective insulator is then removed and replaced with a good one. With proper tools it is not necessary for any of the workers to approach or place their hands or any part of their body within dangerous proximity of any live conductor.

Special Precautions to be Observed in Case of Line Trouble.

Noise and static on telephone lines, discharging lighting arresters or an unusual amount of static on or around lines and insulators indicates trouble and it may be due to defective insulators or to an "arcing ground," on the high-tension lines. Foremen should instruct their men to work with extreme caution at such times. It is generally advisable to stop the regular work of changing insulators until the cause of the trouble has been located. This precaution should always be heeded on system with a grounded neutral.

Before any work on high tension transmission lines is undertaken for the first time, a careful analysis is always made of the job. Each operation should be considered and men should be selected and trained for the different operations they have to perform.

It is interesting to note that linemen who have tried both methods of changing insulators would rather work on live lines with insulating rods between them and the line, than on "dead" lines without this protection. The dangers incident to the accidental energizing of lines that are supposed to be "dead" are eliminated. Emergency or rush work which always adds to hazard is to an extent avoided and the work can generally be done in the day time when the light is good.

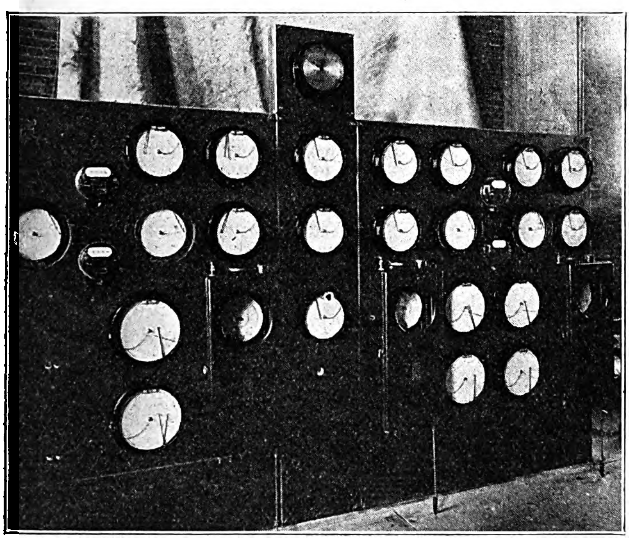
Telephone, telegraph, signal and other lines that parallel high-tension lines are always liable to be more or less energized and dangerous to handle. This fact should not be overlooked in instructions given to linemen.

The above is abstracted from a paper by H. J. Burton, before the Michigan Section of the N. E. L. A. In summing up Mr. Burton said: "The prime requisites for safe working on high-tension lines are: safe construction, a good foreman, competent workmen, equipped with proper tools and insulating appliances."

DETECTING THE PRIMING OF BOILERS.

Thermometers and Leaks in Pipes May Be Used as Tell-tales.

The priming of boilers is often most troublesome and frequently very persistent. As a matter of fact, it often happens that boilers are priming without the knowledge of the firemen or water tenders or whoever it may be that should be conversant with the situation. Evidence of priming may be entirely lacking



Board Containing Full Equipment of Instruments by Which Priming Could be Detected.

in the glass, and the attendants may make the assertion that the boilers are not priming while they actually are doing so.

The real test lies in the quality of the steam leaving a boiler, of course. That means the temperature of the steam leaving the superheater, and this fact may be utilized as a check on a boiler that is suspected of priming, by the very simple expedient of installing a recording thermometer on the steam outlet from the superheater. Priming will be indicated, obviously, by sharp fluctuations in the superheat temperature curve and thus bring to light priming that might otherwise occur and persist without knowledge. The accompanying illustration is that of boiler-room instruments installed in the power house of the Oshkosh Gas Light Co. Fixture recording thermometers are installed in a convenient location so as to indicate priming.

Superheated steam is invisible whereas wet steam is visible, and this fact may also be utilized as a tale-tell of bad priming. A small leak in the steam line between superheater and the main steam header or line does not make itself visible so long as superheated steam escapes, but dirctly the boiler primes and wet steam passes through the leak, the leak becomes visible and indicates that priming of the boilers is occurring.

SEALING OF TURBO LABYRINTHS IN 9400-KW. STATION.

By Mark Meredith.

In a steam plant there were one 4000-kw., two 2000-kw. and 750-kw. turbines, two of which have water-sealed pressure, and a comparison of these two methods of sealing, from an operating point of view, can therefore be readily made. The load curve for a 24-hour run of the small central station is a very erratic one, as there are continual small variations occurring in the load and also high peaks. This entails constant vigilance on the part of the turbine attendant, as the exhaust pressure on a turbine varies with each variation of the load, and the steam pressure on the high and low-pressure glands has to be adjusted accordingly. Any neglect or oversight on the part of the attendant in this matter, if the load drops considerably, results in a decrease in vacuum and a corresponding increase in steam consumption for the turbine. As this will probably occur a considerable number of times during a 24-hour run, it will be realized that it has a tendency to cause the steam consumption to be excessive.

The load connected to this station includes a 600-kw. electric furnace, which causes widely-varying and continual fluctuations in the load, and this aggravates the troubles, especially when it is run from one of the 2000-kw. turbines which has steam-sealed glands. The steam for sealing the glands on the 2000-kw. turbines has to be adjusted very closely as an even slight excessive amount of steam causes overheating of the thrusts bearings.

For the two turbogenerators having water-sealed glands the arrangement is as follows: A water storage tank is fixed to the engine room wall at a height considerably above the turbine level, and this is supplied from the city water supply. A ball valve is inserted in the tank to regulate the water level, and the water falls by gravity through pipes to the turbine glands. The water pressure on the glands is therefore a few pounds above atmospheric pressure, say 20 to 25 lb. per sq. in., hence it will be obvious that when a turbine is started up and water is put on the glands, no further adjustment is necessary, as the glands are continually sealed, irrespective of the variations in load and vacuum. This eliminates the reliance placed on the turbine attendant when steam pressure is used, and tends to reduce the steam consumption of the turbine, as the vacuum is maintained during the whole time the turbines are on load, unless condenser troubles occur.

Contractor-Dealer

Getting After the Outlet Business—Value of National Publicity — Successful Advertising — One Jobber's Policies

FOLLOW-UP APPLIANCE SALES FOR OUTLET BUSINESS.

Proper Service Requires Dealer to Assist Customer in Using Appliances.

A great deal has been said recently about laxity of the electrical contractor who when he wires a home makes no attempt to sell the customer electrical appliances at the same time or to follow up the opportunity thus presented and sell the prospect at some future date. But how about the dealer who sells an electrical device without attempting to find out how the customer is going to use it. Isn't he also passing up a great opportunity? He surely is, and not only that, but he cannot consider that his service is even good unless he makes it convenient for his customer to use the device as well as to purchase it.

No reputable dealer would think of selling a customer a bell-ringing transformer to use in a building where the service was direct current. Yet they will sell a customer a washing machine or a vacuum cleaner and give the customer an extra extension cord without even suggesting the convenience of a suitable outlet.

The advantage of following up such sales is shown in a recent article in the *Monthly Sales Service* of the Society for Electrical Development. According to this article, one small contractor-dealer makes it a practice when he has sold a fan or other electric appliance to try to deliver it himself. Very often he calls with the fan on his way home in the evening. He goes into the home, supposedly simply to connect the fan and see that it runs properly, but the real reason is to see what wiring work he can find to be done.

In a great many cases he finds that it is necessary to unscrew a lamp in order to connect a fan. Sometimes there is but one light in the room, as in a bedroom. This gives him an excellent chance to suggest the installation of convenient outlets. By guiding the conversation along the right lines he has in several cases made other suggestions which have resulted in improving the customer's wiring—and in business for himself.

This plan can easily be modified so that a salesman delivers the appliance and makes the suggestions. It is a peculiar fact that many people, once having made a purchase, are in a very receptive mood for other sales suggestions.

HOW CONTRACTOR-DEALERS CAN TIE-IN WITH NATIONAL ADVERTISING.

National Lamp Works Offers Opportunity for Dealers to Cash In on "The Great Discovery."

Many manufacturers of electrical devices and appliances are now conducting national advertising campaigns which both in total amount and attractiveness surpass the advertising of practically every other industry. This advertising is securing a great deal of valuable publicity and creating a desire for these appliances from the public. However in order to get the proper results the electrical contractor-dealer must grasp the opportunity thus presented by tying-in with this advertising and letting the public know where they can get the merchandise advertised.

In order to assist its dealers to tie-in with the intensive national advertising campaign which it will conduct from now until the end of this year, the National Lamp Works of the General Electric Co., Cleveland, is distributing a pamphlet describing its advertising plans and the methods by which the local dealer can co-operate and reap the benefits.

The story of the campaign is hinged upon the phrase "The Great Discovery." In every branch of lighting, people need to make the discovery that lighting is of real importance to their comfort and convenience. The factory man, the merchant, and the home maker, all will come to realize it through the medium of the advertisements. It remains for the dealer to come out in front of this advertising, let the people know where they can get good lighting and who can help them secure it. This can only be done by accepting and using the helps offered the dealer by the company.

The first advertisement of the campaign appeared in the Aug. 30 issue of the *Saturday Evening Post.* To accompany this the company sent out to each one of its agents an attractive window trim similar to the advertisement for display at that time. The other advertisements of the series will appear shortly in prominent publications.

In addition to these tie-up trims the company offers the lamp agent 13 other ways to cash in directly on the national advertising. Among these other ways are plan books covering store lighting, window lighting, industrial lighting, refixturing and relamping electric signs, sales plans, and also a salesmen's contest plan book. There are also seasonable trims. litho cut-out displays, counter displays, an ad book to assist the dealer in preparing newspaper copy, monthly advertisements for newspapers, the regular tie-up theater slides and a special monthly slide.

THE ESSENTIAL FEATURES OF SUCCESSFUL ADVERTISING.

Quality Goods and Good Service Must Back Up the Dealer's Advertising.

By Chester A. Gauss.

A great many people consider advertising a mysterious force which can sell goods and services of all kinds regardless of the value given in return. Nothing is further from the truth. Advertising is something that is intimately associated with the commodity or services on sale. It cannot be applied successfully to a proposition unless it is founded on principles and qualities dug out from the goods or services themselves.

Advertising can make the first sale of a commodity or services but after that the commodity or services must largely help to sell themselves. Advertising will bring a customer into your store but it will not give him courteous and pleasing service. It will not take an interest in seeing that he secures what is best fitted for his purposes nor that he is satisfied with his purchase. Advertising cannot make goods operate satisfactorily. It cannot say "thank you." All this the electrical contractor-dealer must do himself.

Successful advertising is that which is founded on two things—quality goods and good service. No amount of advertising can counteract the adverse advertising created through the selling of unreliable goods in a poor way.

Advertising in the broader sense of the word does not merely mean the use of printer's ink. It means getting one's goods and services impressed as reliable and inviting upon the minds of a community. Printed advertising will aid in doing this. It is cheaper than making a call on every inhabitant of a city and having a heart to heart talk with him about one's goods and services and consumes less time. It is quicker than waiting for people to become acquainted with the quality of the goods and services through satisfied customers. It is, hence, advisable to use printer's ink but, where used, it should be devoted to telling and convincing people that dealers' goods are of the best quality and that the dealer aims to give the most courteous and satisfactory service in town.

But such advertising must have all its statements backed up. The goods must be of the best value. The store show-windows must be attractively dressed, the exterior of the store pleasingly painted and the interior made attractive and inviting. In addition to this courteous and satisfactory service must be given all who enter.

Printed advertising cannot build up business unless it is backed by goods, store and service. But one's store, goods and services can build up trade without the use of printer's ink more slowly, of course, than with the aid of printed advertising, but upon a firm foundation. Make your goods, services and store an advertisement for you before expecting printers' ink to build up your business.

MOHAWK JOBBING COMPANY EXPLAINS POLICY TOWARD DEALERS.

Value of New Self-Selling Box Label Line Also Described to Company's Dealers.

The laudable attitude of the Mohawk Electrical Supply Co. of Syracuse, N. Y., toward its dealers was explained very clearly in a recent issue of *The Mohawk Trail,* the house organ of the company. In this it was stated that no inquiry that comes from any town or city where there is a Mohawk dealer is ever handled by the company except for the account and profit of the local dealer.

It is the company's aim to build up 100% dealers in every town, selling the full household appliance line so that all the appliances sold there may clear through that dealer and bring him income. For this reason a good strong sales letter is sent in reply to every inquiry from towns where there is a dealer asking the prospect to buy from the dealer. A copy of the reply is sent to the dealer also. If the customer insists on purchasing from the company, the dealer is still taken care of, for the sale is made to his account and he is credited with the retail profit.

In the same issue is an article describing the many advantages of new General Electric self-selling box label line and how it opens an opportunity for the contractor-dealer. For many years dealers have realized that they were badly handicapped from the nature of electrical goods, being for the most part mysterious "electrical things" that did not appeal, for few people knew what they were for. In the new line of packages these devices are changed into appealing household merchandise, for each package is covered with a carefully prepared label illustrating its use. It is the little things like this that count the most in merchandising and they should prove a big help to the dealer in increasing sales.

BUY ELECTRICAL GOODS AT ELECTRICAL STORES.

Amusing Incident That Demonstrates Inability of Other Merchants to Sell Electrical Devices.

An amusing incident occurred in a large department store some time ago that clearly demonstrated the desirability of buying electrical goods from an electrical shop. It happened in the toy department where a large collection of toy motors and other electrically operated toys were attracting a great deal of attention.

A prosperous looking customer approached the saleslady, evidently taken from some other department to fill in during the temporary rush, with the question, "Are all those electrical motors?" Upon receiving a reply in the affirmative he asked to be shown a neat appearing device from the display to which was connected several feet of lamp cord and a plug and a tag announcing the price, $2. He explained that his boy had wanted a motor for some time but appeared doubtful as to whether or not this particular device would fill the bill. The girl readily assured him with the statement that "all you have to do is screw this into any light socket" and the sale was made.

The observer was sorely tempted to interfere in the bargain but did not, feeling that the customer will hereafter patronize electrical stores when shopping for electrical goods—after he has tried to make that bell transformer run.

SEPTEMBER IS ELECTRIC WASHING MACHINE MONTH.

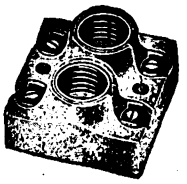
September has been designated on the electrical merchandising calendar or schedule as "washing machine month." During this month electrical contractor-dealers should concentrate their efforts on this particular device, tie-in with the manufacturers' national advertising, the central-station, jobbers and other dealers in local advertising and publicity, display washers, demonstrate washers, talk washers and sell washers. The short, cold, tempestuous winter days will soon be here when washing by hand is more disagreeable and arduous than ever and drying clothes is next to impossible. The use of an electric washer will shorten the washing time and lengthen the drying time and will enable the housewife to take advantage of the first good day and get her wash out to dry early.

New Appliances

Porcelain Cutouts—Improved Type Current Tap—Cleaner with Motor-Driven Brushes — Automatic Compensator

Arrow Porcelain Plug Cutouts.

To its extensive line of sockets, receptacles, switches, etc., the Arrow Electric Co., Hartford, Conn., has added a line of porcelain plug-fuse cutouts, of which the one shown is rated

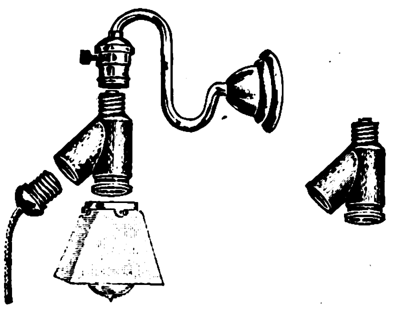


Arrow Plug-Fuse Cutout for 30 Amperes, 125 Volts.

at 30 amperes, 125 volts. They are made in single, double and triple-pole plain types and also in standard double-pole branches from two or three-wire mains. They are all made of the highest grade materials and meet all requirements.

Ajax Plural Socket Plug.

A new attachment plug especially designed to meet the needs for a two-way plug for the use of a lamp and an appliance at the same time has recently been placed on the market by the Ajax Electric Specialty Co., 1011 Market street, St. Louis, Mo. It is called the Ajax plural socket plug and offers many advantages over many of the older types of such plugs that were pri-



Ajax Plural Socket Plug Showing Design Which Does Not Change Position of Lamp. At Right, Plural Plug Only, Showing One-Piece Construction.

marily intended for the use of two lamps rather than a lamp and appliance. On this account such plugs can not be used in modern lighting arrangement without disturbing the original lighting effect.

In the Ajax plug, as shown by the accompanying illustration, the lighting socket remains directly in line with the fixture socket, the appliance socket being set at an angle to this. The lighting socket terminal is also provided with a groove for attaching shade holders and which will accommodate any ordinary holder. Both sockets are designed to accommodate an Edison base lamp or extension plug. In order to insure a good contact with all such plugs, however, a spring center contact has been placed in both sockets.

The plug is made in one piece, eliminating poor contacts, loss of parts or extra terminals. It is covered with Bakelite insulation, which adds greatly to its ruggedness.

New Premier Combination Electric Vacuum Cleaner.

The Electric Vacuum Cleaner Co. Inc., of Cleveland, Ohio, has just announced an addition to its line of cleaners to be called the new "Premier." This is styled the complete cleaner and combines three methods—the bristle brush, the rubber-fingered brush and the vacuum. A tufted bristle brush and a pliable rubber-fingered brush, both motor driven and interchangeable, are furnished. Either can be instantly removed and the cleaning done by the machine's extra powerful suction alone.

The rubber-fingered brush is the special feature of this cleaner it being the only machine so equipped. The rubber fingers pick up the dirt in a manner closely akin to that of a human hand performing the same task. The bristle brush is said to be the most effective yet put on the market.

The machine is equipped with a universal-type, air-cooled General Electric motor and rubber-tired wheels to make it easy running and prevent marring the floor. The power control is an integral part of the pistol grip handle—a handle so arranged that it will stand rigidly upright at will. The ingenious nozzle mechanism makes adjustments unnecessary. Because of this improvement the Premier is automatically adjusted to get all the dirt regardless of the depth of the nap.

This machine will retail at a higher price than the present model Premier so that dealers handling the Premier line will have a low and a medium priced cleaner to meet all demands.

Automatic Compensator for Squirrel-Cage Induction Motors.

The new automatic compensator which has recently been placed on the market by the Industrial Controller Co., Milwaukee, Wis., is a device which is considerably different from anything than has heretofore been offered for the purpose.

This compensator is intended for starting and stopping automatically, or at remote points, squirrel-cage induction motors of practically any size. The entire stopping and starting of the motor is accomplished by means of remote-control stations, one or more of which can be situated at convenient points, while the compensator itself may be located on the ceiling near to the motor, or at any other out-of-the-way location.

The compensator mechanism consists of magnetic contactors operated under oil and which may be easily removed from the oil (revolving around an operating shaft) for convenient inspection or replacement of the contacts. In addition to the magnetic contactors the device contains a suitable autotransformer and two time-limit overload relays, and the entire compensator, including the relays, is enclosed in a single dustproof steel casing.

Under-voltage protection is provided as the magnetic contactors open upon failure of the voltage, and inverse-time-

New Automatic Compensator for Control of Induction Motors from Remote Points.

element relays are provided as standard for overload protection.

A novel feature of this compensator is the fact that the period of acceleration may be at any time changed at the remote-control station without the necessity of disturbing or in any way changing the compensator itself. With this compensator the motor, when so desired, may be "inched," as this in many installations is desired on some types of machinery or when replacing belts.

A suitable lock is provided at each control station, so that when it is desired that the motor be stopped and kept stopped for any reason whatever, it may be locked into the "off" position at the remote-control station so that it cannot be started from the station at which it is locked out or at any other control station operating the compensator.

The makers claim considerable saving in the installation of this type of compensator is due to the fact that it may be conveniently located near to the motor, eliminating long conduit runs for heavy cable which might be required were the hand compensator used.

Trade Activities

Edison Electric Appliance Establishes Central District Office—Godfrey Conveyor Co. Incorporates—Literature

Edison Electric Appliance Co., Hotpoint Division, Chicago, has issued price list No. 16 on Hotpoint appliances, effective Aug. 18 and supersedes all previous issues. A supplementary parts price list on Hotpoint devices is also being distributed.

The Republic Engineers, Inc., consulting and constructing engineer, 60 Broadway, New York City, has been engaged by the Pennsylvania Cement Co. in connection with the proposed installation of waste heat boiler and power plant at its cement mill at Bath, Pa.

Electrical Engineers Equipment Co., Chicago, designer and builder of power plant appliances, has appointed F. H. Boyer as a sales representative. Mr. Boyer, who was formerly connected with the Chicago office, has opened an office in the Hubbell building, Des Moines, Iowa, and will represent the company in the states of Iowa and Nebraska.

E. L. M. Engineering Co., Prescott, Ariz., has been organized by W. C. Ellis, L. H. Lockwood, and E. R. McCartney. The new company will handle civil, electric and mechanical work as designers and supervisors throughout the northern part of Arizona. For the past year these gentlemen have been on the engineering staff at Whipple Barracks, General Hospital No. 20, U. S. A., Prescott, Arizona.

The Wellman-Seaver-Morgan Co., Cleveland, Ohio, is distributing Bulletin No. 27, which has for its subject W-S-M automatic ore unloaders. This publication comprises 12 pages and describes at length the successful use of its ore unloaders on the Great Lakes. Excellent illustrations of typical installations of the equipment are given, which give some idea of what may be accomplished by the use of W-S-M ore unloaders. Copies of the bulletin will be furnished free upon request to the company.

Edison Electric Appliance Co., Inc., 5660 West Taylor street, Chicago, announces the establishment of its central district office at its general offices, Chicago, with Walter M. Fagan, district sales manager, in charge. This district comprises the following states: Michigan, Ohio, Kentucky, west half of West Virginia, Wisconsin, Illinois, Indiana, Iowa, Kansas, Nebraska, Colorado, Wyoming, New Mexico, Oklahoma, North Dakota, South Dakota, Minnesota, Arkansas, Texas, Missouri and eastern part of Montana. With the establishment of the central district, all correspondence pertaining to sales matters, covering all lines of apparatus, should be addressed to the attention of the district sales manager. All salesmen of the company will call on customers whether they are selling Hotpoint, Edison, Hughes or General Electric type appliances.

T. W. Price Engineering Co., New York, announces the appointment of J. L. Dixon as metallurgist and electric furnace engineer. Mr. Dixon was instrumental in the development of the Gronwall-Dixon furnace and has had an extensive experience in the design, installation and operation of electric furnaces, covering a period of 11 years. The company will construct and install an electric furnace to be known as the Price-Dixon electric furnace; and in addition will continue to practice consulting engineering, specializing in the design of foundries, rolling mills and also machinery and processes. The Price company has just recently completed the design and purchased equipment for a rolling mill to be installed in Japan.

Green Engineering Co., with main offices and shops at East Chicago, Ind., announces the appointment of E. L. Sullivan as its representative in the Pittsburgh district, including western Pennsylvania, eastern Ohio and western West Virginia. Mr. Sullivan has been a special representative for the McDonough Regulator Co. for the past ten years, six years in Chicago and four in Pittsburgh. He has devoted all of his time to special investigations pertaining to the securing of more efficient boiler and furnace operation. He has had a long intensive experience in matters pertaining to boiler and furnace operation, and the company is to be congratulated on securing such excellent representation for Green chain grate stokers, Sealflex arches, steam jet ash conveyors, cast iron ash tanks, and replacements for the same. Mr. Sullivan will maintain the present offices at 2545 Oliver building, Pittsburgh.

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., manufacturer of concentrating machinery and equipment, is distributing illustrated catalog No. 107, comprising 112 pages. This bulletin describes the latest types and designs of machinery that have been developed to meet the demands of modern practice in the concentration and dressing of ores. Some ten pages are devoted to a discussion of the subject of concentration following which are detailed descriptions of concentrating equipment. Much data are included covering individual machines, devoting particular attention to those machines which have shown the great progress and which are recognized as standard. The bulletin is profusely illustrated, showing views of typical installations of concentrator equipment and of the various types of machines. It contains considerable data which will be of value and assistance in the selection of suitable and properly balanced units for concentration work.

The Driver-Harris Co., Harrison, N. J., is now selling its wire rope products direct to the trade instead of through its former selling agents. These products include sash cord and tiller rope in plain iron, galvanized iron, phosphor bronze, special bronze, monel metal, and all special grades. In addition to this, the company has increased its facilities to include all grades of rope in 6x7, 6x12 and 6x19 construction, such as drilling cable, elevator rope, haulage rope, sand lines, etc., in all sizes up to ¾ in. The other products of the company are resistance materials of nickel alloys in the form of wire, strip and sheet for electric heating controllers, rheostats and resistance elements, wire for spark plugs and weaving; rods and sheets of pure nickel and its alloys; cold rolled strip steel, nichrome castings such as annealing boxes, carbonizing boxes, pots, tubes, rotary and stationary retorts, dipping baskets, pyrometer protection tubes, etc., flexible heater cord and thermostrip.

Godfrey Conveyor Co., Elkart, Ind., has just completed its incorporation, which will enable this firm to manufacture on a much larger scale the Godfrey coal conveyor in order to meet the wide demand for this device. Ever since the first announcement by John F. Godfrey several years ago of a simple and practical conveyor system that would handle all sizes of coal and similar materials mechanically, there has been a steadily increasing interest in Godfrey conveyors on the part of those firms seeking greater economy and efficiency. Although its facilities for delivering the Godfrey conveyor have been increased during the past few months, the sales have far exceeded production and orders have been delayed from fifty to sixty days. The organization is headed by John F. Godfrey, originator, inventor and manufacturer of the conveyors, who has been chosen president of the board of directors. With 15 years' experience in the business of handling coal he is in a position to guide the company along lines required by the needs of industrial plants and dealers. The engineering department, with a staff of capable engineers of extensive experience, is headed by J. Sumner Kirk, under whose guidance special plans are made for every installation of Godfrey conveyors. I. D. Landis is sales manager.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Rutland, Vt. — Temple Brothers, operating granite and marble works, have arranged for the electrification of their plant. Electric power will be furnished by the Rutland Railway, Light & Power Co.

New Bedford, Mass.—A new power plant will be erected by the Beacon Manufacturing Co. in connection with the erection of an addition to the weave works at its cotton mill.

Bridgeport, Conn.—Work has commenced on the erection of a one-story addition to the plant of Harvey Hubbell, Inc. The structure will be 82x140 ft. and cost about $18,000.

Hartford, Conn. — Hartford Electric Light Co. has completed plans for the erection of a new power plant at Colt's Meadows. The present plans are for a station with a capacity of 100,000 kw., or 125,000 hp., with oil as the fuel to be used. Construction will be by Stone & Webster.

Middletown, Conn.—In connection with the erection of an addition to its webbing works, the Russell Manufacturing Co. plans to erect an extension to its power plant, to include one-story turbine department, 20x20 ft. Plans include a two-story engine and pump house and one-story boiler plant.

Woonsocket, R. I.—A new boiler plant and pumping works will be erected by the French Worsted Co., 50x50 ft. on Hamlet avenue, for increased capacity.

Bath, N. Y.—Judd Gunderman has been given an option on his mill property with its water rights located between this village and Kanona to the Lamoka Power Co. The Lamoka Power Co. proposes to make extensive improvements.

Lockport, N. Y.—The city has under consideration the erection of a municipal light plant.

New York, N. Y.—Charles Cory & Son, 290 Hudson street, manufacturers of electrical apparatus, are having plans prepared for a six-story concrete addition, 140x175 ft. to cost about $200,000. Russell G. Cory, 39 Cortlandt street, engineer.

New York, N. Y.—New York Edison Co. has awarded a contract to the George Sykes Co., 70 East 45th street, for the construction of a new two-story building, 25x75 ft. at Hester and Norfolk streets.

New York, N. Y.—A boiler plant, 35x45 ft. will be erected by Fraser, Brace & Co., 1328 Broadway, in connection with their new shipbuilding and repair plant at Clifton, Staten Island. The entire plant will cost about $3,000,000, and considerable electrical equipment will be required for the different works departments, including machine shop, plate and angle shop, forge and pipe shop, tinsmith and carpenter shop and other works buildings. It is proposed to inaugurate immediate construction.

New York, N. Y.—American Radio & Research Corp., 21 Park Row, a Delaware corporation, has increased its capital from $125,000 to $500,000.

New York, N. Y.—Electrical and mechanical equipment will be installed by the Bronx Consumers Ice Co., Devoe avenue and 180th street, in connection with alterations and improvements in its one and two-story refrigerating plant to cost about $60,000.

New York, N. Y.—Rector Electric Co. has removed its main office from 81 Washington street, New York, to 327 Atlantic avenue, Brooklyn. The former New York office will be retained as a branch.

New York, N. Y.—New York Telephone Co. has arranged for immediate extensions and improvements in a number of its local exchange buildings, with the erection of new structures as required. The work includes a new four-story telephone building at Liberty avenue and Milford place, Brooklyn, 60x120 ft. to cost about $200,000, with equipment; alterations and additions to its two-story exchange at West New Brighton, S. I.; and alterations and extensions to its telephone building at Buffalo, N. Y.

New York, N. Y.—Plans have been filed in the building department for alterations and extensions in the boiler plant used for the building at 29 East 35th street, property of Q. S. Morgan, to cost about $9000.

Syracuse, N. Y.—Dyneto Electric Co., Wolf and Park streets, is planning for the erection of a new one-story plant, 70x200 ft., on Wolf street, to cost about $50,000.

Brielle, N. J. — Following a controversy with the Lakewood Coast Electric Co. relative to furnishing service for the Brielle fire house, the borough officials are negotiating with the Atlantic Coast Electric Co., Asbury Park, to extend its lines to this district and enter the field on a competitive basis. The street lighting contract with the Lakewood company has expired, and it is proposed to give a new contract to the Atlantic Coast organization.

Dover, N. J.—New Jersey Power & Light Co. is now building a new line to Newton, and expects to have construction completed for service at an early date. Both lighting and power service will be furnished by the company in the Newton district, including domestic and industrial consumption; the initial load is estimated at about 300-kw. The company has secured a power contract with C. Kleiner & Co., who are establishing a cigar manufacturing plant at Dover.

Garwood, N. J.—The plant of the C. & C. Electric Manufacturing Co., recently offered for sale at a receiver's sale, has been purchased by Paul E. Ryan, New York, through Joseph P. Day, agent, 31 Nassau street. The plant will be used by the new owner for manufacturing, with large department for the production of aluminum and other castings.

Keyport, N. J.—Common Council is arranging a new contract with the Monmouth Lighting Co. for street lighting and service for other municipal work during the coming year.

Newark, N. J. — New York Telephone Co., 15 Dey street, New York, is planning for the construction of two new central exchange stations in northern New Jersey, and extension to 40 present switchboards in this territory. The work will provide for an increase of about 11,000 subscribers and is estimated to cost nearly $2,000,000.

Newark, N. J.—American Can Co. will build a new boiler plant in connection with its proposed three-story factory, 50x130 ft., at Oliver street, and New Jersey Railroad avenue.

Newark, N. J.—A one-story boiler plant, 25x42 ft. will be erected by the American Platinum Works, New Jersey Railroad avenue, in connection with the construction of a factory addition, and alterations and improvements in the present plant to cost about $100,000.

Newark, N. J.—Donavan & Erlach Co., 64 Forest street, Kearney, has filed notice of organization to operate an electrical engineering business. Andrew Donavan and James C. Erlach head the company.

Nutley, N. J.—A one-story boiler plant addition, 40x53 ft. will be erected by L. Sonneborn & Sons, in connection with the erection of an addition to their local chemical works.

South Amboy, N. J.—Monmouth Lighting Co. is planning for improvements in its service in this district. A communication to this effect has been sent to the Common Council.

Allentown, Pa. — Lehigh Valley Light & Power Co. and the Lehigh Navigation Electric Co. have filed application with the Public Service Commission for permission to merge under the name of the first mentioned company.

Carlisle, Pa.—C. H. Masland &

Sons, Amber street, Philadelphia, are taking bids for a power plant to be erected at Carlisle, in connection with a new carpet manufacturing plant at this place.

Easton, Pa.—Pennsylvania Utilities Co. has constructed an additional power line from its Dock street power station to its substation at Ferry street, for increased service.

Erie, Pa.—Erie County Electric Co. has commenced the erection of a one-story addition to its turbine plant for increased capacity. The structure will be 60x110 ft., and is estimated to cost $43,000.

Greencastle, Pa.—The Town Council is considering plans for the establishment of a municipal electric light and power plant. Plans are under way for co-operation in the erection of a plant with the borough of Waynesboro, which is also planning for a similar station.

Harrisburg, Pa. — Application has been made to the Public Service Commission for a merger of a number of power companies in the vicinity of Mauch Chunk, and in Carbon county, under the name of the Industrial Power Co. The new organization plans to operate a large electric generating plant in the anthracite coal fields.

Morrisville, Pa.—Considerable electrical and mechanical equipment will be required for the new local sewerage disposal plant to be constructed by the Borough Council. The plant with sewerage system is estimated to cost about $265,000. Thomas F. Bovie, engineer, has prepared plans and specifications.

Philadelphia, Pa. — William B. Grimshaw Co., Drexel building, is in the market for a single drum mine type electric hoisting engine, 2300 volts, 3-phase, 60-cycle, a. c. and haul 6 tons up 66% grade at speed of from 2 to 300 ft. per minute.

Philadelphia, Pa.—Plans have been filed by the Wirt Co. for a new two-story plant, 62x158 ft. at Green street and Queen Lane, to cost $60,000. Charles Wirt is president.

Philadelphia, Pa.—Bell Telephone Co. of Pennsylvania has leased the eight-story building, 47½x120 ft., at 263-65 Broad street, for a new local establishment. The structure has been used heretofore by the Emergency Fleet Corp.

Philadelphia, Pa.—Plans are being prepared by Architect M. H. Dickinson, 1785 Chestnut street, for a new boiler plant to be erected in connection with a new local dye and textile works.

Philadelphia, Pa.—A boiler and engine plant will be erected by the Rockland Hosiery Co., Kensington avenue, in connection with its proposed hosiery mills at Kensington avenue, near O street.

Pittsburgh, Pa. — Maitland-Rago Co., manufacturer of electrical fixtures, has leased the three-story brick building, 20x110 ft., at 1029 Liberty street, for a new establishment.

Pittsburgh, Pa.—Susquehanna Collieries Co., operating coal properties in Dauphin, Schuylkill, Northumberland and Luzerne counties, is planning the complete electrification of its works at Williamstown and Lykens, with construction of a new shaft at Big Lick, between Lykens and Wiconisco. The work is estimated to cost about $2,000,000. The company has arranged for a mortgage aggregating $11,000,000, to be used in part for expansion and betterments.

Pittsburgh, Pa.—The Government has commenced the construction of a new concrete power plant at Lock No. 3, on the Monongahela river. The structure will be operated by water power and will furnish electric power for the operation of the local lock. Lieut.-Col. Wistar M. Chubb, local United States engineer, is in charge.

Reading, Pa. — During the past month the Metropolitan Edison Co. has secured about 913 additional contracts for furnishing electric power. A number of plants in this section are closing down their steam-operated stations, and using central-station service, including the Quaker Silk Mills, which have recently arranged for power supply for works operation.

DATES AHEAD.

Washington State Association of Electrical Contractors and Dealers. Annual convention, Seattle, Sept. 11. Secretary, Forrest E. Smith, 205 Boston Block, Seattle.

Indiana Electric Light Association. Annual convention, French Lick Springs, Ind., Sept. 11 and 12. Secretary, Thomas Donohue, Lafayette, Ind.

Association of Edison Illuminating Companies. Annual meeting, New London, Conn., Sept. 16-18. Secretary, H. T. Edgar, Stone & Webster, Boston, Mass.

Southeastern Section, N. E. L. A. Annual convention, Asheville, N. C., Sept. 17-19. Secretary-treasurer, T. W. Peters, Columbus, Ga.

Iowa State Association of Electrical Contractors and Dealers. Annual convention, Sioux City, Iowa, Sept. 22 and 23. Secretary, F. Bernick, Jr., Oskaloosa, Iowa.

New England Section, N. E. L. A. Annual convention, New London, Conn., Sept. 22-24. Headquarters, Hotel Griswold. Secretary, Miss O. A. Burgiel, Boston, Mass.

Association of Iron and Steel Electrical Engineers. Annual convention, St. Louis, Mo., Sept. 22-26. Secretary, John F. Kelly, Empire building, Pittsburgh, Pa.

American Electrochemical Society. Fall meeting, Chicago, Sept. 23-26. Headquarters, Congress Hotel. Secretary, Prof. Joseph W. Richards, Lehigh University, Bethlehem, Pa.

International Association of Municipal Electricians. Annual convention, Chicago, Sept. 23-26. Secretary, Clarence R. George, Houston, Tex.

Empire State Gas and Electric Association. Annual meeting, New York City, Oct. 9. Secretary, Charles H. B. Chapin, 29 West 38th street, New York City.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Ellendale, Del. — Plans are under way to inaugurate operations at the new municipal electric power plant at an early date. The construction of local distributing lines is now under way.

Baltimore, Md.—In connection with its proposed group of buildings at Roland Park, the Maryland Casualty Co. is planning for the construction of a large central power plant to furnish electric service to the administration, clubhouse, printing plant and other structures. The entire project is estimated to cost about $2,000,000.

Baltimore, Md. — Bethlehem Shipbuilding Co. is planning for the construction of a new drydock, 400x80 ft., at its Sparrows Point plant, to be operated by electric power. Sufficient power capacity will be developed to raise the structure in ten minutes.

Cumberland, Md.—Western Union Telegraph Co. and the Baltimore & Ohio Railroad Co. will build a new underground conduit system between the viaduct and Queen City building. The system is estimated to cost $50,000. J. H. Hays, Western Union Telegraph Co., Baltimore, is in charge.

Sparrows Point, Md. — The construction of an additional floating drydock, 400 ft. long, 80 ft. wide and 20 ft. deep, equipped with electric power is contemplated by the Bethlehem Shipbuilding Corp.

Bristol, Va.—Virginia Tub Co. is in the market for an electric welding machine for round iron tub and bucket hoops.

Cambria, Va.—James Rigby & Son are in the market for a 25-30 hp. a. c. motor, 3 phase, 60 cycle, 2300 volts.

Clarksburg, W. Va.—A syndicate is being organized to purchase and operate the Grafton Power & Light Co., and the Grafton Traction Co., operating at Grafton and vicinity, and now in bankruptcy. O. E. Wyckoff is referee in bankruptcy for the companies.

Fairmont, W. Va. — Monongahela Valley Traction Co. is planning for the erection of a large addition to its electric power plant at Rivesville, to double the present capacity. A new turbogenerator will be installed, with auxiliary operating equipment. The company is also planning for the construction of a new 60,000-volt transmission line from this plant to Grafton and Clarksburg, with a number of distributing branches. A new high tension transmission system will also be built in Barbour county.

Grafton, W. Va.—Potomac Edison Co., recently incorporated with a capital of $4,000,000 to take over electrical properties in this district, plans for a new power plant in the mining section to furnish electric power for coal mines operation.

Belmont, N. C. — Electrically operated machinery and equipment will be installed in the proposed cotton mill to be established by the Sterling Spinning Co., recently organized with capital of $800,000. R. L. Stowe is president.

Winston-Salem, N. C.—J. S. Kuykendall, Winston-Salem, is planning for the establishment of an electric power plant at Black Mountain, to furnish local light and power service.

Gaffney, S. C. — Piedmont Telephone Co. will erect a two-story building. Sam Gaulet, mayor.

Summerville, S. C. — Summerville Public Service Co. has purchased electric light plant and ice plant and will improve them. M. Barshay, president.

Bainbridge, Ga.—Southwest Georgia Power Co. has published its application for charter for the purpose of placing a power plant on Spring Creek. Address I. F. Murphy, or E. J. Perry.

Fort Pierce, Fla. — East Coast Lumber & Supply Co. is in the market for 20 electric motors, 5 to 20 hp. W. E. Tylander, general manager.

Kissimmee, Fla. — Mach Brothers, Oxford, Fla., will build a mill and install electric motors.

Daytona, Fla.—The Daytona Beach Council has granted an electric light and power franchise to Nelson Mounts, who plans to install and operate a local system.

Stuart, Fla.—Stuart Public Service Co. recently incorporated with a capital of $50,000, will operate a light and power plant for local electric service. George R. Hilty is president.

NORTH CENTRAL STATES.

Fremont, Ohio.—The plant of the Ohio State Power Co. (on the Sandusky river, six miles from Fremont), was damaged by explosion. The plant valued at $3,000,000 was erected along the Sandusky river a mile south of Fremont, six years ago. The company supplies power to many neighboring towns and in addition furnishes power to the Lake Shore electric lines and the Fostoria and Fremont interurban railway.

Minerva, Ohio. — Engineers Froelich & Emery, 412 Second National Bank building, Toledo, are preparing plans for a $50,000 power house and distributing station. R. A. Penweth, mayor.

Evansville, Ind.—Ohio Valley Seed Co. will build a five-story mill and grain elevator. The company has increased its capital stock from $25,000 to $100,000.

Fort Wayne, Ind.—Thieme Brothers Co., manufacturer of silk hose, will erect a $185,000 factory building.

Indianapolis, Ind.—J. D. Adams & Co., manufacturers of road building machinery, will build a new one-story storage house, 162x175 ft., with balcony containing 4100 sq. ft. of floor space, at cost of about $60,000.

Indianapolis, Ind.—Henry L. Dithmer, secretary of the Polar Ice & Fuel Co., announces plans in the enlargement of the company's manufacturing and storage capacities which will double its facilities. Additions will be built to three different plants in the city of Indianapolis at an expenditure of $150,000.

LaFayette, Ind. — Numerous improvements on building and grounds of Purdue University are being rushed to completion. Throughout the summer a large force of workmen has been at work in the mechanical, civil and electrical buildings, constructing concrete laboratories, testing devices and installing new equipment. A new tractor testing laboratory has been completed.

Portland, Ind. — The Detamore plant of the Union Traction Co. of Indiana, has been offered to the city of Portland for $18,000, and a transfer of the property will soon be made. This move has been approved by the citizens of Portland and the factory owners who have been demanding more light and power current.

Warsaw, Ind. — A new auditorium will be erected at Winona Lake to cost between $100,000 and $150,000.

Elgin, Ill.—A municipal lighting and electric power plant is the expectation of the city commission. A $200,000 bond issue to cover the original cost of the plant is planned and it is stated that a special election to vote upon this question will be held soon.

Herrin, Ill. — U. S. Reduction & Atomizing Co. is erecting a $100,000 factory building. The new plant will handle the by-products of the mines around Herrin.

Rock Island, Ill.—The plant of the Universal Tractor Works, the property of the Moline Plow Co. will be rebuilt, following a fire which destroyed the machine shops with loss of $150,000.

Mt. Clement, Mich.—Henry Ford of Detroit, has petitioned the council for franchise to develop power house from the Clinton river. It is proposed to establish a motor factory here to employ 300 persons.

Appleton, Wis.—Langstadt & Meyer Co., manufacturer of farm lighting systems and other electrical equipment, will erect a two-story addition to its plant to cost $25,000. New tools and other equipment will be purchased. Herman Wildhagen is architect.

Minneapolis, Minn.—Sales department of the Minneapolis General Electric Co. during the week ended Aug. 15, secured 456 new electric light and power customers with 266 kw. of lighting and 674 hp. in motors. New power business includes contract for 400 hp. in motors with the Schreiber Milling Co., and 90 hp. with the Victoria Elevator Co. New business connected to the company's lines shows an increase of 185 new customers with 135 kw. of lighting and 673 hp. in motors, which includes the two contracts mentioned above as well as 130 hp. for the city of Minneapolis for the construction of the Franklin avenue bridge. An increase of 26.5% is shown in the output of electric energy during the week as compared with the corresponding week last week.

St. Louis, Mo. — Wagner Electric Co. is preparing plans for a five-story plant, 160x400 ft.

Lincoln, Neb.—Wakefield Electric Co. has applied to the Nebraska Railroad Commission for a certificate of convenience and necessity.

Mullen, Neb. — The city contemplates a bond issue for electric light improvements.

SOUTH CENTRAL STATES.

Louisville, Ky. — United Casket Co., will erect a fireproof factory, 100x440 ft., also dry kilns and power house. Planers, molders, sanders, saws, etc., will be installed.

Louisville, Ky.—Commercial department of the Louisville Gas & Electric Co. during the week ended Aug. 16, secured 56 new electric light and power customers with 35 kw. of lighting and 158 hp. in motors, and accepted contracts for wiring 11 already built houses. New business connected to the company's lines shows a gain of 57 customers with 20 kw. of lighting and 36 hp. in motors. The output of electric energy was 10.5% greater than during the corresponding week last year.

Maysville, Ky. — The council will take up at once the construction of a municipal electric light plant.

Piedmont, Ala. — Coosa Manufacturing Co. will erect a $100,000 addition to its mill. Electrical equipment will be purchased.

De Riddie, La.—$100,000 in bonds have been voted for building a light and power plant and water works. Address mayor.

New Orleans, La.—Plans are being prepared by the Interstate Electric Co. for the erection of three large buildings in New Orleans, to cost about $1,500,000. The company deals in electrical appliances and automobile appliances. Percival Stern is president of the company.

New Orleans, La.—The Navy Department will install a power plant here, and purchase equipment to cost $115,000.

Lexington, Miss.—Common Council is planning for improvements in the local electric system to cost about $20,000. Bonds for this amount will be voted. W. L. Jordan is city clerk.

Natchez, Miss.—National Box Co. will improve its plant. Electrical equipment will be purchased.

Centreville, Tenn.—Common Council is planning for the immediate construction of a municipal electric plant to cost about $15,000. Owen L. Bates is mayor.

Little Rock, Ark.—Dixie Power Co. has perfected plans for the erection of its proposed hydroelectric power plant near Cotter, on the White river. The station will have an initial capacity of about 100,000 hp., and with machinery and equipment installation is estimated to cost about $4,000,000. A dam about 1500 ft. long and 100 ft. high will be constructed. An extensive high-tension transmission system will be constructed. H. A. Allen, Chicago, is engineer.

Pine Bluff, Ark.—Missouri & Southeastern Utilities Co., affiliated with the Arkansas Light & Power Co. is planning for the construction of a new steam operated electric power plant in this section. A transmission system, with local distributing lines, will also be erected. O. P. Moss is manager.

Perry, Okla.—$260,000 light and water bonds have been authorized. Address city clerk.

Canton, Tex.—Hercules Power Co. recently incorporated with a capital of $10,000,000, is planning for the erection of a large electric power plant with transmission system thorughout this district. A. B. Saling is manager.

WESTERN STATES.

Bonners Ferry, Idaho.—Washington Electric & Supply Co. of Spokane, is considering the matter of installing a street lighting system here, to include 14 post lamps.

Sandpoint, Idaho. — Contract has been closed with the Calispell Light & Power Co., Dalkena, Wash., which purchases electric current from the Sandpoint division of Mountain States Power Co. covering 40 hp. in motors for the Dalkena Lumber Co., with prospects of an additional 100 hp.

Libby, Mont.—It is reported that the Lukens-Hazel Mining Co. will expend $240,000 for a 200-ton concentrator, and power plant. A pipe line will be installed from Granite Creek which will develop 600 hp.

Albuquerque, N. M. — Rio Grande Light, Heat & Power Co. has had specifications prepared for $4,000,000 electric light plant to be erected at White Rock Canyon on the Rio Grande, 40 miles north of Albuquerque. The power company will maintain its general offices in Philadelphia, with a branch office here.

Portland, Ore.—Application for an increase in rates which will enable the company to realize a return of seven per cent on its investment has been filed with the city auditor by the Portland, Railway Light & Power Co. has a necessary formality to the hearing to be held soon before the Public Service Commission. The application gives the city ten days in which to prepare and file its answer as one of the affected parties.

Colfax, Wash.—Washington Water Power Co., Spokane, is planning to spend about $28,000 this fall in putting in a heavier line to the city.

Hoquiam, Wash.—Plans and specifications have been completed by the Commercial Club for a curb lighting system on 8th and 9th streets.

Morton, Wash. — Morton Electric Co.'s plant has been sold to J. P. Haggerty of Tacoma, for $10,000.

Seattle, Wash.—Ordinance has been passed by the city council authorizing the Board of Public Works to continue work of investigation to determine proper location for dams and reservoirs in the vicinity of Ruby, Gorge Creek and Diablo Canyon.

Seattle, Wash.—J. Bechler, Mayflower Dairy, 917 Virginia street, will erect a brick power house at a cost of $24,000.

Spokane, Wash.—Universal Electric Co. will erect a building at 1218 Second street, at a cost of $10,000.

CANADA.

Thorold, Ontario.—Ontario Power Co. is planning for the erection of an addition to its local substation to double the present capacity. A new bank of transformers will be installed, and other operating equipment. Apparatus now at the Welland substation will be utilized, in part in the new addition.

Winnipeg, Manitoba. — Winnipeg River Power Co. has commenced the construction of its proposed hydroelectric power plant at Little Du Bonnet Falls, on the Winnipeg river. The structure will be one of the largest plants of its kind in the world; it will have an initial capacity of about 160,000 hp., and is estimated to cost $5,000,000.

PROPOSALS

Generator and Equipment. — Bids will be received Sept. 23, at Saskatoon, Sask., for a steam turbine, alternating current, generator, surface condenser and condenser auxiliaries. C. J. Yorath, city commissioner.

Power Plant Extensions.—Bids will be received until 3 p. m., Sept. 10, for extensions and improvements in the power plant and power system at the State Hospital, Binghamton, N. Y. Address State Hospital Commission, Capitol building, Albany.

Pumps.—The purchasing agent of Kansas City, Mo., will receive bids until Sept. 17, for a pumping station, centrifugal type pump driven by steam turbine through reduction gears, centrifugal type pump driven by vertical cross-compound Corliss engine. Plans are on file with W. C. Goodwin, chief engineer.

FOREIGN TRADE

[*Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.*]

Lighting Fixtures (30,461). A firm in Australia wishes to purchase from manufacturers opalescent glass for use in indirect and semi-direct electric fixtures.

Electrical Supplies (30,462). A firm of important merchants in India desires to connect with selling agents of American manufacturers of hardware, mill, gin, and railway stores, machinery, electrical supplies, chemicals, dyes, general sundries, etc. Quotations with samples where necessary are requested. Reference.

Incandescent Lighting Glass (30,466). The purchase of large quantities of incandescent gas mantles and incandescent lighting glass is desired by a company in England. Quotations should be given c. i. f. London. References.

Electrical Conductors and Machinery (30,475). An agency is desired by a firm in Spain for the sale of electric conductors, electrical machinery, material for central generating stations, small electrical material, pumps, turbines, internal combustion motors, and lamps. References.

Motors (30,498). The president of a Spanish mining company is in the United States and is soon to return to Spain. He desires to purchase mining machinery, gasoline and kerosene engines, electric motors and equipment, and agricultural machinery. References.

Wireless Equipment (30,504). An American firm desires to obtain for one of its clients in Spain all classes of apparatus used by manufacturers of wireless equipment. References.

INCORPORATIONS

New Berlin, N. Y.—Berholme Power Co. Capital, $25,000. To operate a light and power system at South New Berlin. Incorporators: T. B. Parker, F. Van Valkenburg, and E. W. Hovey, all of South New Berlin.

Rochester, N. Y.—Rochester Storage Battery Co. Capital, $40,000. To manufacture storage batteries, etc. Incorporators: W. W. Armstrong, E. F. and A. C. Dyver, Rochester.

New York, N. Y.—Electric Keyless Lock Co. Capital, $10,000. To manufacture special locking devices. Incorporators: H. Gottesman, S. Greene and A. M. Block, Woolworth building.

Buffalo, N. Y. — Milner Flower Electric Co. Active capital, $30,000. To manufacture electrical machinery. Incorporators: C. B. McBride, M. W. Bense and A. E. Moore, 37 Wall street, New York.

Wilmington, Del.—Phix Light Co. Capital, $100,000. To manufacture electrical and power machinery. Incorporators: T. L. Croteau, H. E. Knox and S. E. Dill.

Huntington, W. Va.—Electric Unit Corp. Capital, $50,000. To furnish light and power service. Incorporators: C. C. Hatzell and E. F. Kincaid, Huntington.

Fairview, N. C.—Cane Creek Telephone & Light Co. Capital $10,000. To furnish local electric light and power, and telephone service. Principal incorporator: R. B. Williams.

Varnville, S. C.—Twin City Light & Power Co. Capital, $30,000. To operate a local light and power system, with lines to Hampton, S. C. Principal incorporator: R. H. Gibson.

Indianapolis, Ind.—Wheeler Automatic Transmission Co. has been incorporated with capital of $500,000 for the manufacture of an automatic transmission which is said to do away with the shifting of gears in automobiles. George W. Ray is the president, and J. M. Milner, secretary-treasurer.

Personal

Captain Porter to Take Charge of Railroad Department, Western Electric—F. D. Egan Promoted—Other Changes

JOSEPH D. WHITTEMORE and FRANCIS R. HARBISON have been appointed ancillary receivers for the West Virginia Traction & Electric Co., Morgantown, W. Va., by Judge Orr, United States District Court.

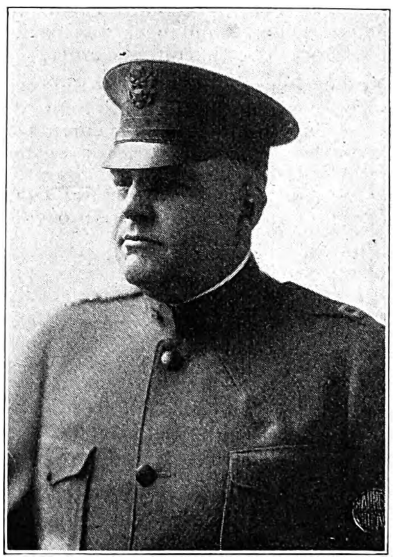
GEORGE R. JONES has been elected assistant to the vice-president of the Public Service Co. of Northern Illinois. Mr. Jones has been connected with the company for more than ten years, most of this time as purchasing agent.

RAYMOND D. SHERMAN, superintendent of the Deerfield River Power Co., Watertown, N. Y., has been promoted to the position of superintendent of the Connecticut River Power Co., both companies being under the management of the New England Power Co.

L. H. STRATFORD, for about two years assistant manager of the W. A. Baehr Co., Great Falls, Mont., is now manager of the Pocatello Gas & Power Co., with headquarters at Pocatello, Idaho. Mr. Stratford is well known in that section, having held important positions with the Utah Power & Light Co., Ogden, and with the Portland Gas & Coke Co., Portland, Ore.

W. H. TIMBIE, who is well known for his teaching in vocational subjects and for his important list of books relating to electrical engineering and applied electricity, has been appointed associate professor of electrical engineering in the Massachusetts Institute of Technology. Mr. Timbie was graduated from Williams College in 1901 with honors, being high in the list of Phi Beta Kappa. During his college course he prepared for teaching and shortly after graduation became a teacher of applied science at the Pratt Institute in Brooklyn. Upon the establishment of the Wentworth Institute in Boston he became head of the Department of Applied Science in that institute. During the past year he has been editor-in-chief of the Committee on Education and Special Training in the United States War Department at Washington. He is joint author with Professor Higbie, of the University of Michigan, of a well known book on alternating currents and himself is author of a book on practical electricity and other books relating to electrical engineering, which are known and used throughout the world. Certain of these books have been translated into foreign languages. Mr. Timbie is a member of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers. He has been active in the National Educational Association and has memberships in other engineering and educational societies. At the Massachusetts Institute of Technology his principal duty will be the supervision of the co-operative course in electrical engineering which is carried on in association with the General Electric Co. This course is arranged so that the students receive a scientific training of very high order in electrical engineering at the institute and associate with this a training in manufacturing methods and shop management and industrial research at the works of the General Electric Co. Mr. Timbie's marked success as a teacher and his enthusiasm in such work assure great success in his new position.

CAPT. GEORGE HULL PORTER has just been appointed manager of the railroad department of the Western Electric Co., in charge of the railroad business for the Western Electric Co.'s 53 houses extending from coast to coast. This well merited promotion comes after an experience covering a number of years as railway salesman in Chicago territory. Captain Porter is well and favorably known in railroad circles as well as in the electrical field, having served as president of several railroad associations as well as chairman of various committees. He is also a past president of the Illinois Athletic Club, Chicago. Captain Porter saw service in the army during the war, being attached to the signal corps.



Capt. George Hull Porter.

F. D. EGAN, former works manager of the Pittsburgh Iron & Steel Foundries Co., has accepted a position in the General Engineering Department of the Westinghouse Electric & Manufacturing Co. at East Pittsburgh, Pa., where he will devote his entire time to the development of electrical apparatus for steel mill application. Mr. Egan's experience with electrical apparatus as applied to steel mills has extended over a period of a score of years, all of which time was spent in mills in the Pittsburgh district. In 1899 he entered the electrical department of the Carnegie Steel Co.'s Homestead Plant, working under the direction of Alva C. Dinkey, then superintendent of the electrical department. He resigned this position in 1903 to enter Grove City College, where he completed his college course. After graduating from school, he went to work in the inspection department of the Westinghouse Electric & Manufacturing Co., remaining a little over one year, leaving there to accept a position with the Carnegie Steel Co., where he served as assistant chief electrician during the construction of its Nos. 6 and 7 blast furnaces. When this work was completed he joined the electrical engineering force of the National Tube Co.

While working for the tube company Mr. Egan devised a plan whereby he could attend the Engineering School of the University of Pittsburgh and at the same time devote a major portion of his time to his work. After successfully laying his plans before the management, the aspiring engineer entered the university where he studied for two years, when he found it necessary to give up his course for the time being in order that he might enter the electrical superintendent's office. As a result of considerable study and hard work, he was later promoted to the position of assistant superintendent of the electrical department. In 1911, at the end of the construction period that lasted for four years, he left the tube company, accepting a position as electrical engineer with the Pittsburgh Crucible Steel Co. during the construction and operation of its Midland Works. In the latter part of 1917 he left the Crucible Steel Co. to enter the employ of the Pittsburgh Iron & Steel Foundries Co., of Pittsburgh, Pa., as works manager to have charge of all war work done by that company. Serving in that capacity until just recently when he joined the general engineering department of the Westinghouse company. Mr. Egan is a member of the Iron and Steel Committee of the American Institute of Electrical Engineers, a member and past president of the Association of Iron and Steel Electrical Engineers, a member of the Iron and Steel Institute, the Delta Tau Delta Fraternity and the Pittsburgh Athletic Association.

Obituary.

HENRY A. REED, 88 North 9th street, Newark, N. J., a pioneer in telegraphy, died at his home in that city, Aug. 23, at the age of 90 years. As an operator, Mr. Reed opened in 1850 the first telegraph office on the Harlem Railroad, New York. He was one of the organizers of the Electric Club and Electric Trade Society in New York.

Institutional Advertising Combined With Specialization

New Sherwin-Williams Campaign Takes Advantage of Changed Conditions of Property-Owner Demand and Increased Building Activities

By C. L. LEMPERLY, *Advertising Manager, The Sherwin-Williams Company.*

HOW to give sudden point and direction to advertising that had been wholly institutional, says the above named writer in Printers' Ink, was a question with which The Sherwin-Williams Company was recently called on to deal.

Institutional advertising might be compared to a club. It is intended to gain large ends, to cover big space, to carry great weight. But a club is usually not flexible. It cannot be readily bent, nor is it easily adapted to specific ends.

The Sherwin-Williams Company wanted to retain the momentum and larger benefits of its institutional campaign, and at the same time utilize its force in specific directions. The solution lay, it found, in putting spikes on the club, so to speak. It retained the institutional idea of advertising its products as a whole, and at the same time, by featuring certain products in response to changing demands in the market, it lost no ground.

Prior to the war, the company had been advertising its leading lines through national advertising, alternating the schedule by seasons.

Last year, while some advertisers were holding back, Sherwin-Williams decided it was an opportune time to launch a larger campaign than ever, even though its plants were overtaxed with large bulk business, mostly from big manufacturers. Consequently it opened its Products campaign.

This was entirely institutional, telling in double spreads of some particular achievement of the company as an institution. No mention was made of individual products by trade name. The campaign was not designed to bring inquiries.

During the time when this campaign was running there was little or no demand for the household products formerly purchased in large quantities by property owners. This was due to several reasons. Price had gone up, which naturally restricted the demand, as people figured that painting was something which they could put off. Then came the building restrictions. There was not a great deal of activity in the dealer lines while there was tremendous activity in the larger bulk lines.

The large advertising campaign was decided upon, as it had always been a policy of the company to strike out boldly when others were holding back. There was very little paint advertising competition in the publications at the time, which gave this campaign particular prominence and brought about the desired result of making the name and the scope of the institution better known. It presented an opportunity to tell the public about many of the new activities of the company, such as the manufacture of dyes, chemicals, disinfectants, coal-tar products, etc., in addition to the old-established lines of paints, varnishes and insecticides.

THE PRESENT NEED.

Then came peace which brought a heavy demand for the old dealer lines of paints and varnishes from property and building owners. Painting had been put off for two or three years. Building had been restricted. Now the people were realizing that on account of the high replacement cost of building materials, painting could not be put off much longer. With the taking off of building restrictions great activity followed along these lines.

This meant that there would be specific demand for the company's leading specialties by trade name, a factor that could not be overlooked. The institutional plan had made a decided impression and should be retained.

The solution, therefore, was to retain the "Sherwin-Williams Products" with a touch of institutional copy and to incorporate by groups into the new campaign the leading specialties which the company wanted featured.

This was worked out by retaining practically the same general treatment of the double spreads as in the last campaign, and by adding illustrations in circles showing the use of various specialties.

Groupings were arranged according to seasons, with reference to demand for exteriors or interiors, from home-owners or from manufacturers, etc.

By keeping before the public the institutional thought, and at the same time featuring the leaders, like SWP House Paint, Flat-Tone Wall Paint, Mar-Not Floor Varnish, Rexpar Outside Varnish, etc., it is logical to assume that the question has been met in a satisfactory way. The campaign retains the bigness of the former idea and adds an effective means of acquainting the public with the specific trade names of the articles manufactured.

The company's new plan comprehends an extension of its direct-mail and dealer display service, built around the intention of continuing to make its retail agency as attractive as possible to the old agent and to the prospective agent.

The company's sales for its fiscal year closing August 31, 1919, indicate a realization of the "Million A Month Gain" campaign launched a year ago. The sales reflect directly a condition shown by an investigation among the company's agents and dealers. In this investigation the market situation was reported satisfactory, with brisk demand. Eighty-one per cent of the dealers reported good sales conditions, in spite of the price situation.

The price advances have been due to unprecedented linseed oil, turpentine, and other raw material costs. Only a small percentage of the dealers reported that there was a deferring of purchases on account of the price, and even these stated that the smaller lines were selling well and that only big orders were being held up.

The situation appears to be somewhat similar to that in the automobile field where it is a question, as Ned Jordan says, whether there will be enough automobiles to go around. It is evident that there will not be enough paint and varnish to go around.

Manufacturers who have been operating on a big bulk production have been forced to switch to a peace-time property-owner production without a long preparation period. Many manufacturers advised the retail trade to get orders in early, but orders were smaller than usual. When spring came, dealers deluged the manufacturers with orders, and there appears to be a genuine realization on the part of the public that paint primarily preserves property, whereas the old concept used to be that paint primarily beautified property. As a matter of fact it does both, and painting cannot be put off without genuine economic loss.

I am giving up my Readjustment Period page this week to the reprint of an article which I think has extraordinary suggestive value. Read it carefully.

Financial News

Business Uncertainty Temporary.

The business uncertainty which has been occasioned by general industrial unrest and by the focusing of attention on the prevailing level of prices is described as temporary by the National Bank of Commerce in New York in its monthly discussion of the money market.

"In this respect," the bank says, "there would not seem to be grounds for undue apprehension. The business activity of the country is based on fundamentally sound and essential production. With due consideration given to producing costs, the price-level agitation does not threaten general business activity, and losses resulting therefrom should fall mainly on speculative profiteers. Furthermore, as the Federal Reserve Board has pointed out, the existing level of prices has not resulted from an undue inflation of currency.

"There is another aspect of the situation, however, which is receiving too little consideration—namely, the importance which our foreign trade has assumed in relation to our total trade. During the war, production was expanded to meet a good share of the needs of the world. Our industries have been committed to an output greater in many respects than domestic markets can now absorb, so that the continuance of domestic prosperity is involved with our foreign trade. For the fiscal year ending June 30, 1919, the balance of exports to Europe over imports totaled about $4,250,000,000. During the same period, credits extended by the Government to the allied nations amounted approximately to $3,250,000,000. In a word, our exports were financed by ourselves, through the Government, on a long term credit basis. In the present year, however, sums available for such financing are negligible.

"The permanent maintenance of the high level of war exports is not desired, but our own continued prosperity demands that readjustments be effected gradually. The needs of the countries of Europe are common knowledge. Their inability to pay for supplies at once in either gold or goods requires no reiteration. What must be appreciated is that under existing circumstances we cannot afford not to sell to Europe; and that consequently the problem of financing our exports is most urgent.

"Bills are pending in Congress which would provide the legal basis for the formation of financing corporations. There is an unfortunate tendency to hope for salvation by legislation—to delay action pending the enactment of a law. The situation calls for the direction and leadership of men who will work out plans, enlist the co-operative efforts of industry, build up an organization, and go at the matter in hand. Such elements of leadership, which would give meaning to whatever laws may be passed, and would make such measures a success, are not now distinctly in evidence."

Westinghouse Earnings Show Large Gain.

The business of the Westinghouse Electric & Manufacturing Co. has shown splendid recovery from the falling off incident to the slackening of structural activity following the signing of the armistice.

Bookings are now running at the annual rate of $100,000,000 and billings at $120,000,000, against actual billings of $160,379,943 in the year to March 31, 1919. For a number of months, after the cessation of hostilities, bookings fell considerably below a $100,000,000 rate.

The Essington plant is still busy on government turbine contracts. When this work is completed it is planned to move the turbine business from the East Pittsburgh plant and concentrate all the work of this character at Essington, located on the Delaware river outside of Philadelphia. The facilities thus released at East Pittsburgh will be devoted to the construction of electric locomotives. Contracts have recently been signed with the New Haven railroad for a number of these and with the growth of railway electrification equipment orders are expected to reach substantial proportions.

The company made a manufacturing profit of $31,108,387 on its $160,379,943 of gross in the 1919 year, or 19.3%. At the same rate in the present fiscal year the manufacturing profit on $120,000,000 gross would be approximately $24,000,000. After allowance of $10,000,000 for federal taxes, against $15,000,000 last year, a balance of $14,000,000 would be left for dividends, equal to $9.30 a share on the $74,812,650 preferred and common stocks.

General Electric to Bid for Foreign Trade.

That the General Electric Co. through its new $20,000,000 subsidiary, the International General Electric Co., plans to make a strenuous bid for foreign business, is the statement of one of its directors. The departure of President Swope for Europe lends color to the belief that announcement of interest to the electrical trade may be expected within a short time. The General Electric Co. has grouped all of its foreign possessions into one corporation, the International General Electric, of which $10,000,000 is 7% cumulative preferred and $10,000,000 common. All of this stock is reported to be in the treasury of the company.

Foreign Credit Corporation Formed.

Announcement is made of the incorporation of the Foreign Credit Corp., with capital of $5,000,000 and a paid-in surplus of $1,000,000, and with the following officers: President, Grayson M.-P. Murphy, vice-president of the Guaranty Trust Co. of New York; vice-presidents, G. M. Dahl and D. Raymond Noyes. The directors, of whom President E. V. R. Thayer of the Chase National Bank is chairman, will represent the banks in New York and elsewhere that are stockholders of the corporation. The corporation, organized under New York laws, is believed to be the first company formed in this state to do primarily an acceptance business. It will be interested chiefly in the financing of exports, though it will have other broad powers and will accept drafts of both foreign and domestic clients. The manager of the company will be Mr. Noyes. Albert Breton, vice-president of the Guaranty Trust Co. of New York will be the chairman of the executive committee.

Duquesne Light Issues Bonds.

The Public Service Commission has granted permission to the Duquesne Light Co. to issue bonds for $25,000,000 and notes for $2,000,000, to be used in part for the construction of its proposed new power plant at Cheswick, Pa. Initial construction work on this plant is well under way; the structure with machinery and equipment is estimated to cost about $15,000,000.

Dividends.

General Electric Co. has declared a dividend of $2 per share, payable Oct. 15 to stock of record Sept. 15.

The board of directors of the Canadian General Electric Co. has declared a quarterly dividend of 2%, also a semi-annual dividend of 3½% on preferred stock, payable Oct. 1 to stock of record Sept. 13.

New York Edison Co. has declared a quarterly dividend of 1¾%, payable Sept. 14.

Galveston-Houston Electric Co. has declared a semi-annual dividend of 3% on preferred stock, payable Sept. 15 to stock of record Sept. 3.

Arkansas Valley Railway, Light & Power Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Sept. 15 to stock of record Aug. 30.

Muskogee Gas & Electric Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Sept. 15 to stock of record Aug. 30.

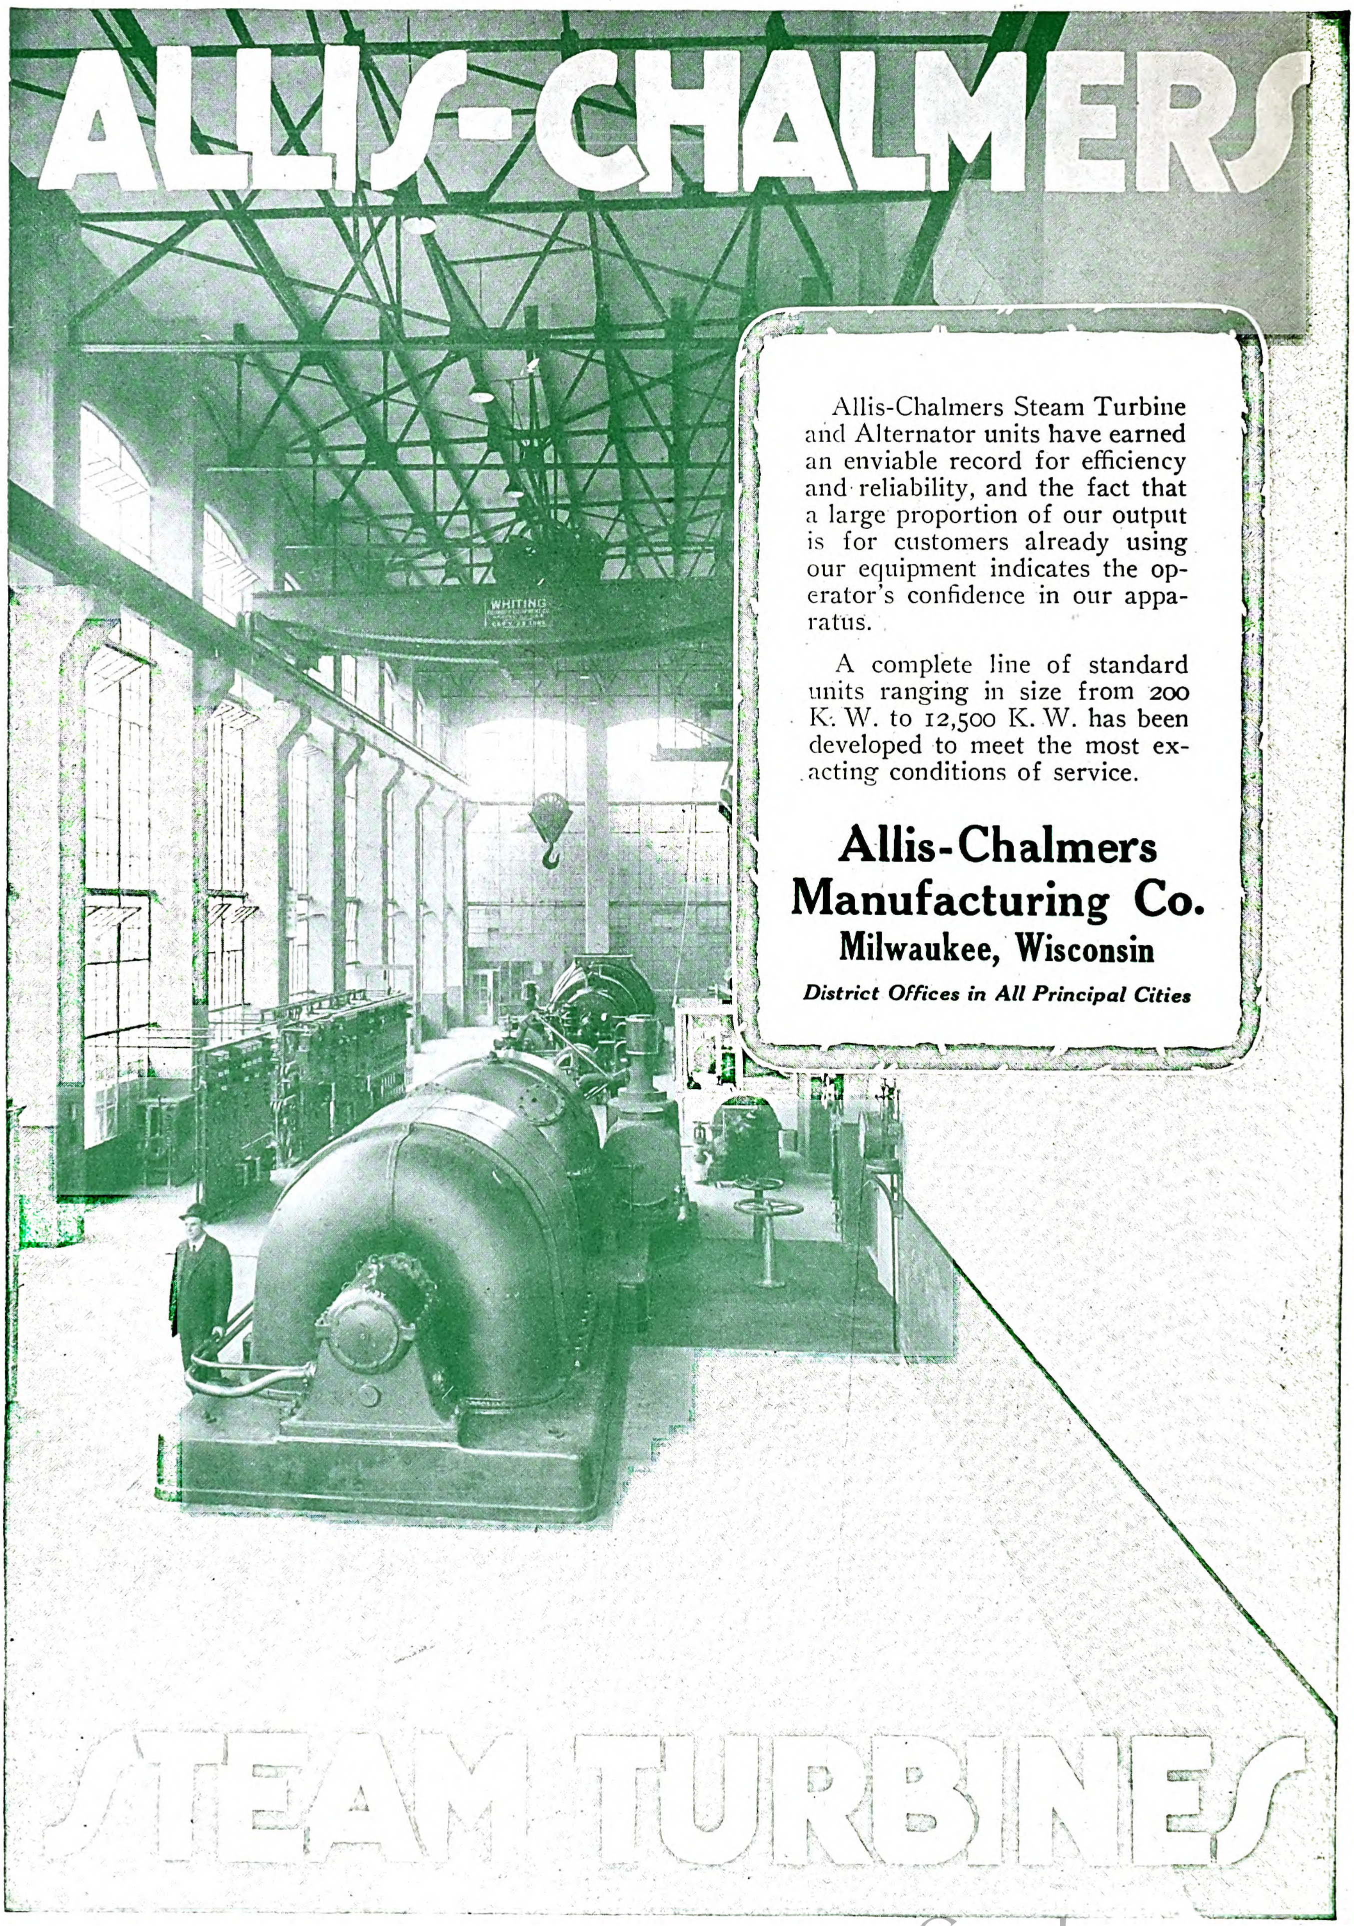
Electrical Review

Vol. 75. No. 11. CHICAGO, SEPTEMBER 13, 1919 Three Dollars a Year



ALLIS-CHALMERS
WHITING
Allis-Chalmers Steam Turbine and Alternator units have earned an enviable record for efficiency and reliability, and the fact that a large proportion of our output is for customers already using our equipment indicates the operator's confidence in our apparatus.
A complete line of standard units ranging in size from 200 K. W. to 12,500 K. W. has been developed to meet the most exacting conditions of service.

Power-Factor Correction by Use of the Static Condenser

Characteristics of Static Condenser Installations—Causes of Low Power-Factor — Operating Costs and Purchase Price — Paper Before Pennsylvania Electric Association

By O. C. ROFF

General Electric Co.

THE importance of maintaining a high power-factor on the system is generally recognized by operating companies. Low power-factor represents a purely economic loss with a consequent reduction in efficiency. The law of conservation demands that equipment should be made to serve to the limit of its capacity, and to accomplish this it follows that alternating-current apparatus should operate at the highest possible power-factor.

The detrimental effects of low power-factor conditions are similar to an insidious disease, and often become a distinct menace before the gravity of the situation is appreciated.

While in all instances the character of the load imposed on the distribution system should be carefully scrutinized, and preventive measures taken wherever possible to avoid an undesirable power factor, it frequently happens that such precautions alone are not sufficient. It is then necessary to adopt some corrective means and the static condenser offers a solution of the problem in many such cases.

FEATURE OF STATIC CONDENSER INSTALLATION.

The static condenser, as the name implies, is devoid of any moving parts and is extremely simple in operation, requiring practically no attention aside from throwing the necessary control switches to connect or disconnect the apparatus from the system. The

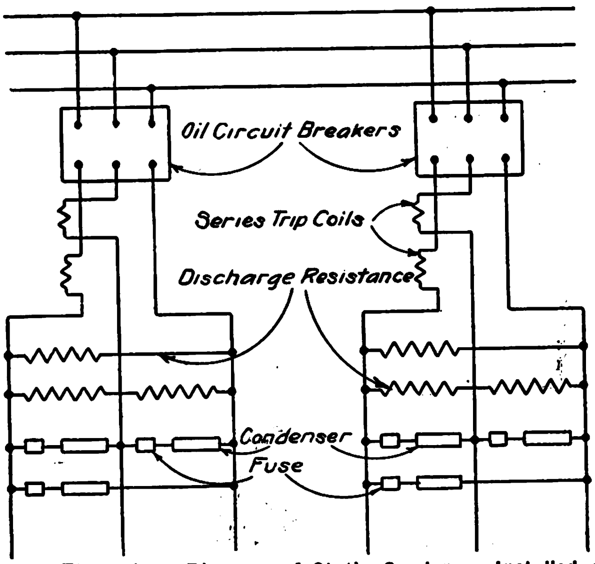

Fig. 3.—Elementary Diagram of Static Condenser Installed on Three-Phase Circuits.

condenser units are immersed in oil in hermetically sealed metal cases and mounted upon racks. The number and grouping of the units is dependent upon the kv-a. capacity and the number of phases.

A series reactance for the purpose of excluding all possibility of resonance with the higher harmonics is inserted in each phase.

The synchronous motor or converter, when over-excited, acts as a capacity for the fundamental frequency, but is dead for the higher harmonics, and the static condenser is made equivalent to the synchronous condenser by the introduction of this reactance.

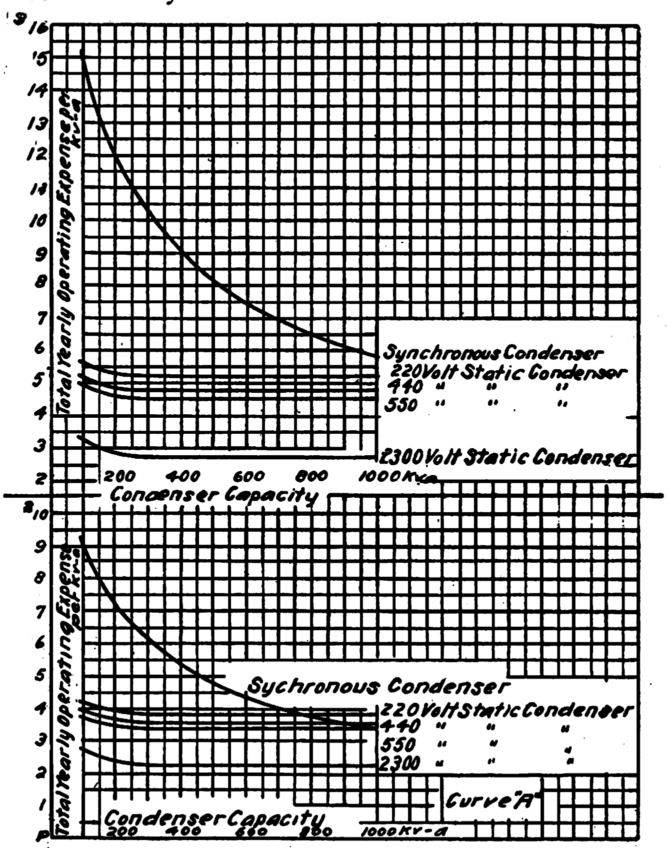

Fig. 4.—Total Yearly Operating Expense per Kv-a./Kv-a. Capacity on Basis of Full-Load Operation 7000 Hrs. per Year. Capital Charge 15% per Year of Purchase Price.

Upper Curves: Losses charged at 1½ ct. per kw-hr. Lower Curve: Losses charged at ¾ ct. per kw-hr.

Discharge rods of high resistance are arranged across each phase of the equipment, where required, so that when disconnected from the system any charge will be dissipated.

As an additional precaution for the protection of the condenser units, and to increase the reliability factor of the equipment, a fuse element is inserted in series with each unit.

On account of the active element of the condenser units being immersed in oil, the insulating properties are greatly increased, which consequently insures long life with resultant low maintenance. The equipment can easily be housed for outdoor installation along transmission lines or remote locations.

Static condensers can be arranged for mounting in tanks to provide for subway installation, or in

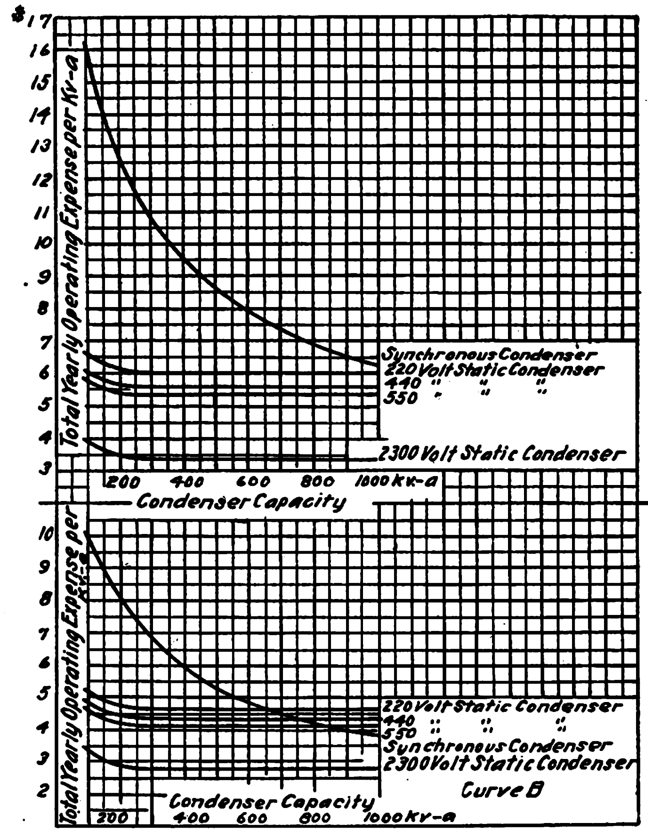

Fig. 5.—Total Yearly Operating Expense per Kv-a./Kv-a. Capacity on Basis of Full-Load Operation 7000 Hrs. per Year. Capital Charge 20% per Year of Purchase Price.

Upper Curve: Losses charged at 1½ ct. per kw-hr. Lower Curves: Losses charged at ¾ ct. per kw-hr.

capacities up to approximately 20 kv-a. for pole mounting.

The equipments have been standardized in capacities from 60 to 300 kv-a., preferably in 60 kv-a. steps, and for all commercial voltages from 220 to 2300 volts.

As it is impossible to produce an economical design for 550 volts or below for direct operation, it is necessary to utilize autotransformers for stepping up the potential for the condenser units.

The frequency of the circuit is also closely related to the characteristics of the equipment, due to the fact that the current in a condenser with a given voltage is dependent upon the frequency. By reason of this, static condenser outfits become correspondingly expensive on frequencies less than 40 cycles.

An elementary diagram of the equipment is shown in Fig. 3. The simplicity is a factor which produces a low maintenance.

The following summary of the pertinent characteristics of the static condenser render it particularly adaptable as a power-factor corrective device:

(1) Total absence of moving parts insure practically noiseless operation.

(2) Due to the simplicity of its control and operation, which amounts to merely connecting or disconnecting the apparatus from the system through the medium of an oil switch, the minimum amount of operating attendance is required.

(3) By virtue of their construction, condenser equipments can be installed in remote locations or distributed over the system in small units as the situation may demand. This puts the correction at the source of the poor power-factor, and allows the maximum advantage to be obtained, as the transmission losses of the wattless component are eliminated.

welding equipments, underloaded induction motors, and unwieldy distribution networks, composed of oversized transformers.

Naturally, lightly loaded transformers introduce considerable reactance into the system, and when low power-factor exists excessive current must be transmitted with the consequent necessity of increased transformer capacity. It follows, therefore, that such transformers under light load at off peak periods tend to still further reduce the power-factor. A large number of such oversized transformers distributed over the system are consequently productive of a greatly lowered over-all system power-factor.

While the regulation of transformers is inherently good, nevertheless it is a factor which is considerably affected by low power-factor conditions.

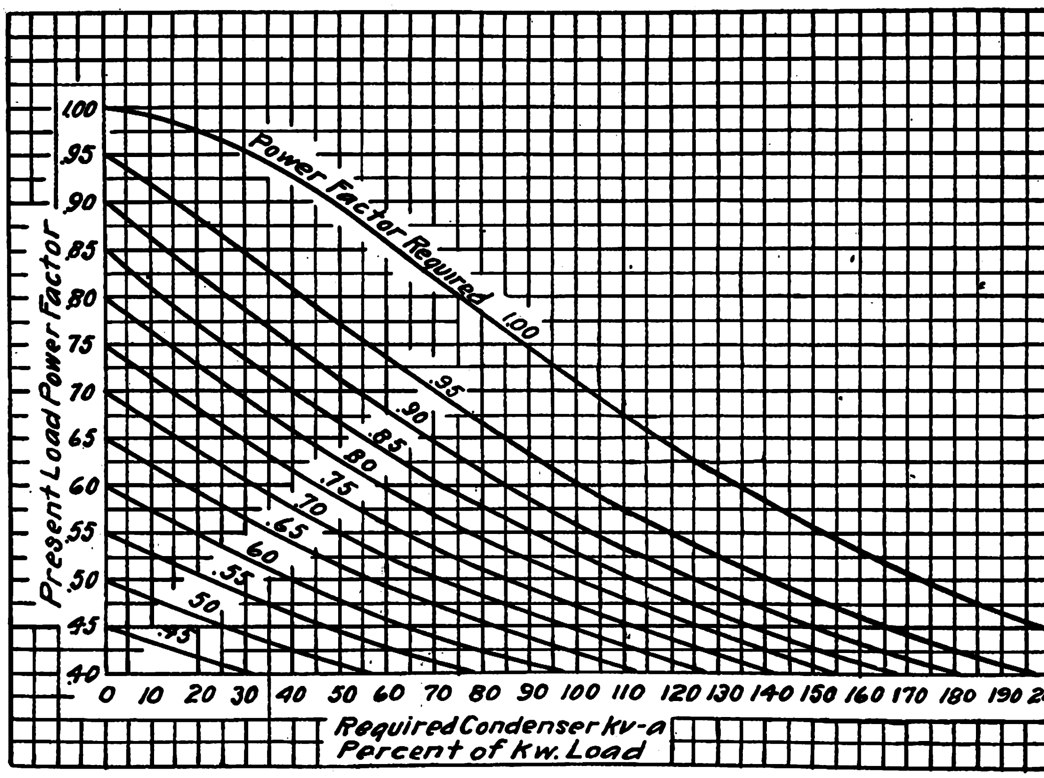

Fig. 6.—Curves Showing Condenser Kv-a. Required for Any Desired Power-Factor Correction in Per Cent of Existing Kilowatt Load.

(4) No expensive foundations are necessitated for the installation.

(5) The high efficiency of the apparatus, better than 99% for direct application, results in good operating economy which when capitalized is a valuable asset.

The location of the equipment is of paramount importance, for to secure the best results the correction should be made at the source of the wattless current and thus avoid the transmission of this component, thereby decreasing line copper losses.

It might even be found advantageous on long feeders with a large number of distribution circuits emanating therefrom, to install small condenser units with each distribution transformer, thereby obtaining a balanced corrective effect over the entire network. Such an arrangement would obviate the transmission of wattless current, and in many instances be preferable to confining the corrective apparatus at a central distribution point.

Causes of Low Power-Factor.

The conditions producing low power-factor are many and varied, such as electric furnace loads, arc

Small lighting transformers have a regulation ranging from 1½ to 2% at unity power-factor with a reduction in this characteristic of from 4 to 5% at 70% power-factor. In the case of larger units, with a regulation of 1%, this value would be lowered to 3% at 70% power-factor.

The detrimental effects of a poor power-factor are even more apparent in generators than in transformers and is productive of both a decrease in kilowatt capacity and efficiency. Not only will such a condition impair the voltage regulation, but often demands increased exciter capacity to overcome the demagnetizing tendency of the lagging power-factor current set up in the armature.

As a consequence the field heating of alternators is greatly augmented, while the increased energy input and decreased energy output considerably lowers the efficiency.

It is, therefore, evident that a relatively high leading power-factor is more efficient than a low lagging power-factor, for the voltage will be maintained at a higher value with a corresponding decrease in excitation, owing to the fact that the generator will be partially excited by the capacity current in the armature winding. The detrimental effect of low power-factor is further emphasized when it is considered that the regulation of modern alternating-current generators is approximately 14% at unity and drops to 30% at 70% power-factor.

The question of the flexibility factor of the static condenser is closely related to the foregoing, but it will be found in the majority of cases that the reduced power-factor at light load periods is offset by the comparatively high condenser capacity, so that the power-factor will improve at this point and possibly advance to a leading value.

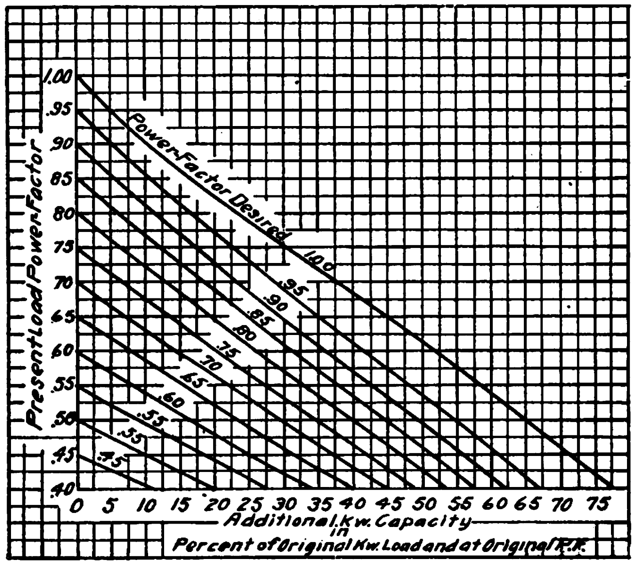

Fig. 7.—Curves Showing Additional Kilowatt Capacity Made Available by a Given Correction of Existing Power Factor.

If, in extreme situations, automatic operation is justified, it can be accomplished by the introduction of a time switch or other automatic features.

The effect of lower power-factor on the distribution circuits is even more pronounced as evidenced by the following example:

Assume that a load of 100 kw. is to be transmitted a distance of two miles at 2300 volts, three-phase, 60 cycles, with an energy loss of 10%—each conductor at unity power-factor would require an area of 25,000 c.m., at 0.9 power-factor 30,820 c.m., while at 0.60 power-factor it would necessitate the use of 69,500 c.m.

It is thus apparent that it will require 2.8 times as much copper at 60% power-factor as at unity.

If the initial cost is capitalized, it will be found that the increased copper demanded will cost somewhat less than a static condenser of sufficient size to accomplish the same result, but it is evident that the gain in the available capacity of generators, transformers and lines would justify such cost differential.

A few of the benefits derived from an improvement in power-factor may be summarized as follows:

(1) Makes possible the meeting of increased demands without the purchase of additional generating equipment, and this refers not only to the generators themselves, but to the necessary prime movers and auxiliary apparatus.

(2) Permits additional load being carried on existing distributing feeders, which might otherwise be fully loaded with the low power-factor existing.

(3) Effects a material saving in present transmission losses.

Operating Costs and Purchase Price.

The extremely moderate operating cost and approximate prices of static condenser equipments are illustrated by the curves shown in Figs. 4 and 5.

The total yearly operating expense referred to in the curves comprises two items, one a capital charge at some assumed percentage of purchase price of the equipment in question, and the other representing the cost of furnishing the losses of the equipment at an assumed number of hours per year operation at full load charged at a stated price per kilowatt-hour.

Application of the Static Condenser.

The determination of the size of a static condenser equipment required to correct the power-factor of a given load is graphically illustrated by the curves in Fig. 6.

A concrete idea of the saving made by correction of the power-factor is emphasized by the curves appearing in Fig. 7, which show with a given improvement in power-factor the amount of load in kilowatts at the original power-factor which can be added to the system. It is assumed that the circuit was carrying the maximum amperes before the correction was made.

If, however, when the correction is accomplished, only the load on the circuit at that time was considered, the addition of more load at the original power-factor will cause a consequent reduction in power-factor, and this point should be considered, if it is desired to maintain a certain power-factor and keep the line loaded to a maximum carrying capacity. Fig. 7 illustrates the resultant power-factor for different corrections, assuming that the line is again loaded to capacity. The solution of practically any power-factor problem may be developed from the use of the curves appearing in Figs. 6, 7 and 8.

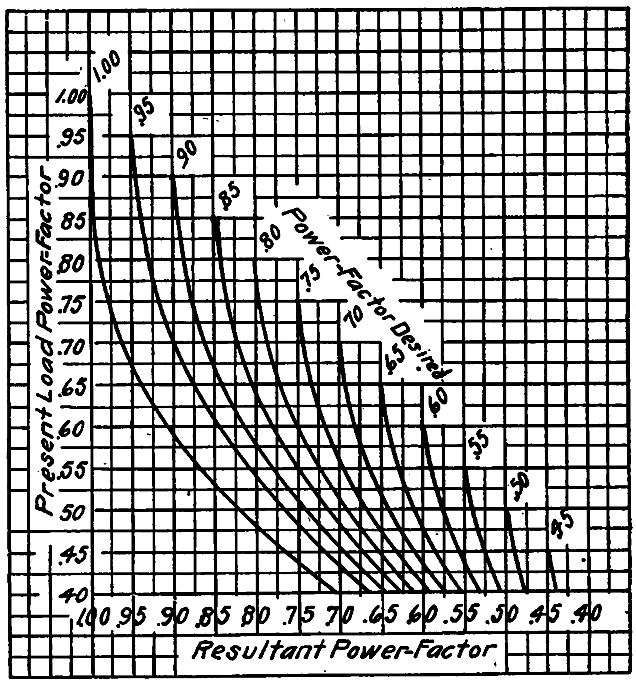

Fig. 8.—Curves Showing Resultant Power-Factor.

Determined by original load at corrected power-factor plus additional load at original power-factor so that total kilovolt-amperes of circuit is equal to original kilovolt-amperes.

The problem of power-factor improvement is at the present time closely allied with the question of rates, and numerous remedies for bettering conditions are either being utilized or are under consideration. Prominent among such corrective measures are the enforcement of power-factor penalty clauses or metering on the kilowatt-ampere basis.

The rapid growth in load so frequently encountered illustrates the necessity for a rather generous attitude on the part of the public toward the utility, so that the increase can be properly taken into account and the best interest of both the public and company conserved.

The importance of power-factor is appreciated more and more by engineers, but there is still the need for more organized co-operative effort toward the betterment of power-factor conditions in alternating current systems. This tendency is particularly apparent in many sections of the country, especially where large individual users of power are scattered over the system, and without doubt will ultimately be more seriously considered as a vital element of power distribution and transmission.

FRENCH MARKET FOR ELECTRICAL GOODS.

Report by American Chamber of Commerce in France.

In a recent report made by American Trade Commissioner Charles P. Wood during his investigations in France in regard to the possibilities of marketing American electrical goods, he stated that prior to the war a considerable amount of electrical goods was imported from Germany by French dealers in competition with other dealers handling French-made goods. It is thought that most of the inquiries in this line now come from the former class of dealers, who have lost their connections and who, naturally, have no claim on French manufacturers already represented.

American underwriters' standards are not necessary in France. French houses are more nearly fireproof than American houses and the same precautions do not have to be taken. American dealers exporting to France will have to furnish French patterns in several fittings that differ essentially from American practice. Among the more common instances will be: Bayonet sockets instead of screw sockets, tumbler switches instead of snap switches, sheet-metal tube with crimped joint and lined with treated paper instead of heavy metal conduit. This light conduit employs sleeve unions instead of screwed joints.

There have been inquiries regarding the conduit mentioned above, which is scarce in France at present. Other inquiries refer to: Multipolar snap switches, flush-type push button switches, all fittings requiring hard rubber in their manufacture, high-candlepower low-volt incandescent lamps for motion picture machines.

While there is a certain demand for the importation of electrical goods in France at present, and while it is undoubtedly worth while to solicit this business and to take orders, if possible, it is also well to bear in mind that there are French factories well equipped for making a full line of electrical goods and that their production will be on the increase. Therefore orders taken during the present emergency, should not be considered an indication of a considerable future demand, except in the case of specialties controlled in America.

NEW HYDROELECTRIC INSTALLATION FOR MADAGASCAR.

Plant of 3000-Hp. to Be Built with Fifteen-Mile Transmission Line.

The installation of a water and electric-light system for Tamatave, the principal port of Madagascar, is under consideration by the authorities and the project has the approval of the Governor General.

The electric current is to be furnished by waterfalls situated 10 to 15 miles west of Tamatave, in the Ivondronó river. In view of the capacity of these falls, estimated at 3000 hp., it is agreed that in addition to the municipality of Tamatave the colony of Madagascar and dependencies should also become interested, and that this water power should be made available in order to furnish power for the general future needs of the colony in connection with such important undertakings as the electrification of the railway from Tananarive to Tamatave, a distance of 229 miles, electrometallurgical and electrochemical industries, etc. It is proposed, therefore, that the colony undertake the harnessing of this water power, which would necessitate the building of a dam, reservoirs, canals, and a power plant. The obligation of the municipality will thus be reduced to the installation of two groups of turbines to furnish 500 kw. of alternating current, power cables, transformers, and the distribution of water in the town of Tamatave. The colony's expenses in this connection will, it is estimated, be $120,625, and those of the municipality of Tamatave $236,425.

It is being considered whether it will be better to have all of this work done under contracts to be awarded on bids or to have it undertaken by the local services. Whatever might be decided, however, it is admitted that the first part of the work—that which is to be undertaken by the colony—should be awarded only to contractors in the colony, and proposals for the second part should be submitted concurrently in the colony and in France. As a rule, all contracts for public works in Madagascar are awarded to French citizens only.

INTERESTING BOOKLET DESCRIBES CHICAGO ELECTRICAL SHOW.

Amusing Report by Well-Known "Japanese School Boy" Describes Features of Coming Exposition.

An interesting and amusing pamphlet entitled "The Japanese School Boy Learns of the Land of the Wonderful Lamp" is being distributed by the Electrical Trades Exposition Co. describing the Electrical Show to be held in Chicago Oct. 11 to 25. In this pamphlet the Japanese school boy, originated by Wallace Irwin, relates in his most amusing style an interview with E. W. Lloyd, general manager of the show. in which he describes its features and attractions, and supposedly is given the Herculean task of arranging the display before the show and of serving tea to its lady visitors.

The booklet is attractively illustrated with views of the various Chinese display booths, all of which are pleasingly decorated and designed to fit into the general decorative scheme.

Copies of this booklet can be obtained by writing E. W. Lloyd, general manager of the Chicago Electric Show, Edison building, Chicago.

Practice in Making Electric Utility Appraisals

Discussion of the Value of Unit Costs and Necessity for Care in Their Preparation — Practical Methods of Appraising the Land, Buildings and Pole Lines

By CHARLES W. McKAY

Chief Appraisal Engineer, L. V. Estes Incorporated, Chicago.

THE importance of the subject of unit costs in appraisal work can hardly be exaggerated. No matter how carefully the inventory may be prepared, nor how accurate it may be, it is worse than useless if the unit costs used in its appraisement are faulty. To illustrate:

Let us assume that a certain electric utility plant contains 1000 30-ft. 7-in. poles and that the field men in recording the inventory have observed the utmost detail in describing the condition of the poles, noting whether or not they are stepped, painted, butt-treated, etc., in short that the inventory represents an extremely accurate record of the conditions actually existent in the plant. Such an inventory should result in a splendid appraisement, if reasonable care is exercised in preparing the unit cost. Obviously, it will be necessary to derive but one unit cost and this cost will be multiplied by 1000 to obtain the total cost of the 1000 poles. Hence, even a slight error in the preparation of the unit cost may result in a grievous error in the appraisement. Assume that due to some mistake in computation, or in the basic assumptions, the unit cost is $1.50 too low. There will be a resultant appraisal error of $1500.

Methods of Determining Unit Costs.

The unit cost, it should be remembered, includes not only the cost of material used in plant construction but also the cost of the labor necessary to install such materials as a part of the operating plant.

As a prelude to a more detailed discussion of the subject of unit costs, it may be well to say that there are two prevalent methods of determining the costs used in electric utility appraisement. One of these methods is known as the "trend method" and the other as the "average method."

In the trend method curves are plotted showing the prices prevalent for the various materials used in electric utility construction; the slope of these curves is determined for the period immediately antedating the appraisal and the curves are extended, or projected, to predict future material prices. A similar process is followed with respect to labor costs. In other words, when it comes to a final determination of the unit cost, the *trend* of material and labor costs is considered.

This method has not found favor with many of the state commissions and for this reason it will only be mentioned as a factor in public utility appraisement. No attempt will be made to enter into a discussion of the merit of this method, as advanced by its defenders. The writer is of the opinion that the trend method is obsolescent and quite unsuitable for use in these days of abnormal prices.

In the average method of determining electric utility unit costs, a careful investigation is made of all material and labor costs for a period of five years or more antedating the appraisal and the results obtained by averaging these costs are used as a basis for determining the unit costs. The word "basis" is used advisedly in this connection. The exact average as obtained by the consideration of the costs prevalent over a given period is not always suitable for use in appraisal work. The individual peculiarities of every case must be considered and an effort made to so reconcile these peculiarities as to determine a *fair* cost. Such a fair cost may, or may not, be an average cost, although in applying the average method the *average* cost is a guiding factor in determining

Suggestions for Making the Appraisement Dependable.

IN previous articles of this series it has been shown that valuation of the utility's property is a usual accompaniment of rate cases in which the utility is involved. This valuation must be quite accurate and yet made with reasonable speed and at as moderate a cost as possible. The first feature in the valuation is the inventory and this Mr. McKay discussed in his last article (see August 9 issue), showing methods for systematic counting and recording of the data. In the present article he makes valuable suggestions for determining accurate unit costs to facilitate setting down the actual appraisement figures.

This article is the fifth of a series of twelve by Mr. McKay covering the subject of valuation and rates, as related especially to electric central-station companies. The first article appeared in the issue of May 17 and presented a general introductory discussion of modern ideas of utility regulation. In the second article (issue of June 7) there was a compilation of the principal terms used in this work and definitions thereof. Why reproduction cost is now used as the basis of appraisement was discussed in the third article, in the June 28 issue. The actual inventory was the topic taken up in the fourth article, August 9 issue. Several other articles dealing with appraisement will be included before other topics bearing on rate-making will be taken up.

Throughout this series it is the author's aim to present the principal features of valuation and rate-making in a simple and understandable manner that will make clear to the central-station manager and engineer, as well as others interested in the subject, the fundamental basis of modern practice in utility regulation.

what is to be taken as the actual fair cost in the particular case.

With this brief resumé of the theory of the unit cost derivation we may proceed to a consideration of the appraisement of the inventory discussed in the issue of the Electrical Review for August 9.

Land Appraisement.

It is interesting to note that several of the leading public utility commissions have taken the stand that neither the utility companies nor the engineers who represent them are competent to testify as to land values. In the writer's opinion this point is not well taken, but nevertheless it is well to bear it in mind in preparing a case for presentation before a commission that has put itself on record as holding such a prejudice. Be it understood that the foregoing statement is by no means intended as a criticism of the method of procedure of any commission—the fault may be laid at the door of several members of the engineering profession who have floundered in their testimony as to land appraisement, to the discredit of the entire profession.

Use of Land.—There has long been a difference of opinion between public utility appraisal experts as to whether or not *use* should be a factor in the determination of the value of the land occupied by electric utility companies. One faction argues that there is no real reason why land, or right of way, belonging to, say, an electric railway company, should be treated any differently from land belonging to a private individual. The other faction argues that the mere fact that the railroad is present raises the values of adjoining properties and therefore automatically raises the value of the land, or right of way, under appraisement. There is undoubtedly much to be said in favor of this argument, but one point should be carefully borne in mind and that is that if this policy be adopted in one case it must, to be consistent, be adopted in all cases, at least in the same appraisement. While the presence of an electric railway may increase surrounding property values it is equally true that the presence of a large central station using soft coal, let us say in a residential district, may cause a decrease in surrounding property values and the utility company owning the central station must suffer a depleted valuation of its land.

The attitude of the courts on this subject is evidenced by the following quotation from the case of Columbus Southern Railway *versus* Wright (151 U. S. 481):

"The value of the land depends largely upon the use to which it can be put, and the character of the improvements upon it."

Method of Appraising Land.—Two methods have been advanced for the appraisement of land in public utility rate cases, the one known as the "expert method" and the other as the "sales method."

The expert method consists in the appraisement and description of the land by one or more competent real-estate experts, or appraisal engineers, the valuation as thus determined being substantiated by expert testimony on the witness stand. Sometimes a modification of this method is adopted by having a local real-estate expert make a valuation of the land, submitting his findings to the commission, and subsequently to have the appraisal engineer make an entirely separate investigation and submit his findings to the commission. The commission's engineer, having both of these valuations before him and having cross-examined the witnesses to his entire satisfaction, may take upon himself the problem of assigning the final value of the land to be included as evidence in the rate case.

Again, it may happen that as many as three or four experts may be called upon to evaluate the same parcel of land. Subsequently their valuations may be compared and a final value assigned by the appraisal engineer as evidence to be presented to the court or commission.

The sales method of evaluating public utility land requires a careful study of land values in the territory contiguous to the land under appraisement and as a result of this study the derivation of a unit cost to be used for valuation purposes. This unit cost may consist of a cost per square foot, cost per front foot, or a cost per acre as the case may require. The value of the adjoining land is determined by examining records of sale or transfer at a time as nearly coincident as possible, to the date of appraisement. In some cases tax-assessors' valuations are used as a basis for determining the unit.

In a decision, dated March 8, 1910, the Wisconsin Railroad Commission (in the case of State Journal Printing Co. *versus* Madison Gas & Electric Co.) discussed the sales method of evaluating real estate at some length. The case is a historic one and excerpts from the Commission's decision are quoted herewith.

"The sales method of valuing real estate was used partially in the Michigan railway appraisals of 1900-01, and in the light of the experience gained in that work the method was adopted in the Wisconsin steam-road valuation made under the provisions of the ad-valorem-assessment law of 1903. It has since been extensively used in Wisconsin and elsewhere in connection with important valuations of public service properties for both rate-making and taxation purposes, and is generally accepted as a valuable aid to the judgment by experts engaged in such valuation work on a large scale.

"The sales method may be defined as a plan or process for the systematic collection and comparison of data relating to real-estate transfers for the purpose of estimating true market realty values. It consists in a study of the transfers of neighboring property having conditions or characteristics similar to the land whose value is to be determined, and is intended to duplicate, as nearly as may be, the mental or judicial processes ordinarily employed by the so-called 'local real-estate expert,' with a view to arriving at results approximating those which would be reached by such local expert acting without bias or suggestion.

"The sales method is capable of application in a variety of ways, in fact, is as flexible in its possible applications as are the varied methods employed by individual local experts. Two interpretations of the sales method have been most commonly employed. In one of these the area and consideration in each sale of similarly situated land is found, and the average unit price—per square foot, per foot frontage, per lot, per acre, etc.—ascertained, and this unit applied to the tract under investigation.

"The other application of the method introduces what, in many cases, is believed to be an additional safeguard, consisting of the use of the average assessed value of adjacent or similarly situated lands in combination with an average ratio or percentage representing the relationship of the assessed value of transferred lands to the total consideration paid for such transferred lands in the district or locality under consideration, all of these figures being based on the 'ground values' exclusive of the improvements thereon.

"Such use of assessment figures is designed to introduce, as far as may be, the results of the judicial processes of the assessor, who, at least in theory, serves on behalf of the public as an unbiased expert in the matter of relative valuations, and who attempts to make allowance for the peculiar attributes or characteristics of individual parcels of real estate in any given locality or neighborhood of a city.

"In the broader and more flexible applications of the sales method, the expert adopts one or the other of the processes just outlined, or blends the two together in such fashion as to yield the most consistent and trustworthy final result. In the process of valuing a tract of land involving conflicting data, as in the case under consideration, the expert user of the sales method on this flexible basis derives a series of tentative results similar to the results representing the judgments of individual local experts.

"The judicial function involved in the discriminating selection of data and in the derivation of final results is exercised along essentially parallel lines with the two classes of experts here compared. The further act of the judgment in selecting a final preferred valuation figure in the light of a group of preliminary or tentative results is identical in the two cases.

"In the particular valuations here considered, the similarity of the basis is further emphasized by the fact that the results by the sales method represent the composite judgment of four members of the Commission's expert staff, as against an equal number of local real-estate experts employed by the company. . . . ."

Building Appraisement.

Given the inventory data specified in the article on inventory methods (see Electrical Review for August 9) and a complete set of floor plans, the appraisement of the buildings occupied by an electric utility company is an exceedingly simple problem. There are several ways in which such an appraisement may be effected. The buildings may be appraised by making a detailed estimate of the cost of all materials entering into their construction; they may be appraised by computing the total number of cubic feet of contents and applying a unit cost per cubic foot, or they may be appraised by determining the number of square feet of floor area and applying a unit cost per square foot.

It is probable that the first mentioned method is the best—that of estimating, with a considerable degree of detail, the amounts of the various kinds of materials entering into the building construction; estimating the cost thereof, and of the attendant labor necessary to erect the building. However, this method is somewhat laborious and it is thought that accurate results may be obtained, by specially experienced building appraisers, with the aid of simpler methods.

Knowing the type of construction—and most central-station buildings may be divided into a half dozen or more standard classifications—it is a comparatively simple matter to determine a unit cost per cubic foot of contents which may be used in the building appraisement. The use of this method, however, should only be attempted by one thoroughly versed in the appraisement of central-station buildings. Great care should be exercised to see that the unit costs are representative ones—especially in these times of high material prices and high wage rates. All unit costs derived upon the volume basis (cubic foot of contents, cubic yard of concrete foundation, etc.) should be carefully checked before they are used. If a building is appraised by the cubic foot method special attention and special treatment should be given to such items as stack, stack foundation, building foundations, piers, excavation, back-filling, etc.

There is still another point which should be most carefully investigated. Most central stations, whether hydraulic or steam, are located near a waterway. It frequently happens that quicksand is encountered in excavating for foundations. This, of course, appreciably increases the cost of the building foundations and provision for such a contingency should be made in deriving the unit cost used in appraising the building. The writer recently appraised a plant in South Dakota, where the central-station building was located a few feet from a stream. It was found that the brick stack cost the company $2500. Under ordinary conditions the concrete foundation for this stack should not have cost over $500 or $600. Something in the soil conditions near the central station made the appraiser suspicious of sub-surface quicksand. After a good deal of trouble the appraiser interviewed the contractor who built the stack and found that his suspicions were well founded. As a matter of fact the actual cost of the concrete foundation—including shoring, piling, pumping, extra concrete reinforcement, etc., amounted to nearly as much as the cost of the stack itself—over $2000.

In view of the fact that, in the case under discussion, the central station was located at the only logical site for a power house, the additional cost of building on quicksand could not be avoided. An allowance, therefore, for this cost was included in the reproduction cost of the power plant. As the foregoing illustration will indicate, it is most important that an investigation be made of the construction history of a central-station building in order to provide, insofar as possible, for such unusual contingencies.

A Practical Method of Building Appraisement.—The following method has been used by the writer in appraising the central-station buildings of electric utility companies.

Assume the case of a brick and concrete building —brick walls with concrete foundations. Assume further that the concrete foundations extend about four feet above the level of the ground. Measure the length and width of the building. Determine the average thickness of the concrete foundation wall and estimate, as closely as possible, the distance the foundations extend below the ground. Knowing the average thickness of the wall and its height (below and above ground) the cross-sectional area in square feet may be determined. Multiply the result by twice the length plus twice the width (in feet) of the building; this will give the total number of cubic feet of concrete in the foundation wall. Make a deduction for door and window openings and reduce the figure above obtained to cubic yards. Apply a unit cost per cubic yard which will include the cost of material, cost of mixing concrete and cost of placing.

Determine the average height of the building above the foundation wall, multiply the figure thus obtained by the length in feet and the result by the width of the building in feet. The result will be the displacement of the building, expressed in cubic feet. Apply a unit cost per cubic foot—this unit cost being weighted to correspond with the type of building under appraisement. It is assumed that the appraiser has a large amount of data available upon which to draw and from which he can select a suitable unit cost. Buildings with different types of roofs and different types of structural steel construction will have correspondingly different unit costs.

Estimate the number of cubic yards of concrete in the stack foundation and apply a suitable unit cost to cover the foundation in place, including material cost, cost of mixing and placing concrete. In this connection it is most important, as heretofore suggested, that the sub-surface soil conditions shall be determined and adequate allowance made in the unit cost for unusual conditions.

If the stack is of brick, determine the height and the average diameter. Build up a unit cost per linear foot of height and apply this unit cost to the total height in feet.

If the stack is of metal, determine the height, diameter and the gauge of the metal. Determine the cost of the material, estimate the cost of riveting and estimate the cost of placing. Stacks of this nature will usually be delivered in cylindrical sections ready for assembly and erection. Provision in the total cost should be made for freight and cartage charges.

There are firms who make a business of building stacks and it is well to obtain all possible cost data from these firms and, where possible, to have them check the cost as determined by the appraiser.

The Pole Line Appraisement.

In the final recapitulation of the inventory of the pole lines, all of the items of inventory are divided into groups according to their individual character-

[1]Western or red cedar.

istics. Poles are grouped according to height and top diameter; anchors according to size and type (patent anchors are separated from log anchors); guys according to size of strand and average length; crossarms according to length in feet and cross-sectional area in inches, etc. The next step in the appraisement is, therefore, the derivation of a suitable unit cost for each inventory group.

Unit costs applicable to the various classifications of poles are usually built up simultaneously, one study being made of material costs and another of labor costs. In determining the material costs, prices are obtained not only as of the date of appraisement but also for the several years preceding the appraisal. Table I presents the results of the pole-cost study made in connection with an actual appraisal. In this connection it should be noted that the appraisement under consideration was made some time ago and the prices, of course, are useless today. Prices as used in this series of articles are merely for illustrative purposes and should not be used in actual appraisal work. It is most unwise to quote prices in technical articles, or in books on the subject of appraisement, except for illustrative purposes. Prices vary so rapidly that there is always danger of misleading the reader.

In the first column of Table I the height of pole (in feet) is given; in the second column the top diameter (in inches) and in the last five columns quotations, over a two-year period, f. o. b. various points in the vicinity of the plant under appraisement. It will be noted in this particular case it was not necessary to examine prices over a five-year period. The reason for this will be apparent from the date of the price quotations. Prior to 1914 there was little change in pole prices for several years. The appraisal from which this illustration was taken was made in the latter part of 1916. Hence, the analysis of prices over a two-year period was sufficient. It proved the fairness of the unit costs used in the appraisement.

The next step in the derivation of the pole unit costs involves the determination of proper labor costs. Table 2 presents a rather complete analysis of the labor costs entering into the preparation and erection of electric light poles. The various operations are listed in the left-hand column (for pole sizes of from 25 to 35 ft., inclusive) and the corresponding costs for different diameters of poles are entered in the last six columns.

It will be noted that the item "supervision" is included in Table 2. Supervision, in this case, is limited to the direct supervision of the gang foreman, only the salary and expenses of the gang foreman and that portion of the salary and expenses of the supervising foreman which may be allocated to pole-construction work being included in the unit cost. The cost of general supervision—the supervision of general officers—falls under the collateral construction costs and will be discussed in a subsequent article.

Before preparing a study of the nature of the one illustrated in Table 2 it is necessary to ascertain the labor wage rates prevalent in the community in which the plant under appraisement is located and also to see that the labor rates used as a basis for the labor unit costs are not too high or too low, in other words, that they represent fair average prices for the four or five years antedating the appraisal.

Table 3 is in the nature of a summary of the studies presented in Tables I and 2. Fair pole prices, as determined from Table I, are shown in the third column. In the fourth column it will be noticed an allowance of 2% of the cost of the pole is added for waste and loss. Such an allowance is customary in

deriving unit costs for materials used in outside plant construction. The reason will be obvious when it is remembered that no matter how carefully materials may be handled, a certain percentage will be broken or lost. Naturally the amounts represented by this percentage will not be found in taking an inventory of the plant, but nevertheless the material was paid for at the time of the plant's construction. In the case of the poles the allowance of 2% is to compensate for poles that are broken in handling. A 2% allowance for waste and loss is used in the derivation of practically all of the unit costs for outside plant construction. This percentage has been determined from observation of a large number of actual construction jobs.

The fifth column of Table 3 is determined by adding the respective figures in columns three and four, in other words, it presents the total material and its costs. The sixth column (labor cost) is taken from Table 2, and the last column presents the complete unit costs.

The unit costs as derived in Table 3 are exclusive of painting and stepping. Where the poles are painted or stepped or both, it is necessary to derive additional unit costs. The derivation of such unit costs is illustrated in Tables 4 and 5. The method will be obvious and it is thought that no explanation is necessary.

Unit Costs for Pole Attributes.—In addition to the poles themselves placed, painted and set, there are several items that must be considered in connection with the appraisement of the pole plant—the pole attributes, as they have been aptly termed by one of the large midwestern companies. The pole attributes consist of crossarms, anchors and guys. Illustrative examples will be given showing the method of deriving the unit costs used in the appraisement of the pole attributes. These illustrations, together with a brief description, should suffice to show the reader how this phase of the work is handled.

Crossarm Unit Costs.—In deriving the unit costs used in the appraisement of the crossarms, it is first necessary to tabulate all data pertaining to crossarm prices for a period of several years antedating the appraisal, in much the same manner as that suggested for the pole plant and illustrated in Table 1. In a similar manner a representative wage-rate schedule must be used in computing the labor costs. Having determined the material and labor costs on a satisfactory basis, the appraisal engineer will then proceed to build up a unit cost per crossarm installed in the manner illustrated in Table 6. It will be noted that a complete bill of material is given (priced out at average material prices) and, after the total material cost is obtained, there is added an allowance for waste and loss and a labor cost for placing the crossarms. The unit labor cost of placing the crossarms is derived by estimating the daily cost of a gang necessary for placing crossarms and determining as accurately as possible the number of crossarms that such a gang would place ordinarily in one day; the total cost per day divided by the number of arms placed a day will give the unit labor cost. The time element (number of arms placed per day) is a most important one and may only be properly determined from extensive data showing the results of actual performances.

Cost of Anchors and Guys.—A similar method is adopted for determining the unit costs used in the appraisement of the anchors and guys. Table 7 illustrates the method of building up the unit cost for anchors and Table 8 that of building up the unit cost for headguys.

We have now completed a consideration of the method of appraisement of the land, buildings and pole-line equipment of an electric utility company. It may be well to again caution the reader that all costs used in the examples are merely for illustrative purposes and should not be used in appraisal work. The practice of prescribing appraisal costs in technical articles and in books on the subject of valuation is an exceedingly dangerous one. Prices change rapidly and, furthermore, prices that are suitable for use in one locality may not be in another, due to differences in freight rates or to some local condition. In every appraisement the unit cost problem should be carefully analyzed by an expert. No attempt should be made to use costs merely because they have been used in some other appraisal, or because they have been quoted in a technical journal.

The next article in this series will deal with the derivation of the unit costs for, and the appraisement of, the remaining items of outside plant—the conduit system, the underground wire and cable, the aerial wire and cable and the transformers. The question of inventory and appraisement of the items "Tools and Supplies" will also be discussed. The appraisement of the central-station equipment will be made the subject of a separate article in which there will be incorporated, in addition to the description of standard appraisal methods, a synopsis of "short-cut" methods which may be used for rough-and-ready ap-

PRIVATE OWNERSHIP SUPERIORITY DEMONSTRATED IN WORLD WAR.

E. N. Hurley, Former Shipping Board Head, Says Lesson Taught Is to Be One of Greatest Benefit to Country.

E. N. Hurley, formerly chairman of the United States Shipping Board, who has resigned after serving throughout the war, was asked if he would tell, as a sort of valedictory to the American people, what in his job had impressed him most. Mr. Hurley's opinion is valuable in that he knows both phases of industry, having risen from a railroad fireman to the head of one of the largest machinery concerns in Chicago.

"The efficiency of private ownership and operation as compared with public ownership and operation," was the answer, "and I believe this lesson, as it is brought home more emphatically to the American people, is to prove one of the greatest benefits we derived from the war.

"As new facts about the conduct of the war come out, as our experience in many fields of production is appraised, they will point, I predict, more unerringly to this same conclusion—the superior efficiency of private ownership. *All production centers on the cost*—you can't get away from that. Shift responsibility for the cost, for the best possible result under a given set of circumstances, and you shift the responsibility for efficiency. That is what we did on the Shipping Board, under the pressure of war's necessity, when the question of cost was forced into second place. We shifted the responsibility of the cost from private shipbuilding concerns to the Government.

"With the shifting of responsibility of cost to the Government, that keen interest in results which follows private initiative was gone. There you have the whole problem as between public ownership and private ownership stated. No way has been found to instill in public ownership the incentive that possesses private ownership to improve conditions of production.

"The cost-plus-percentage system was a great mistake, and from the start had a bad effect on the workmen and the management. No private concerns could have operated and paid their way on the wages paid under that system. On the basis of cost they could not have borrowed money from the banks. The whole proposition of government ownership is fine in theory; in practice the push of individual energy is missing.

"I don't know of a government-owned plant that produces more than two-thirds efficiency. When the manager has no dividend to strive for when the toll is paid, the slowing up is sure to follow. In the years to come some way may be found to keep incentive to best endeavor in men under government ownership, but until that is discovered that system may be classed as a failure."

ANOTHER MARITIME APPLICATION OF ELECTRICITY DEVELOPED.

Earl C. Hanson Devises Practical Method of Guiding Ships in Harbors by Electricity.

If a new electrical device now being perfected meets with expectations, much delay in ocean travel due to weather conditions will be eliminated in the near future. This has already been accomplished to a certain degree by the development of the radio compass. The new device, however, carries the electrical guiding idea further by enabling a vessel to enter and leave a harbor in all sorts of weather with comparative safety.

It was invented by Earl C. Hanson, of Los Angeles, Cal., and has already been turned over to the Navy Department where it will be put into practical application as soon as all its details are perfected. Tests are to be made at once at the naval base at New London, Conn., and later it is intended to give it a further trial in Ambrose channel in New York harbor using some of the large ocean liners for the test.

The device and the methods of application are comparatively simple. A suitable cable is laid in the ship channel through which is sent a low-frequency electric current. The current in this cable actuates devices on the ship which in turn set up a peculiar sound. This sound indicates when the vessel is directly over the cable. Any variation in the course away from the cable is indicated by visible indicators that show in feet the distance away from the cable. Several of the indicators and sounding devices may be located in the various parts of the ship.

By following these indications the ship can follow the cable line from the harbor line to the dock. Two such cables will be installed, one for ships entering the harbor and the other for those going out. The sound on each cable is different and there can be no confusion which greatly lessens the possibilities of a collision.

Along the cable at certain intervals a short section is insulated with lead. Through such sections no sound can come and therefore the man on listening duty can tell instantly how far the ship has progressed and by referring to the cable chart ascertain where the cable turns and dangerous places are and in which direction the ship must be steered to follow the channel.

Central-Station Rates in Theory and Practice

Tenth Article—Continuation of the Mathematical Analysis of Price Splitting When Value-of-Service Principle Is Followed—Conditions Under Which Price Reductions Are Desirable as Regards Earnings

By H. E. EISENMENGER

This is the tenth article of this series. A general outline of the entire series appeared in the July 5 issue and the first of the articles in the July 12 issue. The first seven articles discussed the cost of electric service, which must be taken into account in any system of rates. In the last two articles a comparison has been made of the cost-of-service and value-of-service policies in rate making, it being shown that the latter permits an extension of the service to such groups of customers as could not be reached if a uniform percentage of profit were expected from all groups. The conditions under which price reductions are possible without curtailed earnings are studied mathematically in Insert IX, which will be concluded next week, and then the main text will be resumed for practically the remainder of the volume.

PART II—THE PRICE OF ELECTRIC SERVICE—Continued.

Insert IX—Appendix to Section 80 et Seq.—Relations Between Selling Prices and Earnings—Continued.

II. PRICES DEPENDING ON THE CUSTOMER'S VALUATION (VALUE-OF-SERVICE PRINCIPLE).

A. EVERY PARTICLE OF THE SERVICE IS CHARGED IN ACCORDANCE WITH ITS VALUATION.

SECTION 7. We change over now from the cost-of-service principle to the value-of-service principle in such a way that, starting with the unit price p, we add one or more other prices *lower than* p, for instance first the unit price p_1, in such a manner that this lower price applies to those parts of the commodity (service) *only* for which the respective customers are not able or willing to pay the original price p, whereas we continue to charge the original price p for all those parts of the commodity which had been sold heretofore under the original system of charging. We will in practice, of course, not be able to fulfill this theoretical requirement entirely, but there are several ways of approaching it with a reasonable degree of accuracy (see Sections 94-102 of the main text and Section 14 of this Insert).

This operation of applying two or more different prices to the same commodity according to the valuation by the purchaser will be called *"price splitting"* and the prices formed in this manner will be called *"conjugated prices"* or a *"price combination."* If the prices split off in this manner are all lower than the original price (as has been assumed so far), the operation will be called *"price splitting downwards"* and the prices split off are *"lower conjugated prices."* If prices are added higher than the original price p in such a manner that they apply only for such parts of the commodity for which the customers would be ready to pay these higher prices instead of the original lower price, the operation is called *"price splitting upwards."* Price splitting upwards and downwards can be combined with each other.

8. As a result of the splitting of the prices we will sell the same total amount of the commodity as if we would offer every unit at the lower unit price p_1, that is, we will sell the quantity m_1, which is greater than m. The gross income b_c of the price combination is composed of two parts: (1) The gross income mp of the original customers who are charged the original price p and therefore buy the original quantity m and (2) the gross income of the new customers who buy the balance, that is $m_1 - m$ at the price p_1, therefore

$$b_c = mp + (m_1 - m)p_1 \quad \text{.......................} (4)$$

$(m_1 - m)\,p_1$ is given by the rectangle MM_1L_1L' and b_c is therefore represented by the shaded area in Fig. A.* No matter how small the lower conjugated price p_1 is, it will always increase the gross income.[1]

9. The total cost of production is determined only by the quantity sold (produced) and not by the prices at which the commodity is being sold. The total cost under the combination of prices is therefore $M_1T_1 = P_1S_1 = s_1$, just as if the whole commodity were offered for sale uniformly at the lower price p_1. Likewise the capital will be $M_1J_1 = P_1K_1 = k_1$.

If the price combination applies, we will therefore have the net income given by

$$n_c = b_c - s_1 = mp + (m_1 - m)p_1 - s_1 \quad \text{..........} (5)$$

and the dividend (interest)

$$v_c = \frac{n_c}{k_1} = \frac{b_c - s_1}{k_1} \quad \text{..........} (6)$$

10. The question with which we have to deal here is the following: When is it possible to add one or more conjugated *lower* prices to the original price p in such a manner that the "earnings" (that is, the gross income b_c, the net income n_c, or the interest v_c, respectively, as the case may be) are *increased* over the original earnings b, n and v?[2]

11. As regards the gross income b we have seen from equation (4) of this Insert that it is always possible to increase it by price splitting downwards, no matter how large or small the original price p or the conjugated lower price p_1 is. There are no lower or upper limits for the prices.

12. As regards the net income we find the following: The original net income is given by

$$n = b - s = mp - s \quad \text{...........................} (7)$$

Subtracting this equation from equation (5) we get

$$n_c - n = (m_1 - m)p_1 - (s_1 - s)$$

Using the symbol Δ for differences in the customary way so that $\Delta m = m_1 - m$ (positive value) and $\Delta s = s_1 - s$ (also positive value) and $\Delta n = n_c - n$ (to be investigated whether positive or negative value) we can write the above equation in the following form:

$$\Delta n = p_1 \Delta m - \Delta s$$

Δn will be >0, that is n_c will be $>n$, if $p_1 > \dfrac{\Delta s}{\Delta m}$.

This means, the net income is necessarily increased by the addition of a lower conjugated price in all cases where that price is higher than the cost increment per unit.[3] Now the original price from which the lower conjugated price has

*See page 389 of last week's issue.

[1]It may be stated here incidentally that we can, of course, add more than one conjugated lower price, in which case the gross income will become greater and the shaded area will contain more than two steps. We can, in fact, add an infinitely large number of conjugated lower prices which will change the shaded area, representing the gross income, into the total area under the sales curve between ordinates given by the highest and lowest prices.

[2]The importance of this problem is based on the following considerations: If it is possible to add the lower prices with the result mentioned, this means that we will be able to increase the earnings by price reductions to some customers without price increases to others. Or with constant earnings we can reduce the prices to all customers as a consequence of the change from the cost-of-service system to the value-of-service system. (See Sections 78 and 88-91 of the main text). The solution of this problem is therefore at the bottom of the question of the superiority of the cost-of-service or the value-of-service system of charging.

[3]See footnote to Section 75 of the main text.

been split off must, of course, according to the definition of a *lower* conjugated price (Section 7 of this Insert) be greater than that lower price. On the other hand, the original price upon which the original cost-of-service system was based must have been greater not only than the cost increment per unit, but even greater than the average cost (see Section 2 of the main text) given by equation (1) of this Insert, otherwise the enterprise would have been a losing one from the outset. We will therefore always be able to add lower conjugated prices which increase the net income. The lower limit of such profitable conjugated prices is the cost increment per unit.

13. As regards the interest (dividend) v we have the original interest v given by

$$v = \frac{n}{k} = \frac{b-s}{k} = \frac{mp-s}{k} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (8)$$

Subtracting this from equation (6) we get

$$v_c - v = \frac{b_c - s_1}{k_1} - \frac{mp-s}{k}$$

or, substituting the value of b_c from (4),

$$v_c - v = \frac{mp + (m_1 - m)\,p_1 - s_1}{k_1} - \frac{mp-s}{k} \quad \ldots\ldots (9)$$

Now, again introducing the symbol Δ in the same way as in Section 12 above (also $\Delta k = k_1 - k$), we find from (9) that v_c will be $> v$ if

$$[mp + p_1\Delta m - (s + \Delta s)]k > (mp - s)\ (k + \Delta k)$$

or if $(p_1\Delta m - \Delta s)k > (mp - s)\Delta k$

$$\text{or if } \frac{p_1\Delta m - \Delta s}{\Delta k} > \frac{mp-s}{k} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (10)$$

The fraction on the left-hand side of this relation may be called the "rate of return of the increments" or "interest of the increments," inasmuch as it is the increment net income divided by the increment capital (see Section 27 of this Insert). We can say, therefore, that the interest will always be increased by the addition of a lower conjugated price if the "interest of the increments" is *greater* than the original interest.

It remains to be shown that such a lower conjugated price can be found in all cases which are to be considered in practice. This is proved in the following way:

If we make the lower price just a trifle, a differential, smaller than the original or upper price, that is if Δp becomes dp, and if we then should find that the differential of v *must* be positive for all upper prices which would be considered under the cost-of-service system, that would mean that the adding of lower prices, at least in a certain range below the upper price, *must* increase the interest (rate of return). It will be shown in the following that this is actually the case.

Calling $v_c - v = \Delta v$, we get from equation (9)

$$\Delta v = \frac{mp + (m_1 - m)p_1 - s_1}{k_1} - \frac{mp-s}{k}$$

Substituting now $p_1 - p = -\Delta p$* or $p_1 = p - \Delta p$
and $m_1 - m = \Delta m$
and $s_1 - s = \Delta s$ or $s_1 = s + \Delta s$
and $k_1 - k = \Delta k$ or $k_1 = k + \Delta k$

we get Δv

$$= \frac{mpk + \Delta m(p - \Delta p)k - (s + \Delta s)k - mp(k + \Delta k) + s(k + \Delta k)}{k(k + \Delta k)}$$

$$= \frac{pk\Delta m - k(\Delta m\Delta p + \Delta s) - (mp - s)\Delta k}{k(k + \Delta k)}$$

If we now choose Δp smaller and smaller and let it converge towards dp with a consequent change of the other differences into differentials, magnitudes of the second order will vanish beside those of the first order and we get

$$dv = \frac{pk\,dm - k\,ds - (mp - s)dk}{k^2} \quad \ldots\ldots\ldots\ldots\ldots (11)$$

If now dv shall be > 0 the numerator of (11) has to be positive or $p(k\,dm - m\,dk)$ has to be $> k\,ds - s\,dk$ or

$$p \text{ has to be}^4 > \frac{k\,ds - s\,dk}{k\,dm - m\,dk} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (12)$$

This is the condition for a positive dv, or in other words the condition that there is a certain range of prices in existence within which the conjugation of lower prices raises the rate of return v.

Now, from Fig. A and equation (1) of this Insert we see that the average unit output cost $s/m = \tan\sigma_0$. According to fact No. 3 of Section 1 of this Insert, $\tan\sigma_0$ must continually decrease if m increases (see Fig. A) which means that

$$\frac{d\,(s/m)}{dm} \text{ is always} < 0$$

$$\text{or } \frac{m\,ds - s\,dm}{m^2} < 0$$

$$\text{or } m\,ds \text{ is always} < s\,dm$$

Multiplying by k and then subtracting $sm\,dk$ from both sides: $m(k\,ds - s\,dk)$ is always $< s(k\,dm - m\,dk)$

We can divide both sides of this relation by $m(k\,dm - m\,dk)$ without reversing the sign of inequality because this product is essentially positive[5] and we arrive in this manner finally at the following relation for s/m:

$$\frac{s}{m} \text{ is always} > \frac{k\,ds - s\,dk}{k\,dm - m\,dk} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (13)$$

The right sides of (12) and (13) are identical. If therefore $p = s/m$ the condition (12) will be fulfilled and if $p > s/m$ the condition (12) must be all the more fulfilled. As we have seen in Section 12 of this Insert,[6] prices which are fit for a practical system of charges under the cost-of-service principle will always be greater than s/m and therefore there will always exist a certain range below the original price within which the conjugation of lower prices raises the rate of return.

B. THE VALUATION AFFECTS THE PRICES OF GROUPS OF SERVICE ONLY, BUT NOT OF EVERY PARTICLE.

14. The above deductions are based on the assumption that we can charge every particle of the service according to the valuation it meets from the customer, which means, not only are different services charged differently to the same customer, and different customers differently for the same service, but different units of the same service will be charged differently even though they are sold to the same customer (see Section 73 of the main text).

We can, of course, never carry out this assumption strictly in practice. We must group large numbers of units into one class of service or of customers, and then charge the whole class under a uniform rate or rate schedule. We may, for illustration, charge all kilowatt-hours for heating service at the same price and differently from the kilowatt-hours for other classes of service. The same may apply to the kilowatts demand for heating service. Or we may charge the first 500 kw-hr. of wholesale power service at a separate price, etc. We will thus select a certain limited number of unit prices and the problem is to choose these prices at such amounts as produce the maximum of earnings which is possible with the chosen number and distribution of prices. This grouping of the individual units into classes means of course a deviation from the theoretical system of charging, inasmuch as some of the units will be charged at lower prices than they could fetch at the utmost, whereas for others there will be demanded too high a price so that they cannot be sold. Therefore this grouping will reduce the earnings below the earnings of the theoretical system which charges every particle of the service individually.

As the units within each group are charged at the same price, this grouping amounts to resolving the value-of-service system into a number of cost-of-service systems. The relative prices of the various groups are determined according to the value-of-service principle. We have therefore in this *practical value-of-service system* a hybrid between the cost-of-service system and the real value-of-service system.

15. We have now a problem parallel to the problem of Section 10 et seq. of this Insert as follows: Can we increase the "earnings" in this practical system by lowering the prices of one or more of the groups without raising the prices to any

*Note that $p_1 - p$ has a negative value because the lower price p_1 is smaller than p, whereas with the values m, b, s, and k the subscript 1 indicates an increase: $m_1 - m = +\Delta m$, etc., because the amount m, etc., which belongs to the lower price p_1 is greater than the amount which belongs to the original price p.

[4] We could also arrive at the same result by direct differentiation of v, n and b and subsequent substitution of the results, but the above method seems to be both shorter and clearer.

[5] The factor m is obviously always positive and as regards $(k\,dm - m\,dk)$ this can be written as $k^2 \frac{d(m/k)}{dm}\,dm$. Now fact No. 4 of Section 1 of this Insert shows that m/k (which is given by $\cot\kappa_0$, see left-hand portion of Fig. A) increases with increasing m so that $\frac{d(m/k)}{dm}$ is essentially positive: dm is also positive because we start with a *reduction* of the price p by the differential dp, which (with reference to the shape of the sales curve Fig. A and fact No. 1 of Section 1 of this Insert) necessitates dm being positive. The product of all these factors is therefore positive.

[6] This can also be seen from equation (7) which shows that the net income (and consequently also the rate of return) is positive as long as $mp > s$, which means as long as $p > s/m$.

other group? To investigate this matter we will start with two groups of service only, called g and G (for instance, electric service for heating purposes only and for all other purposes) and the conclusions drawn from this investigation will then be extended to the case of a subdivision into more than two groups.

Each one of these groups has its own sales curve, M and m, respectively. The total-sales curve M_t is formed by the addition of the ordinates of M and m (see Fig. B). Under the original cost-of-service system both groups are charged the unit price p_0. This results in the sale of M_0 units of group G and of m_0 units of group g.

We shall now investigate the behavior of the three species of "earnings" (gross income, net income, and rate of return) if we split the prices between the two groups.

1. Gross Income.

a. Shape of the Gross Income Curve.

16. The question is: When can we lower the unit price in any one or both of the two groups, for instance in g, in such a manner that the aggregate gross income is increased thereby? We lower the price in group g from p_0 to p_1, thereby

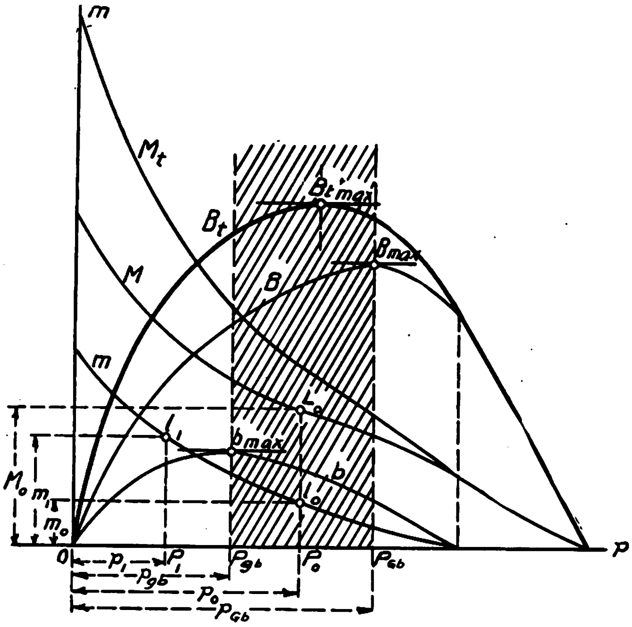

Fig. B.

increasing the number of units sold in that group from m_0 to m_1. The original aggregate gross income B_{t0}, which is given by $(M_0 + m_0)p_0$ changes into $B_{t1} = M_0p_0 + m_1p_1$. If this change shall be an increase, that is, if B_{t1} shall be $> B_{t0}$, it follows from the above equations for B_{t0} and B_{t1} that

m_1p_1 has to be $> m_0p_0$..........................(14)

Now m_1p_1 and m_0p_0 are the gross incomes from group g alone without any reference to its combination with group G and relation (14) means therefore the following: The necessary and sufficing condition for an increase of the aggregate gross income from the two groups as a result of a price reduction within one of the groups is that the income b from that group alone—group g without regard to the other group G—is *increased* by the price reduction. With reference to Fig. B, which shows the sales curves M and m, the gross income curves B and b, and their summation curves M_t and B_t, we see that this is possible only if the original price p_0 is greater than the price $p_{gb} = OP_{gb}$ which produces a maximum of gross income b from that group g alone for which the price is to be reduced; otherwise any price reduction for group g would necessarily result in a reduction of the gross income[7] b. (See Section 2 of this Insert.)

17. This condition means, in other words, that the original price must be high enough so that the corresponding point on the gross income curve b of group g is situated on the descending (right hand) branch of that curve. This wording of the condition is sometimes more convenient for application than that of the preceding paragraph.

18. We can now distinguish the following three cases:

(a) The original price is lower than the lower one of the two respective prices which make the income of one of the two groups a maximum, that is, according to the assumptions made in Fig. B, it is lower than p_{gb}. The original price lies in the range to the left of the shaded range in Fig. B.

(b) The original price is lower than the higher one of the prices which make the incomes of one of the two groups a maximum (p_{Gb}) but higher than the lower one of these prices (p_{gb}). This means it is situated in the shaded range in Fig. B.

(c) The original price is higher than either of the above named prices p_{gb} and p_{Gb}; it lies to the right of the shaded range in Fig. B.

In case (a) any price reduction in any group will always reduce the aggregate gross income.

In case (b) any price reduction in group g to a price not lower than p_{gb} will increase the aggregate gross income, any price reduction in group G will reduce it.

In case (c) any price reduction in group g to a price not lower than p_{gb} and any price reduction in group G to a price not lower than p_{Gb} will result in an increase of the gross income. Although therefore a price reduction in either one of the groups will be of advantage in this case, we will prefer an initial general reduction of all prices, as this is of greater advantage until the price p_{Gb} has been reached which results in the maximum gross income B_{max} of group G alone. After this has been done, this case necessarily reduces to case (b)[8], thus making advisable a further price reduction to one of the groups only.

It may be pointed out here that case (c) will not occur in a well designed cost-of-service system of charging. As the same gross income, and even a greater one, can in this case be obtained with a lower uniform price, case (c) would mean that the price has been chosen too high altogether from the producer's point of view and consequently also from the consumer's point of view. (Compare the closing sentence of Section 5 of this Insert.)

19. Wherever we find that a price reduction in any group is of advantage to the aggregate gross income it is obvious that, in order to obtain the best results which can be obtained by a variation of the prices in the respective group, this price reduction must be continued so long and not longer until we have reached the price which results in a maximum of the gross income of the respective group, for the following reason: If we stop reducing the price earlier there will still exist the possibility of further increasing the gross income by a continued price reduction, because in that case we are still on the descending branch of the income curve[9]. Conversely by pushing the reduction beyond the mentioned point we will come onto the ascending branch of the income curve which shows that an increase of the price would be proper in its place and that we have therefore gone too far with the reduction.

20. Relation (14) can be written

$$\frac{m_1}{m_0} > \frac{p_0}{p_1} \text{ ....(15)}$$

This means in words: A reduction of the price in a certain group or class of service *must* have the effect of increasing the gross income if the sales curve has such a shape that the number of units sold of that group rises more rapidly than the price is reduced. If, for instance, the price of a certain class of service is reduced to 3/4 of its original amount, the number of units sold would have to rise to more than 4/3 of the original amount; $\frac{p_1}{p_0} = \frac{3}{4}$, $\frac{p_0}{p_1} = \frac{4}{3}$, $\frac{m_1}{m_0} > \frac{4}{3}$.

The above is another way of expressing the law contained in Section 17 of this Insert. If the price corresponds to the descending branch of the income curve the number of units sold at a price in the immediate neighborhood of the original price increases at a more rapid rate than the price reduction indicates, and vice versa. This is demonstrated by relations (14) and (15).

21. It is easy to extend this line of reasoning to more than two groups (and to income curves with more than one

[7] This wording is based on the preliminary assumption that the curve of the gross income has only one maximum.

[8] An exception is the special case when the shapes of all the sales curves should happen to be such that the maxima of the income curves of all groups occur at the same price, in which case $\frac{dB}{dp} = \frac{db}{dp} = \ldots = 0$ for $\frac{dB_t}{dp} = 0$. The width of the range within which price splitting is of advantage becomes zero in this limiting case.

[9] If there should occur more than one maximum of the group's gross income curve in the range of prices below the original price (wavy income curve, see footnote to Section 22 of this Insert) we must obviously push the price down so far and not farther until we have reached the highest one of these maxima, because if we stop reducing earlier, that is, before reaching the maximum or on reaching a maximum which is lower than the highest one, there is still the possibility of increasing the income from that group, according to relation (14) of this Insert, by a price reduction of that group.

maximum). As a result we can express the law laid down in Section 18 of this Insert in different words and with more general validity as follows:

Where it is intended to bring about an increase of the gross income by means of price reductions to one or more groups of service without any price increase to others, this is always possible if the sales curves of these groups have such a shape that a ratio of price reduction can be found which makes the number of units sold in that group or groups rise at a more rapid rate than the rate at which the prices decrease; (if, for instance, at a reduction of the price to one-half its original value, the number of units sold would rise to more than twice their original amount). Whether this means a general reduction of the prices or a splitting off of prices for a certain number of groups only, depends on the number of groups which have the above quality. If they *all* have sales curves of the shape mentioned [Section 18—case (c)] a general lowering is the most efficient means of increasing the income, and according to Section 19 of this Insert, the price of every group will generally be lowered to a different level, which means price splitting downwards. Otherwise [case (b)], the prices will be lowered to some, but not to all, of the groups (again generally to a different level in every group, if the reduction takes place in more than one group.) This again means price splitting downwards.

b. Shape of the Sales Curve.

22. A graphical representation will make the above clearer and at the same time pave the way for the subsequent deductions. If, instead of the relation (14) $m_1p_1 > m_op_o$, which states the condition for an increase of the gross income by price splitting downwards, we write the equation

$$m_1p_1 = m_op_o \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (16)$$

this represents the limiting case of relation (14), and consequently also of (15). The graphical expression of this equation is an equilateral hyperbola with the axes of coordinates m and p as asymptotes (Fig. C). If the value of $m = P_oN_o$, which belongs to p_o, is assumed as variable (P_ox_1, P_ox_2 ..., etc., see Fig. C) a family of such hyperbolas, as indicated by the thin lines in Fig. C, will result. With sales curves having the shape as determined by facts Nos. 1 and 2 (stated at the beginning of this Insert), every sales curve must from left to right intersect higher and higher situated hyperbolas of this family until it just touches one of them from below (dash-and-dot line, point N_t) indicating that the maximum gross income has been reached and then it intersects a second time all the hyperbolas in the reverse order.[10]

Where the sales curve intersects the hyperbola in such a manner that it is lower than the hyperbola to the left of the point of intersection and higher to the right, the gross income curve is therefore in its ascending (left hand) branch, and vice versa. The two points of intersection with the same hyperbola, for instance H_1 and H_o, indicate prices which produce the same income (because mp is constant along the whole course of every hyperbola of the family).

23. From this follows another way of wording the condition that price splitting downwards will increase the gross income. We reduce the ordinates of the sales curve to percentages of the ordinates of the respective curve at the price p_o, choosing, for instance, for all curves the ordinate M_o of group G at abscissa p_o as 100%. Thus, for illustration, the sales curve M of group G has been transferred unchanged from Fig. B to Fig. C and the sales curve m of group g has been entered with ordinates increased in proportion so as to reach the percentage $M_o = 100\%$ at abscissa p_o. Consequently this curve, which has been called %m in Fig. C, will intersect the sales curve M (which now might also be called %M) at the point N_o (abscissa p_o). If we have more than two groups, the curves of the remaining groups will be treated like curve m so that the percentage curves of all the groups will pass through point N_o. A hyperbola of the family will of course also pass through the same point N_o in which all the percentage sales curves intersect. If now at least one of the percentage curves has a greater slope than the hyperbola (in other words, if the hyperbola is not the steepest one of the bundle of curves passing through the point N_o) then it *must* be possible, within a certain range of prices $< p_o$, to improve the gross income by price splitting downwards. The prices are to be lowered for that group (or those groups) which has a greater slope than the hyperbola.

It is also clear, and needs no further explanation *per longum et latum*, how far down the range reaches within which price splitting downwards is of advantage in every group and for which price the maximum of income is reached.

24. The same lines of reasoning as have been applied in the above, beginning with Section 16, for the gross income, can also be applied *mutatis mutandis* to the net income and to the rate of return (dividend) with entirely analogous re-

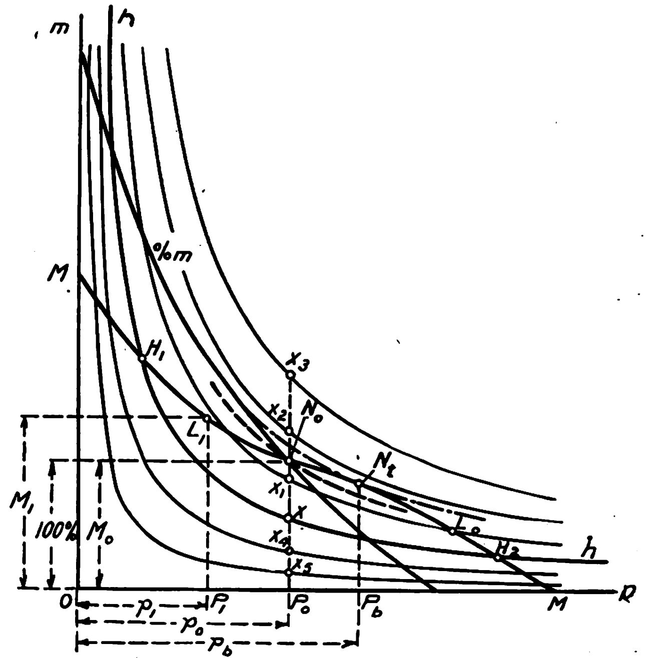

Fig. C.

sults. In the following will be shown in what respects the methods and the results of the investigation differ from those for the gross income.

(*To be continued.*)

UNITED STATES MAY BECOME WORLD'S CHIEF COAL EXPORTER.

The United States has now moved up from third to second place in the list of coal exporting countries of the world and British newspaper opinion seems to contemplate America's becoming the world's permanent chief coal exporter. According to figures in the London *Times*, reported by the American Chamber of Commerce in London, Britain's coal exports for the twelve months ended June, 1919, were approximately one-half her exports in 1913, the last pre-war year. The figures given are 37,000,000 tons and 73,400,000, respectively. Meanwhile America's exports have increased from 19,000,000 tons in the fiscal year 1914 to nearly 26,000,000 tons in the fiscal year 1918.

Even allowing for the worrisome exodus of foreign labor from the United States and the consequent falling off in coal production, it is estimated that the American output for 1919 will be three times that of Great Britain and four or five times that of any other country. The statement is made that about one-half of America's output is produced by means of machinery whereas only one-fifth of Great Britain's output is thus produced.

[10] We can see from this that if the sales curve has no point of inflection the income curve cannot have more than one maximum, because then obviously the above mentioned point at which the sales curve just touches one of the hyperboles from below, cannot be repeated in the course of the sales curve. As will become clear from the latter part of this Insert (Sections 37-38 and 41-42) this applies not only to the curve of the gross income, but also to those of the net income and of the rate of return. On the other hand, one or more points of inflection in the sales curve do not necessarily mean that the curve of earnings must have more than one maximum.

It also follows that a sales curve with the concave side facing upwards, such as the sales curve in Fig. A, results in a flatter peak of the gross income curve (and of the other earnings curves) than a sales curve with the concave side facing downwards and that the choice of the right price is of greater importance in the latter case. If the sales curve runs along one of the hyperbolas in Fig. C through a certain range of prices the curve of the gross income will be entirely horizontal for that entire range and it will make no difference on the income which price we choose as long as we remain within that range.

Hydroelectric Energy in France

Fuel Supply Being Inadequate, France Must Develop Her Sources of "White Coal" in Order to Meet Industrial Needs —America Can Co-operate in Hydroelectric Development

By C. W. A. VEDITZ

Former American Commercial Attaché at Paris and Madrid

IT IS recognized by most authorities in France that if that country is to become a greater industrial nation she will have to find some substitute for coal as a producer of motive power. In normal times, and more particularly since Alsace and Lorraine have been restored to her, the industrial situation of France is largely explained by two fundamental facts: France has an abundance of iron ore and a shortage of coal. In normal times France consumes about 60,000,000 tons of coal per annum, and her coal mines produce about 40,000,000 tons. (In 1913, the last complete year before the war, the amount was 40,844,000 tons, of which 67% came from mines in the Nord and the Pas-de-Calais—regions invaded by the Germans.) France's imports in 1913 included 18,711,000 tons of coal, 3,070,000 tons of coke, and 1,086,000 tons of fuel agglomerates, such as briquettes, etc. Most of the coal came from Great Britain, most of the coke from Germany, and most of the agglomerates from Belgium.

France, even though she draws more coal from her mines, and notwithstanding the coal output of the annexed territories, will undoubtedly need some substitute for coal to meet not only her future requirements, but also her present requirements. It should be noted particularly that the bulk of the coal produced in France is mined in the northern and northeastern parts of the country, whereas numerous new industrial plants requiring power are established already, or will be hereafter established, in the southeast, the center, and the southwest parts of France, to which places French coal has a "haul" long enough to make it dearer than elsewhere, and in which, therefore, the imported coal is used, especially near port towns. It is also recognized that even after peace is signed, coal, while it may not continue to be as dear as it was during the war, will nevertheless be much dearer than before the war; likewise, it is obvious that labor will be dearer in productive enterprises than it was before the war. On the basis of these facts, the following conclusions may be drawn:

Fuel and Power Conditions Confronting France.

(1) Labor will be dearer and scarcer, and therefore there will be increased incentive to substitute machinery and motive power for labor and human or animal power.

(2) Coal will continue to be insufficient for the needs of the nation as a producer of power, and will probably cost much more than it did before the war. The mines in the region invaded by the Germans have been left in a state deplorable beyond expression; the French chief inspector of mines states that many of them will require from five to ten years to be put into full working order.

(3) The new industrial establishments that will be established, or that will expand their activities, in the southern, western and central parts of the country, where coal is relatively dear, will welcome some other more economical method of producing power.

(4) Attention will have to be turned more largely in the direction of utilizing what the French call "white coal"—hydroelectric energy. The trend in this direction was manifested before the war, and has been emphasized during the war to a noteworthy extent, inasmuch as several newly established plants working for the government in the manufacture of munitions, and especially chemical products and gases, have utilized hydroelectric energy on a comparatively large scale.

The Hydroelectric Power Available.

From the standpoint of utilizing industrially the power of falling water, France is well placed. According to Robert Pinot, general secretary of *Forces Hydrauliques,* the following is the rank of European nations with respect to available hydroelectric power:

Country	Horsepower
Norway	7,500,000
Sweden	6,750,000
Austria-Hungary	6,460,000
France	5,857,000
Italy	5,500,000
Spain	5,000,000
Switzerland	1,500,000
Germany	1,425,000
Great Britain	963,000

These figures, taken apparently in part from the engineer Pacoret, and in part from reports of the German Union of Electricians, have of course been subjected to much discussion. One of the leading French advocates of the use of "white coal," M. Ader, estimated the minimum available power in France as 4,600,000 hp. and the *average* power as 9,200,000 hp. M. de la Brosse, engineer-in-chief and director of the hydroelectric service of the Alps, agrees on 4,600,000 as the minimum realizable power. Others give as a rule higher figures. But, of course, all of them fall short of the 30,000,000 hp. said to be available in the United States.

Comparing the available power with the size of the several countries, France has 6 hp. per acre, Norway 15, Sweden 8, Austria-Hungary 7.5, Spain 4, Switzerland, 4, and Germany 1.2 hp.

The available power is, of course, unevenly distributed throughout the French Republic. Half of the national area has no utilizable waterfalls. M. Ader has estimated that the minimum power or the low-water productivity of the Southern Alps region (the Savoys and the Dauphinate) is 1,000,000 hp.; for the Jura, the Vosges and the so-called Massif Central, 900,000 hp.; and 1,400,000 for the remainder of the country, including the Pyrenees region. According to de la Brosse, the distribution is as follows: 2,300,000 hp. for the Alps and the Pyrenees; 900,000 for the Center and the East; and 1,400,000 for the rest of the country. There is little doubt now that these figures are too low for the Alps departments of France.

Water Falls Not Yet Extensively Utilized.

If it be remembered that in 1868 and 1869 two paper manufacturers of the province of Dauphiné installed the first plants using water falls for power purposes along modern lines, and that the problem of transporting the power over considerable distances was solved between 1880 and 1900, France has made but little use of her opportunities. In 1911, only 600,000 hp. were produced in all of France, of which total 473,000 are in the Alps, 55,000 in the Pyrenees, and 51,000 in the so-called Massif Central. It is probable that at the present time the total is from 850,000 to 900,000 hp. The figures for 1916 probably represent about one-tenth of the available power, whereas Germany has utilized about one-half of the power utilizable in that country, despite the fact that Germany is a great coal-producing, and even coal-exporting, nation.

According to Prof. Auguste Pawlowski, France spent in 1913 one billion francs ($200,000,000) for hydroelectric industrial establishments, of which 650,000,000 francs ($130,000,000) went into enterprises for the production and transmission of power; and 200,000,000 francs additional have been since that time devoted to hydroelectric industries. Says this authority: "The work is still in its beginnings. All the available power should be realized, and in the quickest time possible, in the interest of the economic uplift of the country, of its social regeneration, and of its wealth; and in order to permit it to conquer the markets of the world. 'White coal' gives us the means for compensating our lack of coal, enables us to obtain electricity at a low price, to lower in many cases our industrial costs of production, and to improve our agriculture. It will become the surest weapon in the economic struggle of after-the-war."

M. Loucheur, former French Minister of War, now Minister of Industrial Reconstruction, and a leading authority on industry and transportation, speaking of the plan for utilizing the Rhone falls at Genissiat, presented by Messrs. Blondel, Harlé and Mahl, stated that it would involve the annual production of 1,300,000,000 kw-hr. As each kilowatt-hour corresponds to 1.2 kilograms (2.64 lb.) of coal, the falls at Genissiat would represent over 1,600,000 tons of coal, or the equal of more than one-third of the output of the coal mines of Lens or Anzin, or more than all of the output of the coal mines of Blanzy, the richest in the interior of France.

Utilizing "White Coal" for Railway and Traction Service.

The most important utilization of French "white coal" would probably be for railway traction. In 1909, according to the statistics of the "Service des Mines," the steam locomotives or those using self-produced power, represented a total of 7,373,000 hp., while traction current did not amount to more than 138,000 hp. Since then, however, a large number of electric tram lines in the larger towns have been substituted for horse cars, and numerous so-called secondary railways and local railway lines have been electrified. In the Alpine region, the tramways of Lyon and Grenoble, the railways of Dauphine and those along the Mediterranean coast are comparatively recent developments.

The tramways of Bayonne, Biarritz, and Pau are propelled by hydroelectric energy, but those of Toulouse, Perpignan and a number of other towns in this southwestern region are still tributary to steam-power establishments. Some local railway systems are operated by hydroelectric power. The big French Midi (Southern) Railway system inaugurated electric traction upon certain sections of its roads, and proposes to electrify 327 kilometers of its lines (203 miles). But at the present time there is hardly as much as 250 kilometers (155 miles) of railways and street tramways utilizing hydroelectric energy in all the south of France.

In the center of France, hydroelectric power operates the tramways of the Haute Vienne region, of Loir-et-Cher, of Puy, of Limoges, and of a few industrial towns like St. Etienne and Roanne. In all, France in 1914, at the outbreak of the war, had used hydroelectric energy for only a fractional part of her local or general railway system and lines.

Opportunity of American Interests to Co-operate in Development.

In conversations which I had from time to time with engineers and with public officials in France interested in hydroelectric developments, the suggestion was repeatedly made that France would welcome the co-operation of American engineers and of American capital in French engineering enterprises. They recognize our achievements in this line and, while they sometimes resent the "Look who's here" attitude of American visitors proud of the industrial and scientific progress we have made in controlling the resources of our vast continent, they now feel that the work of reorganizing industrial France after four years of exhausting war is not the work of France alone, but of the whole of allied civilization. To be sure, our engineering concerns hesitate to "go ahead" upon the basis of uncertain costs of material, of unusually high wages, of political factors of a more or less disconcerting nature. But did we not find it possible to make war under strange and foreign conditions, and do it fairly successfully? Are we less adaptable in the arts of peace than we have proved ourselves to be in the arts of war?

ELECTRICAL MEANS EMPLOYED IN THE ANTI-SUBMARINE CAMPAIGN.

Scientific Adviser to British Admiralty Tells of Developments Following Adoption of New Attitude.

One of the papers read at the Victory meeting of the North East Coast Institution of Engineers and Shipbuilders held at Newcastle-on-Tyne was contributed by Prof. J. C. McLennan, Scientific Adviser to the Admiralty, who took for his subject science and its application to marine problems. He said it was realized in the autumn of 1917 that the submarine problem was one of the most difficult ever presented to science for solution. It became clear that it was necessary to introduce into service practically a new system of physical science and engineering. It was accordingly decided to broaden the field from which scientific and engineering talent could be drawn and within the British Admiralty a Department of Research and Experiment was set up under the direction of Charles H. Merz. Professor McLennan could not give details of certain of the means and measures adopted in the anti-submarine campaign, but he gave particulars of developments in the following directions: Listening devices; echo methods; magnetic and electro-magnetic detection; leader gear; invisible signaling; wireless telegraphy and telephony; explosion pressures; sound ranges, and helium.

As a result of investigations in connection with listening devices, great improvements were made in hydrophones. Microphones and magnetophones of exceeding high sensitivity were realized, and after enormous labor, ways and means were devised for standardizing their construction and their functioning. Hydrophones were constructed and put into service which were suitable for use in water of moderate depth, and other types were made which could be used in water of great depth. In one particular type of instrument modifications and attachments were introduced which enabled one to detect with it the direction of bearing of a source of sound with a fair degree of accuracy. But probably the method of determining the direction of a source of sound waves in water which had proved to be the best was founded on the fact that the sound wave was in the same phase at all points of its wave front. Thus, if there were two hydrophones, in themselves non-directional, placed in the path of the incoming sound, they could be used for finding the direction of the origin of the sound if the phase difference between the sounds received could be detected. There were two ways of doing this: the "binaural" method and the "sum and difference" method.

The binaural method depends on the fact that if the sound from one receiver is conveyed to one ear and that from the second to the other ear, the impression is formed that the sound comes from a certain direction and this direction, as interpreted by the sensations experienced, changes as the phase difference is altered. It can be brought to a certain position with respect to the listener (say to the position directly in front) either by rotating the two receivers about an axis, or by introducing an artificial delay in some form of "compensator." This binaural method was the subject of much work on the part of both British and American scientists, and in the anti-submarine campaign it was found to be of very considerable service. In the "sum and difference" method the impulses from the two receivers are united before reaching the ear, the combined effect observed being a maximum when there is no phase difference between the waves and a minimum when the phases are in opposition. The French Navy developed a hydrophone or listening device known as the Walser gear which had been found very efficient.

With most hydrophones and many listening devices, ship's noises and water noises generally seriously interfered with their effective use, and in practice the chasing ship was compelled to stop at intervals and listen when not under way. This meant that in many cases the quarry was lost. This defect was overcome in a measure by towing a directional hydrophone encased in an artificial "fish" behind a chasing ship. By adopting stream-line formation for the towed body and suitably supporting the hydrophone, water noises were fairly well eliminated. Moreover, as the "fish" could be towed at a considerable distance behind the chasing vessel, many of the sounds emitted by the latter did not reach it and others which did arrive were received with weakened intensity. The development of sensitive listening devices of course received a great impetus by the use of thermionic amplifying valves. As it was found possible under certain conditions to render the propulsion of submarines practically silent, it became necessary to look in other directions for fundamental methods of detecting them.

A system of detection which is full of promise involves the use of a beam of sound waves sent out by a chasing ship in a manner analogous to the use of a searchlight. With such beams of sound waves it is possible to sweep the seas, and when an object of sound such as a submarine happens to come within the beam, the sound waves are reflected and echo effects are obtainable. The character of the beam is, of course, determined in large measure by the frequency of the waves constituting it. The method has been employed with great success and promises to be a very helpful agent. The method is obviously applicable to the locating of mine-fields and other obstacles to navigation as well as to submarine chasing.

In regard to magnetic and electromagnetic detection, Professor McLennan said that magnetic detectors usually require the movable system to be poised or pivoted. They can therefore be used as yet with only a moderate degree of satisfaction in towed bodies or in vessels subjected to violent mechanical disturbances. The range at which magnetic effects can be detected is, moreover, comparatively short. As a result of these defects the use of magnetic detection is somewhat circumscribed. Such instruments can, however, be used under certain conditions, and in particular sea area with great effect. In the war very considerable results were actually obtained by their use. The range at which electromagnetic detection can be applied is greater than is possible with magnetic detection, but the method is, however, essentially a short range one, and in many of the forms in which it has been worked out it cannot be used with success at greater distances than about 300 yards or in depths greater than about 100 fathoms.

The Leader gear represents an important application of an electromagnetic effect which was developed during the war. This gear consists of a cable laid on the bottom of the sea along the course of a narrow tortuous channel leading into a harbor or through a mine field. If an alternating electric current be passed through such a cable it is possible by means of delicate devices installed on a ship to obtain either aural or visual indications of the presence of such a cable, and by these indications the ship can be guided in safety in fog or darkness at speeds as high as 20 knots almost with as much precision as a tramcar by a trolley wire over a railway. Experiment has shown that it is a simple matter to apply this method in water of suitable depth for distances as great as 50 miles or longer.

Research has shown that it is possible under certain conditions to utilize polarized light or ultra-violet and infra-red radiations for secret signalling. With the last-mentioned type of radiation, especially valuable results are obtainable over considerable distances, even in the presence of light fogs. Where it is not advisable to use wireless communication between chasing ships, infra-red signalling is of special value.

One of the most remarkable developments which had taken place in the war, said the author, was in the field of wireless telegraphy and telephony. By the use of oscillating thermionic valves especially great progress had been made. It was now possible to hold conversation with ease between a land station or a ship and an airship or seaplane over considerable distances, and by this means observers on aeroplanes or aircraft could also converse with one another. With high power installations it had been demonstrated that wireless telephonic communication could be maintained on the sea over hundreds of miles. On the directional side of wireless great advances had also been made. If an aeroplane, an airship, or surface ship should send out continuously for a short interval a series of ether waves, these waves could be picked up over long distances by devices installed in a land station, the direction of the source of these ether waves could be ascertained, and in a minute or two the land station could give the observer of the emitting source his bearing within two degrees relative to the land station. With two land stations it was possible to obtain cross bearings, and the latitude and longitude of the sending air or surface ship could be determined with a high degree of accuracy. With directional devices installed on ships it would be possible for two ships whose positions were known to communicate its true position to a ship enveloped in a fog and situated several hundreds of miles away.

In the section dealing with explosion pressures Professor McLennan said that one method of investigating such pressures was suggested by Sir J. J. Thomson and applied by D. A. Keys. It consisted of the employment of the phenomenon long known to scientists that certain crystals become charged with electricity when subjected to pressure. The amount of the charge produced is proportional to the pressure applied to the crystals, so by having a suitable arrangement for measuring this charge and its variation with time, a complete record of the variation of pressure with time is obtained by placing the crystal detector at any given distance from the exploding charge. Since the duration of the wave in passing over the crystal or engulfing a submarine is only a few thousandths of a second and the pressure generated may be of the order of a half a ton or more per square inch, one can readily imagine the difficult nature of the problem in hand. But by making use of the inertia of a beam of cathode ray particles and employing the fact that they carry negative charges and are deflected by electrostatic and magnetic fields, it has been possible to obtain records of the variation of such pressures with the time. The electrons affect a photographic plate, i.e., they leave an impression on the plate when they strike it. This additional fact has made it possible to determine the change in pressure of the wave from the instant the charge is fired and at as small intervals as we please afterwards. Changes which have taken place in 1/100,000 of a second have been recorded by this means.

A LABOR SUBSTITUTE FOR THE WAREHOUSE.

Additional Features of Application of Electric Industrial Trucks and Tractors for Warehouse Use.

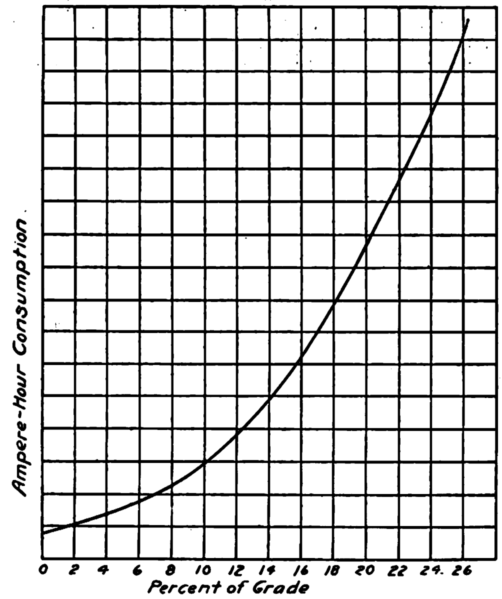
By D. L. Darnell.
The Baker R. & L. Co., Cleveland, Ohio.

During the war, when the army and navy had drawn upon our human resources to such an extent that there were two or even three jobs to every man, every employer wished for the return of the halcyon days when labor was plentiful. It was generally supposed then that peace would dump two or three million men upon the country and that the troubles of the employment man would be at an end.

Today peace is a fact. Except for a few divisions still on the Rhine our armies are back on this side of the water. The men have been discharged and have returned home to take up their old jobs, or better ones. But there is very little change in the labor market. Wages are still away up in the air, and it is next to impossible to find a man who is really experienced at anything.

There have been a number of reasons advanced to explain this condition, and probably the falling off of immigration is the best answer. For five years there has been no immigration at all and now that overseas transportation has been resumed there are few who wish to come—few as compared with the hordes of five years ago. The breaking down of the monarchial system in Europe, fewer men as a result of the ravages of war, more work for those who survived, the hope for a new future—these and many other reasons explain the stoppage of the labor reservoir to which we have looked in the past.

With the labor market in its present condition, and very little hope for improvement, warehouse men are of necessity learning how to do more work with fewer men. Many new labor-saving machines are coming into being and many new uses are being found for old ones. In this latter class comes the electric industrial truck, and even in the past few months numerous new adaptations of this labor-saving machine have been worked out. In fact, there is very little handling work about the average warehouse which these little electrical machines cannot take care of.



Curve Showing Relation of Ampere-Hour Consumption and Percentage Grade for Electric Truck.

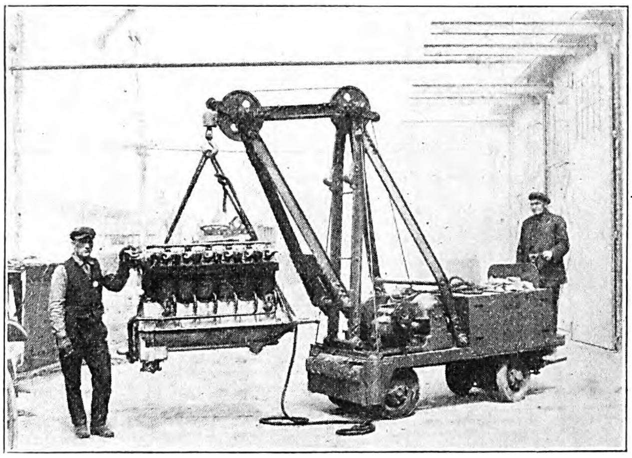
The application of a system of industrial transportation to any warehouse installation requires careful consideration of all the conditions and an intimate knowledge of the limitations and possibilities of the various truck models. The industrial truck salesmen must have this knowledge and the ability to quickly analyze conditions and solve for the proper answer. No one has time any more for the man who knocks at the purchasing agent's door and asks, "Are you buying any trucks today?"

There are two general systems which may be applied to warehouse installations—namely, the tractor and trailers or the load-carrying truck. This latter class embraces the utility truck, the elevating platform truck and the crane trucks.

The tractor and trailer installation seems to be best suited for large terminal warehouses where immense amounts of freight are carried for comparatively long distances. An installation of this sort will employ from 4 to 10 or more tractors and from 300 to 1,000 trailers. The empty trailers coming out of the inbound freight house or storage warehouse are dropped on the platforms along side of the freight cars to be unloaded. A crew of men at each freight car places the boxes, bales or other freight on the trailers and when there are enough to make a train a tractor comes along and picks them up, whisking them away to be either unloaded into storage space or onto drays for delivery.

In the outbound house a similar set of tractors and trailers carries the freight from the dray shed or the storage warehouse to the cars. The tractor drops its load and goes on to gather up some empties—it is always busy.

In many places it is becoming the practice to rent out portions of the warehouse to different manufacturing firms about the city. Material or supplies are received in carload lots and stored here until required.



Electric Truck Equipped With Crane for Handling Heavy Material.

In such installations the elevating platform type of truck presents a very convenient method of handling. The material is loaded right out of the cars onto wooden skids. The elevating truck picks these skids up and deposits them in the storage space in the warehouse. The material while in storage is kept right on these skids. When the manufacturer is ready to use it the elevating truck places the material still on the skids on the manufacturer's truck; then at the manufacturer's plant another elevating truck carries the material to its ultimate destination. In this way hand labor is absolutely eliminated from the time the material is unloaded from the cars until it is ready to be worked or used.

There has recently been brought out a skid equipped with casters. These live skids are very handy for terminal installations, as such a skid can be loaded right in the box car and then easily pushed out to the platform by hand. Also, in cases where it is necessary to move the skids from one floor to another, the elevating truck can deposit the skids one at a time at the elevator. When the elevator arrives at this particular floor, the operator can easily push three or four skids onto his elevator, take them to the proper floor and push them off again, where another elevating truck will pick them up and carry them to the proper place.

In some warehouses where heavy machines are stored a crane which will pick these up and carry them about is almost a necessity. Such a crane is shown in the accompanying photograph. This crane has a capacity of 3,500 lb. and with its 12-ft. lift can also be used for stacking.

In the foregoing the industrial truck is considered only as a substitute for hand labor, but there is another big point in its favor which is just as important nowadays. The electric industrial truck offers the cheapest, as well as the most efficient, handling method. For the sake of comparison, take the straight load-carrying type truck which is the least efficient of all the types. This truck will handle 4000 lb. at a steady speed of 4½ mi. per hr. It will make the return trip, empty, at 6 mi. per hr. and will not stall and rest in between loads.

Design of Buildings to Prevent Truck Traffic.

In some of the older warehouses conditions exist which prevent the use of electric trucks. Either the aisles are too narrow, or the floors are not in proper shape, or else the elevators have not sufficient capacity. In view of this, the owners must worry along with hand labor and all of its difficulties. So it is important that any firms which are considering building new warehouses should impress upon their architects the necessity of so designing the buildings that the most modern handling systems may be installed.

The most important points to consider are the aisles, the elevators and the ramps. Main aisles should be at least 12 ft. wide and the cross aisles 8 ft. wide. This will give plenty of space of maneuvering the truck and for passing.

Where elevating trucks are used, and it is not intended to move the truck itself from one floor to another, the elevator need only have sufficient capacity to take care of the load. This will depend upon the number of loaded skids which are to be handled at a time. Each skid with its load will weigh in the neighborhood of 4200 lb. If the truck is to be lifted as well as its load, the elevator should have a capacity of at least 7500 lb., and should be at least 8 ft. wide, or preferably 10 ft.

Where the tractor and trailer system is used, the ramp offers a convenient way of getting from one floor to another. However, it is quite important to see that these ramps are long enough so that the grade is not too steep. The limit of good practice is 15%, although some manufacturers make quite a point of the fact that their trucks can climb a grade of even 25%. This is all right as a stunt for advertising purposes, but for actual operation it is better to make the ramp twice as long and cut down the per cent of grade by half. It is a fact that a truck going from one floor to another on a 25% ramp will use 40% more current than if the ramp were twice as long and only 12½% grade. The reason for this is that all trucks are equipped with the series motor which gives a large starting torque. It is a characteristic of this motor that the number of amperes drawn from the battery is proportional to the load put upon the motor, while the speed decreases with the load. For this reason a truck operating on a 25% grade uses twice as much current as a truck operating on a 12½% grade. The reduced speed on the steeper grade is such that very nearly the same time is consumed in climbing the steeper grade, although it is only half as long.

The small diagram on this page shows how the current consumption increases as compared to increase in grade. Up to 15% grade the proportion between the current consumed and the height climbed is within the limits of good practice, but grades above this figure are not recommended.

Editorial Comment

Promote the Idea of Service

SERVICE as the fundamental aim of public utility organizations has made much headway in recent years. Progressive utility managers recognize that service is the primary object of their business and constantly keep this idea before their employes. The result has been most beneficial in those communities where this policy has been consistently followed out. Not only is the service given to the public of high standard and therefore the appreciation of the public shown by its good will to the utility, but the entire attitude of the utility employes is raised to a higher plane. Instead of looking upon their employment merely as a ready means of gaining a livelihood, they find in it also opportunity to serve the community.

The success of the service idea among utility organizations prompts us to suggest cultivation of the same spirit among the employes of municipalities and other public bodies. Within the present year there has been shown contemptuous disregard for the interests of the public by policemen, firemen and other employes of several of our American cities as well as of cities in Canada, Great Britain, France and other countries. Strikes of municipal employes are becoming almost as common as among industrial employes. Let these employes be taught that it is an honor to serve their communities and with fair remuneration the quality and continuity of their service will be raised to the standard on which it should rest.

French Water-Power Development

HYDROELECTRIC power is one of the important agencies that is going to put France back on her feet after the gruelling devastation of over four years of frightful war. The taking over of certain German coal-mining districts for a period of years will barely compensate for the deliberate destruction of French coal mines, so that France will remain short of fuel as before the war. This shortage and high cost of fuel combined with similar shortage and high cost of labor will call for more power developed from what the French so appropriately call their "white coal"—glaciers, mountain snows and water falls.

These facts are very clearly set forth in an article on this subject by Dr. C. W. A. Veditz that appears in this issue. He shows that French hydroelectric development has not yet been carried out very extensively and that there is room for an abundance of it, in which American engineers and other interests should co-operate. The French authorities clearly recognize the potential value of hydroelectric power development especially at this time when every energy and resource must be bent to hasten that nation's reconstruction. Although financial and other difficulties may seem formidable just now, it is to be hoped that these may be cleared away so that that courageous country may have every facility to return to a normal industrial and commercial basis as soon as possible.

A Brief for the Static Condenser

POWER-FACTOR, what it is, what it costs, the manner in which it affects capacity of machines and conductors and voltage regulation are subjects that have been discussed so long, so often and from so many angles that it would seem that everyone connected in any way with alternating-current workings, whether in the small or the vast system, should be conversant with the extravagances and drawbacks of low power-factor.

The fact is we all realize what low power-factor means. But it is only when we are brought face to face with some difficult situation, or the colossal waste the low power-factor entails is brought home to us, that we come to the full appreciation of the true significance of low power-factor. It is then that we seek palliative measures, whereas we might have, not always but quite often, prevented the cause. And prevention is almost always preferable to cure.

However, taking it for granted that the power-factor could be raised to advantage—which is the condition that obtains in practically every instance, whether it be the small alternating-current generating installation of the industrial plant, or the vast network of transmission lines with its interconnected generating stations and ramifications of distributing circuits—the question to be settled is to what extent it will be financially worth while to raise the power-factor, what will it cost to do it, and what is the gain in investment, in improved operation, and so forth. The condition that exists is the condition that decides what alleviative measure should be adopted. If it be over-motorization or too many lightly-loaded transformers, the remedy may be to change matters by adopting apparatus better suited to the need. On the other hand, it might be more practical to cure the situation rather than prevent it.

Elsewhere in this issue appears an article on the application of the static condenser to power-factor improvement. This is the second article in the ELECTRICAL REVIEW within recent months on this phase of power-factor correction; although editorial comment has repeatedly bespoken the cause of the static condenser. In this article Mr. O. C. Roff reviews the cost and the objections of low power-factor in a manner that makes one appreciate once more what a waste of material and fuel accompanies decreasing power-factors. He explains what the static condenser does and the conditions under which it may be successfully employed. The very limited application of the synchronous converter for power-factor correction, so limited and accompanied by so many objections that this piece of apparatus is rarely considered for corrective purposes, *per se;* and the much more flexible synchronous converter with its wide latitude in use, are both well understood. But the application of the static condenser, and the conditions under which it is an almost ideal piece of equipment are not so well understood. Mr. Roff's article should make the matter clear; and, incidentally, should serve to emphasize the many instances in which the static condenser should be used where at present low power-factor is tolerated where little excuse exists for such tolerance.

Electrical Engineering and Electrochemistry

IT IS the province of the engineer to utilize the forces and materials of nature. Chemistry is the science which deals with materials; and it is the chemist who studies the fundamental construction of materials, separating the common substances into their constituent elements, devising new combinations and producing new properties. Electricity, being a force, comes within the province of the engineer.

A combination of the two fundamental, forceful sciences—electricity and chemistry—the combination of the science of materials and the science of forces—has given the investigator, the inventor, the investor and the manufacturer a new vast field for action. And it is the combination of these sciences and these human associations that has, and will still more in the future, attain results otherwise unattainable.

The chemist, the electrochemist, utilizes electricity in two ways, according to what he aims to produce or attain: by high temperatures, as for the production of nitrogeneous compounds from the air and for the production of carborundum and steel; and secondly, by electrolytic action, as in the refining of copper, the electrolyzation of water for the production of hydrogen and oxygen. In these two ways, electricity has made vast and rapid progress in coming to the aid of the chemist, hence to the betterment of mankind. The full story is not yet told of what electrochemistry and the electrochemist accomplished in the waging of the World War.

Toward the close of this month the American Electrochemical Society convenes in Chicago. This is a comparatively young society, has a vigorous and active organization that has done much to co-ordinate effort and further matters pertaining to electrochemistry. The membership in the organization has increased very rapidly, almost phenomenally during the last few years, because of the vital importance that electrochemistry has played in the waging of war, and the vast field that remains to be explored and developed in the callings of peace. Many of the members are power engineers of the large central-station companies, for these men must be in touch with manufacturing methods "in readiness to serve" their clients; and continuity of supply of power is often of paramount importance.

Chemistry is a science unto itself; as is also electricity. But electricity facilitates chemical action and is sometimes indispensable. The electrical engineer does not need to be a chemist. But the electrical engineer well versed in chemical engineering is a better electrical engineer and is of greater value to himself and to his profession. And this, after all, is the criterion as we pass judgment upon ourselves.

Science and Marine Problems

ELSEWHERE in this issue we give particulars of some of the scientific achievements secured during the war in connection with the anti-submarine campaign. It is not too much to say that only the utter abandonment of the pre-war governmental attitude toward science in England cleared the way for investigation and practical application which were essential in dealing with what in the late months of 1917 was realized to be one of the most difficult problems ever presented to science for solution. It became necessary to introduce practically a new system of physical science and engineering and the British Admiralty agreed to broaden the field from which scientific and engineering talent could be drawn. Professor J. C. McLennan, fellow of the Royal Society, and scientific adviser of the British Admiralty at a Victory meeting of engineers held at Newcastle-on-Tyne has revealed particulars of some of the means and measures devised by scientific experts.

He confessed his inability to reveal everything of the kind, but vouchsafed such information as it was in the national interest to give in order to foster and stimulate co-operation in the development of science and of its application to naval and other marine problems.

It is interesting to learn that with a view to developing and extending the scientific results which were obtained under the stress of war, the British Admiralty has recently put forward proposals for a permanent establishment of a Department of Research and Experiment within the Navy.

Plans have been formulated for the erection of a central research institution for the investigation of first principles and for carrying on researches of a fundamental and pioneer character. Steps have been taken to organize a sea experimental station and to provide buildings and equipment for an engineering laboratory, a wireless and signal school, and a torpedo and mining school in place of "Vernon," and it is believed that these institutions will prove of great value in developing not only means of increasing the efficiency of the British Navy, but in providing aids to navigation for the mercantile marine.

Current Events

Pennsylvania Electric Association Meets—Electric Transportation—New N. E. L. A. Committee—Other Happenings

PENNSYLVANIA ELECTRIC ASSOCIATION HOLDS INTERESTING CONVENTION.

Quality of Papers and Exhibits Notable Features of Successful Meeting.

The twelfth annual convention of the Pennsylvania Electric Association, held September 3-6 at Bedford Springs, Pa., was opened by President Thomas Sproule, Philadelphia, who comprehensively reviewed the work of the past year, summing up what had been accomplished during after-the-war conditions.

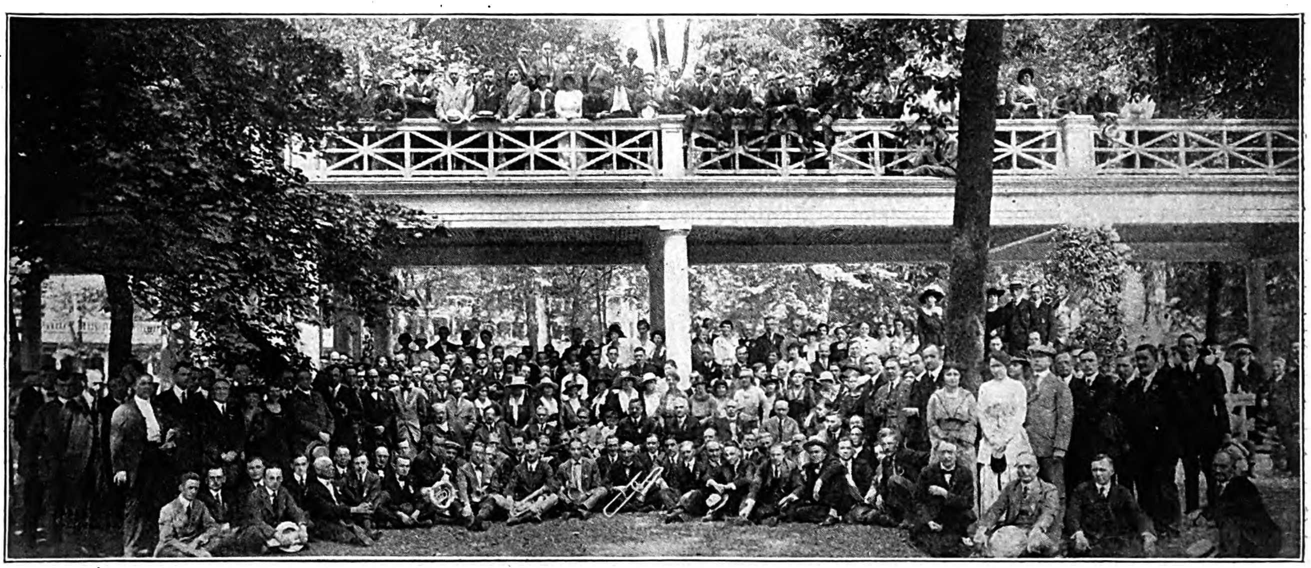
In reports of committees, that of the engineering committee was concerned with the joint use of poles and the elimination of the 5000-volt maximum clause, agreement on which will be reached later. Joseph B. Seaman, of Philadelphia, chairman of the geographic section's committee, reported on the feeling of good-will and mutual helpfulness derived from the meetings of the different geographic sections.

The first paper to be presented was on "Increasing Capacities of Existing Lines and Cables" by E. C. Stone, Duquesne Light Co., Pittsburgh, in which was given the relations between line capacity, costs and voltage regulation when increased capacity is obtained by increasing the copper and by increasing the insulation. In a general way, voltage regulation is not only a criterion of service but also of line cost, and when it becomes excessive, usually money can be saved in investment and operating cost by increasing line voltage. Line capacity can also be increased by improving the power-factor and is warranted if the total saving in line, transforming and generating equipment is greater than the cost of making the improvements. By means of charts and tables, Mr. Stone showed a comparison of methods of increasing line capacity under different conditions. In the discussion, the question of using regulators on 2300-volt power circuits was raised. In regard to furnace operations, it was suggested that the effect of a furnace on the line is solely a question of variation between the furnace load and load that the line can carry.

John A. Barnard's paper on "Effect of War on Boiler-Room Practice" showed savings made during the past year at the Schuylkill and Chester stations of the Philadelphia Electric Co., these being accomplished by training an economical coal-burning crew and checking its work by use of instruments. The discussion dealt fully with the use of pulverized coal, culm and fuel oil in place of coal. The statement was made that if the price of fuel oil could be guaranteed as anywhere near permanent it would pay to make the necessary changes in equipment to install fuel oil apparatus.

E. H. Tyson, Lehigh Valley Light & Power Co., Allentown, read a paper on "Method of Operating a Meter Department in Scattered Territory," in which was outlined methods for the organization and operation of a meter department for such conditions. The discussion enumerated the difficulties in securing efficient men, and the thought was expressed it was a good plan to draw from high school graduates, who usually remain for an average of one or two years and require but a short period of training.

A paper on "Economical Boiler Room Practice for Medium Sized Plants" was presented by H. B. Bryans, Counties Gas & Electric Co., Norristown. Methods employed to obtain more efficient operation of the Norristown plant in the face of high labor and fuel costs were given in detail. The discussion brought out the suggestion that gas house tar is valuable as a coating for boiler settings because it does not dry out.



Assembled Delegates at the Twelfth Annual Convention of the Pennsylvania Electric Association at Bedford Springs, Sept. 3-6.

The Manufacturers' Exhibit of Electrical Appliances in the "Big Top" at the Convention of the Pennsylvania Electric Association Helped in Large Measure to Make Its Convention Very Successful.

The use of an agitator in hoppers was advised. The evaporation of oil in gauges was mentioned, with the suggestion that they be kept as far as possible from heat. Tissue paper scale on tubes and savings in replacement resulting from regular cleaning out of scale were also included in the discussion on Mr. Bryans' paper.

H. P. Weaver discussed his subject of "Management and Men" extemporaneously, dividing his talk under five heads: Sincerity, honesty, willingness to lay aside prejudice, practicalness, and conservatism. In speaking of sincerity, he said the mere desire to do the right thing is not enough; the management must understand human nature sufficiently to know what is a fair deal. Under "honesty," he suggested that we must be honest with ourselves and then it would follow that we would be honest with others. Mr. Weaver cautioned against nostrums in dealing with the management and men question. He said there was no one remedy or system to fit the problem, but that it must be handled intelligently. He urged the necessity of drawing out the latent abilities in men and creating a mutual understanding between the management and the men so that both may understand that neither has "hoof and horn." He expressed the thought that the doing away of the limitation of production would be one way and perhaps the very best way of meeting present conditions. Mr. Weaver's paper provoked a great deal of earnest discussion, and the thoughts he presented were commented upon at length, several instances being given of the application of his suggestions and of the satisfactory results achieved.

In his paper on "The Story of the Insulations," C. E. Skinner, Westinghouse Electric & Manufacturing Co., gave the history of the development of sheet insulations, insulating varnishes and oils, mica, molded insulation, and glass and porcelain insulators, and indicated the trend of insulations of the future. In the discussion upon this paper, Mr. Skinner's ideas were very heartily concurred in. It was suggested that the permanent confinement of the equalizing potential to the selected path constitutes reliability; therefore the reliability of electric light and power apparatus is absolutely staked on insulation. Insulation's hope of climbing from the weak link to the strong link position that it deserves lies in the increasing requirement of reliability. Insulating varnishes were spoken of as being still worthy of serious consideration. Attention was called to the changes that have come about in the uses of mica and to the fact that the use of mica in large pieces cut to size has been abandoned in this country.

G. E. Wendle, Lycoming Edison Co., Williamsport, presented a paper on "Selecting a Switchboard for a Plant of Moderate Size," in which was given a resumé of changes in switchboard installation necessary to care for increases in power load and a comparison of the advantages of truck and cell-type panels.

At the Friday evening session W. H. Johnson, vice-president of the National Electric Light Association, enlarged upon the work of the association and the good to be accomplished through its various geographical sections.

The Hon. William D. B. Ainey, chairman of the Public Service Commission of Pennsylvania, in his address referred to the subject of capital and labor and to the necessity for them both to become better acquainted to the end that each could better understand the other. He said that there must be loyalty in service and loyalty in employment in order to insure harmonious relations and the accomplishment of the best good for both.

John W. Meyers, Philadelphia Electric Co., presented a paper on "Isolated Plant Costs as Influenced by the War," giving comparative figures on the cost of power plant materials and labor between 1916 and the present time, as well as reviewing economic features of the production and sale of electrical energy. Discussion on the paper was limited owing to the nature of the subject matter.

"Power-Factor Correction by Means of the Static Condenser" is the title of a paper presented by O. C. Roff, which is published in full in this issue. In the discussion it was stated that the static condenser will take a current which is proportional to the voltage and the kv-a. will be proportional to the square of the voltage. Accordingly, if the voltage decreases 10% the current will fall 10% and the reactive kv-a. by 19%. On the contrary, the synchronous condenser will take a considerably increased current and a somewhat larger reactive kv-a. This is due to the relative change of line voltage and excitation voltage, the decrease of line voltage corresponding to an increase in over-excitation since the excitation voltage does not change. The increase in current is approximately 20%, and the increase in kv-a. about 8% for a 10% drop in voltage.

It is evident then that the synchronous condenser will exert an increased correcting effect at the very time when the correction is most needed in order to maintain proper voltage while the static condenser will exert a decreased effect. This should not be interpreted to mean that the static condenser should not be used in any case, for it certainly is very much better than none at all, but is simply one of the points which should be considered in deciding upon the type of correction apparatus to be used.

It is interesting to note also the behavior of an induction motor under these conditions. If an average induction motor operating near full load and driving a load of constant torque, such as machine tools or hoists, experiences a 10% decrease in line voltage, the power component of the current will increase about 10% and the reactive component will be practically constant; that is, the necessity for correction is practically unchanged for moderate changes of voltage.

The officers elected for the succeeding year are: W. R. Kenney, Connellsville, president; Henry Harris, Pittsburgh, first vice-president; E. H. Davis, Williamsport, second vice-president; H. S. Cantlin, Allentown, treasurer. Members of executive committee (two year term), W. E. Long, Philadelphia; J. H. Shearer, Altoona, and G. M. Gadsby, Pittsburgh. Henry N. Muller was elected to fill out the unexpired term of Henry Harris.

ECONOMIC FUTURE OF ELECTRIC TRANSPORTATION UTILITIES.

Western Society of Engineers Conducts Symposium on Condition of Electric Railways.

An interesting symposium on electric railway problems of the times formed the topic of discussion at the opening meeting of the season held by the Western Society of Engineers in Chicago on the evening of Sept. 8. Four experts on electric railways presented different phases of the complicated economic problem.

The subject was opened by James R. Bibbins, of the Arnold Co., Chicago, in a paper introducing the problem as a whole and giving a historical review thereof. He showed the importance of the electric railway utilities to the communities they serve. Their capitalization of $4,800,000,000 has been subjected to heavy shrinkage. Not only have material costs risen, but wages also, while labor apparently has the whiphand. The public has been educated to the 5-cent fare and demands that consideration be given only to the depreciated value of the properties. Some nine different remedies have been proposed, of which many are quite radical. Mr. Bibbins reviewed the history of a railway system in a large city with 5-cent fare dating to 1860. Fairly stable conditions existed up to 1890 when the line were electrified; the heavy capital costs thereof practically wiped out earnings for nearly 10 years. As they picked up again, optimism was felt and franchise renewals were accepted without proper allowance for depreciation. The 5-cent fare does not now yield sufficient income.

A paper by P. J. Keeley, president of the Kansas City Railways Co., on "Valuation and Accruing Depreciation" was read by Secretary Nethercut in Mr. Keeley's absence. At first the problems seemed local and greatly diversified, but more recently they have become national and crystallized into realization that the companies cannot render service on their present incomes. The Federal Electric Railway Commission may produce some valuable findings from its investigation. One feature coming to be recognized is that it is impossible to keep a street-railway property in better than 80 to 90% perfect condition, yet it can give 100% service. The practice set by the Wisconsin Railroad Commission of fixing rates on the depreciated value of the property is being abandoned by this and other commissions because it is essentially unfair to the investor. Valuation based on reproduction new is now the accepted practice because equitable. Solution lies in acceptance of the cost-of-service principle as basis for rates.

"The Actuarial Problem" was the title of a paper by W. J. Hagenah, consulting engineer, Chicago, read by Mr. Jirgal in the author's absence. Depreciation funds are seldom set aside specifically as such. The practice of accountants is usually to draw on the general surplus or reserve for renewals instead of on special depreciation funds. Each generation should bear its share of development expense and depreciation. Patrons must provide sufficient income to meet costs and investors must make proper allowance for current and accrued depreciation in order to permit continuous service and keep the property intact. Depreciation must be provided for in advance and the income must be sufficient to permit this. There is an undoubted tendency toward using the reproduction cost new as basis for rate making.

George Weston, consulting engineer, Philadelphia, presented a paper on "Electric Railway Policy." One of the most important problems is to secure harmony between labor and capital, then to promote economy and give the best possible service. Public authorities must be fair; in the past they have taken the "pound-of-flesh" attitude too often and denied a fair deal to the companies. Labor must be assigned a participating partnership in the business and compelled to assume its obligations. Assuring it full opportunity to have redress for wrongs, it must be deprived of the right to strike. Mr. Weston referred to the success of the Philadelphia Rapid Transit co-operative plan, which has been developed during 9 years. A feature of it is to promote thrift and stimulate service. Most companies cannot resort to such slow development of co-operative service in the present emergency and must have more revenue.

The subject was discussed by Colonel Junkersfeld and Messrs. Lewis, Bibbins, Mabbs, Jirgal and Stephenson.

TWO NEW COMMITTEES ARE ESTABLISHED BY N. E. L. A.

Committee on Service and Committee on Co-operation in Industry Are Formed.

President R. H. Ballard of the National Electric Light Association has received the acceptance from S. M. Kennedy, general agent of the Southern California Edison Co. of Los Angeles to act as Chairman of the Committee on Service, and from Lee H. Newbert of the Pacific Gas & Electric Corporation of San Francisco to be chairman of the Committee on Cooperation in the Industry. Both of these important committees will pursue lines of original investigation and will make reports along constructive lines to the national convention of 1920, which will be held in Southern California.

Mr. Kennedy's committee will work on the conditions of service from this viewpoint: With the regulation of rates and finances by state utility commissions, to provide only safe returns on capital invested, and with a courageous attitude toward these regulating commissions to see that such return is allowed; electric utility companies are entirely out of politics and should devote their energies to the service of the public, without any encumbrance to the achievement of its highest development.

Mr. Kennedy is well known in the national forum of the industry both as a progressive official and an author.

Mr. Newbert's committee will endeavor to formulate and submit to the next convention a plan by which all of the branches of the electrical business may co-operate and to show specifically how this can be practically worked out in the geographic sections.

Mr. Newbert has been very active in the California Electrical Co-operative Campaign, of which he has for several years been chairman. This movement had its origin in the Pacific Coast Section, has met with remarkable success in the centralization of central stations, manufacturers, jobbers and contractor-dealers, and has demonstrated that they can work together for the general good of the industry. Chairman Newbert, in appointing the members of his committee, will make selections from all branches of the industry.

CENTRAL STATIONS CONFRONT PROBLEMS DURING READJUSTMENT.

Chairman Britton of Public Policy Committee, N. E. L. A., Outlines Policies to Be Adopted.

In anticipation of weighty problems that confront the central-station industry during the readjustment period, John A. Britton, chairman of the public policy committee, N. E. L. A., has written the following letter to members of that committee with a view to standardizing fundamental policies of public utilities, to place rate regulation on principles of equity, to promote water-power development in the West, and to correlate the work of the different committees so that the problems of the year may be handled consistently and well.

To the Members of the Public Policy Committee, National Electric Light Association:

As chairman of the Public Policy Committee of the National Electric Light Association, I wish to discuss with the members of that committee the policies deemed essential by me to be pursued during the coming year.

First and foremost, I am in sympathy with and ready to stand back of all the plans which have been suggested by President R. H. Ballard, and pledge myself to support him in his more than laudable effort to make his administration year a record one for the association. I hope that the members of our committee will assist Mr. Ballard in securing men of prominence in the industry for chairmen and members of several new general committees he is trying to organize to work out the big problems now confronting us. These will require the thought of some of the best minds and work of the best men.

We of the West want the East to know us better. We want to expand the usefulness of the association; we want it to be nation-wide in its influence. It can be of the greatest good.

The fundamental policies which must govern the attitude of public utilities should be alike. In my judgment this can best be accomplished through the suggestions made by our president, particularly with reference to the formation of Geographic Sections.

The methods of approach to the rate regulating bodies must be upon sound principles of equity. Individual opinions enforced through argument in special cases should not be permitted to raise questions inimical to the public utilities as a whole.

The East has never been appreciative of the necessities of water power development; it has been more or less inactive in support of Western needs and conditions. This condition must be remedied.

Standards should not be encouraged in one section of the country that might be detrimental to other sections. In this concert of action is necessary.

The Public Policy Committee should be a judicial body acting upon the general questions raised in the association and coming through the avenues of the different committees. For that reason it should be closely in touch with the action of all committees, but more especially the Executive Committee, and should have intimate knowledge of what is being discussed and of the problems that concern each of the subdivisions of the organization. I have arranged with the president that copies of the minutes of the Executive Committee meetings will be sent to each member of the Public Policy Committee.

If ever there was a time in the history of our association when to overcome the insidious working of antagonistic interests we should stand together, that time has now arrived.

National legislation and state legislation should be correlated with the needs of all states, so as not to form dangerous precedents. Matters of this kind can best be worked out through the agency of such a committee as the Public Policy Committee.

I want each and all of you to pledge yourselves to a shoulder-to-shoulder campaign with our president. Like the West from which he comes, he is progressive, ambitious and resourceful.

I am sending a copy of this letter to you, to each of the vice-presidents, and invite from you and them such suggestions of matters to be considered at the meeting of the Public Policy Committee to be held in September as may occur to you as things that should receive consideration at the hands of that committee in line with the policies which I have outlined in the preceding paragraphs.

Yours very truly,
JOHN A. BRITTON,
Chairman, Public Policy Committee, N. E. L. A.

MANY FEATURE EXHIBITS PLANNED FOR NEW YORK SHOW.

Model Electrical Home and Complete Vehicle Display to Be Shown at Exposition Sept. 24 to Oct. 4.

A model of a modern home, in the form of a small apartment equipped with electrical machinery and devices which either supplant entirely or greatly lighten the manual labor associated with the operation of a household will be a feature exhibit of both interest and value at the New York Electrical Exposition which opens Sept. 24 in Grand Central Palace, New York City. These machines and devices are literally as well as figuratively electrical servants.

The idea of the model home originated with Arthur Williams, Federal Food Administrator, and also head of the exposition. He called together a staff of experts and told them to lay out an average small home, and then to apply electrical devices and machines to every manual labor task necessary for its operation. They have succeeded beyond expectations and found many new inventions applicable to the work. Altogether a remarkable demonstration of the emancipation of household drudgery through the modern application of electricity is provided.

In addition practically every make of electric passenger car and electric motor truck, including the small industrial trucks, will be exhibited. There will also be numerous displays of the various accessories applicable to the electrical vehicle, ranging from batteries to decorative lighting. Those engaged in the automobile business will have a further interest in the electrical show, because of the many exhibits of electrical devices for the garage and repair shop and the wonderful displays of electric lighting and decoration for large showrooms.

Commercial Practice

Successful Merchandising Methods—Refixturing Campaign of Commonwealth Edison—Advantage of Irons as Specialty

ELECTRICAL MERCHANDISING METHODS OF DETROIT EDISON CO.

Abstract of Interesting Paper Read at Michigan Section Meeting by A. H. Touscany.

The methods employed by the Detroit Edison Co., Detroit, in conducting and promoting the sale of electrical merchandise in its territories were fully described in a paper, "Electrical Merchandising," presented at the recent convention of the Michigan Section of the National Electric Light Association by A. H. Touscany.

In Detroit, this company sells only lamp socket heating devices such as irons, toasters, etc., leaving the marketing of the larger devices to the electrical contractor-dealers, department stores and hardware merchants. There are about 250 such stores in the city at present. A number of these, having important agencies, support excellent selling organizations. During 1918, approximately the following number of major devices were sold: 16,979 cleaners, 8153 washing machines, 1335 ironing machines and 1536 sewing machines.

Most of the business is obtained by soliciting and it can safely be said that no housewife in Detroit need go shopping for such devices. Because of the existing competition every reasonable courtesy is extended to the customer.

The one device that the Edison company will perhaps always handle is the flat iron. This is because many of the other merchants have a tendency to handle the cheaper lines of this appliance and if the business were left entirely to them the company's lines would be flooded with low priced goods of inferior makes that would cause considerable trouble.

In the small towns outside Detroit, known as the Eastern Michigan Division, little or no attention is paid to the development of the electrical appliance business by the local dealers. In order to develop these territories the company carries an adequate stock of devices in all its local offices.

By establishing such stores it is also hoped to bring the small town dealer to a better realization of the opportunities offered in the sale of electrical appliances for in the future a large portion of his business will come from this source.

In this connection the possibilities of the electric appliance business were brought out. The range, washer, cleaner, sewing machine and ironing machine were described as the popular major electrical devices of today and will undoubtedly be sold in ever increasing quantities in the future. The dishwasher and clothes drying machine are devices expected to be brought forth in the near future and the electric refrigerator has already been developed but not exploited as yet to any extent. In addition, electrical merchandise is the cleanest line of merchandise there is today, and every time a labor-saving device is sold the customer is rendered a valuable service which gains his confidence and good will—a wonderful asset to any business.

In regards to the methods used to stimulate appliance sales, Mr. Touscany is of the opinion that the house-to-house hawker method of selling is undesirable for a central station to employ. It is true a certain amount of educational work must be done but it seems to him that a certain portion of the line is sufficiently introduced to make it unnecessary to continue what is considered by the largest and most sucussful merchants to be a most undesirable method of getting business.

In its Eastern Michigan Division in which there are 30 display rooms the Detroit Edison Co. is endeavoring to market electrical appliances in much the same way as a hardware dealer sells his goods. It is trying to teach its customers through window display, newspaper advertising and store demonstrations the uses and advantages of electric appliances. By pursuing this policy the merchandising business in this division is growing steadily,—the 1917 sales being 50% greater than in 1916, in 1918 they were 85% greater than in 1917 and during the first six months of this year it has had a 148% increase over the same period last year.

Everything is sold at manufacturers' list price, no commission or bonuses are paid and no free wiring is done. The company believes in local newspaper advertising but does not advertise any particular make of appliance, and although nationally advertised products are preferred it does not disfavor new lines being put on the market. Advertising matter is sent out in the monthly bills but the company's name does not appear on the advertisements. The show windows are also used as advantageously as possible and the returns justify all the time, money, care and thought that is put into them. It has been found that the simple window exhibiting a single thought is the most successful. Such windows can be trimmed more easily and the displays are changed as often as three times a month.

Special attention is paid to store arrangements and the stores are so arranged that a customer in paying a monthly bill walks through the entire display. All of the small heating devices are kept in glass show cases which not only adds materially to the appearance of the store but allows a sample of each device to be kept on display constantly without depreciating their value. Washing machines and ranges are connected so that customers can see the devices in action.

All our appliances are sold on a deferred payment basis, and although there is no set rule governing time and payments, terms are usually arranged to suit the customer's convenience. Every opportunity to demonstrate to customers is taken advantage of and it is found that the stores doing the must demonstrating make the greatest number of sales. The value of dignified store solicitation cannot be over-estimated and the increase in business is largely due to the fact that the merits of electrical devices are being continually demonstrated in all display rooms. Service, of course, is the most essential requirement. One of the main reasons for a central station being in the appliance business is because it furnishes a greater chance to serve the customer.

As mentioned before, the Detroit Edison Co. offers no bonuses or commissions to its sales people in the sale of appliances. Recognizing that there should be some incentive offered, a comparative appliance sales report is issued each month. These reports are not only sent to each local office, but to all officers of the company interested in the development of appliance sales. This report not only indicates the amount of appliance sales for each town and district, but it shows the amount of appliance sales in cents per meter. Because of the close attention that is paid to this report by various officers of the company and because the district agents are vitally interested, each local agent is very anxious to make a good showing for his community.

In conclusion, the paper called attention to the necessity for enthusiasm in selling electrical appliances. Enthusiasm is the biggest word in business today. Cash can buy, but it takes enthusiasm to sell. The slogan of the best salesman is "Enthusiasm," because it is the zeal that puts zero in competition. Enthusiasm is what gets you home from third. It is that power that compels you to stick in the home stretch. Without it, the fullest measure of success cannot be achieved as it is the contributing factor of any finished product. The best clerks, the most resourceful salesmen, are those filled with enthusiasm. Each and every one of us dealing in electrical appliances should be filled with a sincere enthusiasm for the wonderful line of merchandise which we sell.

TENANTS URGED TO BUY THEIR OWN LIGHTING FIXTURES.

Commonwealth Edison Co. Plan Enables Apartment Building Tenants to Improve Lighting Conditions.

For many years central stations, contractors and the rest of the electrical industry, as well as the public, have realized that the lighting fixtures installed in the average apartment building left much to be desired both from the artistic and practical viewpoints. This is due to the fact that the lighting fixtures are usually the final purchase in constructing a building and must be paid for out of the money left over after all other expenses are paid. On account of the large number of extras encountered in the construction, this amount is seldom as large as originally intended and the cheapest possible fixtures are usually installed.

In addition practically every occupant of such a building possesses a different style of furniture and for each of these styles there should be installed a corresponding electric fixture if the best results are to be obtained. People will go to a great deal of expense to purchase furniture of a certain period or style and arrange it tastily only to have the whole effect spoiled by a lighting fixture that is not in harmony with the rest of the room, for the lighting fixture dominates everything else in the room. Furthermore, existing lighting fixtures are seldom used properly. They are either equipped with lamps of a size too large or too small or every socket is not filled with a lamp.

To overcome this condition a fixture department has been added to the Electric Shops of the Commonwealth Edison Co., Chicago, where tenants may purchase their own fixtures to harmonize with their furniture and individual tastes. The fixtures are sold on the time-payment plan which makes their purchase much easier. Although the plan is a comparatively new one and has not been widely advertised as yet—the advertisement reproduced herewith being the only one to date—the demand for fixtures is already exceeding all expectations and promises to become an important factor in its business.

NOTICE to TENANTS

Own Your Fixtures as You Do Your Furniture — Many a tenant, moving into an apartment, finds fixtures that, even if modern, are discordant with the period furniture. The problem is solved by selecting and owning fixtures in keeping with such furniture—replacing the landlord's fixtures during tenancy.

The Fixture Room at Our Electric Shop — We make this easily possible. The Fixture Room at Electric Shop displays a most comprehensive variety of period as well as modern designs in artistic effects, in keeping with every possible need. Select the fixtures you wish—we will arrange for their installation in your apartment.

Small Monthly Payments — Make a small payment, and you may pay the balance—added on your lighting bills—spread over eleven months.

Tenants and Landlords — Whether you are a tenant, or a landlord, you are urged to avail yourself of the convenience afforded by this plan.

ELECTRIC SHOW COMING OCTOBER 11-25—COLISEUM

Recent Advertisement of Commonwealth Edison Co. Electric Shops Urging Tenants to Buy Their Own Fixtures.

SEWING MACHINE DEALERS URGED TO HANDLE ELECTRIC IRONS.

A recent issue of *Sewing Machine Times*, a publication devoted to the interests of the sewing machine trade, contained an interesting article explaining the advantages of carrying a line of electric irons as a specialty for dealers in that line. It was pointed out that by handling such devices as a side line the sales of sewing machines and other appliances could be materially increased. The sewing machine dealers were urged to take advantage of the advertising and sales campaigns conducted from time to time by electrical manufacturers and central stations by tying in their own advertising and concentrating their sales efforts on these articles during such periods. The article then described the methods that have been used with success in the past by different electrical interests in the conduct of such campaigns.

Without attempting to discuss the desirability of such a procedure from a practical point of view it surely indicates the attractive selling qualities of such appliances and it is interesting to note that another industry recognizes the great demand that has been created for electrically operated appliances and the advisability of handling them.

Operating Practice

Intermittent Ground in Turbogenerator Field—Heating of Underground Conductors—Synchronous Motor Ammeters

OBSTRUCTION IN VENTILATING DUCT CAUSES INTERMITTENT GROUND.

Peculiar Ground Existed Only with Machine in Rotation. Location of Cause and Moral?

Many companies make it a practice to test periodically the fields of their machines for earths or grounds. In this way many occurrences can be brought to light and worse happenings prevented. In steam generating stations containing turbogenerators and extensive exciter systems it is particularly advisable to make frequent tests for grounds on the exciter system and the generator field circuits.

In one instance recently a rather peculiar form of ground occurred. When making the periodic tests for grounds it was discovered that one of the turbogenerators had a ground on its field. This unit was of 25,000 kw. and was in service at the time the ground was discovered. When the unit was shut down, repeated tests showed that the ground had disappeared. Starting the machine again showed that when up to speed or nearly so, the ground existed, but when the machine was at rest or turning over very slowly it had disappeared. Such grounds occur frequently, and are usually found in the flexible leads that pass from the actual field coils to the rings, and may be due to frayed insulation, the collection of greasy dirt containing conducting particles such as metal dust.

As it was found impossible to locate the ground by test or inspection it was necessary to take out the field and remove some of the field end plates. The fault was found to be half way down in one of the slots directly in line with the spot where the field leads come out of the field. End plates were removed from each end of the field and the insulation on the end turns of the field coils was then found to be damaged quite extensively. The reason for the damage was found to be due to the fact that the bolts holding the end plates in position had been pulled up so tightly that the insulation on the coils had been badly crushed. As bearing out this cause of damage to the insulation, was the further fact that the supporting studs against which the end plates are pulled up against were badly buckled and marred, the end plates themselves even being sprung where the bolts passed through.

On pulling out the defective coils, it was found that the ground had been occurring in the bottom of the slot directly on top of one of the ventilating ducts. At this point inspection of the core showed that a brass wedge, such as is employed for securing the pole laminations, was resting in that ventilating duct that terminated at the fault in the field conductor. This wedge was standing on edge and was free to move backward and forward along the ventilating duct, according to whether the field was turning over or at rest. When the field was rotating, this wedge was thrown out against the faulty conductor, striking the insulation at the point where it had been cut and causing a ground.

The cause of the ground on the field resulted from the wedge, the crushed insulation due to the end plates being pulled up too tightly, being only incidental and a fact that was brought to light only because the conductor in a certain slot was pulled out. While being a weakness, the crushed insulation had not caused trouble up to the time the field was overhauled. The moral from this incident seems to be that special precautions should be taken to prevent loose objects from being left in ventilating ducts and similar places, and that the force that it is possible to exert through the leverage of wrenches, etc., be not abused, as had obviously been the case in the present instance, since the end plates had even been sprung.

HEATING OF UNDERGROUND CONDUCTORS UNDER INTERMITTENT LOAD.

Abstract of Paper Describing Experiments Before A. I. & S. E. E. in Philadelphia.

BY A. L. FRERET,

Assistant Electrical Engineer, Tennessee Coal, Iron & Railroad Co.

When a conductor is carried in conduit buried in solid material, convection of heat is prohibited and the heat created by the current must be dissipated by conduction through the insulation and through the conduit into the surrounding substance. The amount of heat so dissipated through conduction is roughly proportional to the temperature difference between conductor and surrounding solid substance, and is also proportional to the area of radiating conductor.

The process of conduction of heat from the cable is so slow compared to the process of convection from a conductor suspended in air that the limiting carrying capacity of the underground cable is the temperature dangerous to the insulation. This temperature is reached long before the power losses represented by the heating reach values which need be seriously considered.

Obviously, heavier currents can be employed when they exist only intermittently than when existing continuously, and experiments were carried out to determine safe loading with intermittent loads. The experiments were carried out by constructing a pine box 10 ft. long, and 1 ft. wide and high, the pine boards being ⅞-in. in thickness. Several rubber-covered cables were laid at different times in the box and surrounded by ground firmly packed. Heat runs were made and the current and time required to attain 100° F. was noted.

Tests were then made to determine the effect of an intermittent current upon the temperature rise of the conductors. Current was applied for one minute, was shut off for two minutes, and then on again for one minute, and so on for two hours. In the case of a 2/0 cable carrying 200 amperes with the intermittent current of 200 amperes on one minute and off two minutes, after two hours a temperature of 107° F. was attained compared with 180° F. for continuous load, a difference of 73° F. In the case of a 4/0 cable carrying 300 amperes, the temperature attained with intermittent load was 120° F. compared with 220° F. continuous load, a difference of 100°.

The conclusions reached are that with an intermittent load, one minute on and two minutes off, an underground cable need only have 56% area of the conductor for carrying the same load continuously.

The foregoing shows that the current being intermittent, the heating of the cable really depends upon the mean effective current, which is the square root of the mean squares of the current. In the case where the current is on and off the same length of time, that is, one minute, this would correspond to the $\sqrt{2}$ and for current alterations amounting to one minute on and two off, this same value is very nearly correct, so that the simplest way to arrive at the safe value of current for underground cables in intermittent service would be to use the manufacturer's rating multipled by the $\sqrt{2}$.

EXPERIENCE OF THE HAZARDS OF SYNCHRONOUS MOTOR FIELD AMMETERS.

Relative Methods of Starting Motor—Location of Field Ammeter.

By B. H. Smith.

The synchronous motor has passed through a stage of development during the last five years by which its operating characteristics, pull-in torque, starting torque and stability in running have been greatly improved. Today, the synchronous motor can replace the induction type of motor for many applications, whereas its use would not have been even considered a few years ago. However, while there are many modern synchronous motors in service, with the latest improvements, there are also many of the older types still in service, with their shortcomings and their dangers. The following serves to emphasize one of the dangers of the old methods of starting synchronous motors and how it could be overcome under such circumstances, and how the danger has been eliminated by recent improvements in motor design.

Methods of Starting Synchronous Motors.

When starting a synchronous motor from rest, a partial voltage is applied to the armature or stator. The field winding or rotor acts as the secondary of a transformer, of which the primary or stator is the winding to which potential is applied. Under these circumstances, of course, a voltage is induced in the field winding of the synchronous motor, this voltage depending upon the ratio of turns in stator and rotor, the applied voltage, the frequency in the rotor circuit or flux density, according to the familiar transformer equation.

At the instant of starting from rest, the potential induced in the field winding is a maximum, because the frequency of the stator is the same as that of the rotor. As the rotor gains speed, the frequency of the rotor becomes lower until the motor "pulls in," when the frequency of the induced current in the rotor is zero, because no potential is induced since no flux is cut by the rotor.

The ratio of field turns to armature turns of the synchronous motor is such that at the time of starting a high voltage is induced in the field winding. To guard against breakdown of the field coils, it is the custom to break up the field winding into sections, thereby limiting the number of turns in series. In the latest types of synchronous motors it is the practice to start the motor with the field short-circuited upon itself through a resistance, thereby preventing the piling up of a potential dangerous to insulation or persons. Moreover, the low-resistance bars or winding in the pole pieces also serves to reduce the induced potential in the field while the motor is being started up. In other words, the synchronous motor of today presents little danger to insulation or to persons.

As many of the older types of synchronous motors are still operating, it may be instructive to describe a serious accident that occurred, explaining the manner in which it could have been and has since been avoided. The synchronous motor was employed for driving an alternating-current generator and thereby changing the frequency from 25 to 60 cycles. The motor was rated at 1000 kw. and operated at a line pressure of 9000 volts, 25 cycles. The motor was equipped with wattmeter, voltmeter and ammeters on the alternating-current side and with a voltmeter and an ammeter in the field windings.

Location of Field Ammeter.

The motor was started up from an autostarter or autotransformer, at about 50% line voltage, or 4500 volts. It so happened on the day under consideration that the chief operator was supervising the starting of the unit by an assistant operator. The former was standing at the switchboard, before the panel controlling the unit to be started, with one hand resting upon the case of the ammeter in the synchronous motor field circuit. When the assistant operator closed the motor to the autotransformer, the chief operator received a shock that caused him to be unconscious for several minutes and that resulted in burns that kept him in the hospital for several weeks.

A consideration of this case shows that (1) ammeters in the field circuit of synchronous motors should be treated with the respect due to apparatus subjected to high voltages, and should not be touched while the motor is being started; (2) that the ammeters of synchronous-motor fields should be located on the exciter bus side of the field circuit-breaker so that the ammeter and its shunt are isolated from the field coils until excitation is applied to the field winding.

In the present instance the synchronous motor received its excitation from two sources, an exciter at the end of the synchronous motor shaft and a separately driven exciter set. The ammeter was located close to the field winding of the motor, so as to shorten up the heavy leads from the direct-connected exciter. In other words, the circuit-breaker located at the rear of the switchboard only controlled the separately driven exciter set. The same result could have been obtained by installing the circuit-breaker on the panel carrying the knife switches for the direct-connected motor exciter.

With the present-day practice of short-circuiting the synchronous-motor field through a resistance, plus the grid resistance winding in the pole pieces, the danger mentioned above is very remote. However, as there are many of the older types of synchronous motors still in service, the precautions outlined above deserve consideration.

Contracting-Construction

Co-operative House-Wiring Campaign in Chicago—English House-Wiring Problem—Effort to Standardize Construction

HOUSE-WIRING CAMPAIGN TO BE CONDUCTED IN CHICAGO.

Union Officials Call Meeting to Arrange Plans for Campaign During Coming Winter.

About 110 Chicago members of the Illinois Electrical Contractors Association were present at a meeting held in Chicago on Sept. 5. This meeting was called by the officers of Local 134 of the International Brotherhood of Electrical Workers and in addition to these officers and the contractors there were present representatives of the Commonwealth Edison Co. and of the Electrical Inspection Department of the city. Charles Paulsen, president of the labor union, presided.

The purpose of the meeting was to arrange the plans for carrying on an intensive campaign to wire existing buildings during the coming winter and to work out a solution to some of the problems encountered in such work. Due to labor difficulties that have risen in Chicago and for which the electricians' union is by no means responsible, construction work in this city has been practically at a standstill and with the cold weather coming on it is not probable that it will be resumed to any extent until spring. In order to provide work for the electricians therefore, it was decided to urge the local electrical contractors to exert every effort they possibly can toward securing a large number of old house-wiring contracts during the winter period.

The principal speakers on this occasion were Victor H. Tousley, chief inspector of the city's inspection department; E. W. Lloyd, general contract agent of the Commonwealth Edison Co.; M. J. Boyle, business agent for the labor union, and J. W. Collins, secretary of the contractors' association. Mr. Tousley explained very clearly the requirements and provisions of the new Chicago license ordinance, which was described in our issue of Aug. 9. A lively discussion followed in which the advantages of the new ordinance and many of its important provisions were fully brought out.

Mr. Collins explained the arrangements which he has recently completed for bonding the members of the association. Under the new ordinance each contractor is required to provide a $5000 bond. Mr. Collins has arranged with a prominent company to bond all the members of the association collectively. This has reduced the amount of the individual bond fee to a large extent, more than enough to pay the association membership dues, and has resulted in a great increase in the membership. He has also arranged with a local banking company to finance a time-payment plan for old house wiring for the membership of the association, whereby the contractor can receive cash immediately for his contracts and the bank accepts the responsibility for making the collections.

Mr. Lloyd spoke of the Chicago Electrical Show to be held Oct. 11 to 25 at the Coliseum. The success of this show is already assured and the contractors were urged to co-operate and participate in it as far as possible. All of the electrical contractors' associations in Chicago have co-operated and made arrangements for a booth at the show and the state association will hold a meeting while the show is in progress.

The difficulties encountered in conducting the old house-wiring business in Chicago were then discussed. The principal difficulty seems to be in getting the buildings connected after the wiring is completed. In order to overcome this the electrician, contractor, central station and the inspector must co-operate very closely to avoid any unnecessary delay. Several plans have already been developed to accomplish this, but to date these have only been successful in a small degree. As a result of this meeting, however, steps are to be taken by the various factors in the industry which will undoubtedly result in the elimination of such delays.

INTERESTING FEATURES OF ENGLISH HOUSE-WIRING PROBLEM.

J. W. Beauchamp Advocates Use of More Completely Manufactured Fittings to Reduce Labor Costs.

Some interesting information regarding the wiring costs of small buildings in England was recently brought out in an address by J. W. Beauchamp, director of the Electrical Development Association, before a joint conference of electrical engineers, contractors and supervising electricians recently.

In this address Mr. Beauchamp stated that it was seldom that an opportunity occurred of wiring a large number of houses at the same time in quantity and in a businesslike manner, and at a time when the construction of the houses was not completed. Generally the houses are wired one at a time and are in quite a completed condition, which involved a lot of extra work.

Assuming the case of an average house situated about a mile from the shop of the wiring contractor, it would appear that at pre-war prices some 10 to 15% of the labor cost in wiring was spent for "walking time" and the transport of materials to the job, leaving only 85 to 90% of the labor cost for effective operation within the house. Today, the percentage lost in this way has increased to 15 to 20%, owing to the change in the working hours. It was obvious that everything possible must be done to reduce the number of days spent on any job of this kind and to expedite the transport of men and materials to the job; very strong arguments in favor of using some form of mechanical transport for conveying both men and materials. Where an estate or block of houses was being wired, a clerk and a hut could be set on the job, stores accumulated, and a great deal of loss avoided.

Another point was that the underlying principle of improved wiring systems was to get a larger proportion of the money spent in a factory and a lesser proportion spent actually in the house being wired. For example, in a standard building wired in a simple way throughout with plain pendants, the usual class of material and conduit, and full-price trade union labor, it appears that the total cost (without overhead charges and profits) is divided as follows:

	Per cent of total cost. 1914.	1919.
All fittings and accessories	14	17
Cable	15	12
Conduit	13	17
Labor	40	41
Lamps	18	13
Total	100	100

Thus, although the total cost was almost exactly doubled, there had been no great change in the relative proportion of the cost of the several items. The manufactured fittings, conduit, and the labor were up a little; cable was relatively lower, and lamps are reduced by a substantial percentage. For these reasons there is no great prospect of reducing the labor cost, excepting where large blocks of houses were being wired at once and better organization and more division of labor could be brought together to effect economies.

However, Mr. Beauchamp believes that by giving the workmen more completely manufactured articles than coils of wire and lengths of tube and thus bringing more of the work within the four walls of a factory the labor cost could be materially reduced. After amending the present regulations if possible to permit the use of simpler and less elaborate wiring systems, the industry should then devise a system in which the wiring and fittings were produced in the most finished possible form in the factory, leaving the smallest call upon the skill of the workmen to fit them neatly to the installation.

Mr. Beauchamp also called attention to the fact that the percentage of the total cost of electrical work expended for labor was very high compared with other accessories of the house, for instance, the fixing of the fire grates, hot water systems and baths. In the case of these other articles the cost of the goods as purchased from the manufacturer was much higher in relation to the cost of installing them than was the case with electric wiring. This proves that such articles are much more completely finished in manufacture than electrical devices.

COMMITTEE FORMED TO STANDARDIZE CONSTRUCTION.

New Committee of National Federation of Construction Industries Expected to Solve Problem.

One of the greatest problems confronting the construction industry at present is the lack of standardization. This applies to building codes, to state legislation relative to licensing and inspection as it refers to construction and care of buildings, to building equipment of all kinds, to construction materials, to building specifications, to contractors' methods of bidding, etc., to financial operations in connection with construction, and to other considerations involved in the construction industry.

If it were possible for manufacturers of construction materials to standardize their product into a minimum number of varieties compatible with successful building operations, the manufacture of such material could be placed upon a bulk basis which in many cases is now impossible. Quantity manufacture has made the United States supreme as an industrial nation. The construction industry, however, is in many particulars so unstandardized that quality production is now impossible.

In order to overcome this difficulty the National Federation of Construction Industries has recently created a Committee on Standardization which will be formed as rapidly as possible. It is intended to organize this committee so as, if possible, to reach into all phases of construction interests, since it will be practically impossible to effect standardization without the co-operation and assistance of all of the interests concerned. The work of this committee will undoubtedly extend over a number of years, and the results which are possible of achievement are at the present time almost beyond estimate.

BOSTON DISTRICT CONTRACTORS TO HOLD IMPORTANT MEETING.

Report of Activities at National Convention of Contractors and Dealers to Be Read.

There will be a meeting of the Boston district of the Massachusetts State Association of Electrical Contractors and Dealers on Sept. 18 at the Boston City Club. On that occasion, Alfred J. Hixon, National Committeeman from Massachusetts, will make a report on the activities of the annual convention of the National Association of Electrical Contractors and Dealers in Milwaukee. Many matters of vital importance were considered at this convention and notwithstanding the fact that they have been published in the trade press, Mr. Hixon will give a more lucid explanation than it would be possible to obtain from reading matter. Also the members will have an opportunity of asking questions upon matters not fully understood from reports of the National Secretary.

It is particularly desirous that a large attendance be present at this meeting, as it is possible that later on the association may be called upon to express an opinion upon vital questions that possibly may affect the entire industry.

REQUIREMENTS FOR RUBBER-COVERED WIRE IN AUSTRALIA.

Commonwealth Imposes Rigid Specifications on Manufacture of Wire.

In order to insure the quality of the rubber-covered wire used in Australia and keep the possibilities of danger or fire arising through the failure of insulation at a minimum the Australian Commonwealth authorities impose the following regulations on rubber-covered wire: Each coil must bear (1) the maker's name and address; (2) the length of wire; (3) the date of manufacture; (4) the gauge of conductor; (5) the insulation resistance per statute mile after 24 hours' immersion in water at 60° F. and one minute's electrification at . . . volts—the voltage to be plainly marked on the label—or details of the test voltage applied, or other definite and comprehensive description of quality.

QUESTIONS AND ANSWERS

All readers are invited to submit questions and answers to this department. Anonymous communications will not be considered. Questions should relate to electrical matters of any kind. Answers contributed by readers should be submitted preferably within eight days of the date of publication of the question and should be limited, if possible, to 300 words. Payment will be made for all answers published.

Questions.

No. 464.—Transformer Design.—I am trying to build a transformer with 110-volt primary and 14 steps on the secondary varying by 7½ volts up to 105 volts, thus, 7½, 15, 22½, 30, etc. Each step must be capable of carrying 10 amperes. What size and amount of wire is necessary on the primary and secondary windings?—W. A. S., Augusta, Kans.

No. 467.—Operating Cost of Electric Household Refrigerators.—I would like to know from some reliable source what is the operating cost of the electrically operated refrigerators that are being recommended for household use. What is the experience as to their dependability?—R. H. T., New York, N. Y.

No. 471.—Ringleman Charts for Determining Smoke Density.—The use of Ringleman charts is frequently mentioned in connection with the determination of the density of smoke emitted from smokestacks. I would much appreciate an explanation of what the Ringleman chart actually is and how the density of smoke may be determined from its use.—M. A. P., Spokane, Wash.

No. 472.—Rewinding a Transformer.—I have the complete core and case of a 2½-kw., type H, 60-cycle G. E. transformer which I would like to rewind for the ratio of 88-176-volt primary and 115-230-volt secondary of about 2 kw. capacity. The inner core is 3 by 3 ins., extending over the outside of the coil in four equal sections of 2½ by 1¼ ins. cross-section, leaving a winding space around the core of 2 by 5¾ ins. The original voltage ratio was 1200-2400 primary and 120-240 secondary. The use of this transformer is to be for intermittent service only of about 2 to 3 hours' duration for demonstration of fractional-horsepower alternating-current motors. Please advise what size of wire and number of turns to use on primary and secondary windings. Would it have to be oil-cooled like the original? Would a 3-hp. direct-current motor, old style G. E., wound with two No. 14 B. & S. wires in parallel, wave-connected, running as converter on 115-volt direct-current line, be sufficient for this purpose or would it be necessary to decrease the capacity of the transformer to suit the converter? The present alternating-current voltage obtainable at the converter averages 88 volts, 60 cycles, single phase.—V. S., Portland, Ore.

Answers.

No. 468.—Wiring Lights from a Bell-Ringing Transformer.—Is there any provision in the National Electrical Code against reducing 110 volts to a lower voltage by means of a bell-ringing or toy transformer and then wiring some small lights from this? Is it all right to run this wiring in the same way as ordinary bell wiring? If this is permitted, what is the highest voltage and wattage permissible on such bell wiring?—S. T. E., Bridgeport, Conn.

I find no provision in the Code covering this class of wiring and would conclude that it is not prohibited. The local inspector would have to be the judge as to the voltage and wattage permitted on bell wiring; my own opinion would be not over 12 volts and 10 watts. I should advise using No. 18 or 16 wire if the lamps are located at a distance over 50 ft. (one way) from the transformer or if the load is as much as 25 watts on 24 volts; this is to prevent excessive voltage drop and therefore poor light from the lamps and also to make a more substantial installation. There is not much to be gained from such wiring unless the lamps are very small and used for signals or decoration instead of real illumination. Christmas-tree lights up to 13 volts are sometimes wired in parallel from such a transformer to avoid the trouble of having all of the usual series string go out when one of them burns out or breaks. There are some combined transformer and lamp sets on the market that are especially suited for economical use as low-voltage night lights; these have the outfit connected to the ordinary 115-volt circuit and the transformer forming the base or other part of the lamp steps the voltage down to 5 or so volts. For permanent service such an outfit is certainly preferable to a makeshift use of bell wiring and a toy transformer; the latter would not be recommended by me for lamp service except in small, emergency and temporary installations or for small signal lights.—H. T. M., Indianapolis, Ind.

No. 469.—Length of Motor Branch Line.—What limit, if any, is there to the length of a tap line from a No. 0000 feeder to an autostarter for a 2300-volt motor? The tap line is to be No. 6 or No. 8 lead-covered cable run in conduit.—A. S. N., Plymouth, Mass.

If the size and type of the motor and the allowable percentage volt drop were given, the length of the branch could be stated. For ordinary short-distance wiring, such as one finds in the average shop, No. 8 wire would serve for a 75-hp., three-phase, 2300-volt, 60-cycle motor and No. 6 for a similar 100-hp. motor. If the motor is a 75-hp. machine and No. 8 wire is used, the branch can be run up to nearly 8000 ft. without exceeding a voltage drop of 5% on a 2300-volt supply.—A. W. S., Youngstown, Ohio.

No. 470.—Pulling in Lead-Covered Cable.—I would like information in regard to pulling lead-covered cable into iron conduit. What kinds and sizes of grips are suitable for use in pulling No. 0000 triple-conductor, lead cable of 2-in. outer diameter into 2½-in. conduit? Through how long a run and around how many elbows is it safe to pull this? I should like similar information regarding other cable sizes down to ¾-in. in diameter.—A. S. N., Plymouth, Mass.

Answer A.—A 2-in. Gem grip would answer the purpose, but in the absence of such a grip I would use a home-made hitch made of pieces of No. 15 iron wire wound about and lapped over each other to form a sort of laced loop at the end of the cable. If the runs are long, would use elbows very sparingly or make them of very large radius. Junction boxes would be preferable to use in this case, and in underground work manholes. Facilities for actually pulling in a heavy cable like this and supply of proper tools must also be considered.—J. H. L., North Cambridge, Mass.

Answer B.—This subject was discussed in three illustrated articles by Terrell Croft, entitled "Attaching Conductors to Fishing Wires and Pulling-in Lines," that appeared in the Electrical Review of Jan. 11, 18 and 25, 1919.—Editor.

NEW YORK TELEPHONE CONSTRUCTION PROGRAM.

The New York Telephone Co., which operates the telephone exchanges in New York City, reports that the increase in local calls since the armistice was signed is unprecedented. To relieve the traffic load, the company is carrying on a construction program that will involve the expenditure of $20,000,000 within the city during the coming year. This expenditure will provide the equipment necessary to catch up with the requirement of traffic. The rate of expansion of traffic is indicated by the fact that company is adding girls to its staff of operators at the rate of 125 per week.

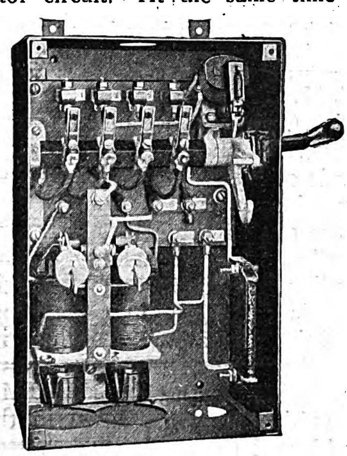
New Appliances

Motor-Starter Developments—Vaporproof Reflector—New D. C. Motors—Solderless Connector—Semi-Portal Crane

Two Enclosed Motor Starters with Overload Relay and Starting Resistor.

A starter with inverse-time-limit overload protection for squirrel-cage motors and a standard induction motor switch with a starting resistor, both having important operating safety features, are now manufactured by the Cutler-Hammer Manufacturing Co., Milwaukee, Wis., and known as Bulletins 9117 and 9118, respectively.

The Bulletin 9117 starter has, besides a low-voltage release, a duplex time-limit overload relay which is a complete unit in itself. The design of this overload movement is such that it does not open the circuit of the low-voltage coil on a high initial inrush of current nor on a momentary overload, but it will not permit a harmful overload to be maintained. This condition is obtained by retarding two moving plungers in oil dashpots. The plungers, which are actuated by two operating coils, trip a single contact-making device, thus opening the motor circuit. At the same time the

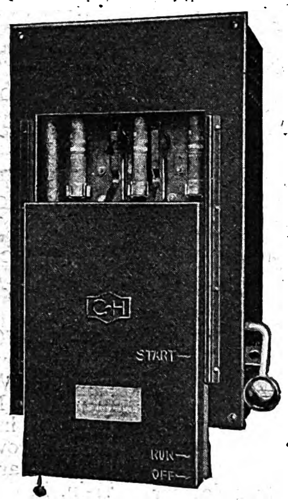


Bulletin 9117 Starter with Front Cover Removed, Showing Contactors, Duplex Relay and Low-Voltage Coil.

force of each plunger must overcome an adjustable weight which may be set at various positions along a lever arm, depending upon the amount of current desired to operate the plunger. By turning an adjusting screw the flow of oil around the plunger head may be regulated, thereby changing the time required for the relay to operate on any given overload condition. A coil, plunger, lever and weight are provided for each of two phases.

To start the motor, the operator moves the starter handle to the "up" position. This connects the motor to the line and brings into position an interlock which prevents opening the cover of the case. To stop, the operator simply moves the lever back to the stop position, which opens the circuit with a quick break and removes the interlocking bar. The starter is made with either three or four poles for use with standard squirrel-cage motors from 3 to 15 hp., and with high-torque motors of the "internal starter" type from 7½ to 25 hp. where the line voltage does not exceed 550 volts.

The starter known as Bulletin 9118 is essentially a modification of the en-



Lowering the Panel of Bulletin 9118 Starter Makes Fuses Dead and Accessible for Renewal—Switch Cannot Be Closed While Panel Is Lowered.

closed polyphase motor starter, Bulletin 9116, a description of which has already appeared in these pages. This starter is adapted for those motors which cannot be connected directly to the line without resulting in a dangerously large starting current. One step of resistance is provided in each of three phases during starting, allowing the motor 60% line voltage and an inrush of approximately three times full-load current. By using another set of terminals the resistor is decreased to give approximately 75% line voltage, and 3½ to 4 times normal current. The low-voltage protection coil automatically returns the switch to the "off" position upon failure of voltage.

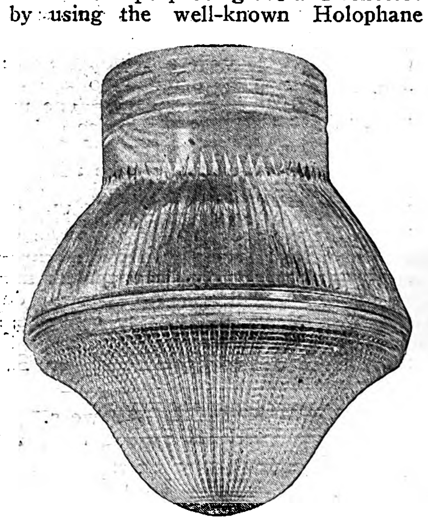
The motor is started by raising the handle to the starting position which closes the switch. The handle is held here until the motor has reached full speed. Releasing the handle causes the switch contacts to slide into the running contacts, without opening the motor circuit. The fuses are not in the motor circuit until the switch is in the running position. Therefore, they do not carry the large starting current, and need be of no greater capacity than proper protection demands. This starter is designed for starting standard polyphase squirrel-cage motors of from 1 to 10 hp. on any commercial voltage not exceeding 550 volts. The starter can be furnished with resistors suitable for two-phase four-wire circuits, in which case an additional knife switch is required to entirely disconnect the motor.

Both types of starters are completely enclosed and are so designed that it is impossible to touch any live parts either while operating or while renewing fuses and making adjustments. Contact posts and fingers are of standard C-H construction used in the heavy drum controller, easily inspected and renewed. The enclosing cases are arranged for conduit wiring.

Vaporproof Prismatic Reflector Globe.

In the past all vaporproof lighting fittings have been equipped with clear glass globes and in order to obtain an efficient and glare-free lighting unit it has been necessary to place a reflector over the glass globe and a diffuser around the globe.

The Holophane Co., 340 Madison avenue, New York City, has designed a combined vaporproof globe and reflector by using the well-known Holophane



Holophane Vaporproof Reflector Globe.

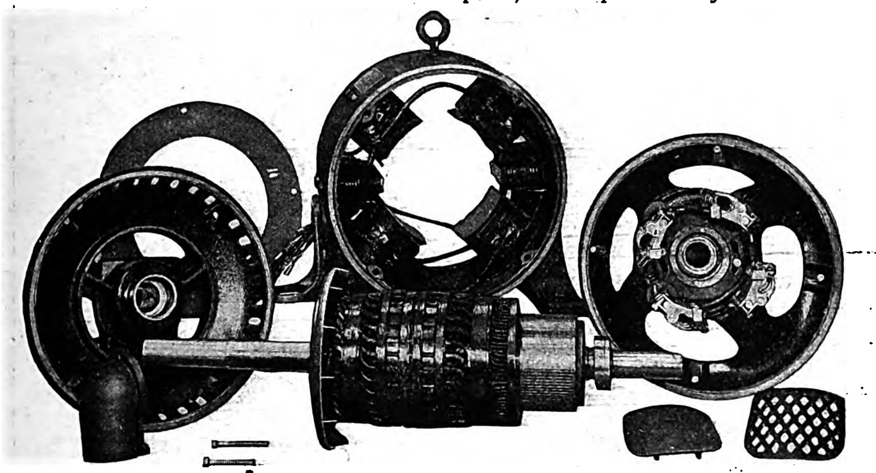
prismatic construction. The reflecting prisms are on the upper portion of the globe to redirect the light in downward directions and the refracting and diffusing prisms are on the lower surface to distribute the light in different directions in the desired proportions so that the resulting illumination on the work will be uniform.

Tests show that the useful illumination is increased by 75 per cent over that given by an ordinary clear vaporproof globe.

These vaporproof reflector globes are made for the 40 and 60-watt Mazda type B lamps and for the 75, 100 and 150-watt type C lamps for use in connection with the standard vaporproof fittings now on the market, including the navy thread.

A New Line of Direct-Current Motors Developed by Allis-Chalmers.

In the new line of commutating-pole direct-current motors and generators which has just been introduced by the Allis-Chalmers Manufacturing Co., Milwaukee, Wis., the machines are not only rugged and compact, with excellent operating characteristics, but the many details which contribute to accessibility, reliability and safety have been thoroughly worked out. Commutating-pole construction was chosen because of its sparkless operation and possibility of getting wide speed adjustment.



Type "E," 25-hp., 230-Watt, 1150-r. p. m. Motor Dismantled.

This line includes the following standard ratings:

(1) Continuous rated (50° C. rise) motors, for applications where the power requirements are definitely known.

(2) Normal rated (40° C. rise) general purpose motors.

(3) Adjustable-speed motors for continuous or intermittent service.

(4) Generators and exciters.

For constant-speed motors the ratings and speeds are the same as those of 60-cycle induction motors, and they can thus be used interchangeably with induction motors for direct-connected applications without changing the method of drive or the ratio of gearing.

Adjustable-speed motors, intended particularly for machine tool and similar applications, are provided for 2:1, 3:1 or 4:1 speed range.

The generator speeds also correspond to those of induction motors, thus permitting direct coupling of the machines to form motor-generator sets in various combinations.

The line of ratings now complete covers motors from ½ to 50 hp. and generators from ½ to 40 kw., while larger sizes are under development.

Cast-steel yokes, combining light weight and rigid construction, are used for the larger ratings while the smaller machines, which are of the bipolar type, have riveted frames.

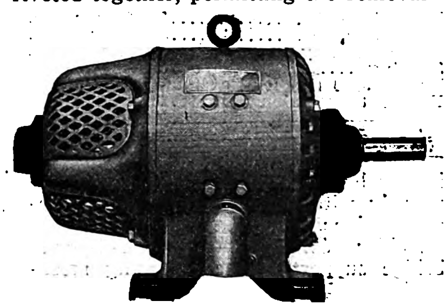
The accessibility of the commutator is apparent from the accompanying illustrations. Protecting grid covers can be provided for these openings in the front bearing bracket; they are readily attached and may be applied even to machines in service without affecting the rating. Solid covers are used with completely enclosed motors, the rating of these machines being somewhat lower than open or semi-enclosed motors.

All machines have ring oiling dust-proof bearings, while the windings are treated to resist oil and moisture. Conduit terminal boxes of simple design are regularly supplied; they have removable covers, giving ready access to the terminals; these boxes serve admirably in protecting the terminals and connections.

Box-type brush holders are adjustable for tension and suitable for either direction of rotation. Each holder can be removed independently with a screw-driver or wrench. At least two brushes per stud are used.

The field coils are wound on metal spools, which prevent any movement of the coils, and are protected by an outside layer of enameled wire.

The armature core has the laminations riveted together, permitting the removal



Semi-enclosed Type "E," Direct-Current Motor.

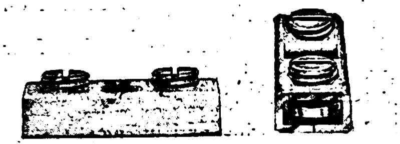
of the shaft without dismantling the core or commutator, while for ratings of 20 hp., 850 r.p.m., and larger the core and commutator are built on a sleeve, so that the shaft can be pressed out of the finished armature without disturbing the windings.

An important feature of the machines is the very thorough ventilating system which has been provided, the heated air being drawn out by the fan mounted on the rear armature head; fresh cool air flows in through the liberal ventilating ducts and takes up the heat from the iron and windings. This heated air is forced out through openings in the periphery of the rear bearing bracket. With thorough ventilation the internal temperatures are kept low thus greatly prolonging the life of the insulation.

This new line, which is designed as the Allis-Chalmers type "E," is completely new throughout, no attempt having been made to re-design old apparatus or to employ parts from any previous machines. The motors are designed for belted as well as direct-connected applications and are particularly suited to the exacting requirements of machine tool service.

Sherman Solderless Fixture Connectors.

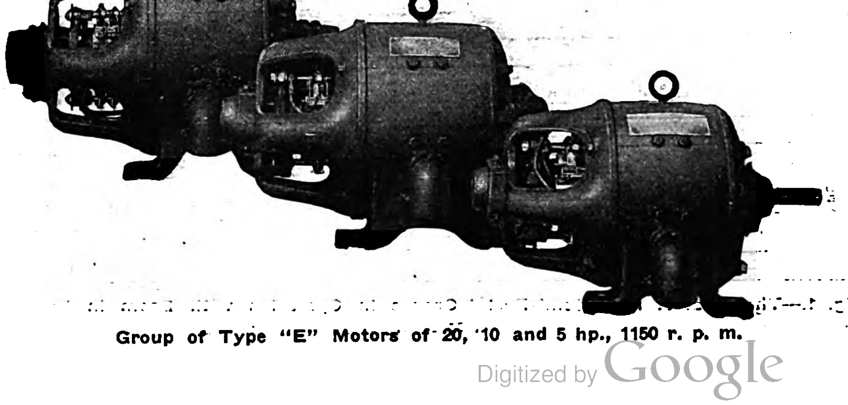
One of the best established rules in electrical installation work requires wire splices or joints to be made both mechanically and electrically secure without solder, and then they must be soldered unless made with some *approved* splicing device. Several such devices



Side and End View of Sherman Fixture Connector.

are now available on the market, a recently developed one with unique features being the Sherman fixture connector made by the H. B. Sherman Manufacturing Co., Battle Creek, Mich. As shown in the accompanying views, it is of very simple and effective design. It is made entirely of heavy brass to give high conductivity and freedom from danger of corrosion and consists of only three parts. The body or sleeve is of rectangular section with a depression in the upper side between the two screws forming a sort of bridge or dividing wall in the middle of the wire channel. This makes a definite place for each wire and insures that the end will be clamped by the proper screw. These screws are made of one piece each, the inner end being enlarged to give an unusually large bearing and contact surface and also to prevent the screw from dropping out.

It will be observed that this construc-



Group of Type "E" Motors of 20, 10 and 5 hp., 1150 r. p. m.

tion has several important advantages. The screws are always in place and ready for use and they have a large thread that is not likely to get crossed. Thus no time is lost in looking for screws or in driving them home. No connectors need be discarded because of missing screws. The connectors are of durable make and can be used to join any fixture or lighting wires up to No. 12 in size. Two No. 12 solid wires can be accommodated at either end or three No. 14 wires. From this brief description it is evident that the Sherman connectors have all the usual advantages of good solderless connectors with the additonal features noted; also their cost is low.

Electric Semi-Portal Hoist Cranes at Boston Army Supply Base.

The Wellman-Seaver-Morgan Co. is now installing four semi-portal bridge-type hoist cranes at the U. S. Army Supply Base, Boston. The first of these cranes is in operation and is shown in the accompanying illustration, Fig. 1.

This crane carries a lifting boom operated from a carriage, which in turn is mounted on a semi-portal bridge, and arranged to rotate about a fixed axis. The bridge runs on two rails, one located near the face of the wharf, and the other supported on brackets carried on the side of the wharf shed.

It will be seen that the crane has four distinct motions:

1. Bridge travel along the wharf;
2. Trolley slewing;
3. Boom hoisting and luffing;
4. Load hoisting.

All of these motions are under the control of the operator located in the cab on the rotating carriage.

The crane is designed so that another drum can be added and a 2-rope grab bucket operated. The crane is rated to handle 8000 lbs. at a distance of 29 ft. from the face of the capsill at the rate of 200 ft. per min., and 500 lbs. at a distance of 52 ft. at 250 ft. per min. It will, however, take care of occasional loads of 8000 lbs. at 52 ft. from the center of rotation without any undue stress in any part of the crane.

The principal dimensions of the crane are as follows:

Horizontal span, center to center of runway rails	26 ft. 5 in.
Maximum reach of boom from face to capsill	44 ft.
Minimum radius of boom	29 ft.
Angle through which boom may be slewed	360°
Concrete counterweight required, about	3 cu. yds.

Speed.—The various motions of the crane have approximately the following speeds under full load:

Hoist 5000 lbs.	250 ft. per min.
Hoist 8000 lbs.	200 ft. per min.
Boom hoisting or luffing	125 ft. per min.
Slewing	2 rotations per min. with 5000 lbs. load at maximum radius.
Bridge travel along wharf	200 ft. per min.

The different mechanisms are so arranged that the motion of either hoisting or luffing can be operated simultaneously with both rotating and traveling motions.

Bridge Structure.—The semi-portal bridge supporting the operating mechanism was designed in accordance with the "General Specifications for Steel Railway Bridges" issued by the American Railway Engineering Association in 1910, 100% being added to all live loads to allow for impact. In designing this structure, ample allowance was made for the swaying of the load. To the deck of the semi-portal is bolted a steel casting for supporting the revolving superstructure. This casting has a track

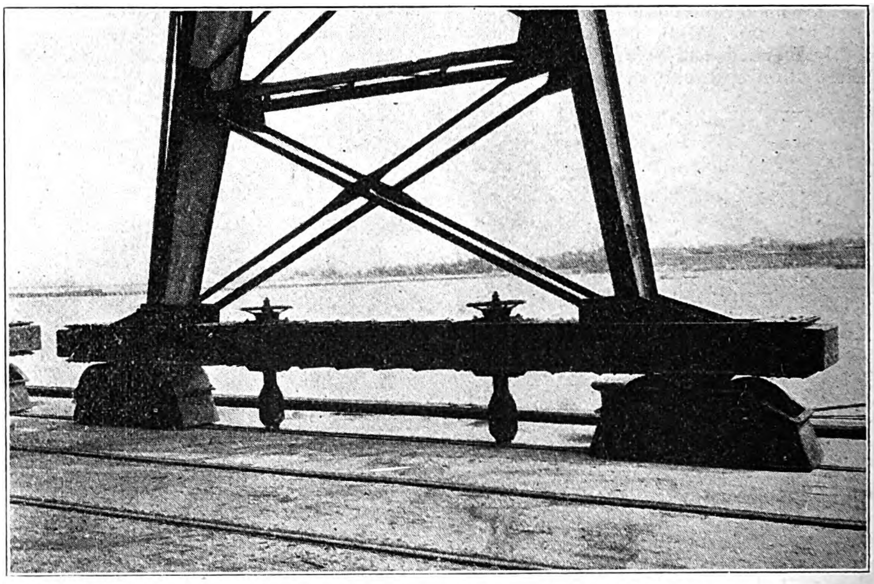


Fig. 2.—View of Trucks and Rail Clamps.

plate, and bolted to the outside, a circular rack for the slewing motion. Concentric with this casting is a hollow center pivot pin, the lower end of which is securely held by cross-framing between the main girders of the semi-portal. A portion of deck not covered by the casting is covered with Diamond pattern steel plate. Hand railings are provided along the sides and outside edges of the deck, and a steel ladder is attached to one of the legs to give access from the wharf.

Wheels.—Each leg on the wharf side is carried on two wheels (as shown in Fig. 2) which are driven through the necessary spur and bevel gearing by the traveling motor. Each pair of wheels is equalized for the proper distribution of load. On the shed rail, the frame is supported by two wheels, one at each corner. These track wheels are double-flanged, high-carbon, cast steel, of ample size to carry maximum load and accurately finished to the diameter. The flanges of the wheels running on the shed rails are placed to give about a 7-in. tread. Wheels running on the wharf rail have the flanges spaced to allow proper clearance for the head of the rail upon which they run. All track wheels are forced on steel pins of ample size arranged to rotate in Hyatt roller bearings carried by the truck brackets.

Base Frame and Rollers.—The base frame is made up of rolled-steel shapes and plates well braced in all directions. The revolving superstructure is carried on six steel rollers or wheels, four in front where the heaviest load occurs, and two on the back. The front rollers are carried in a pair of steel equalizers. These rollers or wheels are of steel of ample size arranged to rotate on Hyatt roller bearings and placed so as to properly run on a circular track of about 5-ft.

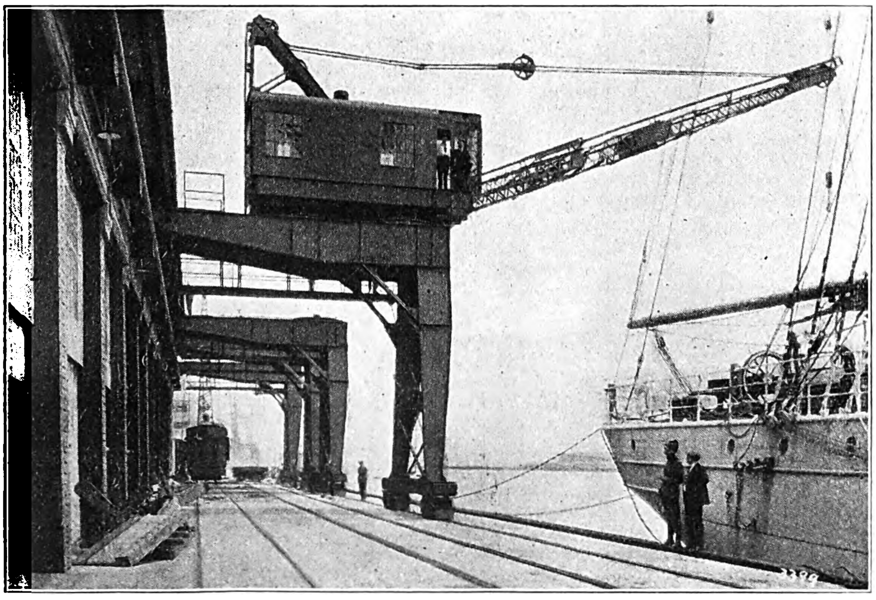

Fig. 1.—The First of Four Semi-Portal Cranes in Operation with Boom in Lowest Position.

radius about a pivot pin. A babbitted casting free to rotate about the center pivot pins is attached to the base frame to hold the crane concentric with the center pivot pin and to transmit longitudinal and overturning loads from the revolving superstructure to the semi-portal.

Pivot Pins.—The center pivot pin is made of a hollow steel casting to permit the threading of conductors through its center to the collector rings on top. The crane is designed so that under normal operating conditions, with a 5000-lb. hook load at the maximum radius, no appreciable load will be thrown on the center pin. It is, however, designed to transmit any possible vertical or horizontal load from the revolving jib crane to the semi-portal bridge without cramping or binding in any part.

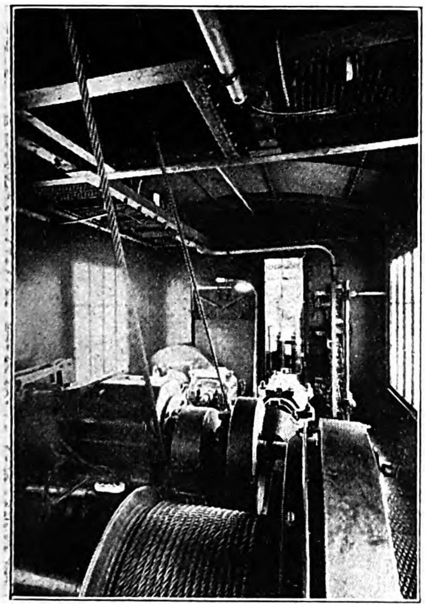

Fig. 3.—Inside of Machinery Section of Cab.

Jib and Main Frame.—The jib and main frame is made of steel plates and shapes well stiffened in all directions. The frame is designed to support the jib, counterweight, machinery, electrical equipment and operator's house. A steel ladder is provided on the jib to provide access to the sheaves and other parts.

Counterweight.—The counterweight is made of concrete blocks in such shapes and sizes that they can be readily handled in case it is desired to dismantle the crane.

Cab.—The cab is composed of a steel framework covered with sheet steel. It contains the main part of the hoisting, luffing and rotating mechanisms. The control of all motions is so located that the operator has an unobstructed view of the load at all times. Figs. 3 and 4 show the interior of the cab.

Hoisting Mechanism.—The hoisting and lowering mechanism includes a winding drum, driven through a jaw clutch and a train of spur gearing by a motor equipped with a solenoid brake and necessary control apparatus and miscellaneous parts.

Luffing Mechanism.—The luffing of the boom is accomplished by a worm-driven drum operated by the hoisting motor through a jaw clutch and gearing so arranged that the boom can be raised or lowered at the convenience of the operator. The pitch of the worm is such that no mechanical brakes are required to prevent the load from lowering; but, as an additional safety, a pawl is provided to lock the luffing drum in any desired position.

Slewing Mechanism.—The slewing is accomplished by means of a motor operated through a train of spur and bevel gearing and a pinion meshing with the master gear attached to the semi-portal bridge. A powerful foot brake is provided on this mechanism having a latch, by means of which the brake can be locked for any desired fixed position of the revolving superstructure.

Traveling Mechanism.—A motor for traveling the bridge is mounted on one of the girders of the semi-portal bridge. This motor is connected to the driven track wheels through spur and bevel gearing and line shafting. One truck on the wharf rail is driven and one wheel on the shed rail. A solenoid brake is mounted on the armature shaft extension. Control apparatus for traveling is located in the operator's house. Electrical connections between the conductors on the semi-portal bridge and on the revolving superstructure are made through collector rings mounted on the center pivot pin or an extension of same. In addition to the solenoid brake, hand-operated rail clamps (shown in Fig. 2) are provided which clamp the wharf rail to hold the bridge in any fixed position.

Winding Drum.—The winding drum for hoisting mechanism is made of cast iron with turned grooves to fit the rope.

Electrical Equipment.—The electrical equipment is designed for direct current, 230 volts. The motors, controllers and magnetic brakes are General Electric Co.'s standard make. The motors are of the following rating:

1. Main hoist and luffing......one 65 hp.
2. Slewing ....one 15 hp.
3. Bridge travel ....one 24 hp.

The controller for the hoist and luffing motor is of the reversing magnetic switch, dynamic-braking type, consisting of a control panel, heavy-duty, cast-grid resistor and a vertical-handle master controller.

In connection with the clutch-shifting lever which engages the hoist and luffing gearings with the driving motor, there is an interlocking switch mechanically operated. When the clutch-shifting lever is in central or neutral position, with both clutches disengaged, this switch prevents the operation of the motor. In other words, the function of this switch is to prevent the starting of the hoist motor without any load.

The slewing motor is controlled by a magnetic-switch reversing and plugging controller, consisting of a control panel, heavy-duty cast-grid resistor and a vertical-handle master controller. The plugging feature incorporated allows the motor to be reversed from full speed in one direction to full speed in the opposite direction without exerting over approximately 180% full-load torque.

The bridge-motor control is of the magnetic-switch reversing type with shunted armature points and consists of a control panel, heavy-duty cast-grid resistor and a vertical-handle master controller. The armature shunting points allow slow bridge speeds and also permit accurate control in case a favorable wind may help the motor in traveling, which would ordinarily give an excessive speed.

All of the above controllers are equipped with series relays for accelerating motors.

Safety Devices.—Ample provision is made for the protection of workmen. Guards extending down close to the rails and forming part of the truck brackets are placed in front of the track wheels. All gears are enclosed. Ladders and platforms are provided for access to mechanical parts of the crane which are subject to inspection and repairs. Hand railings are provided around all platforms. Sheaves are provided with tight-fitting guards where necessary. A limit switch is provided to prevent overtravel in the hoisting direction on the main hoist motion. A pressed-steel foot gong is provided in the operator's cab for signaling purposes. There is a mechanical gong on the bridge motion. This gong will ring continuously.

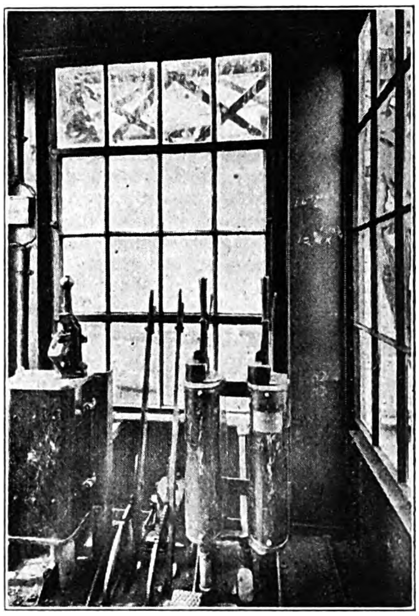

Fig. 4.—Inside of Operator's Part of Cab.

Bearings.—Hyatt roller bearings are used throughout the different motor-driven units.

Adaptable and Portable Electric Drill and Hammer Stand.

A portable stand to permit a safer, simpler and more economical method of using electric drills and hammers in overhead work has been placed on the market by the Hammerstand Manufacturing Co., 370 Pearl street, Brooklyn, N. Y. This device is for use in installation of electrical apparatus, pipe work, supports in concrete stone work and such location where the workman would ordinarily have to employ a ladder and scaffolding to support himself and his tools.

The hammer stand can be moved readily from place to place upon wheels. The drawing handle automatically raises the wheels off the ground when the tool is in position. Very light pressure applied to the lever keeps the drill hammer following the work. The operator stands on the floor while working. An attachment enables holes to be drilled in corners and other awkward places. The attachment is simply a rigid horizontal bar bolted to the top of the stand on one end and carrying the drill in the other.

Trade Activities

General Electrtc Exhibit at Chemical Exposition—Electric Furnace Installations—Western Electric to Erect New Plant

The Valentine-Clark Co., producer of cedar poles, having offices at Chicago, Minneapolis and Toledo, has lately established a western office in Peyton building, Spokane, Wash.

Page & Hill Co., Minneapolis, Minn., has greatly increased its facilities by the installation of a new 15-ton Browning locomotive crane. This crane will be used in handling cedar poles at the butt-treating plant and for loading cars at Minnesota Transfer.

Electric Furnace Construction Co., Finance building, Philadelphia, advises the receipt of an order from the Hammond Steel Co., Syracuse, N. Y., for one 3-ton furnace for the manufacture of high grade tool steels. A Greaves-Etchells furnace is also being installed for the Hong Kong Steel Foundry Co., China.

Western Electric Co., New York City, has purchased for a consideration of $190,103 55 acres of land, situated in Berkley, Norfolk, Va., from the St. Helena Corp., and within a few weeks will build shops on the site for the manufacture of submarine cables and other products. The land was formerly used by the Tunis Lumber Co., and fronts on the south branch of the Elizabeth river. It is believed that a large financial outlay will be involved in the establishment of the new shops and that 1000 or more employes will be given work. It has also been stated that in addition to the manufacture of cables, a large number of other electrical products will be made at the Berkley plant.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has issued a new 8-page, 8½ by 11-in. booklet on "C-H Mine Duty Apparatus." This booklet makes special reference to the Cutler-Hammer mine duty apparatus installed in the plant of the St. Louis Smelting & Refining Co. at St. Francois, Mo. A detailed description of the method of handling the ore from the three levels of the mine until it is ready for shipment is given. Special emphasis is laid on the hoist and conveying machinery and the C-H automatic control and safety apparatus used on this machinery. The illustrations show the mine hoist control panel, master switches, limit switches, overspeed governors and electrically operated brakes; also the automatic starters for the crushers and conveyors. These starters are controlled from push-button stations and the speed of the conveyors and crusher is governed by armature regulators. The front and back covers of the booklet display a panoramic view of the buildings above the mine, including everything from man-hoist to chat dump.

The Detroit Electric Furnace Co. has sold to Oregon Brass Works, Portland, Ore., two Detroit electric rocking brass furnaces of 2000 and 1000-lb. charges, respectively. It is expected that the installation of the two furnaces will be completed in the next sixty days. The Oregon Brass Works, of which H. C. Prier is president and manager, has thus taken the initiative in equipping its brass foundry with the first electric furnaces in the Northwest, to better meet the demands for marine and structural bronze.

A. C. Mannweiler Co., Fort Wayne, Ind., manufacturer of miniature incandescent lamps, is illustrative of the remarkable growth of this industry, having within the brief period of its existence increased its output from 25 to 50 bulbs per day to the present daily output of 4000 lamps. This concern had its inception about six years ago, having as its president and founder Anthony C. Mannweiler, who prior to that time had had an extensive experience in the manufacture of incandescent lamps. The company, which began operations in very modest quarters, consisting of only one room, has grown to such generous proportions that today it ranks as one of the largest manufactories in Fort Wayne. The product of this organization has a wide range of application, being used extensively for flash lights, illuminating mines, for surgical instruments, automobile lights, boat lights, switchboards, etc.

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., is distributing Bulletin No. 1106 introducing the new Type "E" motors and generators. In developing this new line it has been the aim of the company to produce not only a rugged, serviceable motor, with superior operating characteristics, but also to incorporate the many details which contribute to reliability and safety. These machines are designed for belted as well as direct connected applications and particularly suited to the exacting requirements of machine tool service. Among the important features claimed for the Type "E" motors are: Ratings and speeds corresponding to standard 60-cycle induction motors; complete line of constant and adjustable speed ratings; rugged cast steel yokes; commutating poles, insuring sparkless commutation; dust-proof bearings; windings treated to resist oil and moisture; thorough ventilation; conduit terminal boxes on all motors; improved box type brush holders; standard enclosing covers; interchangeable parts, and accessibility of all parts, all of which are illustrated and described in detail in the bulletin.

Williamsport Wire Rope Co., Williamsport, Pa., manufacturer of wire rope, announces the establishment of its warehouses in Chicago at 753-55 West Quincy street, also a branch office at 122 South Michigan avenue, both under the management of C. M. Ballard. Every size and construction of wire rope, cut to any desired length, will be carried at the Chicago warehouse. The company through the establishment of this local branch will be enabled to give its customers better service than in the past.

Landers, Frary & Clark, New Britain, Conn., manufacturers of Universal electric heating and cooking devices, are erecting a new factory in the eastern part of Plainville, located on the bank of the Housatonic river, and it is expected that the new quarters will be ready for occupancy in about a month. The building, which is a four-story structure of fireproof construction, will be used as a celluloid plant. A power plant, which will furnish power and light for the new plant, has been erected on the bank of the river. The walls are of double brick thickness, with three or four set divisions throughout the entire building.

General Electric Co., Schenectady, N. Y., will exhibit at the Chemical Exposition, to be held at the Coliseum, Chicago, Sept. 22 to 27, a very interesting model of a precipitation outfit, illustrating the Cottrell process of precipitation. The model is the property of N. H. Gellert of the Gellert Engineering Co., which holds the precipitation patents as applies to blast furnaces. It was made by the General Electric Co., and is an exact miniature of the apparatus and is completely operative. Other apparatus exhibited by the General Electric Co., includes a KT-312-6-15 hp. 1200 r.p.m. 440-volt motor with frame and coils completely coated with an acid resisting insulation, which is particularly adapted for use in chemical and fertilizer plants. Two stater coils of this motor will be shown. Another feature will be an RC-25, 2-hp. 1150 r.p.m. 230-volt totally enclosed DS-2 shunt wound motor which is equipped with the new Argute plug bearings. A 100,000-volt Kenetrom with a filament heating transformer will be shown in operation. Of special interest will be an exhibit board, showing welded terminals for flexible cables used on blast furnaces. Chester T. McLoughlin of the power and mining department, Schenectady Works, will be in charge and will be assisted by Raymond Barclay, and several representatives from the Chicago office of the General Electric Co.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Rutland, Vt.—In connection with the construction of the new plant of the Tauber-Lipton Co., work on which was commenced recently, contract has been awarded to the Rutland Railway Light & Power Co. for furnishing electric energy for light and power for the operation of the new works.

Cambridge, Mass.—Work has recently been commenced by Page & Shaw, 18 Ames street, on the construction of a power plant to be used for the operation of a six-story manufacturing works now in course of construction. The plant will be about 60x140 ft., and will be used for increased capacity. Considerable mechanical and electrical equipment will be required. The E. A. Abbot Construction Co., 3 Park street, Cambridge, is the contractor.

Bridgeport, Conn. — Bridgeport Brass Co. will build a one-story, 150 x220 ft. addition to its casting shop on Grand street. Electric power to operate crane will be installed. The estimated cost of the work is $150,-000.

Albion, N. Y.—Board of Managers of the Western House of Refuge for Women has awarded a contract to the John W. Danforth Co., 70 Ellicott street, Buffalo, for extensions and improvements in the heating system at the institution, at $8187. Lewis F. Pilcher, Capitol Building, Albany, state architect.

Canandaigua, N. Y.—Lisk Manufacturing Co., 160 Fifth avenue, New York, has awarded a contract to Curren & Swartout, Granite building, Rochester, for the construction of a one-story power plant at its local properties, about 63x87 ft.

Geneva, N. Y.—O'Malley Motor Co. plans the erection of a three-story, 50x100 ft. machine shop, garage and service station, on Canal and Exchange streets. Transmission and electric power will be installed. Estimated cost, $50,000.

Long Island City, N. Y.—Large quantities of electrical and mechanical equipment will be required in connection with the construction of the proposed plant of the American Trunk Co., to be located at Thompson, Mound Markey streets and Mott avenue, preliminary work on which was inaugurated recently. The entire new works are estimated to cost in excess of $1,000,000.

Long Island City, N. Y.—In connection with the construction of the six-story and basement plant of S. Karpen & Brothers, 68 West 34th street, New York, on Jackson avenue, near Hulst and Harold avenues, Long Island City, large quantities of electrical and mechanical equipment will be required. The new plant, contracts for which have been awarded, is estimated to cost $725,000.

New York, N. Y.—Contract has been awarded by the Fulton Laundry, 312 East 92nd street, for alterations and improvements in the boiler plant at its property, to facilitate operations.

New York, N. Y.—Announcement has been made by the Commercial Cable Co., 20 Broad street, of a reduction in commercial cable rates from all parts of the United States, the Philippines and China of 22 and 20 cts. per word, respectively, effective Sept. 1.

New York, N. Y.—Following the purchase of the Chesebrough building by Henry L. Doherty & Co., 60 Wall street, negotiations have been completed for the acquirement of the Battery Park and Maritime buildings on State street, located between Pearl and Bridge streets, held by the same interests formerly controlling the Chesebrough structure. The entire consideration for the three buildings is said to be approximately $5,-000,000.

Syracuse, N. Y.—U. S. Hoffman Co., 329 Temple street, is making rapid progress on the construction of its one-story building at Taylor and Oneida streets. The structure will be about 80x195 ft., and is estimated to cost $23,000.

Talcville, N. Y.—St. Lawrence Transmission Co., which has purchased the rights of A. J. McDonald in the Freeman Talc Mines, plans extensive improvements and the installation of crushing and conveying machinery and electrically driven units. Estimated cost of improvements, $60,000.

Boonton, N. J.—Eastern Signal & Supply Co., 30 Church street, New York, has rented property in a local building covering about 5000 sq. ft. of floor space for a new establishment. The company specializes in the manufacture of primary storage batteries.

Camden, N. J.—American Ice Co., Philadelphia, Pa., is having plans prepared for the construction of a new brick and concrete ice plant at 12th and Federal streets, Camden.

Dover, N. J.—Contract has been awarded to the Jersey Corp. by the Paige & Jones Chemical Co. for furnishing electric energy for light and power purposes for the operation of the new plant to be established at Boonton.

Harrison, N. J.—Driver-Harris Co., Middlesex street, manufacturer of electric wires, cables, etc., has had plans prepared for the construction of a new three-story reinforced concrete structure at its plant, about 50 x100 ft. The building is estimated to cost $50,000. Lockwood, Greene & Co., 103 Park avenue, New York, are engineers.

Lambertville, N. J.—Lambertville Public Service Co. has inaugurated preliminary work for the construction of a new high-tension transmission line from Lambertville to Flemington for improved electric service, and new generating equipment is being installed in the local power plant. At the present time the company has under way the construction of a similar transmission line between Netcong, Morris county, and Newton, Sussex county, passing through Stanhope and Andover. Harold R. Wilbur is local manager.

Newark, N. J.—American Transformer Co., 178 Emmett street, has filed plans for alterations and improvements in its local plant to facilitate operations. The work is estimated to cost about $5700.

Perth Amboy, N. J. — Lighting Committee of Board of Aldermen has under consideration plans for the installation of electrical machinery in the municipal light and power plant.

Pompton Lakes, N. J.—Tri-County Electric Co. has been granted a franchise by the Borough Council, Wanaque, for furnishing electricity for lighting and power service to the borough. The company purchases electric energy from the municipal power plant at Pompton Lakes.

Trenton, N. J.—Fire on Sept. 1, seriously damaged one of the large dynamos at the power plant of the Trenton & Mercer County Traction Co., on Lincoln avenue. It is understood that the company will make repairs immediately.

Trenton, N. J.—City Commission has completed plans for the installation of considerable new electrical and hydraulic apparatus at the city pumping station on Calhoun street. An appropriation of $150,000 was authorized some time ago to cover the cost of the improvement, but owing to war conditions the work has been delayed. It is proposed to proceed with the installation at once.

Trenton, N. J.—Trenton Malleable Iron Works, New York avenue, have had plans prepared for the construction of a new one-story power plant and boiler house, of brick and concrete construction, to be used for works operation. R. A. Schuman, 923 Lexington street, Trenton, is architect.

Trenton, N. J.—Hearnen Storage Battery Co. has completed negotiations for the purchase of the plant and property of the Charles W.

Carll Co., at West Front and South Warren streets, for a new establishment.

Allentown, Pa.—City Council has recently inaugurated tests in the new electric street lighting system installed in various thoroughfares of the city.

Bolivar, Pa.—It is reported that Bolivar has under consideration the installation of an electric light plant.

Harrisburg, Pa.—Harley D. Carpenter, Crawford county, has filed application with the Public Service Commission for approval of contracts to furnish electric energy for lighting service, etc., to Cochranton Borough and the townships of North, West and South Shenango, and East and West Fallowfield.

Philadelphia, Pa.—American Ice Co., Sixth and Arch streets, is having plans prepared for the erection of a new plant at Mascher street and Ducannon avenue, in the Olney section. It is planned to use a portion of the building for manufacturing and another section for storage purposes. Walter Lee is vice-president.

Philadelphia, Pa.—Electric Storage Battery Co. has awarded a contract to the William Steele & Sons Co., 1600 Arch street, for the construction of a new one-story brick addition to its plant at 19th and Willard streets. The structure will be about 32x97 ft., estimated to cost $14,000 and will be used for increased operations.

Philadelphia, Pa.—Caledonian Dye Works, Cornwall and Emerald streets, have awarded a contract for the construction of a new boiler plant at their works, about 18x22 ft., for increased operations. The structure is estimated to cost $14,000. J. K. Petty & Co., Stephen Girard building, are the contractors.

Philadelphia, Pa. — Pennsylvania Salt Manufacturing Co., Widener building, has had plans prepared for alterations and improvements in the boiler plant at its works at Delaware avenue and Porter street, estimated to cost $5000.

Pottsville, Pa. — Philadelphia & Reading Railroad is understood to be considering plans for the electrification of the Pottsville and Mill Creek Junction section of its system this fall.

Titusville, Pa.—Titusville Light & Power Co. has filed notice with the Public Service Commission of the operation of a new schedule of increased rates for service, effective Sept. 1.

Wilkes-Barre, Pa.—Guaranty Silk Co. is taking bids for the erection of the proposed power plant at its works to be used for general factory operation. Reese D. Isaacs, Anthracite building, is architect for the company.

Huntington, W. Va.—The secretary of state has issued a charter to the Electric Unit Corp., of Huntington, with a capital of $50,000 for the purpose of carrying on a general electrical buisness in Huntington. Incorporators: C. C. Hartzell, H. T. Lovett and others.

DATES AHEAD.

Association of Edison Illuminating Companies. Annual meeting, New London, Conn., Sept. 16-18. Secretary, H. T. Edgar, Stone & Webster, Boston, Mass.

Southeastern Section, N. E. L. A. Annual convention, Asheville, N. C., Sept. 17-19. Secretary-treasurer, T. W. Peters, Columbus, Ga.

Iowa State Association of Electrical Contractors and Dealers. Annual convention, Sioux City, Iowa, Sept. 22 and 23. Secretary, F. Bernick, Jr., Oskaloosa, Iowa.

New England Section, N. E. L. A. Annual convention, New London, Conn., Sept. 22-24. Headquarters, Hotel Griswold. Secretary, Miss O. A. Bursiel, Boston, Mass.

Association of Iron and Steel Electrical Engineers. Annual convention, St. Louis, Mo., Sept. 22-26. Secretary, John F. Kelly, Empire building, Pittsburgh, Pa.

American Electrochemical Society. Fall meeting, Chicago, Sept. 23-26. Headquarters, Congress Hotel. Secretary, Prof. Joseph W. Richards, Lehigh University, Bethlehem, Pa.

International Association of Municipal Electricians. Annual convention, Chicago, Sept. 23-26. Secretary, Clarence R. George, Houston, Tex.

Northwest Electric Light and Power Association. Annual convention, Seattle, Wash., Sept. 24-27. Secretary-treasurer, George L. Myers, Portland, Ore.

Empire State Gas and Electric Association. Annual meeting, New York City, Oct. 9. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

Black Mountain, N. C.—J. S. Kuykendall, Winston-Salem, N. C., has prepared plans to furnish electric power.

Homestead, Fla.—An election will be held Sept. 23 upon the issuance of $12,000 bonds for doubling the capacity of the electric light plant. Address the mayor.

Savannah, Ga.—City of Savannah has taken options on 1600 acres of land, with 2500 ft. frontage on the Savannah river, with a view of developing a municipally owned and operated terminal and wharves. The plan involves about $200,000 initial consideration, which will later be expanded to an outlay of practically $5,000,000.

NORTH CENTRAL STATES.

Alliance, Ohio.—Architect Wade Steidler, City Hall, has prepared plans for $525,000 gas producing station to be erected by city. The building will be brick construction, steam heating, plumbing, electric lighting.

Dayton, Ohio.—Gem City Ice Cream Co., 1005 West Third street, plans to enlarge its plant and will install a 180-ton Hardwick ice machine and new electric motors.

Kent, Ohio. — Ohio Machine & Tool Co., Canton, Ohio, will erect a factory addition. The building will be 40x80 ft. in dimensions, brick and reinforced concrete construction, steam heating, plumbing, fireproof interior finish, boilers and pumps, electric lighting. Estimated cost $75,000.

La Grange, Ohio.—$20,000 in bonds have been authorized for electric light system. C. S. Adams.

Bluffton, Ind.—H. C. Bay Piano Co. will erect a three-story office building and salesroom. The main office of the company will be removed from Chicago to Bluffton. The company is now operating a plant in Bluffton employing 650 men.

East Chicago, Ind.—Fire has destroyed the west part of the General American Tank Corp. plant, with loss estimated at $300,000. The burned buildings include the brass foundry, car shop and insulating shop. The newer part, which is of metal construction, was saved.

Greenfield, Ind. — Charlottesville Electric, Heat & Power Co. has been incorporated to establish a plant for the town of Charlottesville.

Indianapolis, Ind.—Extensive improvements are planned by the Interstate Public Service Co., which operates the electric traction line between Indianapolis and Louisville. The company plans the expenditure of approximately $350,000 which will make the line between the two cities one of the best equipped in the Central West.

Chicago, Ill.—William R. Johnston Manufacturing Co. has purchased property on Crawford avenue, Schubert avenue, between Fullerton and Wrightwood avenues, having a frontage of 150 ft. and depth of 750 ft., and contains an aggregate of about 100,000 sq. ft. As soon as building conditions warrant, the company will erect a modern building, having about 50,000 sq. ft. of floor space, to cost about $100,000.

Hawthorne, Ill.—A $5,000,000 addition to the present Hawthorne plant of the Western Electric Co. is contemplated. The addition is needed on account of the steady growth of the business.

Medora, Ill.—An election will be held to vote on the issuance of $12,000 light and power bonds. Address city clerk.

Springfield, Ill.—An election will be held Nov. to vote on the issuance of bonds to the amount of $400,000 to extend the electric service to the entire city.

Springfield, Ill. — The property owners of Douglas avenue have petitioned for an extension of the ornamental lights. Address City Engineer Seeley.

Ecorse, Mich.—Village will soon let contracts for building elevated steel tank with capacity of 150,000 gal., two motor-driven centrifugal pumps, with capacity of 500 gal. per minute, reinforced concrete reservoir, 500,000 gal. capacity, and 8000 ft. water pipe. Separate bids on steel tank and on remainder of job complete. R. A. Murdock, 706 Free Press building, Detroit, engineer.

Marquette, Mich.—City Commission has had plans prepared for the erection of a power plant. Plans call for a building of brick and steel, reinforced concrete construction, including steam heating. The specifications include electrical equipment. Contracts will be let by the city clerk.

Vassar, Mich. — The council is planning ways and means to improve the light and water system. Address village clerk.

Emmons, Minn.—Contracts have been let to Minnesota Gas & Electric Co., Albert Lea, for building a high-tension line from its central plant to Emmons for light and power.

Atlantic, Iowa.—The city is having plans prepared for a $26,000 addition to the power plant. Generators, pumps, motors, etc., will be purchased. Address city clerk.

Mason City, Iowa.—C. H. McNider and associates are planning the erection of an eight or nine-story hotel to cost with the site $650,000.

Tama, Iowa.—Contracts have been let to Blythe Brothers for grading of electric line to be built from Tama to Toledo. Address Perry Walters, Toledo, Iowa.

Bison, Kans.—A 6-mile transmission line will be built from Bison to La Crosse. D. M. Rothweeler, mayor.

Chanute, Kans.—A bond issue of $250,000 has been voted by the city to build water works and an electric light plant.

Hugoton, Kans.—The City Council is contemplating the erection of a new electric light and water plant.

Winfield, Kans.—Plans are being prepared for a $45,000 electric light plant. Address city clerk.

Mountain Grove, Mo.—J. Fred Ellis and L. H. Williams contemplate building a dam and power plant at Double Grove Spring near Dora. The plant will develop 1000 hp.

St. Joseph, Mo.—A turbine of 12,500-kv-a. capacity is being installed in the steam plant of the St. Joseph Railway, Light, Heat & Power Co. The entire plant is being remodeled and equipped for oil burning. The steam capacity of the plant will be increased by the installation of two 1000-hp. Bigelow Hornsby boilers, and two smoke stacks of 16 ft. and 12 ft. in diameter, each 260 ft. high.

SOUTH CENTRAL STATES.

Lexington, Miss.—The city will vote on the question of issuing $20,000 additional electric light system. W. L. Jordan, city clerk.

Starkville, Miss.—The city will issue $55,000 in bonds for water, electric system. Address mayor.

Springdale, Ark. — The city has voted to issue $200,000 in bonds for sewer and water system. J. S. Ewalt, mayor.

Chelsea, Okla.—The sum of $30,000 in bonds have been voted to erect light and water plant. Address mayor.

Enid, Okla.—Enid Pipe Line Co., owner of the line from the oil fields to the Enid refineries, decided to construct a new power plant. The plant will be located where the line turns west from the oil fields towards Enid. Houses for employes and other improvements will also be built.

Pawhuska, Okla.—The attorney general has approved the issuance of $67,000 electric light bonds. Address mayor.

Stroud, Okla. — City will vote bonds for a light and water plant. W. A. Hadley mayor.

Hearne, Tex.—The city will increase the capacity of the light and water plant 100%.

San Angelo, Tex.—San Angelo Water, Light & Power Co. contemplates the erection of a water filtration and purification plant to cost between $40,000 and $50,000.

WESTERN STATES.

Buhl, Idaho.—Idaho Power Co. will increase the generating power of its plant at Thousand Springs from 6000 to 8000 hp. Improvements will include the installation of gates and dredges. R. B. King, district manager.

Roosevelt, Ariz.—Salt River Valley Water Users Association, Phoenix, plans fo erect a 5000-kw. steam generating plant for furnishing power to about 60 pumps, which will be used to lower underground water level. C. A. Van der Verr is secretary.

Yuma, Ariz.—Yuma Ice Co. has placed an order for transmission-line poles with R. E. Downie, Seattle.

Hardin, Mont.—The Hardin electric light and power plant is to be remodeled, new and larger steam boilers and engines and a new generator installed. As soon as the new equipment is ready, both day and night service will be given, instead of only night service, as at present.

Astoria, Ore.—Pacific Power & Light Co. has arranged for the purchase of a 15-acre tract on Young's Bay, as a site for a power plant, which is to be built at a cost of $750,000. It will comprise equipment for electric generation and the production of gas. The electric plant planned, it is estimated, will be of a capacity sufficient to supply all power and lighting demands in the lower Columbia river region.

Bandon, Ore.—The proposal to build a municipal electric power plant at Bandon is receiving the consideration of the mayor and council. A water-power site on Elk river is being investigated.

Princeville, Ore.—$150,000 in bonds have been voted to complete the municipal dam and power system.

Reedsport, Ore.—A $10,000 railroad spur which will serve four mills and one warehouse is planned by the firms concerned. Warren Reed, V. G. Hindmarsh and C. McJohnson are interested.

Everett, Wash.—The city commissioners have engaged Burns & McDonnell, Kansas City, to prepare and present data with the view of either buying or building a light, heat and power plant for the city.

Seattle, Wash.—An ordinance is before the council providing for an issue of $432,000 in bonds to be used in constructing electric road, building a saw mill and a temporary electric plant.

Seattle, Wash.—Mayor Fitzgerald has announced as the result of an inspection trip made by him to the Cedar river dam and the Cedar Falls power plant, bids will be called at once for the installation of a 10,000-kw. generator at the Cedar Falls plant and the new pipe line from the dam to the power house. Provision has been made for these extensions by the city council, utility bonds in the sum of $1,755,000 being available.

Spokane, Wash.—Universal Electric Co. will erect a building at 1218 Second street at a cost of $10,000.

Tacoma, Wash.—The city will install an Allis-Chalmers 1500-kv-a. 3-phase outdoor transformer, from which energy will be furnished for motor drive in the mills of St. Paul & Tacoma Lumber Co.

Fresno, Cal.—San Joaquin Light & Power Co. has ordered 7500 wood poles from R. E. Downie, Seattle, Wash.

Pasadena, Cal.—Warnerlite Co., Davenport, Iowa, manufacturer of lighting plants and electrical products for automobiles, will start within six months the construction of a $100,000 factory building in Pasadena. This building will be the first unit of a plant in Pasadena to manufacture products to supply the Pacific Coast and export trade of the company.

Sierra Madre, Cal.—Plans are under advisement for civic improvements, involving an expenditure of about $100,000, which will include extensions to waterworks, sewer systems and installation of ornamental street lamps.

CANADA.

Naramanta, B. C.—Town Council has awarded contract to K. Winger, Peachland, for the construction of power house.

St. John, N. B. — The Department of Public Works, Ottawa, Ont., has awarded contract for the construction of a coffer-dam at Courtenay Bay, at the entrance to the dry dock of Bedford Construction Co., Halifax and St. John. Two 12-in. electrically driven water pumps will be installed.

Forest, Ont.—The town plans to build a water works system to include electrically driven pumping equipment. James, Loudon & Hertzberg, Excelsior Life building, Toronto, engineers.

PROPOSALS

Centrifugal Pump.—Until Sept. 17 bids will be received by the purchasing agent of Kansas City, Mo., for furnishing pumping station with centrifugal type pump driven by steam turbine through reduction gears; centrifugal pump driven by vertical cross compound Corliss engine. W. C. Goodwin, engineer.

Lighting Plant and Distribution System.—Bids will be received by C. H. Bolland, town clerk, Tishomingo, Okla., until 8 p. m., Sept. 18, for the construction of a complete electric light plant and distribution system, consisting of a power house, two 75-kv-a. generators, direct connected to semi-Diesel oil engines, switchboards, 15,000 lbs. copper wire, 400 poles, line material, etc. Johnson & Benha, construction engineers, Firestone building, Kansas City, Mo.

Motor-Driven Pumping Plant.—Bids will be received Sept. 16 at the office of the country auditor at Wapello, Iowa, for furnishing all material, labor, tools and appliances and constructing as a part of the drainage system of the district a complete drainage pumping plant. Bids are desired upon several types of plants as follows: Steam-driven pumping plant, motor-driven pumping plant to operate on electric current furnished under another contract, oil engine pumping plant, combination plant with present plant. Address F. G. Wright, acting on behalf of drainage district No. 13.

Conduits and Wiring.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Sept. 30, for furnishing the labor required in the construction, complete (including heating, plumbing, electric conduits, and wiring), with materials that will be furnished by the Government for senior medical officer's quarters, attendants' quarters, tuberculosis pavilion and approaches, for the United States marine hospital at Boston, Mass. Drawings and specifications may be obtained from the custodian, or at the above office, in the discretion of the supervising architect, James A. Wetmore, acting supervising architect.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Pumps, Motors, Turbines, Etc. (30,552).—The representative of a firm in Spain is at present in the United States and wishes to secure an agency for the sale of electrical machinery, material for central generating stations, small electrical material, pumps, turbines, internal combustion motors, and lamps. References.

Electrical Supplies (30,556). — An agency is desired by a man in Italy for the sale of agricultural and general machinery, tools, metals, electrical supplies, cloth and yarn. Correspondence may be in English. References.

NEW PUBLICATIONS

Prices of Coal and Coke, 1913-1918, is a publication of 115 pages by C. E. Lesher, prepared in co-operation with the United States Fuel Administration and War Industries Board. This paper, which deals with the prices of domestic coal and coke from 1913 to 1918, inclusive, is one of 50 similar studies of war-time prices in different industries prepared by or at the request of the War Industries Board. The aim of these studies is both to make the price quotations gathered by various Government agencies available to men concerned with problems of business readjustment and also to provide a permanent record of the great revolution in prices that accompanied the World War. The report is one of the products of the joint efforts of the United States Fuel Administration and the United States Geological Survey, which during the war combined their statistical work on coal and coke. It is published as a chapter in the history of the Fuel Administration and as a part of the annual report on the mineral resources of the United States by the Geological Survey for 1918; it is also combined with reports on other commodities in the history of prices published by the War Industries Board.

Telegraphs — The Bureau of the Census, Department of Commerce, has issued a report on the census of telegraphs and municipal electric fire-alarm and police-patrol signaling systems for 1917. This report is a part of that on electrical industries which in its entirety covers telephones, electric light and power stations and street and electric railways, and covers 61 pages.

The Constitution and Metallography of Aluminum and Its Light Alloys with Copper and with Magnesium is the title of a new publication of the Bureau of Standards, Scientific Paper No. 337. This paper deals with the solubility-temperature curves of $CuAl_2$ and of Mg_4Al_3, and incitally with the solubility of $FeAl_3$ and the condition and solubility of silicon in aluminum. The solubility-tempertures curves were determined by the method of annealing and microscopic observation and it was found that aluminum dissolves about 4.2% of copper as $CuAl_2$ at 525° C and abcut 12.5% of magnesium as Mg_4Al_3 at 450° C. The solubility of both compounds decreases with decreasing temperature. Observations are made regarding the structural condition of iron and of silicon in commercial aluminum. This publication is now ready for distribution and copies may be obtained by addressing a request to the Bureau.

INCORPORATIONS

Stuart, Fla.—Stuart Public Service Co. has been incorporated with a capital of $50,000. Geo. R. Hilty, president; J. A. Philips, secretary.

Delray, Fla.—Delray Utility Co. has incorporated with a capital of $10,000. Address D. K. Carter, general manager.

Chicago, Ill.—Paramount Electric Co. has been incorporated with capital of $10,000 by Joseph Vickman, Leonard Cohn and Joseph Rosenberg.

Ventnor City, N. J.—Valentine Engineering Co. Capital, $100,000. To engage in a general electrical engineering capacity. Incorporators: M. G. Valentine, Alfred B. Ripel, and W. F. Sooy.

New York, N. Y.—Manhattan Lamp Works, Inc. Capital, $10,000. To manufacture electric lamps and kindred appliances. Incorporators: G. P. Leberthon, M. Burkelman, and F. R. Geering, 44 Seventh avenue, Brooklyn.

Brooklyn, N. Y.—Hygrade Lighting Fixture Corp. Capital, $10,000. To manufacture electric and gas fixtures, etc. Incorporators: H. S. Axelrod, H. Cohn and P. L. Woodward, 115 Broadway.

Rome, N. Y.—Halstead Wire Co., Inc. Capital, $50,000. To manufacture wires, cables, and kindred products. Incorporators: F. W. Wallace, Plainfield, N. J.; J. P. Halstead, and H. T. Dyett, Rome.

Tamaqua, Pa. — Souder, Hornsley Co. Incorporated under Delaware laws with a capital of $100,000. To manufacture heat regulating apparatus. Incorporators: Daniel F. Graham, Robert H. Souder, and John H. Hornsley.

Decatur, Ill.—Argenta-Warrensburg Electric Co. has incorporated with a capital of $25,000 by Lloyd W. Brown, III, M. Bekemeyer and G. N. Conover. The principal office is in the new Suffern building in Decatur.

Newton, Ga.—Application has been made for incorporation of Southwest Georgia Power Co., and Baker County Power Co., to develop water power on Notchaway Creek, use of one of two or more sites being contemplated. It is proposed to furnish electricity at different points in southwest Georgia. Address R. L. Hall.

Indianapolis, Ind. — Stutz High Duty Fire Engine Co. has been incorporated with capital of $250,000 to manufacture motor-driven fire engines. The company is independent of the Stutz Motor Car Company although several of the directors will be identical. Among the Stutz Motor Car Company men interested are W. N. Thompson, secretary and treasurer; Edward G. Sourbier, Frank H. Wheller and Martin M. Hugg.

Personal

W. R. Kenney Elected President of Pennsylvania Electric Association—M. H. Wagner Joins Kelso Co.—Changes

BURTON R. STAIR, Seattle, has taken over the agency of the Independent Pneumatic Tool Co., of Aurora, Ill., manufacturer of Thor electric tools.

W. M. STRONG, hydroelectric and mining engineer, formerly of Denver, Colo., has opened an office in Alaska building, Seattle, Wash.

J. E. CRILLY has severed his connection with the National Conduit & Cable Co. to become Pacific Coast representative of the Habirshaw Electric Cable Co., with headquarters at the San Francisco office of the Western Electric Co.

E. H. BULL, who for seven years has served the Green Engineering Co., East Chicago, Ind., in the capacity of engineer, is now a member of the firm of Bull & Liversparger, which has been appointed sales representative of the Green company in Chicago and northern Illinois territory.

WILLIAM H. CHURCHMAN recently severed his connection with the East Bay Water Co., Oakland, Cal., as superintendent of pumping stations, and has become constructing and erecting engineer of steam, electric and hydraulic machinery with the California Hydraulic Engineering & Supply Co., San Francisco, Cal.

H. E. CAVE, for a number of years a member of the Benson Lighting Fixture Co., Baltimore, Md., has severed his connection with that concern to take charge of the sales department of the Luminous Specialty Co. of Indianapolis, Ind. Mr. Cave's wide experience in artistic decorating and lighting will doubtless prove invaluable in pushing the sales of the Luminous Specialty Co.

MAJ. ALLEN E. RANSOM recently returned from France and joined the Westinghouse Electric International Co. as special representative in the west coast of South America with headquarters at Valparaiso, Chile. He was formerly a sales engineer with the Seattle office of the Westinghouse company, and was later identified with other machinery interests. During the war Major Ransom served as chief electrical engineer for the St. Nazaire base and later as major commanding the 137th engineer battalion.

GEORGE M. WOOD has been appointed supervisor of power plants for the Connecticut Co., New Haven, Conn. Mr. Wood has been connected with the Connecticut Co. in the power department for about eight years, first serving for two years as draftsman and later being connected particularly with erecting jobs on the company's plants and heating systems. In 1913 he was made assistant engineer in the operating department, and in 1915 was transferred to the construction department. He was graduated from the Sheffield Scientific School of Yale University in 1908, with the degree of Ph.B.

T. AROSIN, who has been engaged in power construction work in Portland, Ore., has accepted the appointment of station operator of the Isleton (Cal.) plant of the Great Western Power Co.

SIG. NORMAN is back with the Page & Hill Co. after 20 months' service in France with the 20th Engineers. Mr. Norman was on board the *Tuscania* when it was sunk, but was rescued. He has taken up his station with the Page & Hill Co. as assistant manager of the Newport, Wash., office.

MILTON H. WAGNER, electrical engineer on the staff of the Bureau of Standards, Washington, D. C., resigned August 25 to become associated with the Charles M. Kelso Co., industrial engineer and contractor, Dayton, Ohio, as manager of the electrical department. Mr. Wagner received the degree of electrical engineer at the University of Cincinnati in 1908, since which time he has been connected with the power and mining engineering department of the General Electric Co., Schenectady, N. Y., and the Dayton (Ohio) Power & Light Co. Mr. Wagner was in charge of the entire transmission and distribution system of the Dayton company, during which period he was chairman of the Transmission and Distribution Committee of the Ohio Electric Light Association and a member of the Overhead Lines Committee of the National Electric Light Association. During the war Mr. Wagner entered the Government service as power engineer for the United States Fuel Administration, Washington, D. C., and later was appointed electrical engineer on the staff of the Bureau of Standards for the purpose of assisting in the formulation of safety standards in connection with the design, construction and operation of the central stations and their transmission and distribution systems and all industrial electrical installations.

Milton H. Wagner.

J. B. ERBLANG has been appointed auditor of the Northern States Power Co., Faribault division, succeeding H. O. Alm.

M. E. KEEFE, formerly with the Mercantile Bank of America, has joined the sales force of H. M. Byllesby & Co. at the New York office.

LIEUT.-COL. C. F. HIRSHFIELD recently received his discharge from the service and returned to his old duties at the Detroit Edison Co.

CHARLES EDISON, of Thomas A. Edison Co., West Orange, N. J., has become treasurer of the National Social Unit Organization, a society organized for the promotion of community development and organization.

A. J. SCHOOBEIN, who has been an assistant in the accounting department of the Fort Wayne, Ind., branch of the General Electric Co., has been named head of the accounting department to succeed J. H. Lotz, who has taken a position as traveling auditor with headquarters at Schenectady, N. Y.

D. C. HOPPER, formerly assistant superintendent of underground cable system, Commonwealth Edison Co., Chicago, and more recently in charge of the electric distribution and signal systems of the American International Shipbuilding Corp., is now connected with the Newport News & Hampton Railway, Gas & Electric Co.

J. E. LYNCH has returned to the Page & Hill Co., producer and dealer in cedar poles, and has taken over the management of the firm's Chicago office. He served in France with the 311th Engineers. Mr. Lynch enlisted as a private and received promotion to the rank of lieutenant shortly after the signing of the armistice.

F. H. SWAYSE, who for a number of years has been connected with the Western Electric Co., has been appointed eastern district line material manager. He was first employed in the general auditing department of the American Telephone & Telegraph Co. about 18 years ago and after one year was transferred to the purchasing department. He joined the Western Electric Co. in January, 1904, when that company absorbed the purchasing department of the A. T. & T. Co. The Western Electric Co. immediately organized its cedar and chestnut timber operations in North Carolina and Tennessee into a separate corporation called the Carolina Pole Co., Mr. Swayze acting as assistant treasurer and later as manager. In 1907 he was transferred to Philadelphia for field work under the dean of them all in chestnut poles, H. P. Marshall, and in

1909 was given charge of that work in the territory of the Philadelphia house, Pittsburgh house territory having later been added.

Brig. Gen. George H. Harries, head of the American military mission in Berlin and in private life a vice-president of H. M. Byllesby & Co., has left that city with his staff homeward bound, via Copenhagen. General Harries was the first United States officer in Berlin a few weeks after the armistice, and from his headquarters in that city has performed service of the most important kind with distinguished success.

E. H. Waddington, recently appointed western district manager, line material department of the Western Electric Co., with headquarters at St. Louis, Mo., entered the employ of the company in 1910 and was located with the Minneapolis branch for about two years as lamp, fixture and street lighting specialist. For the past five years Mr. Waddington has been connected with the St. Louis branch, handling syndicate and large industrial business. During the period of the war he was responsible for all transactions with the Government in his territory. He is president of the St. Louis Electrical Board of Trade.

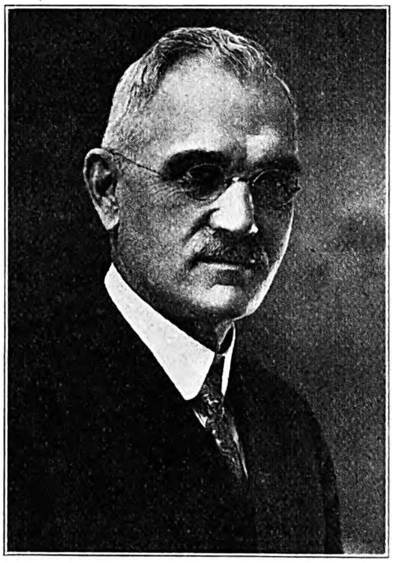
Capt. Lucius A. Fritze, Sanitary Corps, U. S. Army, has become associated with the technical staff of Wallace & Tiernan Co., Inc., New York City, manufacturer of chlorine control apparatus. Captain Fritze, who was sanitary officer of the Rainbow Division, after the armistice was assigned to the office of the Surgeon General in Washington and while there prepared a history of the Sanitary Corps of the A. E. F. Captain Fritze will be the manager of a new office which the Wallace & Tiernan Co. is opening at Kansas City, Mo., serving territory comprised in the states of Montana, Wyoming, Colorado, North Dakota, South Dakota, Nebraska, Kansas and Missouri.

Philip K. Condict, recently appointed vice-president of the International Western Electric Co., in recognition of his service to the telephone and telegraph development in Japan, has had conferred upon him by that nation the Order of the Rising Sun, Fourth Class, an honor that comparatively few Americans have received. The ceremony took place on July 17, at the official residence of the Minister of the Department of Communications in Tokyo. Mr. Condict has been connected with the Western Electric Co. since his graduation from Yale in 1903, with the exception of the time he served as a major in the Signal Corps during the war. He has spent a number of years in foreign fields, and for six years was secretary of the Nippon Electric Co., Ltd., an allied company of the Western Electric Co. in Japan.

E. K. Hall, formerly vice-president of the New England Telephone & Telegraph Co., returned to the Bell System on Sept. 1 as vice-president of the American Telephone & Telegraph Co. He will be associated with N. C. Kingsbury, who is first vice-president in charge of the operation, and will give particular attention to relations with the personnel. His connection with telephone matters began some twenty years ago when he entered the Boston law firm of Powers & Hall, who were the attorneys for the New England Co. of which he later became vice-president and a director. Mr. Hall is a graduate and a trustee of Dartmouth College. He was a famous all-around athlete in college and he has been actively identified with college athletics ever since. For several years he has been chairman of the American Inter-Collegiate Football Rules Committee.

Mr. Hall was business director of the Students' Army Training Corps during the war, remaining in the War Department after the armistice, in charge of settling the contracts between the department and the college. He has long been closely connected with the Boston Chamber of Commerce of which he was vice-president, and he represented that body in the National Council of Chambers of Commerce of the United States. He is widely known, not only as a telephone executive, but also as an authority on civic matters and on business and public relations. Since January, 1917, he has been vice-president of the Electric Bond & Share Co. of New York.

W. R. Kenney was elected president of the Pennsylvania Electric Association at its convention in Bedford Springs last week. The new president



W. R. Kenney.

has been identified with the electrical industry in Pennsylvania during his whole career. Beginning in the modest capacity of electrican's helper he rose to the position of superintendent of the Westmoreland County Light, Heat & Power Co., Greensburg, Pa., and of the Greensburg & Southern Railway Co., continuing in the same capacity when these companies became a part of the West Penn Power Co.'s system in 1903. Five years later he was transferred to Connellsville to become superintendent of light and power of Division A of the West Penn Power Co., which position he now holds. Mr. Kenney has been particularly ardent in his support of association activities, having given unstintingly of his experience, knowledge and enthusiasm to the National Electric Light Association and the Pennsylvania Electric Association, eminently fitting him for the important and responsible duties of chief executive of the latter organization.

E. M. Cutting, formerly Pacific Coast manager of the Edison Storage Battery Co., with headquarters at San Francisco, has been appointed manager of the company's railroad department with headquarters at Orange, N. J. In 1888 he entered the employ of the Southern Pacific Co. in the signal department, and rose to the position of signal supervisor for the western division by 1897. In 1905 he was also given charge of the car-lighting on the Southern Pacific lines and in 1908 became engineer of train lighting, heating and ventilation and in 1912 he resigned to accept the position of Pacific Coast manager of the Edison Storage Battery Co. Mr. Cutting has always taken an active interest in electrical affairs, having been instrumental in initiating the movement which culminated in the Association of Railway Electrical Engineers, of which he was the second president, and also being a past president of the San Francisco Electrical Development League. He is widely known on the Coast, and while his friends will be pleased to learn of his new advancement, they will regret his removal from the electrical field on the Pacific Coast.

A. G. Nabors, formerly district pole manager of the Western Electric Co., Chicago, has been promoted to the position of central district pole line material manager. He has been affiliated with the Western Electric Co. since 1905, prior to which time he was for five years employed with the American Telephone & Telegraph Co. in the capacity of paymaster of a line construction gang and at other jobs in connection with building telephone lines. The last position he held with the company was in the pole line inspection department. When the purchasing and inspection of poles was transferred by the telephone company to the Western Electric Co. he was transferred to the latter company. He was located at its New York and Philadelphia offices for three or four years and was then sent to the Pittsburgh office. In July, 1916, he was transferred to Chicago to take the positon of district pole manager, which position he held until his recent promotion.

E. P. Peck, for more than thirteen years a member of the engineering staff of the Georgia Railway & Power Co., was recently appointed general superintendent of the electrical department of the Utica (N. Y.) Gas & Electric Co. Mr. Peck was born in Atlanta, Ga., Aug. 13, 1882, and attended the Georgia School of Technology. In 1903 he took up practical work, and for two years was connected with electrical construction, maintenance and repair work in northern cities. In 1905 he entered the employ of the Georgia Railway & Electric Co., serving in the repair and meter shops. One year later he was appointed foreman of the testing department, continuing this position until 1912, at which time he was promoted to assistant electrical engineer in charge of electrical station layouts and construction and of testing. Five years later he was again advanced to superintendent of operation. This position he held until October, 1918, when he resigned to take up war work in Washington, D. C. Mr. Peck has an extensive operating experience and is well known in the industry because of his original investigations and development work as a member of the Georgia Railway & Power Co.

Night View in a Knitting Mill Where Indirect General Lighting Eliminated Complaints About Glare from the Needles and Wiped Out High Labor Turnover.

How Better Industrial Lighting Can Improve Working Conditions

Working Conditions, Including Welfare of Employes, Can No Longer Be Ignored—Up-to-Date Lighting Makes Better Conditions and Reduces Labor Turnover and Labor Disputes

By F. H. BERNHARD

DURING the late war was witnessed one of the most splendid examples of national concentration of effort toward meeting a great emergency. With practical unanimity the country saw the need for greater production and proceeded to meet it by more intense and efficient application in all the industries except those non-essential to winning the war.

A different kind of emergency now confronts us. Continuance of high costs of the necessities of life is given as a primary cause of the serious industrial unrest so prevalent in our country as well as abroad. While there is some truth in this, it is not all the truth. Nevertheless, this unrest is a serious menace that threatens to further increase the cost of living. Instead of stimulating efficient production, which is doubtless the most effective remedy for high costs of products, it retards production. Clearly the situation calls for concerted efforts to fight the high costs and allay the unrest.

In an article published in these columns two weeks ago the writer undertook to show that improved industrial lighting can aid materially in stimulating production and thus help reduce the costs of commodities. In the present article an effort will be made to show that better lighting brings about substantial improvement in working conditions and thus affects production favorably while at the same time eliminating some of the causes for large labor turnover and possible labor disputes.

Growing Importance of Attention to Working Conditions.

Any discussion of the value of some proposed improvement in working conditions usually takes for granted that a corresponding improvement in production must follow. This is not always true because the extremely variable human element enters. When we discuss improvement in the efficiency of employes, however, there is a directly proportional relation between efficiency and output, as was pointed out in the article referred to. Betterment of working conditions may in some cases cause more than a corresponding increase in output, while in others the increase may be considerably less than in direct ratio; the latter is especially true where some artificial restriction, such as that of a labor union, is placed upon the output. Thus when we consider workmen merely as productive agencies, like machines, we find their production obeys almost mathematical laws, while when we must take into account their desires, prejudices and frailties as human beings the relation between stimulus and result is no longer as direct. This is one of the reasons why employers have formerly not given as much attention to working conditions as they do now.

Effects of working conditions are of many kinds, depending upon what is covered by the term. One may distinguish at least four different kinds of working conditions: (1) Those associated with the industry, trade or operation considered and determined by the standards developed with the progress of the art. (2) Physical conditions and environment of the plant, outside and inside; the latter includes daylight and artificial lighting conditions, ventilation, heating, sanitary facilities, etc. (3) Conditions set by the management, such as wages, hours of work, superintendence, character of foremen, etc. (4) Conditions determined by workmen, such as character and nationality of fellow-employes, requirement of labor organization, etc. The aggregate of these various conditions determines the desirability of employment in any particular occupation and particular plant.

Great changes have taken place in the importance placed on working conditions during the last few decades. Formerly the workman took up the trade or occupation of his father to a much larger extent than now. He assumed as inherent to that trade the peculiar nature of its work and the hazards and joys, if any, associated with it. The employer determined the principal conditions of employment and there was little change from year to year.

Gradually, however, the employes have taken a more and more active part in saying what the conditions shall be. If these were not satisfactory, many would quit and go to plants where they were better. Shop committees presented requests for improvement; if these were not granted, definite organization and affiliation with labor unions often followed together with subsequent strikes.

Any unbiased person must admit that through the labor unions there have resulted extremely important improvements in working conditions, the net result of which has been a marked raising of the standard of living of the great mass of our population. He must also admit that, in the last few years especially, many of the leaders of the unions have seemingly lost their heads and have presented demands beyond all reason, backing them up by provoking unwarranted strikes that constitute a very serious economic loss to the country and, if not checked, may become a grave menace to the nation. The president of the National Association of Manufacturers has just stated that during the last eight months strikes and threatened strikes have cost our country an average of about $10,000,000 a day—an outright and needless loss in wages and business. Under such conditions no manufacturer can afford to ignore giving close attention to the working conditions in his plant, any one of which may become the seed for the growth of discontent and thus lead to disputes and stoppage of work.

In presenting the following discussion of the several ways in which up-to-date lighting can improve working conditions, it is fully recognized that it is not a panacea in this regard. In fact, there is no single panacea; high wages alone do not constitute an offset for insanitary conditions or an arbitrary foreman with present-day discriminating employes, nor does welfare work make up completely for low wages. There is no question, however, but that reasonable attention to all the working conditions, as a right of the employes and not as a charity, is fully appreciated by them. It demonstrates the employer's real interest in their welfare and develops loyalty to his firm. Further, it makes it very difficult for professional agitators to get a responsive hearing. Therefore it fully pays from every angle it is considered.

Most discussions of improvement in industrial lighting bring out the increase in production as its most important benefit, the other advantages being incidental. There is much truth in this in most cases, especially when production increase is so urgently needed as just now. However, the other benefits are often very substantial and in certain cases of even greater monetary value than increase of output. It is believed, moreover, that they all have also a more or less direct bearing on production increase and this will be brought out in the following. While it is not easy to segregate the welfare benefits from the production benefit, the fact that the former contribute to the output increase must not be lost sight of in determining the aggregate value of an up-to-date lighting system.

How Improved Lighting Betters Conditions for Working.

Some ten or a dozen years ago the appalling number of accidents in American industrial plants began to make an impression from which grew the "Safety First" movement. During the year 1910 an analysis was made of about 91,000 industrial accidents reported to one of the largest accident insurance companies with the surprising result that 23.8% of them were found due to poor lighting or in which poor lighting was an important contributing factor. Eight years afterward a similar study showed that this percentage had fallen to about 18%, a reduction of nearly 6%, in this class because of the intervening years of lighting betterment in the larger plants especially. Even with this reduction, the actual figures for the year 1918 show that our industries lose the services of 108,000 men for a whole year annually because of fatal and serious casualties due to lighting that is inadequate for safety, and 75 men each day lose their lives from such meager lighting in American plants. These figures represent a frightful toll in lives and suffering that should be almost entirely preventable. There is also the heavy loss to employers from paying workmen's compensation. In the state of Massachusetts this loss and that of wages due to industrial accidents of this class is estimated to aggregate $1,000,000 annually, or sufficient to equip each factory, mill and workshop with an ideal lighting system and operate this for several years.

On this score it is not surprising to find that six states have in recent years enacted factory lighting codes laying down requirements as to lighting to safeguard the lives, limbs and eyes of factory employes. Several other states have pending the drafting of similar codes. All these codes are based primarily on the promotion of safety; their specified lighting intensities do not concern themselves with the stimulation of production, since the state cannot compel a manufacturer to be so progressive as to look out for his own best interests. It can compel him, however, to equip his plant with such safeguards, including lighting, as will remove the manifest hazards to his employes.

While he is rehabilitating his lighting to meet the modest safety standards, he would be shortsighted indeed if he did not at the same time and at slight additional cost exceed those standards and provide for lighting intensities that would clearly add to the productive efficiency of his men 10 to 25% or more, as was shown in the article published two weeks ago.

As regards safety and lighting it can therefore be definitely stated that the latter is absolutely necessary to the former and will become more so with the growing tendency to operate plants on the double or triple-shift basis per 24 hours. Data are at hand showing that industrial accidents are more numerous in winter than summer due to the larger percentage of dark hours. Modern lighting can make the night hours as safe and as productive as the daylight hours. The interests of the country require elimination of all preventable accidents, especially at a time when every idle hand is needed to add to the production of all those necessities that the entire world is turning to us to supply.

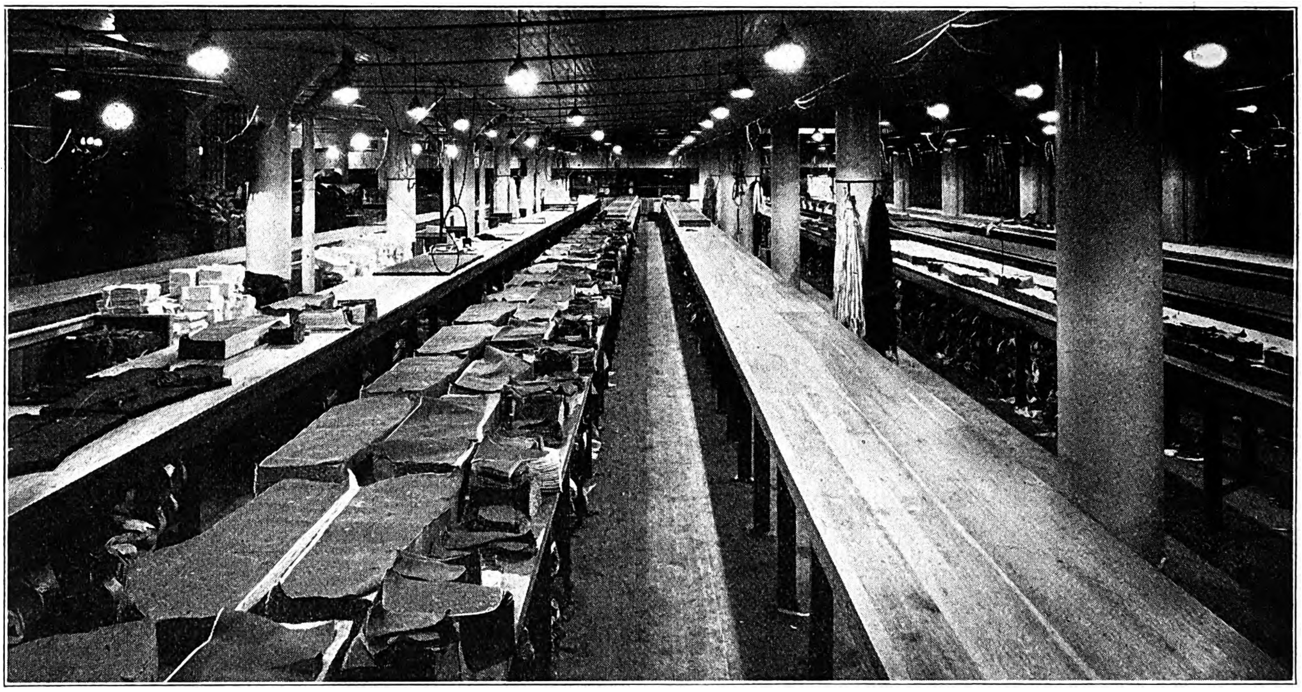
It is generally known that any effort to read or work in a meager light leads to serious eye strain. Similar strain is caused by improperly directed or poorly diffused light which may be ample as to intensity. Thus both inadequate and improper lighting are frequently the source of bad visual conditions by day as well as under artificial light.

One of the first results of eye strain is slowing up of the work; it takes longer to perform any operation under poor visual conditions than when the light is ample and suitable. Then continued eye strain produces a tendency to permanent impairment of vision and reduced visual efficiency. The gradual blindness thus often produced at relatively young ages is one of the saddest sacrifices to the plain disregard of scientific principles of illumination by either ignorant or negligent industrial managers.

Whether the poor lighting is temporary or prolonged, its accompanying poor visual conditions almost invariably result also in much work being spoiled. This, in fact, is found to be one of the most prolific causes of the heavy loss from spoilage in American industries, which amounts to the extraordinary sum of $28,000,000 annually due to poor lighting alone. This is a dead loss to the manufacturer which he can only compensate by adding to the cost of production.

The final results of eye strain and improper visual conditions from poor lighting are inferior quality of product, diminished output because of the lowered efficiency of the employe, increased labor turnover and frequently the growth of discontent developing into disputes. An example of this is depicted in an accompanying illustration showing a view in a knitting mill. The former direct lighting caused very serious glare due to the specular reflection from the polished needles. This almost blinded the operators and it was difficult

View in a Foundry the Excellence of Whose Lighting Makes Accidents Unlikely and Working Conditions Much More Favorable Than in the Average Foundry Where the Gloom Is Both Impressive and Depressive.



Night View in Cutting Room of an Overall Factory—Accidents and Spoilage Would Be Serious if Lighting of This Kind Were Not Provided.

to get them to hold their positions for much over a week. The time and money lost in training new operators almost ruined the firm. Finally a system of indirect lighting was installed that eliminated the glare and the troubles at once ceased.

In the old shops and mills it was quite common to find very dingy workrooms with low ceilings cluttered up with shafting, pulleys and belts; the windows were small, few in number and very dirty. Lighting conditions in such rooms were abominable even in broad daylight. On cloudy days and in the morning and evening hours these rooms were like dungeons and it is not surprising that the operators moved about as if they were in a daze. Accidents were very frequent, spoilage was high and the output low. Such gloomy and depressing workrooms are now rather scarce, thanks to the lighting codes referred to and to the activity of factory inspectors that have not waited for enactment of such codes.

There are still very plentiful cases of factories whose owners have not realized the full value of cheerful workrooms with large and clean windows and skylights, brightly painted walls and ceilings, unobstructed aisles and ceilings, orderly arrangement of machines, workbenches and stacks of material. A bright and pleasant workroom is like a cheerful environment in any place, it has a most wholesome influence in making the employes keen, alert and attentive to their work so that more accurate and speedier work is done, fewer mistakes are made, less material is spoiled, accidents become rare, less fatigue and depression is experienced, grumbling and discontent are almost unknown and the workers are more loyal to the interests of the firm.

Reference has been made to high labor turnover. The day is past when an employer felt this to be a convenient means for keeping down wages. Even when labor is plentiful large labor turnover is a serious loss and burden. It disrupts the organization, increases mistakes and accidents, and lowers the efficiency of the whole plant. Wherever it occurs there is something radically wrong that should by all means be remedied.

In not a few cases poor lighting has been the cause. One case has already been cited. Many cases are on record where employes have quit or threatened to leave in large numbers because the lighting was so inadequate that they could not produce the quality or quantity of work of which they might be proud. Especially has this happened where piecework or bonus payments prevailed; with poor lighting it was impossible to maintain desired standards and insufficient, acceptable product could be turned out to maintain a desirable compensation. Thus not only were the employes displeased but the employer was a loser.

The cost of an up-to-date lighting system that meets all the requirements of productive intensity, freedom from visual strain, safety, efficiency and low upkeep is surprisingly low in terms of the benefits derived thereby. This low cost is due to the rapidity of the scientific and practical development of the lighting art which in the last few years has made very important advances. Thus it has made possible production increases from 10 to 35% at a lighting cost of less than 1% up to about 5% of the payroll and this without adding to the number of employes. Aside from these ascertainable output increases there were the less definitely known but no less real betterments in working conditions referred to in this article.

It has already been shown that most of these miscellaneous benefits have a direct bearing on the output and are therefore partly included in the production increase from good lighting. But even if all of these benefits were intangible and there were no ready check on their monetary value, they are there and of great importance to the manufacturer and his employes as well. Take, for instance, reduction of labor turnover and possible disputes over lighting developing into strikes. The serious losses from these sources are by no means to be ignored and the manufacturer who puts in a modern lighting system as insurance against these troubles is doing nothing more extraordinary than the one who has removed from his plant all possible hazards from combustion and installed the best possible sprinkler system as at least partial insurance against trouble from fire.

Central-Station Rates in Theory and Practice

Eleventh Article—Conclusion of Mathematical and Graphical Analysis of the Conditions Under Which Price Splitting or Reductton Is Advantageous as Regards the Earnings of the Central-Station Company

By H. E. EISENMENGER

This is the eleventh article of this series of which a general outline appeared in the issue of July 5. The first seven articles, beginning July 12, were devoted to a discussion of the cost of electric service on which modern rate systems are based. In the last three articles the general principles underlying rate making have been treated, it being shown that what the author calls the "value-of-service" principle is superior to the strict "cost-of-service" plan. Insert IX, begun Aug. 30 and ended this week, analyzes the conditions for price reductions without curtailing earnings. A summary of the important conclusions of this analysis will be included in the next article when the main text will be resumed and continued through practically the remainder of the volume.

PART II—THE PRICE OF ELECTRIC SERVICE—Continued.

Insert IX—Appendix to Section 80 et Seq.—Relations Between Selling Prices and Earnings—Continued.

II. PRICES DEPENDING ON THE CUSTOMER'S VALUATION (VALUE-OF-SERVICE PRINCIPLE).

2. *Net Income.*

a. Shape of the Net Income Curve.

1. What Is the Net Income or the Rate of Return of a Group?

SECTION **25.** The preceding Sections 16-23 have shown how the conditions for an increase of the aggregate gross income as a consequence of a lowering of the price to certain groups of service can be reduced to certain qualities of the gross-income curve which belongs to the respective group (or groups) in which the price is to be lowered. If we try to extend this method to the net income (and to the rate of return) we must first decide what is to be called "the net income" or the "rate of return," respectively, of a particular group. We can determine the gross income of a certain group of service, but we cannot say without certain additional defining assumptions how large the net income or the rate of return is which results from that group because the aggregate cost (total cost) and the total capital invested cannot be assessed to the individual groups in a definite way unless we make certain assumptions.

26. We can now make various assumptions about what we want to call the "net income" and the "rate of return" of a certain group for the present purpose. The most obvious two methods of defining the net income and return of a group are (a) the incremental net income (return of the increments) and (b) what might be called the group's "segregate" net income (segregate rate of return); (compare also Section 3 of the main text).

27. The "*incremental net income*" is the difference: Increment of the gross income caused by the addition of that group to the other groups minus the increment of the combined cost[1] over the combined cost (aggregate cost) of all other groups. In other words, it is the difference of gross income derived from that group minus the increment of the combined (aggregate) cost of all other groups. The "*rate of return of the increments*" is the incremental net income, as just defined, divided by the increment of the capital.

28. The group's "*segregate net income*" is the difference of that group's gross income minus the group's segregate cost (see Section 3 of the main text; the "group's segregate cost" is the cost of serving that group alone if no other groups were in existence). Likewise the group's "*segregate rate of return*" is the quotient of the segregate net income, as just defined, divided by the capital which would be necessary to establish a manufacturing plant (central station, etc.) just large enough to provide for that group alone.

2. Incremental Net Income of the Group. (Sufficient and Necessary Condition.)

29. Starting again with the assumption that we have two groups of service only, G and g, we call N_{t_0} and N_{t_1} the aggregate net incomes from both groups, corresponding to the aggregate gross income B_{t_0} and B_{t_1} above (Section 16 of this Insert). N_{t_0} is therefore the aggregate net income if the unit prices charged in both groups are the same and equal to p_0, resulting in the sales M_0 and m_0 units in the two groups, respectively, whereas N_{t_1} is the aggregate net income if in group G the price is maintained at p_0 and in group g it is lowered to some other amount p_1, increasing thereby the sales in that group from m_0 to m_1. Let the symbol $f(m)$ denote again the function which determines the cost (excluding the capital cost) if the amount produced is given by m (variable). We have then

$N_{t_0} = (M_0 + m_0)p_0 - f(M_0 + m_0)$...Uniform price p_0. (17)

$N_{t_1} = M_0 p_0 + m_1 p_1 - f(M_0 + m_1)$........Price splitting downwards (lowering price in group g)............(18)

If price splitting downwards shall improve the net income, that is, if N_{t_1} shall be $> N_{t_0}$, then

$m_1 p_1 - f(M_0 + m_1)$ has to be $> m_0 p_0 - f(M_0 + m_0)$ ...(19)

or using, as above, the symbol b (gross income) for the product mp so that $b_0 = m_0 p_0$ and $b_1 = m_1 p_1$

$(b_1 - b_0) - [f(M_0 + m_1) - f(M_0 + m_0)]$ must be > 0..(20)

Writing this in the form

$$\{ b_1 - [f(M_0 + m_1) - f(M_0)] \} - \{ b_0 - [f(M_0 + m_0) - f(M_0)] \} > 0 \quad \text{..........(21)}$$

we have in the first couple of braces the incremental net income of the group if the price is p_1 and in the second couple of braces the incremental net income over the other group if the price is at its original amount p_0. This means: *Lowering the price in a certain group is of advantage to the aggregate net income, if the incremental net income of that group is improved thereby.*

Such an improvement of the group's incremental net income according to relation (21) is the *necessary and sufficient* condition for an improvement of the aggregate net income by price splitting downwards, which means, if the

[1] The increment of the cost is the amount by which the aggregate cost is raised in consequence of the fact that the respective group is being supplied with service. The sum of the increment costs of all groups will be smaller than the total aggregate cost and the sum of the aggregate costs of all groups will be larger than the total aggregate cost. A balance will remain after summing up the increment costs of all groups which has not been assigned to any one of the groups (overhead cost). If we regard the total service as one group, the increment cost of that group is the excess of the aggregate cost over the cost at the production 0, and the cost at production $0 = OS_0$ (on the left-hand part of Fig. A*) will be left over, and not accounted for, so to speak. The same will apply if we have more than one group, provided the line of cost $s = f(m)$ or S_0ST, is a straight line, otherwise the unaccounted portion will be greater (always taking the incremental cost of every group over the combined cost of all other groups).

The same considerations prevail for the increment of the capital.

*See page 389 of Sept. 6 issue.

group's incremental net income is improved by price splitting downwards, the latter is always profitable and conversely, if price splitting downwards is profitable, the group's incremental net income must be improved thereby.

3. Segregate Income of the Group. (Sufficient But Not Necessary Condition.)

30. Can we establish a similar relation between the aggregate income of all groups and the *segregate* income of the group in which the price is to be lowered?

The segregate net income of group g at the lowered price p_1 is greater than at the original price p_o if

$$b_1 - f(m_1) > b_o - f(m_o)$$

or $(b_1 - b_o) - [f(m_1) - f(m_o)] > 0$ .... (22)

How does this compare with relation (21)? A glimpse at Fig. D will make this clear. We have here

$OA' = m_o$ .... $A'A = f(m_o)$

$OB' = m_1$ .... $B'B = f(m_1)$

where m_1 is greater than m_o because the price p_1 is obtained from p_o by price splitting downwards so that $p_1 < p_o$, consequently according to fact No. 1 of Section 1 of this Insert m_1 must be $> m_o$.

We have further in Fig. D

$$A'C' = B'D' = M_o = \text{constant}$$

$OC' = m_o + M_o$ .... $C'C = f(m_o + M_o)$

$OD' = m_1 + M_o$ .... $D'D = f(m_1 + M_o)$

$$\left.\begin{array}{l} B''B = f(m_1) - f(m_o) \\ D''D = f(M_o + m_1) - f(M_o + m_o) \end{array}\right\} \text{..........(23)}$$

If now the curve $f(m)$ complies with fact No. 3 of Section 1 of this Insert, that is, if it rises continuously with increasing abscissae, turning the concave side towards the

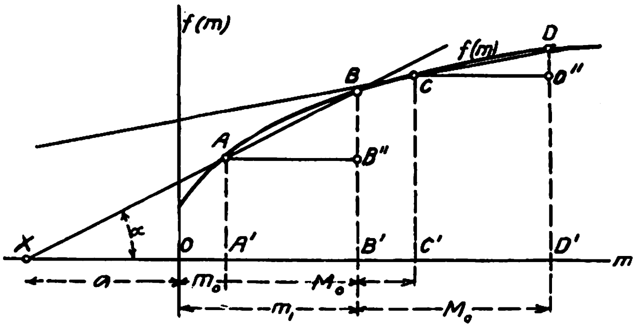


Fig. D.

axis of abscissae and approaching with increasing abscissae asymptotically a straight line, this means that $B''B > D''D$, because $A'B' = m_1 - m_o$ and $C'D' = (m_1 + M_o) - (m_o + M_o) = m_1 - m_o$ and consequently $A'B' = C'D'$. For the limiting case where the $f(m)$ line is a straight line $B''B = D''D$.

This means from (23)

$f(m_1) - f(m_o) \geqq f(M_o + m_1) - f(M_o + m_o)$ .. (24)

Multiplying by (-1) and adding $(b_1 - b_o)$ to both sides (24) becomes

$$(b_1 - b_o) - [f(m_1) - f(m_o)] \leqq$$
$$(b_1 - b_o) - [f(M_o + m_1) - f(M_o + m_o)]$$

The left side of relation (22) is therefore always $\leqq$ than the left side of (20), or if relation (22) is true, (20) and (21) must of necessity also be true, because if the term of (22) is positive, the term of (20) which is equal or greater, must of course also be positive. But we can reverse the statement only in case the $f(m)$ line is a straight line, which means: Unless $f(m)$ is a straight line there will exist cases in which (21) is true, but (22) is not.

In other words: An increase of the segregate group income for a certain price reduction is a sufficient condition for an improvement of the aggregate net income by price splitting downwards by means of that price reduction, but it is not a necessary one, unless the $f(m)$ curve is a straight line.

4. General Remarks.

31. What has been proved in Sections 18 and 19 of this Insert for the gross income can be demonstrated in exactly the same manner for the group's incremental net income and the group's segregate net income. It is unnecessary to repeat in detail all these results in their application to the net income (maximum of the aggregate net income, more than one maximum of the group's net income curve, increase of the net income either by price reductions in *all* or in some of the groups, increase of the net income if the original system of prices has been so designed as to result in the highest possible net income attainable with a uniform price). We can also without difficulty extend the conclusions to more than two groups.

32. Which condition is more strict, that for an increase of the gross income or of the net income by price splitting downwards? The gross income can be raised by price splitting downwards if, according to relation (14), $m_1p_1 > m_op_o$, that is $b_1 > b_o$. The corresponding condition for the net income is, according to relation (20), $b_1 > b_o + [f(M_o + m_1) - f(M_o + m_o)]$. Now since $p_o > p_1$, it follows, according to fact No. 1 of Section 1 of this Insert, that $m_o < m_1$ and, according to fact No. 3, that $f(M_o + m_o) < f(M_o + m_1)$. Therefore $[f(M_o + m_1) - f(M_o + m_o)]$ is always positive. Consequently with a given sales curve for group g and with a given upper price p_o, high enough so that price splitting downwards increases the aggregate *gross* income, there will always exist certain values of the price p_1 which, although making $b_1 > b_o$, and therefore improving the aggregate *gross* income B_t if added as lower prices, still will reduce the aggregate *net* income N_t because b_1 does not reach the value $b_o + f(M_o + m_1) - f(M_o + m_o)$.

For a graphical representation of the fact set forth in this Section see Section 33 et seq. of this Insert.

b. Shape of the Sales Curve.

33. It is of interest to investigate again, as has been done in the case of the gross income (Sections 20-23 of this Insert) how the condition for the possibility of increasing the net income without raising the prices to anybody is expressed in the shape of the sales curve. Calling

$$f(M_o + m_1) - f(M_o + m_o) = \Delta f(M_o + m_o)$$

we can write relation (19) as

$m_1p_1 > m_op_o + \Delta f(M_o + m_o)$ .... (25)

If we now call $r = \dfrac{\Delta f(M_o + m_o)}{m_1 - m_o} = \dfrac{\Delta f(M_o + m_o)}{\Delta m_o}$ .... (26)

this means r is the average cost increment per unit[2] if the quantity produced rises from $(M_o + m_o)$ to $(M_o + m_1)$, or we can say $r = \tan\gamma$ in Fig. A.* If we substitute the value for $\Delta f(M_o + m_o) = r(m_1 - m_o)$ from equation (26) into (25) we get

$$m_1p_1 > m_op_o + r(m_1 - m_o)$$

or $m_1(p_1 - r) > m_o(p_o - r)$ .... (27)

The limiting case of this relation is given by changing the inequality sign into an equality sign:

$m_1(p_1 - r) = m_o(p_o - r)$ .... (28)

34. Assuming now for the present that curve $s = f(m)$ be a straight line, the cost increment r per unit will then be constant for any values of m_o and m_1 (or p_o and p_1, respectively). Equation (28) is then represented by a family of equilateral hyperbolas which is identical with that of equation (16) of this Insert, except that the vertical asymptote does no longer coincide with axis of ordinates m. It runs now at the distance r to the right of that axis (Fig. E). The reasoning of Sections 22 and 23 of this Insert can now be applied to these hyperbolas.

The net-income hyperbola passing through a certain point will be steeper than the gross-income hyperbola passing through the same point. This is illustrated by comparing the family of net-income hyperbolas with the dash-and-dot gross-income hyperbola in Fig. E which has been selected at random.[3] Consequently, considering Section 23 of this Insert, the lowest limiting slope of the sales curve of group g which still allows an increase of the earnings by lowering the price in that group will be greater in case of the net income than in case of the gross income. In other words, the conditions for an increase of the net income by price splitting downwards are more strict than the corresponding conditions for the gross income. (Compare Section 32 of this Insert.)

35. If now the curve $s = f(m)$ is no longer a straight line, but curved, in the only way in which it can be curved, that is with the concave side pointing steadily downwards, this means that r, see equation (26), will no longer be a constant for every m_1, but it will (for a given m_o and M_o) grow smaller as m_1 increases and vice versa. It will, how-

[2] See the first footnote to Section 75 of the main text.

* See page 389 of Sept. 6 issue.

[3] It is hardly necessary to prove this in a more scientific way by comparing the angles of the slope of the two curves as given by the first derivative dm/dp in both cases:

Gross-income hyperbola....... $mp = \text{constant}$...... $\dfrac{dm}{dp} = -\dfrac{m}{p}$

Net-income hyperbola.. $m(p - r) = \text{constant}$...... $\dfrac{dm}{dp} = -\dfrac{m}{p - r}$

Therefore dm/dp is smaller for the net-income hyperbola than for the gross-income hyperbola, but since dm/dp is essentially negative in both cases, the absolute value of the angle of inclination of the net-income hyperbola is greater than that of the gross-income hyperbola passing through the same point.

ever, for very large amounts m_1—mathematically expressed, for $m_1 = \infty$—still have a finite positive value, viz.: the limiting value $c_{1\infty}$ of the increment-cost c_1 per unit, if very large quantities of the "commodity" are manufactured (very large central stations). We will get, therefore, a different set of hyperbolas for every value of m_1 in such a manner that the vertical asymptote will move nearer and nearer to the vertical axis of co-ordinates with increasing m_1 without ever getting closer to it than a certain minimum $c_{1\infty}$. Consequently we can say that in case of a curve $f(m)$ line the conditions for increasing the net income by price-splitting downwards will be less strict for larger quantities m_1 than for smaller ones, but they will always be stricter than the corresponding conditions for the gross income.

The results of this graphical investigation are therefore entirely in harmony with the results of the analytical investigation carried out in Section 32 of this Insert.

3. *Rate of Return.*

a. Shape of the Rate-of-Return Curve.

1. Total Rate of Return of All Groups.

36. Proceeding along the same general lines of reasoning as in Sections 16-24 and 25-35, respectively, of this Insert, we can investigate the criterion for an increase of the rate of return either analytically or graphically and arrive at the same results with either method.

Using the same symbols as heretofore, we can write

$$v_0 = \frac{(M_0 + m_0)p_0 - f(M_0 + m_0)}{F(M_0 + m_0)} \quad \ldots\ldots\ldots\ldots (29)$$

and

$$v_1 = \frac{M_0 p_0 + m_1 p_1 - f(M_0 + m_1)}{F(M_0 + m_1)} \quad \ldots\ldots\ldots\ldots (30)$$

where F is the symbol for the function of m which represents the capital invested (see left side of Fig. A) so that $F(m_x)$ is the capital necessary as an investment for the annual production of m_x units; v_0 and v_1 are then the rates of return corresponding to the gross incomes B_{t0} and B_{t1}, or to the net incomes N_{t0} and N_{t1}, respectively, in the preceding Sections of this Insert, in such a manner that v_0 is the rate of return obtained if the price p_0 is charged to both groups G and g, and v_1 is the rate of return if the price is lowered to p_1 in group g and maintained at p_0 in G (price splitting downwards).

2. Return of the Increments. (Sufficient and Necessary Condition.)

37. In analogy with the investigations of "Net Income" (Sections 25 to 35 of this Insert) we shall investigate whether and how the criterion for an increase of the rate of return as a consequence of the lowering of the price in group g alone can be expressed in terms of

(a) the return of the increments of group g (see Section 27 of this Insert);

(b) the segregate rate of return of group g (see Section 28 of this Insert).

The condition that the rate of return is raised by the change of the price p_0 to p_1, in group g only is: $v_1 > v_0$ or $v_1 - v_0 > 0$, that is from (29) and (30):

$$\frac{[M_0 p_0 + m_1 p_1 - f(M_0 + m_1)]\, F(M_0 + m_0)}{F(M_0 + m_0)\, F(M_0 + m_1)} - \frac{[(M_0 + m_0)p_0 - f(M_0 + m_0)]\, F(M_0 + m_1)}{F(M_0 + m_0)\, F(M_0 + m_1)} > 0$$

This fraction is greater than 0 if the numerator is greater than 0 because the denominator is essentially positive. The condition can therefore be written as

$$[M_0 p_0 + m_1 p_1 - f(M_0 + m_1)]\, F(M_0 + m_0) - [(M_0 + m_0)p_0 - f(M_0 + m_0)]\, F(M_0 + m_1) > 0 \ldots\ldots (31)$$

Substituting into this, for the sake of brevity, the following short symbols: B_0 for $M_0 p_0$, b_0 for $m_0 p_0$, and b_1 for $m_1 p_1$ we get

$$[B_0 + b_1 - f(M_0 + m_1)]\, F(M_0 + m_0) > [B_0 + b_0 - f(M_0 + m_0)]\, F(M_0 + m_1) \quad \ldots\ldots\ldots\ldots (31^*)$$

Setting $f(M_0 + m_1) - f(M_0 + m_0) = \xi$

and $F(M_0 + m_1) - F(M_0 + m_0) = \eta$

we can write (31*) as

$$[B_0 + b_1 - f(M_0 + m_0) - \xi]\, F(M_0 + m_0) > [B_0 + b_0 - f(M_0 + m_0)]\, [F(M_0 + m_0) + \eta]$$

from which $(b_1 - b_0 - \xi)\, F(M_0 + m_0) > [B_0 + b_0 - f(M_0 + m_0)]\, \eta$

or

$$\frac{b_1 - b_0 - \xi}{\eta} > \frac{B_0 + b_0 - f(M_0 + m_0)}{F(M_0 + m_0)} \quad \ldots\ldots\ldots\ldots (32)$$

The fraction on the left side of this relation is the "rate of return of the increments," as will be readily seen by comparing it with the definition of that term as given in Section 27 of this Insert. The right side is the actual rate of return of both groups under the original charges v_0 [equation (29)], that is when the price p_0 is charged in both groups. It is easily seen that this can be extended to more than two groups and we arrive thus at the following law:

Price splitting downwards by groups is of advantage to the rate of return as long as the rate of return of the increments in the respective group where the price is lowered is greater than the original rate of return. (Sufficient and necessary condition.)

3. Segregate Rate of Return. (Sufficient But Not Necessary Condition.)

38. In an attempt to introduce, in analogy with what has been shown previously (Section 30 of this Insert) about the net income, the more convenient term of the segregate rate of return $\dfrac{b_1 - f(m_1)}{F(m_1)}$ we start from the sufficient and necessary condition for an increase by price splitting downwards as given in relation (31*):

$$[B_0 + b_1 - f(M_0 + m_1)]\, F(M_0 + m_0) \text{ has to be } > [B_0 + b_0 - f(M_0 + m_0)]\, F(M_0 + m_1)$$

Calling the two sides of this relation X and Y, respectively, so that $X > Y$, we can replace X by a term $X_1 < X$ and the new relation $X_1 > Y$ will still be a condition for an improvement of the rate of return by price splitting downwards because, if even the smaller value X_1 is greater than Y, the larger value X will all the more be greater than Y. We can thus say that any change in relation (31*) which reduces the left side relatively to the right side will leave the changed relation (31*) a condition for the improvement of the rate of return. But it will no longer be a *necessary* condition after that change because there will be cases where, although the substitute relation $X_1 > Y$ does not hold true, still the real criterion $X > Y$ will be fulfilled. On the other hand, we are never justified in *increasing* the left side relatively to the right side.

Let us now after this introductory remark turn back to relation (24), which may be written in the following form:

$$f(M_0 + m_1) - f(m_1) \text{ is always} \leqq f(M_0 + m_0) - f(m_0) \ldots (33)$$

From fact No. 4 of Section 1 of this Insert we have further

$$F(M_0 + m_0) \text{ is always} < F(M_0 + m_1) \ldots\ldots\ldots\ldots (34)$$

because $m_0 < m_1$.

Multiplying the left and right sides of (33) and (34) with one another, respectively, we get

$$[f(M_0 + m_1) - f(m_1)]\, F(M_0 + m_0) \text{ is always} < [f(M_0 + m_0) - f(m_0)]\, F(M_0 + m_1) \quad \ldots\ldots (35)$$

Adding (35) and (31*) will increase the right side of (31*) more than the left side, and is therefore permissible, according to what has just been found out above. (31*) then changes into

$$[B_0 + b_1 - f(m_1)]\, F(M_0 + m_0) \text{ has to be } > [B_0 + b_0 - f(m_0)]\, F(M_0 + m_1) \quad \ldots\ldots\ldots\ldots (36)$$

Returning now to Fig. D of this Insert it can be shown[4]

$$\frac{A'A}{C'C} < \frac{B'B}{D'D} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (37)$$

Assume now the curve in Fig. D to represent not the $f(m)$ line but the $F(m)$ line, an assumption which is perfectly permissible since both curves have the same character. We can thus write (37) as

$$\frac{F(m_0)}{F(M_0 + m_0)} < \frac{F(m_1)}{F(M_0 + m_1)} \quad \ldots\ldots\ldots\ldots\ldots\ldots (38)$$

---

[4] The secant AB, produced to the left, intersects the axis of abscissae at the distance a to the left of the origin of coordinates and the secant CD intersects it at the distance c where $a \leqq c$. The slope of the secant AB will be called α and that of CD will be called γ. We have now (see Fig. D):

$$\frac{A'A}{C'C} = \frac{(a + m_0)\tan\alpha}{(c + M_0 + m_0)\tan\gamma} \text{ and } \frac{B'B}{D'D} = \frac{(a + m_1)\tan\alpha}{(c + M_0 + m_1)\tan\gamma}$$

For a comparison of the sizes of the two terms we can suppress the factor $\tan\alpha/\tan\gamma$ in each term and write the remaining part of $B'B/D'D$ in the form

$$\frac{(a + m_0) + (m_1 - m_0)}{(c + M_0 + m_0) + (m_1 - m_0)}$$

We see that this fraction which represents $B'B/D'D$ corresponds to the fraction that represents $A'A/C'C$ except that both numerator and denominator are enhanced by the same amount $(m_1 - m_0)$. If we add a constant amount to both numerator and denominator of a fraction the value of that fraction will approach closer to unity and since $\dfrac{a + m_0}{c + M_0 + m_0}$ is smaller than unity (because $a \leqq c$) the value of the fraction will increase, that means $B'B/D'D > A'A/C'C$.

It is now again permissible to multiply (36) by (38) because this will relatively reduce the left side of (36) and we get thus the requirement as

$[B_o+b_1-f(m_1)]\,F(m_o)$ has to be $>$ $[B_o+b_o-f(m_o)]F(m_1)$

or
$$\frac{B_o+b_1-f(m_1)}{F(m_1)} \text{ has to be } > \frac{B_o+b_o-f(m_o)}{F(m_o)} \quad \ldots (39)$$

or
$$\frac{B_o+n_{s1}}{F(m_1)} \text{ has to be } > \frac{B_o+n_{so}}{F(m_o)} \quad \ldots\ldots\ldots (40)$$

where n_{s1} and n_{so} are the segregate net incomes of group g for the prices p_1 and p_o, respectively.

These last two relations (39) and (40) are as close as we can get to basing a sufficient but not necessary condition on the segregate income and segregate capital of the group g. It is impossible to further simplify this relation by the elimination of B_o for the following reason. We have obviously
$$\frac{B_o}{F(m_1)} < \frac{B_o}{F(m_o)} \quad \ldots\ldots\ldots (41)$$

because $F(m_1) > F(m_o)$. If it were permissible to subtract (41) from (40) this would eliminate B_o but it would mean relatively increasing the left side of (40) with respect to the right side and that is just what is *not* permissible, as shown above.

We can therefore formulate as follows a sufficient but not necessary requirement for an increase of the rate of return by price splitting in group g: *The lowering of the price must increase a modification of the segregate rate of return of group g which is formed by adding the gross income of all other groups G to that of group g before the reduction of the segregate cost of group g and the division by the capital necessary for the group g.*

4. General Remarks.

39. Here again everything that has been said in Sections 18 and 19 of this Insert for the gross income can be proved for the group's rate of return of the increments and for the modification of the group's segregate rate of return, the former as necessary and sufficient requirement, the latter as sufficient requirement. This refers, for instance, to the maximum of the rate of return obtainable by price splitting downwards, etc., as per Section 31 of this Insert.

b. Shape of the Sales Curve.

40. We can get a clearer mental picture of the conditions under which a lowering of the price in group g can improve the rate of return from all groups if we apply to the rate of return (dividend) the graphical method which has been shown with reference to the net income in Sections 33-35 of this Insert. This is done in the following:

Call
$$\left.\begin{array}{l}\Delta m_o = m_1 - m_o \\ \Delta p_o = p_1 - p_o\end{array}\right\} \quad \ldots\ldots\ldots (42)$$

and
$$\left.\begin{array}{l}\Delta f(M_o+m_o) = f(M_o+m_1) - f(M_o+m_o) \\ \Delta F(M_o+m_o) = F(M_o+m_1) - F(M_o+m_o)\end{array}\right\} \quad \ldots (43)$$

Substituting this in relation (31), which is the condition for an increase of the rate of return by price splitting downwards in group g, we get

$[M_op_o + (m_o+\Delta m_o)(p_o+\Delta p_o) - f(M_o+m_o) - \Delta f(M_o+m_o)]\,[F(M_o+m_o)] - [(M_o+m_o)p_o - f(M_o+m_o)]\,[F(M_o+m_o)+\Delta F(M_o+m_o)] > 0$

or after proper reduction

$[m_o\Delta p_o + p_o\Delta m_o + \Delta m_o\Delta p_o - \Delta f(M_o+m_o)]\,F(M_o+m_o)] > [(M_o+m_o)p_o - f(M_o+m_o)]\,[\Delta F(M_o+m_o)]$ ....(44)

We call now in analogy to equation (26) of this Insert
$$t = \frac{\Delta F(M_o+m_o)}{\Delta m_o} \quad \ldots\ldots\ldots (45)$$

$t = \tan \tau$ (see left part of Fig. A) represents the same value with respect to the capital-curve k as r does with respect to the cost-curve s. We get by substituting (26) and (45) into (44):

$[m_o\Delta p_o + (p_o+\Delta p_o - r)\,\Delta m_o]\,F(M_o+m_o) > [(M_o+m_o)p_o - f(M_o+m_o)]\;t\Delta m_o$

Divide both sides by $F(M_o+m_o)$ and substitute v_o from (29)

$m_o\Delta p_o + (p_o+\Delta p_o - r)\Delta m_o > v_ot\Delta m_o$

$(p_o+\Delta p_o - r - v_ot)\,\Delta m_o > m_o(-\Delta p_o)$

or
$$\frac{\Delta m_o}{m_o} > \frac{-\Delta p_o}{p_o+\Delta p_o - r - v_ot}$$

Adding the denominator to the numerator on both sides and substituting m_1 for $(m_o+\Delta m_o)$ and p_1 for $(p_o+\Delta p_o)$ from (42) we get
$$\frac{m_1}{m_o} > \frac{p_o-(r+v_ot)}{p_1-(r+v_ot)}$$
$$m_1[p_1-(r+v_ot)] > m_o[p_o-(r+v_ot)] \quad \ldots\ldots (46)$$

This formula is entirely analogous to (27) of this Insert except that, instead of deducting the unit increment cost r of the service from the price, we have to deduct the sum of the unit increment cost plus the interest v_ot on the unit increment capital t, the interest being computed at the same rate of return v_o at which the original capital has been bearing interest before the price reduction.

41. Everything that has been said in Sections 33 to 35 of this Insert regarding the effect of price splitting downwards on the net income applies also to the rate of return, except that the distance of the vertical asymptote from the axis of ordinates (Fig. E) is not r (increment cost) but $r + v_ot$ (increment cost plus interest on the increment capital). This makes the condition for an increase of the rate of return stricter than that for the net income (compare Section 34 of this Insert).

4. Resumé.

42. A resumé in non-mathematical terms of those of the above laws which are concerned with the advantageousness of price splitting downwards is contained in Sections 81 to 86 of the main text. This resumé brings out a few points of view not touched upon in this Insert.

(*To be continued.*)

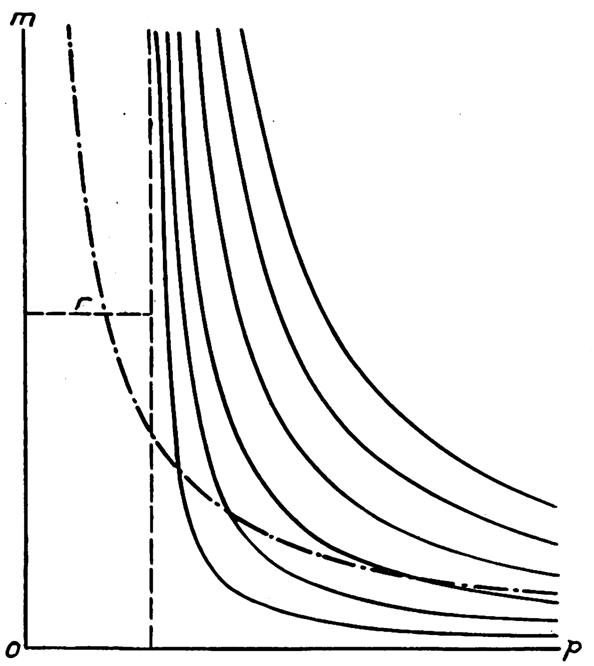

Fig. E.

SUMMER COURSE COMPLETED BY ENGINEERING TEACHERS.

Eleven college professors, representing institutions from Brooklyn to Tokyo, recently concluded the annual course for engineering teachers at the East Pittsburgh works of the Westinghouse Electric & Manufacturing Co. The course was of a month's duration and composed inspection trips throughout the plant, observation of work, and lectures by the various experts of the company. A feature introduced at the lectures was the use of motion pictures to portray the important work of electricity in modern andlarge-scale-engineering projects of many kinds.

The professors who were in attendance at the summer course are: M. P. Cleghorn, Iowa State College; W. D. Emerson, University of Maine; R. S Howell, Georgia Institute of Technology; L. J. Hodgins, Maryland State College; J. E. Lear, University of North Carolina; B. K. Northrop, Cornell University; S. Noda, Imperial University of Japan; C. W. Piper, Purdue University; J. W. Shuster, University of Wisconsin; A. F. Puchstein, Ohio State University, and E. B. Wood, Pratt Institute.

Details of Proposed 220-Kilovolt Transmission Line for California

Conditions to Be Met — Salient Features of 220-Kv. Line to Transmit 1,500,000 Kw. 1100 Miles — Paper Read Before A.I.E.E. Convention

By R. W. SORENSON, H. H. COX and G. E. ARMSTRONG

FUELS, particularly oil, must soon be used for isolated power only in places where electric power is not available, as in the propelling of air and ocean craft. In large power systems, especially in the West, the use must be limited to standby service, for peak loads, low water periods, and other emergencies.

Power Resources.

California has available ample hydroelectric power to supply the industrial and agricultural demand for many years.

Small developments aggregating 325,000 kw. have been completed and many others of this type are available. There are also four large projects as indicated in Table I which can be readily developed to a capacity of 1,500,000 kw. in the near future.

TABLE I—LARGE POWER RESOURCES.

	New developed and under construction. Kw.	Proposed developments 1926. Kw.	Reasonable future development (not ultimate capacity). Kw.
Pit River	None	200,000	500,000
Feather River	100,000	200,000	300,000
Big Creek	100,000	300,000	500,000
Colorado River	None	None	200,000
Total	200,000	700,000	1,500,000

Total 1926 hydroelectric power development including small projects, 1,025,000 kw.

The data for the tables given here of resources and loads, of the northern part of the state, is taken from the various reports which have been published, and no attempt has been made to verify them.

Load Demand.

The best available information indicates a demand in 1926 approximately as shown in Table II.

TABLE II.

		Kw.
1.	Sacramento Valley, northern portion	70,000
2.	Truckee River electrification	40,000
3.	Sacramento Valley, southern portion	125,000
4.	San Francisco Bay district	250,000
5.	Fresno district	90,000
6.	Bakersfield district, including Tehachapi electrification	125,000
7.	Los Angeles district	300,000
8.	Barstow and Needles district, including railroad electrification	40,000
	Making a total of	1,040,000

In order to carry this load, approximately 500,000 kw. additional in hydroelectric capacity will be required.

A demand for power such as is shown in Table II can be supplied most economically by power developed in large units. Large power units require transmission lines of the highest possible economic voltage.

It has been shown by Silver, June A. I. E. E. Proceedings, that for long transmission 220,000 volts is economical under conditions which require a much more expensive construction than has proven adequate for the 150,000-volt lines of the Southern California Edison Co.

California Transmission Bus.

On this basis a plan as shown on the map of Fig. 1 is proposed. In this plan the interconnection of all the California power companies has been assumed as an economic necessity for its best utilization. Interconnections of limited capacity are not entirely satisfactory because they fail just at the time they are needed most to transfer from one system to another large blocks of power.

The plan of the proposed scheme involves the construction of a two-circuit transmission system extending from Pit River to Los Angeles, a distance of 570 miles. Branch lines of like voltage connect the three other power projects and the San Francisco load center to this main line on which the other load centers are located. The main line thus becomes a high-tension bus extending nearly the entire length of the state, hence its name: California transmission bus.

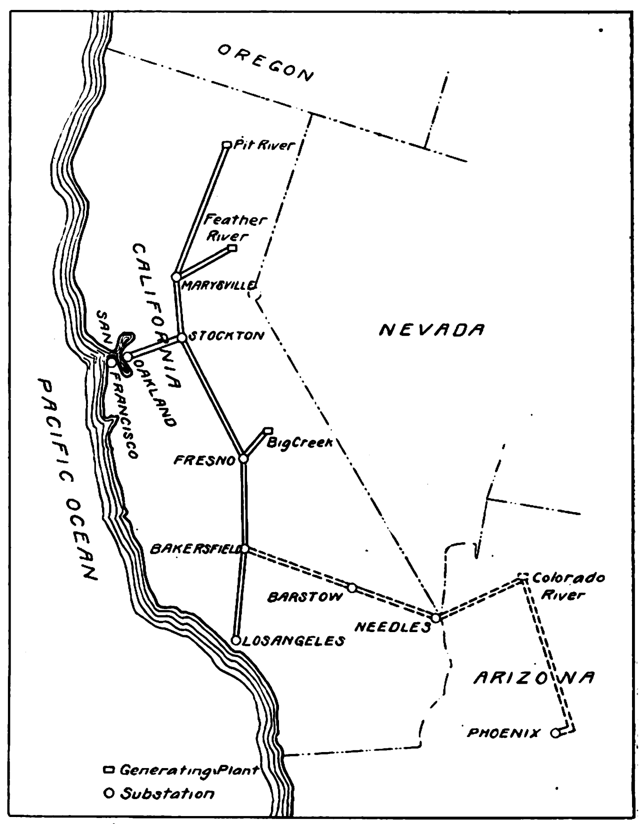

Fig. 1.—California 1100-Mile 220-Kv. Transmission Bus.

This arrangement makes possible unlimited interconnection and exchange between all the power companies of the state.

Substations have been located at Marysville, Stockton, San Francisco, Fresno, Bakersfield and Los

Angeles. These points are natural load centers and suitable points for connecting with the present power systems. On the Colorado River branch, the construction of which is dependent upon the electrification of the transcontinental railroads, substations would probably be located at Barstow and Needles. The substations divide the lines into sections of suitable length for practical operation, the longest section being 150 miles, as shown in Table III.

TABLE III.

	Miles.
Pit River to Marysville	150
Feather River to Marysville	60
Marysville to Stockton	90
Stockton to San Francisco	60
Stockton to Fresno	130
Big Creek to Fresno	40
Fresno to Bakersfield	100
Bakersfield to Los Angeles	100
Bakersfield to Barstow	110
Barstow to Needles	150
Needles to Colorado River	100
Colorado River to Phoenix	100
Pit River to San Francisco	300
Big Creek to Los Angeles	240
Big Creek to San Francisco	230

The Transmission Line.

The standard frequency, 60 cycles, has been assumed on the basis that the Southern California power systems operating at 50 cycles will ultimately find it advantageous to conform to the A. I. E. E. standard. In the natural growth of the load as shown in Table II, 70% of the 1926 load will be supplied by the 60-cycle systems. Interconnection of such large load centers or power sources through frequency changers, limits the exchange of power, is uneconomical, and increases tremendously the required operating vigilance.

The practicability of the high-voltage line has been well demonstrated by over five years of remarkably successful operation of the 150,000-volt lines of the Southern California Edison Co., which, during this period, have delivered from the Big Creek power houses over the 240-mile lines to the Los Angeles distribution systems, 1,200,000,000 kw-hr. at an average efficiency of 87.5% with a 45% load-factor. During this period there have been no interruptions for which the high voltage is responsible, and on the contrary, the system has been free from disturbance and interruption to a greater degree than the lower voltage lines in the same locality.

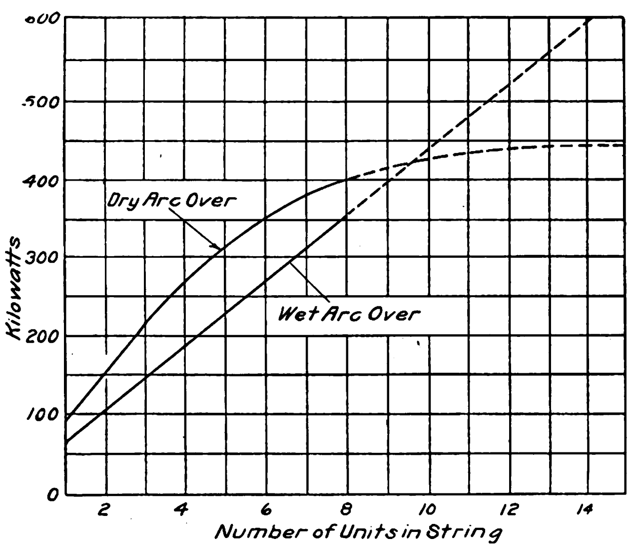

Fig. 2—Typical 60-Cycle Arc-Over Characteristics of Suspension Insulators.

The present Big Creek lines can be operated at 220,000 volts, 60 cycles, without material change, and this is proposed as a link of the transmission bus, and its operation under these conditions will be analyzed and applied to conditions of the proposed system.

Analysis of Big Creek System.

Corona.—As now operated at 150,000 volts and 50 cycles, the voltage is only 80% of the lowest critical voltage of any part of the line and there is no corona loss. At 220,000 volts, 60 cycles, corona loss occurs to some extent on the entire line but amounts to but 0.4% of the line capacity during fair weather. With storm conditions over the entire line, and with an assumed reduction of 20% in the critical voltage, the corona loss would be 8% of the line capacity. This loss is not sufficient to make the line inoperative and would occur too rarely to be an economic factor.

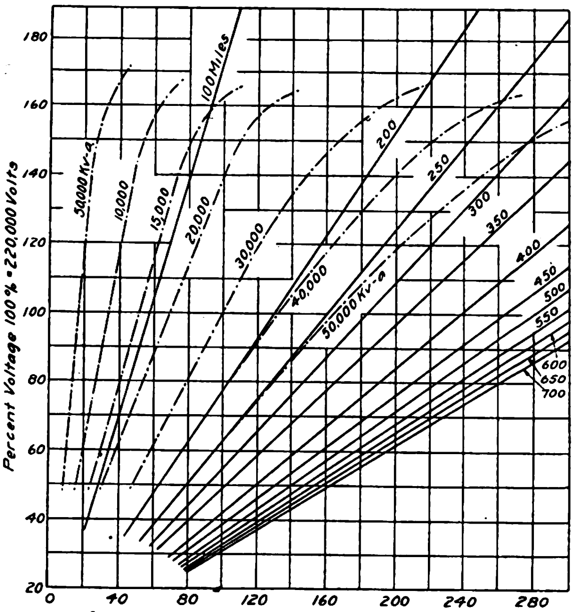

Fig. 3.—Generator and Line Characteristics: 60 Cycles, 220,000 Volts, Generators With Short Circuit Ratio 1.0.

Insulation.—The Big Creek 150,000-volt lines have nine units in each suspension string and two 11-unit strings in parallel on dead ends. During the five and one-half years of operation only two insulator string failures have occurred. Both of these were during normal conditions of operation without any apparent cause, other than that of being in a location where the insulators have been found to have a relatively high rate of deterioration.

The Big Creek line towers allow sufficient clearance to permit the lengthening of the nine unit suspension strings to eleven units, and to any desired number of units at dead ends. Table IV shows safety factors for insulator strings, wet and dry.

TABLE IV.

Safety Factors for Insulator Strings.

	Wet arc-over 9-unit string.	Wet arc-over 11-unit string.	Dry arc-over 9-unit string.	Dry arc-over 11-unit string.
(87 kv. to ground) 150 kv	4.3		4.8	
(127 kv. to ground) 220 kv		3.7	3.3	3.4

The Big Creek line operated at 220,000 volts is at the critical corona voltage and any disturbances resulting in a higher voltage will quickly expend their energy in producing corona loss, which will permit a smaller safety factor to be used.

Fig. 2, curves showing arc-over voltage as reproduced from Mr. Silver's paper, "Problems of 220-kv. Power Transmission," show no practical gain in dry arc-over voltage for strings of more than ten units and with these facts in view, it is proposed that for operating the Big Creek line at 220,000 volts, suspension strings have 11 units and dead end strings 12 units in series. Insulator testing crews have several times reported four and five defective units in a nine-unit suspension string, without any indication of trouble. The only apparent value of a longer string than that proposed would be a decreased probability of sufficient defective units in a string to cause breakdown. Developments of methods of grading insulator units and shielding insulator strings will, in all probability, materially change curves of Fig. 2.

Present-day methods of insulator testing and maintenance would probably have prevented the two failures which have occurred on the Big Creek lines as previously mentioned. These methods applied to the lines operating at 220,000 volts, and the use of the better types of insulators now available, will insure successful operation.

Charging Current.—Long high-voltage lines can not be operated without synchronous condensers at the receiving station to regulate the voltage, and as a consequence the charging current, even at the standard 60-cycle frequency, becomes a factor of no great importance as long as these synchronous condensers are connected to the line.

Without these condensers the line charging current must be furnished entirely by the generators, in which case the generators may become greatly overloaded and at the same time produce a very high voltage over which the operator has no control. To avoid this emergency a transmission line with its generators, transformers and synchronous condenser must be considered as a unit and as such should be securely coupled together electrically at all times. This has been proven practical in the case of the Big Creek system in which it is possible to start the 15,000-kv-a. condensers and bring them up to speed with the generators.

Line Capacity.—The Big Creek lines as operated at 150,000 volts with 30,000-kv-a. condenser capacity per line at the receiver end are each good for 57,500 kw. at 85% power factor, and will have under these conditions a line drop of 11%.

Operated at 220,000 volts, these lines should each have a capacity of 125,000 kw. with an equal line drop when provided with the proper condenser capacity, which is approximately 75% of the line capacity in kilowatts.

This is a fair indication of the conditions which will exist in the proposed system, the load centers of which are so distributed as to limit the actual average distance of transmission to about 200 miles. The economic gain in doubling the capacity of lines which cost approximately $6,000,000, the present cost of which would be at least 30% more, would more than offset the cost of all necessary changes, including the adoption of the standard frequency.

Mechanical.—The type of construction used on the Big Creek line has proven entirely adequate for California conditions. There have been only three mechanical failures, all of which occurred shortly after the line went into service and were all due to defective line hardware. In one case the failure was due to faulty design. This fault was entirely corrected by re-designing the cable clamp so as to grip the steel core independently of the aluminum conductor. The other two were due to individual defects in parts. There have been no tower failures and no tower maintenance whatever has been required. Approximately 20% of the Big Creek line is subject to ice and snow conditions, parts of it reaching altitudes of 5000 ft. Similar conditions exist over practically the entire proposed 220,000-volt system.

Operation.—The most interesting feature of the operation of the Big Creek system is its reliability, which has been equal to that of steam plants of similar capacity located near load centers. Flashovers have caused only momentary interruptions and have in no case resulted in damage such as to prevent immediate resumption of service. During the greater part of the time the power has been carried over a single line for a large part of the distance.

The operating history of the Big Creek system discloses no evidence of any trouble due to the high voltage of the system, and in addition has demonstrated that higher voltages may be used with equal or greater reliability. The Big Creek 17,500-kv-a. generators have operated at 60 cycles satisfactorily and delivered full output at this frequency.

High tension line switching and synchronizing has been carried on consistently throughout the operation of the Big Creek system without trouble and should be possible on the 220,000-volt system. During times of switching slight discharges, never followed by any energy current, occur on the arresters. Operating at corona voltage rather than at 80% of the critical

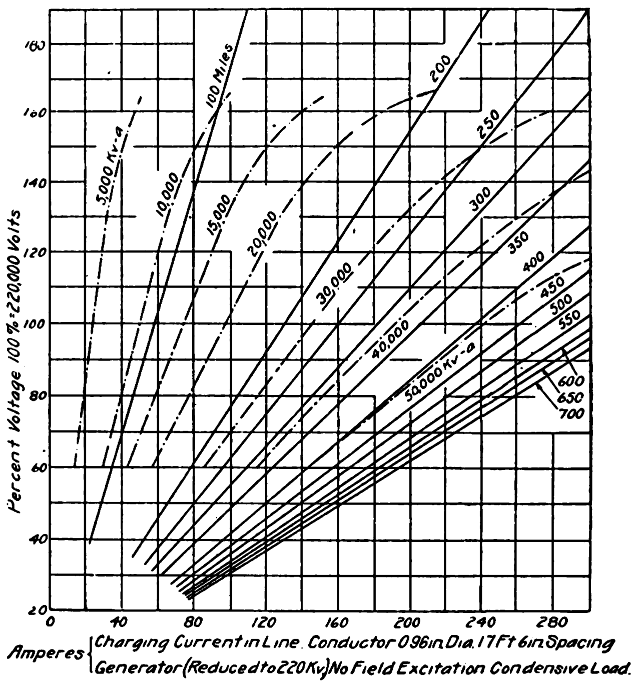

Fig. 4.—Generator and Line Characteristics: 60-Cycles, 220,000 Volts, Generators With Short Circuit Ratio 1.5.

voltage, it may be possible to absorb these disturbances without arresters.

Complete parallel operation of all lines must be adhered to in the proposed system. Satisfactory protective relay systems for dropping defective sections with little disturbance have been developed for present parallel transmission lines and there appear to be no obstacles to extending these to the higher voltages.

Generators.—Curves of Figs. 3 and 4 show generator and line characteristics for 60-cycle, 220,000-volt systems. The full lines are the charging currents in amperes for different lengths of line plotted against per cent normal voltage. The broken lines are generator characteristics of various sizes of generators when connected to condensive loads with no field excitation. The point of intersection of the generator curves with the line charging current curve for any particular length of line determines the voltage to which the generator will build up when connected to that length of line with no field excitation. Fig. 3 is for generators with a short circuit ratio of 1.0 while Fig. 4 is for those with a ratio of 1.5.

Fig. 3 shows that with 50,000 kv-a. of generating capacity connected to a line of 250 miles, the line can be charged without losing control of the voltage with generators of this design. By having synchronous condensers connected to the line at the receiving station generators of this capacity will bring up any length of line necessary to the successful operation of the proposed system. Those curves show that generators for such a system should be designed with the highest short circuit ratio that other conditions will permit, in order to reduce to a minimum the tendency to become self-exciting.

COMPARATIVE DATA.

	Big Creek lines at 150-kv.	220-kv. lines as proposed by Silver
Aluminum steel cable:		
Diameter, ins.	0.95	1.036
Circular mils	683.000	808,900
Weight per ft., lbs	0.75	0.94
Length of average span, ft	750	800
Weight of towers without footings, lbs.:		
Suspension	4,300	9,000 to 14,000
Anchor	6,450	24,000
Stringing tension at 80° F., lbs.:		
No ice allowance	4,740	
Ice allowance	3,130	
Maximum tension allowed, lbs	8,500	17,300
Insulator strings to carry load:

Immediate Action Needed.

Such a system as proposed is needed immediately; all engineering fundamentals essential to a solution of its problems are well understood, and the Big Creek system can be used as a part of the project without material reconstruction.

To supply this need, arrangements should be made without delay for a complete working out of all details of the proposed system, as otherwise in the future it may be necessary to do a large amount of reconstruction to bring together individually designed systems, which is never a wholly satisfactory procedure.

AMERICAN SOCIETY FOR TESTING MATERIALS CHANGES HEADQUARTERS.

Moves Its Offices from University of Pennsylvania to the Engineers' Club of Philadelphia.

Announcement is made by the Executive Committee of the American Society for Testing Materials that the headquarters have been changed from the University of Pennsylvania to the Engineers' Club of Philadelphia, 1315-17 Spruce street. The headquarters of the society will be on the third floor where extensive alterations are now being made. Pending the completion of the alterations, the society will occupy temporarily the first floor of the building, beginning Sept. 13.

The change of headquarters of the society, which has been located at the University of Pennsylvania since its inception in 1902, is made necessary by its growing activities and membership. In continuing the office at Philadelphia the Executive Committee has not acted hastily, but have taken time to compare the advantages of the Philadelphia location with those that would exist in other parts of the country. The city of Philadelphia presented so many advantages that the Executive Committee decided upon that place as the most satisfactory location.

The new headquarters of the society are centrally located and convenient to the principal hotels and railway stations. The Engineers' Club is affiliated with the Philadelphia section of many of the national engineering and technical societies, and is the center of engineering activities in Philadelphia. An auditorum on the second floor of the bulding, with a seating capacity of 125, and a committee room in the society's headquarters will offer very satisfactory facilities for meetings of the committees of the society. Out of town members may use the society's headquarters as their mailing address while in Philadelphia, and facilities will be provided in the society's rooms for correspondence.

WASHINGTON COAST UTILITIES TAKE OVER PORT ANGELES PLANT.

The Washington Coast Utilities, Seattle, has taken over the active management of the hydroelectric plant and transmission lines of the Northwestern Power & Mfg. Co. of Port Angeles, Wash. The property comprises two 3000-kw. generators on the Elwha river, operating under a 100-ft. head, and 110 miles of transmission lines, carrying energy at 66,000 volts. Where this line crosses Hood's Canal, to Port Gamble, a new submarine cable 9000 ft. long is being laid, whereby the company's carrying capacity will be doubled. Transformers of 3000-kv-a. capacity are being installed on each side of the canal by which the voltage is to be stepped down to 15,000 for submarine transmission, and then stepped up to the regular line voltage. This cable is composed of three No. 4 and No. 2 copper conductors, insulated by 11/32-in. of 30% para rubber, and it is then jute covered and armored. The cable weighs 8 lbs. to the lineal foot.

F. D. Nims, who has the management of Washington Coast Utilities, states that power produced here is wholesaled to Port Angeles, Port Townsend, the Coast Defense forts, to Bremerton and the Navy Yard.

FIXTURE MANUFACTURERS WILL MEET IN DETROIT IN FEBRUARY.

The next convention of the National Council of Lighting Fixture Manufacturers will be held in Detroit, February, 1920. This was decided upon at the mid-summer convention held in Cleveland, Ohio, Aug. 5 and 6. Other important work done by the convention was the appointment of a committee for the registration of new designs and of another to perfect a uniform cost accounting system for the members of the council.

All the principal concerns in the country were represented at the convention. The first day's session was held in the club rooms of the Electric League, in the Statler Hotel, and the second day's meeting was at Nela Park, where all those in attendance were guests of the National Lamp Works.

Equipment for Handling Coal and Ashes in Power Plants—

Influence of Methods Upon Plant Operation—Classification of Mechanical Methods of Handling Coal and Ashes—Power Calculations

By ROBERT JUNE

Mechanical Engineer.

"WHAT do you consider the most important advantage of your mechanical coal handling equipment?" I asked the superintendent of a large manufacturing plant the other day.

His answer, given without a moment's hesitation, was, "Elimination of the large and uncertain labor element. We have twenty 500-hp. boilers, and at two seasons of the year we require every pound of steam we can get from those boilers, day and night for weeks at a time. Before we put in our automatic coal handling system we were at the mercy of the coal handlers and passers.

"Time and again the operations of our entire plant were embarrassed and the work in some departments even brought to a dead stop, by the lack of a full boiler-room crew. We always paid good wages, but the physical conditions under which the men had to work were not good, and on a number of occasions I have been called up at my home late at night, and had to dress and start out in my car on a search for laborers. This was no joke at any time, but when it happened on a cold rainy night, or with a blizzard for accompaniment, you can imagine the difficulties in getting men to leave their warm beds for any money or other considerations I might offer. On more than one occasion, when I arrived at the plant with my hastily gathered crew, they took one look at our coal piles drowned in rivers of rain and sleet, or else frozen solid with a forty mile gale whisking about them and the thermometer down around zero, and refused point-blank to touch a tool.

"Automatic coal handling has changed all that. Because of the assurance of continuity of operation, the mechanical system we now have in is worth several times what it cost us. We would employ it, if it cost us twice as much per ton delivered to the boilers as hand labor."

That is one point of view. Another man, manager of a good sized plant, said, "We installed mechanical coal handling because we were able to lay out a system which gave us three times as much storage capacity as we formerly had, and we felt it essential to insure an adequate supply of coal at all times."

A third point of view, typical of many, was expressed by a large operator. "We wanted to reduce handling costs as much as possible, and therefore substituted mechanical means for manual handling. Need I tell you that the savings effected have been very large, particularly during the past two years."

As a rule, one good reason is all a man wants as explanation for an action, hence the failure of the gentlemen quoted to mention the advantage which appealed to the others. Upon further questioning, however, each mentioned the additional points as supplementary benefits which they enjoyed.

There does not seem to be any doubt that nineteen plant managers out of twenty, who have installed mechanical handling are thoroughly satisfied that they made a move in the right direction. Some of them, it is true, would make radical changes in their equipment and layout if they had the work to do over. The point is that they *would* do it over again. Dissatisfaction, where it exists, is with the application of the system, not with the principle.

As Reginald Trautschold sums up the situation: "The coal scarcity has made adequate coal reserve of the utmost importance to every manufacturer and its high cost necessitates that the fuel be handled at the

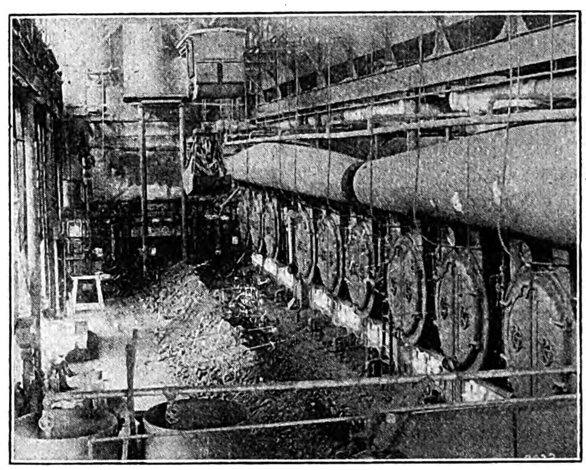

Fig. 1.—Grab Bucket Hoist Shown Inside Power House and Placed Where Coal Is Discharged for Firing Boilers.

plant as economically as possible. This condition has tended to make more general the mechanical handling of coal, for any plant, large or small, cannot now afford to pay the price of manual handling. The attention thus focused on the question of coal handling has resulted in radical changes in the methods employed to store the coal supply and to feed it to the boilers. So effective have been these changes that it would be little, if no exaggeration, to claim that today, a boiler plant for a large manufacturing power plant, exclusive of its steaming equipment, could be erected and furnished with adequate coal storage facilities and equipped with a complete system of conveyor mechanisms for handling coal from the point of receipt at the yards to the furnace grates, for less money than the most efficient layout of ante-bellum days. This, too, in spite of today's high cost of equipment, materials and labor."

Call in an Expert.

Having made out such a strong case in favor of the general handling of coal and ashes by mechanical means, a word of caution is here necessary. When you come to consider the proposition as applied to your own plant, get the advice of a consulting engineer or engineering firm specializing in power plant design.

I do not mean to be little the advice and suggestions of your own works construction engineer, or the engineering departments of the various conveyor manufacturers, or of the engineers and architects who handle your general building construction.

These men are all apt to have mighty good ideas, and they should by all means be consulted. But, as they are all general practitioners, whereas you need a specialist, the law of averages is decidedly against your getting as good results from their plans, as from those of a man who makes power plant design his chief business.

Various Methods Employed.

The delivery of coal to the boilers and the removal of ash are usually the largest items of boiler-room expense. The best method of handling coal and ash in any given plant is that which will do the work at the lowest final cost. I use the term "final cost" because insurance of continuity of operations and adequate coal storage are factors which do not appear in a cost-per-ton comparison of methods, but which may have considerable bearing on what may be termed "earning power" of the power plant. (That is, it may be cheaper in the end to install a particular type of handling system, which will cost more per ton to operate, but will insure avoidance of monetary losses caused by shut-downs, due to lack of coal or labor difficulties.)

That the problem of proper selection of method is not easy is indicated by the almost numberless combinations of means and devices to be found in American plants. The principal factors which influence the choice of system are size and location of plant and cost of fuel and labor. The various systems in use may be tabulated as follows:

1. Hand shovelling, without or with wheelbarrow or car.
2. Conveyors
   (a) Screw or spiral.
   (b) Flight or scraper.
   (c) Apron and buckets.
   (d) Overlapping dump buckets.
   (e) Continuous belt.
3. Hoists
   (a) Hoist and hand car.
   (b) Hoist and automatic cable car.
   (c) Hoist and trolley telpherage.
4. Cranes
   (a) Railroad with clam shell-bucket.
   (b) Transfer with clam shell-bucket.
5. Vacuum System.
6. Combinations of above. (So-called "silo" system, etc.)

Hand Shovelling.

What are the practical limits of economical hand shovelling? No general answer can be given to this question. Its solution depends upon individual circumstances. It is not necessarily a factor of the number of boilers to be served—for instance, the Burroughs Adding Machine Co., Detroit, finds it economical to employ mechanical coal handling for three boilers, whereas the Mulkey Salt Co., of the same city, serves eight large boilers in a thoroughly efficient manner by hand work. The consideration governing the choice of means in each of these cases was point and manner of delivery, and this is the principal factor to consider.

If coal is dumped from cars or dealers' delivery wagons into bins or on platforms directly in front of the boilers, it is certain that no cheaper means can be devised for hand-fired furnaces. In such instances, one man may handle the coal and ashes and attend to the water level of 200 hp. With hand shaking and dumping grates one man may take care of 300 hp.

In cases where coal cannot be stored in front of the boilers, but must be hauled by wheelbarrow, cart or hand lorry, the practical economic limit of haul is usually 100 ft. and the economic quantity limit 20 tons per day. While this is generally true, it is not a hard and fast rule. Thus Professor Gebhart states: "Hand-fired furnaces and manual handling of coal and ashes are usually associated with small plants of 500 hp. and under, but a number of large stations are operated in this way with apparent economy. A notable example is the steam power plant of the Wood Worsted Mill, Lawrence, Mass., in which 40 return tubular boilers are fired by hand. A tipcart with a capacity of one ton brings the coal a distance of 100 ft. to 200 ft. to the firing floor, and firemen shovel it onto the grate. Four men are stationed at the coal pile. One man drives two carts (one of which is being filled while the other is gone with its load), sixteen firemen attend to the furnaces, and two men dispose of the ashes.

A good man is capable of shovelling 40 to 50 tons of coal in eight hours when unloading a car, provided it is only necessary to shovel the coal overboard. An average figure for handling coal by barrow and shovel is not far from 2.5 to 3 ct. per ton per yard, up to 5 yd. Above 5 yd. about 0.2 ct. per ton should be added for each additional yard.

Obviously, the first step in any consideration of the installation of mechanical coal handling in a manually served plant is an accurate knowledge of the methods, results, and costs of the hand work which may be displaced. Study your conditions and costs thoroughly. Perhaps you can make comparatively inexpensive changes in your present methods, which will so improve matters that a mechanical installation will seem inadvisable. If no improvement in methods in use, which can be suggested, appears to meet the situation adequately, the time for an intensive study of mechanical systems is at hand.

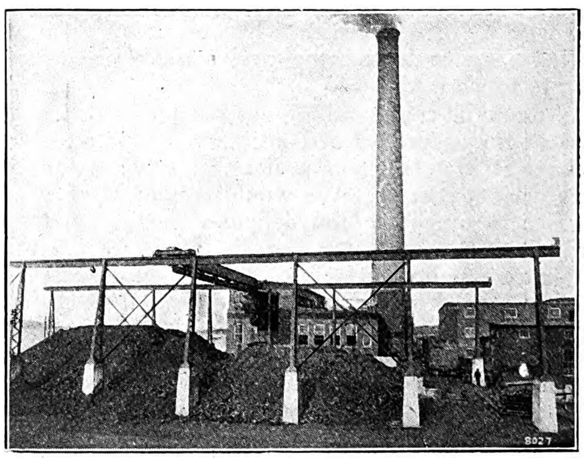

Fig. 2.—View of Installation Showing Transfer Crane Equipped with Grab Bucket Hoist. This Plan Provides for Future Extension.

Conveyors.

Conveyors, like airplanes, are classified as "tractors" or "pushers," depending upon whether they pull or push the load. A third class are genuine "carriers" since the moving parts bear the weight of the load. Of these general classes the "carriers" are usually more economical of operation and maintenance. Before deciding, however, the characteristics of the various types should be examined.

Screw Conveyors: These are of the "pusher" type, the apparatus consisting of a hollow shaft, attached to which is a continuous spiral of sheet metal.

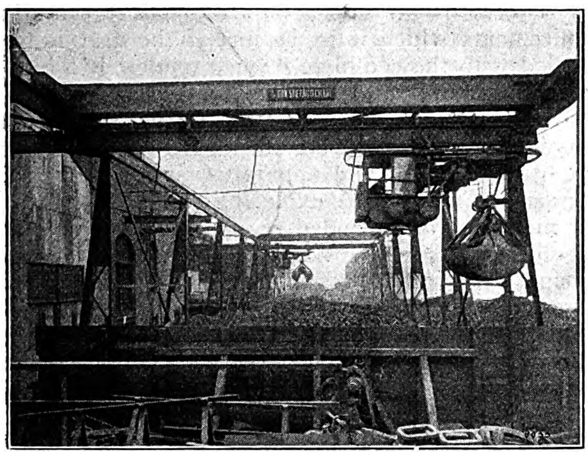

Fig. 3.—Shepard Transfer Cranes Equipped with Grab Bucket Hoists Over Coal Storage Pile. Coal Shown in Background in Barges and Transferred to Storage.

This shaft is revolved by means of a motor in a trough of slightly larger diameter than the spiral, with the result that as the operation proceeds, material placed in the trough is worked forward.

Screw conveyors may be used up to 100 ft., and in sections of limited length up to an angle of 15°. Speeds, capacities, and horsepower requirements are approximately as follows:

TABLE I.

SCREW CONVEYORS—HORIZONTAL RUNS.

Diameter of screw in in.	Highest r. p.m.	Capacity tons fine coal per hr.	Hp. required for each 10 ft. of length (coal).	Capacity cu. ft. ashes per hr.	Hp. required for each 10 ft. of length (ashes)
6	115	6	.5	125	.5
7	110	8	.6	175	.5
8	105	14	1.0	350	.5
9	100	17	1.2	425	.6
10	95	22	1.6	575	.8
12	90	35	2.5	950	1.3
14	85	48	3.5	1,200	1.8
16	80	80	5.6	2,000	2.8
18	75	110	7.7	2,700	3.8

Advantages of this type are low first cost, adaptability, and small space required for installation, but these may be offset by high cost of maintenance, due to rapid and excessive wear and tear, by losses caused by breakdowns at important periods, and by the high cost of power to operate.

Flight or Scraper Conveyors: These are of three types, plain, suspended flight, and roller flight. The trough is of any section, but is usually built with greater width than height. Flights which conform to the shape of the trough are attached to single or double strands of chains. Material is usually discharged through gates in the bottom of the trough.

The design of the plain scraper provides for the suspension of the flights from the chain, which drags them along the trough, pushing the load ahead. Crossbars, having wearing shoes at each end are provided with the suspended flight conveyor. The arrangement is such that the flights do not touch the trough at any time. Differing slightly from the suspended type, the roller flight substitutes rollers for the wearing shoes.

As between the three types of flight conveyors, service and maintenance considered, there is not a great deal to choose. The general layout of the plant will usually suggest the type to be employed. In this connection, we will illustrate one or two typical installations of flight and scraper conveyors in the continuation of this article next month.

The power required to operate flight conveyors may be closely approximated by the following empirical equation[1]:

$$Hp = \frac{AWLS}{1000} + \frac{BLT}{1000} + X$$

in which

Hp = the horsepower required at the conveyor drive shaft.
AB = constants as in Table II.
W = weight of conveyor per ft. of run, lb.
L = distance between centers of head and tail sprockets, ft.
S = speed of conveyor, ft. per min.
T = capacity of conveyor, tons (2000), per hr.
X = 1 for conveyors up to 100 ft. centers and 2 for longer conveyors.

If the conveyor is composed of portions on different inclines compute the power for each section separately and add 10% for each change in direction.

As a general proposition flight conveyors are low priced and offer an economical and efficient means of handling coal and ashes in small plants.

Next month we will discuss other types of conveying apparatus.

[1]C. K. Baldwin. The Robins Conveying Belt Co. quoted by Prof. Gebhart.

(To be continued.)

TABLE II.

HOUSING AND ELECTRICITY SUPPLY IN GREAT BRITAIN.

Organization and Useful Work of the British Electrical Development Association—Electric Service for Workmen's Dwellings.

By Our British Correspondent.

We have in preceding issues stated briefly the main purposes for which British electrical interests have set up the Electrical Development Association (Great Britain and Ireland). The director and secretary, J. W. Beauchamp, is now getting down seriously to tackling the big tasks which everybody recognizes lie before him and his committee if the nature and extent of operations are to be appropriate to the peculiar need and exceptional opportunity of the times or in proportion to the present dimensions and the potential greatness of the electrical industry.

The association only came into existence this year and the first task has been to incorporate itself in formal manner and to set about deriving regular revenue from the individual firms and supply authorities. A good deal of useful literature has already been prepared, however, and some of this is now circulating for the purpose of assisting in assuring for electricity a proper place in connection with schemes of national reconstruction. In the following notes, through the courtesy of Mr. Beauchamp, the writer is enabled to indicate in sufficient detail the constitution, aspirations, intentions and some of the performances down to date.

So far as the constitution of the Association Committee is concerned there is no room for question as to representative character. This being so, it might be supposed that there would be no doubt concerning the amplitude of the funds at its disposal, but that is still dependent on a number of unsettled circumstances and if the thing is to be well done, as American readers have full reason for knowing, most generous allocations are essential. The association has been formed "on a co-operative basis to carry out publicity and propaganda work on behalf of the electrical industry, and its committee of management is representatives of the three sections—supply, manufacturing and contracting—which jointly provide the service of electricity to the consumer." These three sections are not equally wealthy, of course, nor have they all the same freedom of action in the disposal of funds for purposes of this kind. What the organized manufacturers may be prepared to do may depend to some extent upon whether other sections standing to gain from publicity and efficient propaganda make reasonably generous contributions. Liberal and prompt financial assistance will enable the organization to secure a recognized position as:

(1) A medium for directing attention to the developments of the industry, their meaning and potentialities for public service.

(2) A means of creating interest in electrical methods and a better public understanding of the relationship existing between the work of the several branches of the industry, and the services rendered by inventors, manufacturers and the public and private enterprises which have brought the public supply of electricity to its present position of importance.

(3) A recognized source of information for press, public and government departments upon those problems which relate more particularly to the uses of electricity, the interests of the consumer, the economic basis of charges and costs, and the influence of controls and restrictions.

(4) A link between the industrial interests concerned and the user of electricity, assisting that coordination of the work of the designer of apparatus and the experience of the supply authority which is essential to secure the benefits of mass production and to avoid waste of effort arising from independent work carried on without full knowledge of the needs and objects of all sections of the industry and the requirements which must be met if the user is to be satisfied with the complete service rendered to him by the manufacturer and supplier.

It is recognized by the committee that urgent questions lie before the industry in regard to reducing the cost of installation and apparatus, simplifying mains and service work, and exploring the possibilities of new methods and amended regulations. These essential objects will follow more rapidly from intensified demand for electricity supply than from any other cause, and money spent on cultivating new and additional business should react to the advantage of the industry and of the consumers, by stimulating the development of new methods and designs and assisting in standardization of apparatus and production in bulk which is needed to meet the increase in cost of all classes of electrical work.

"The prosperity of all branches of the electrical industry must ultimately depend upon the general recognition of electricity supply as a public utility of the first order." At no period in the history of British electrical industry have circumstances been more propitious for a general and organized effort to instill in the public mind a proper appreciation of the part which electricity can take in helping to solve the urgent problems of national reconstruction, which stated generally, consist in: (1) Improving personal health and efficiency. (2) Increasing effective output of all classes of workers whilst reducing personal effort and hours of work. (3) Economizing the natural assets or wealth of the country.

In the association the following are acting in "co-operative organization" for "promoting the public service of electricity supply": Institution of Electrical Engineers; electricity supply undertakings (publicly and privately owned); manufacturers of electrical machinery and appliances; contractors for installation and maintenance of electrical apparatus. It is unnecessary to detail the names of the various associating organizations and their representatives on either the general or executive committees.

The "E. D. A.", as the body is known, did what it could to assist in connection with electrical illumination arrangements for the peace celebrations but the time was so short that it had no real opportunity for showing of what it would have been capable if there had been many months in which to prepare as in the case of coronation celebrations, if there had been no war-time consequences restricting the available supplies of suitable materials, and if there had not existed the disturbing menace of labor unionism unwilling to co-operate.

Housing and Electric Service.

A direction in which the association may be able to render service of a serious national kind with lasting good both for the public and for the electrical industry is in connection with the vital question of housing. On July 17 this year there were issued "Preliminary Notes on Housing Schemes and Electricity Supply," particularly housing schemes for working class colonies and garden cities. These notes indicated the points of view from which the subject required to be explored: mains and services, internal wiring, fittings, uses of electricity other than wiring, tariffs, general. This was followed a week or two later by a larger pamphlet: "Housing Construction and Electricity Supply No. 1." It was appropriately illustrated and so written as to inform public authorities, officials, architects and contractors interested in building schemes, and it invited all of these who were interested in the application of electricity supply and electrical apparatus to get into communication with the E. D. A. at Hampden House, Kingsway, London, WC., the central offices.

This pamphlet may be quoted from with profit:

On any important building scheme the supply of electricity, as of water, should be made available before work is commenced.

Artificial light and mechanical power are thus provided for the work of laying out roads, constructing sewers and buildings, hoisting, pumping, sawing, crushing, mixing, and driving workshop machines on the site. Hand labor can be superseded as far as possible; plant situated and driven in positions most suitable for the work in view, and moved from time to time, with resulting economy in labor and haulage of material—all the advantages of a modern factory become available to the contractors without waste of fuel and labor and the noise and dirt inseparable from the employment of portable steam engines. A safe and flexible means of lighting is also provided from the same source, enabling work to be carried on efficiently underground or in dark weather.

Where electricity can be obtained from artificial lighting no other system is likely to be adopted and its influence upon design should be taken advantage of. With this illuminant some reduction may be made in the height of rooms, and consequently in the cost of construction; lamps may be fixed close to the ceilings and advantage taken of their reflecting character to reduce expenditure upon shades and fittings; lighting and extinguishing from any convenient point or several points can be effected, and the provision of small-power lamps over fireplaces, sinks, and in other positions where household work is carried on makes for convenience, helps to reduce accidents and breakages, and simplifies the task of the architect by providing him with a means of lighting which entails no special provision for ventilation—can be used in close proximity to ceilings and walls, is available in any power from a pilot light upwards, can be operated from a distance, does not introduce the use of matches, flame or the risk and dirt inseparable from any other illuminant.

Most of the advantages and conveniences conferred by the use of electricity arise from the ease with which it can be converted into light, heat, or power, without any combustion taking place on the consumer's premises or in his appliances. The whole process of deriving energy from fuel is carried out at the generating works under centralized and economical conditions, concentrating in one place the handlings and burning of coal or other fuel and the removal of its residues. The consumer obtains the results of these operations in the form of electricity which he can convert into light, heat for warming and cooking, power for driving machinery, fans, and the small labor-saving appliances which are developing so freely under the present conditions of difficulty in regard to domestic help.

The expenditure to be incurred on working-class housing schemes is very large and it is worth while to consider the cost of any items of equipment as a percentage of the total cost per house erected. Looked at in this way it will be found that many of the modern appliances and working conveniences put forward in connection with these schemes, although perhaps costing considerable amounts, really increase the total expenditure involved by a very small proportion.

At the present time people will live in any house they can obtain, but when the pressure is relieved by the increase in accommodation they will undoubtedly pick and choose and take into consideration the various factors of position, amenity, and particularly of the internal fittings and the public service provided in so far as those fittings and service reduce their personal labor and add to their convenience.

The houses which are most completely equipped with modern devices for comfort and easy work will attract the better class of tenants who in their turn will help to conserve and maintain those houses and their equipment. There can be no doubt that in houses of the class under contemplation good internal equipment and arrangements will prove as the years go by to be a sound investment resulting in the house being always occupied by good class tenants, and a fair rent obtainable, even when the present rush for accommodation has been overcome.

Particulars have been received of a number of large schemes in which very comprehensive proposals for the use of electricity for lighting, heating and cooking are included. In some of these also provision is made for common supply of hot water from the power station. Such schemes will be watched with interest; however, where something less comprehensive is to be attempted there is still a very strong case for the use of electricity for cooking and heating.

In working-class houses and cottages, one frequently finds that the fireplaces in bedrooms are only used in the event of illness and at other times serve but for ventilation, if they are not closed up, as is often the case.

The necessary ventilation can be provided more scientifically and more cheaply when buildings are being constructed, and if in some of these small rooms the fireplaces and chimney breasts were omitted, the reduction in the cost of construction would be considerable; in some cases sufficient to pay for the whole of the electrical equipment. There appears to be a case for constructing houses of this class without fireplaces excepting in the main living and cooking rooms. These may be provided with stoves adapted to consume coal, coke and refuse, and combined with the hot-water system of the house. If such appliances are properly installed and associated with electric cooking ranges, whilst some of the other rooms are permanently fitted with electric heating, the remainder being equipped with plugs so that portable electric fires can be used in them, the result is a dwelling with many labor-saving features, one in which the cost of maintenance and decoration will be low, the occupants' furnishings will be preserved, and the housework reduced in every possible way.

It would appear that colonies fitted in this up-to-date manner must cost the community considerably less in regard to cartage of coal and ashes, the maintenance of roads, and the work of scavenging. The indirect benefits accruing from a less smoky atmosphere, and a happier and less harrassed community need not be explored here, but that they are real cannot be doubted.

The above information is rounded off with the following impressive statement printed in boldface type:

It is of importance at the present time that everyone interested should cast aside prejudice and the shackles of custom and seize the greatest opportunity that has ever been presented for improving the lot of the small householder, by giving him a dwelling in the design of which the architect and the engineer have collaborated to use the latest appliances available and to prepare and provide for the great development of electrical methods in the household which is now likely to be progressive and continuous.

It will be observed that the E. D. A. has gone into this subject of housing with a thoroughness which augurs well for efficient handling of the many public questions that may ultimately fall within the compass of its operations.

DRAINAGE DISTRICT BUYS ELECTRIC PUMPS.

Drainage District No. 7, Skagit county, Washington, has purchased the equipment for two pumping plants which will be installed in the vicinity of La Conner, within the next 60 days. One plant, to be placed near the district seawall, will consist of a 24-in. centrifugal pump of the capacity of 20,000 g.p.m., to be direct-connected to a 100-hp., 440-volt motor. The pump will discharge over the seawall against a maximum head of 20 ft. Both pump and motor are the Fairbanks, Morse & Co. manufacture.

The second plant will be installed a mile from the first one and will discharge into a creek channel. This installation will consist of a 10-in. centrifugal pump of 7500 g.p.m., and will be driven by a 40-hp., 440-volt motor, both of which are also Fairbanks-Morse make. Electric energy will be purchased from the central station company.

Editorial Comment

Selling the Electrical Idea

IN these rapidly moving days the trend of modern business is to seek results and get them quickly. Custom sets the style, even in business, so we are not easily reconciled to let things take the "natural course of events." Direct rather than indirect results are usually preferred.

At the same time efforts are being put forth to obtain direct results it is good policy to establish means for securing indirect benefit. This is especially true of electrical merchandising. Opening up avenues for future sales is good common-sense business.

Electrical manufacturers and central stations who sell appliances have, as a general rule, appreciated this fact, and the result has been they have endeavored to sell not only electrical devices but the idea of their use. For instance, they have tried to sell the idea of good lighting along with fixtures, the idea of the convenience of electric ranges with the ranges themselves.

This pioneer work done by manufacturers and central stations in building up for future sales has been in a large measure responsible for the impetus given in recent years to the sale of electricity and appliances. It has resulted in nation-wide acceptance of the electrical idea.

Dealers and contractors have contributed largely to the movement, but it is doubtful if they all appreciate their opportunities in this direction. Wiring contractors can suggest the use of appliances; it is not necessary to suggest additional outlets if they prove of real service to the customer. They can help sell the idea of good lighting in industrial plants, offices, etc. In like manner the dealer can pave the way for future business by advancing timely suggestions about the utility of the many electrical devices that prove a boon to people after they have been sold on the idea of their use.

Distillation of Coal

ELECTRICITY and gas are prone to play a part in which each is of vital interest to the other before many more years have passed. The only pity is that that day is not now. The reason that those days are not with us now is because as a nation we are opportunists, and we do what we find most immediately economical now, and allow that which is most economical in the ultimate to bide its time. And in this we are, like many a politician, selfish, shortsighted and unwise.

Much is said about our conquest of the mysteries of the German chemical industry; that our dyes and drugs are inferior to none and we can produce enough to satisfy the world; that we shall hereafter be independent of the saltpeter mines of Chili, that we can produce all the fertilizer we need and more for intensive horticulture. True, but are we doing these things? More or less, but not seriously, not wholeheartedly, not sufficiently. From the viewpoint of the chemist, from the viewpoint of those who would conserve the nation's coal; from the viewpoint of those who would safeguard the nation's health; from the esthetic, from the economic, from the philanthropic, and from the common-sense viewpoints, we should carbonize our coal wherever possible instead of wastting it as we do so largely at the present time by burning nearly all of it in the raw state.

The war has taught us the value of the by-products of our coal, of those thousand and more products that can be turned to usefulness or into smoke according to whether we use our coal as we should or as we ought not to do. It is almost appalling when we stop to realize that by burning our coal in our houses, in our factories and under our boilers in lumps as we do, we are sending millions of tons of soot and smoke into the atmosphere to injure health, corrode structures and ruin materials where we could, if we would, make the gases distilled from that same coal into drugs, antiseptics and disinfectants, into dyes, fertilizers, oils and many other products required by a world at peace, not to mention those products necessary for waging war.

One of the pressing problems of the day, a problem of readjustment, a problem of reconstruction, a problem of national security, is that of tackling this matter of wasting the most precious constituents of our coal needlessly where we might, if we would, obtain them and still obtain the heat that is being obtained at so costly a price now.

The beehive coke ovens are being replaced by ovens of the recuperative type where the by-products of distillation are recovered for their thousand and more uses. The rate at which this has gone on during the last five years is the one bright page in the history of our waste of coal since we awoke to the fact that coal not properly used is coal gone forever. But this should be only the beginning, a beginning that should act as an incentive for hastened action to utilize the latent by-products of coal that now go to contaminate the atmosphere, lower the efficiency of our boilers and interfere with obtaining the heat that is obtained so wastefully.

The day must surely come when our gas works will furnish the gas for heating and for steam making, and lump coal will be employed only where it is worthless for anything else—it will be pulverized then, probably. Our cities will be cleaner and healthier then. Our central stations and our gas works will be adjacent, as so many of them are today, but they will be working together instead of in opposition, having learned that each has its own part to play; that there is room for both, and that each needs and can advantageously co-operate with the other.

Of course, such things are not happening now. They are not happening not because it is not desirable that they happen, because it is urgent that they should from every aspect. They are not happening because it would be rather expensive for them to happen, not expensive in the ultimate but now. These things are not happening because it is cheaper for the investor to waste coal now than to save it. But it is to be hoped that public opinion, patriotic spirit and the acumen for which American industry is famed will assert themselves and make the distillation of coal a nation-wide movement.

A 220-Kilovolt Bus for California

CALIFORNIA, it seems, is once again to take the lead in adopting something new, something of vital economic value to the state and something that will have an important bearing upon the utilization of water power. It is proposed that a 220-kilovolt transmission line, which it is suggested should be called a "bus" because that is what it would virtually be, shall traverse the state of California. This bus would connect together a vast number of hydroelectric plants, some now existing and some in the potential stage, and likewise many different widely-scattered markets. By such an arrangement many water powers could be harnessed to advantage, whereas at present it would not be financially worth while to develop them. There are, of course, many other benefits from such a unified system.

One of the statements made by the advocates of this 220-kilovolt bus is that by 1926 the demand upon the unified system would approximate between 1,400,000 and 1,500,000 kilowatts, a demand that almost staggers one, even in these matter of fact days of big things. This is not all, for the bus proposed would extend about 1000 miles. Elsewhere in this issue will be found advanced the reasons for suggesting that a 220-kilovolt bus be made to traverse almost the entire length of California, and the result of weighted conclusions why such a proposal is feasible and appears desirable without loss of time.

Experience with operating the Big Creek line at 150 kilovolts has shown that reliability is equal to that of steam plants of similar capacity located near load centers; in fact the operating history of this line has disclosed no evidence of trouble from the high-voltage system. It has been quite general experience that increasing line voltage brings greater and greater immunity from lightning and similar difficulties so long as the proper precautions are taken in the initial design of the system. Judging from the suggestions of the engineers who look upon a 220-kilovolt bus as the solution of the power problem in California, it would appear that they do not expect any serious difficulty from the high voltage, *per se*, so long as the insulation adopted has a proper factor of safety, so long as generator and the synchronous condenser are treated as an integral unit, and insulator maintenance keeps pace with deterioration.

Another fact worth noting—a fact which, by the way, opens up a very interesting line of thought—is that when operating the Big Creek line at 220 kilovolts corona will occur, whereas the 150 kilovolts now employed is only about 80% of the critical voltage. Operating at the critical voltage will, of course, increase the line loss somewhat, 0.4% normally and during bad weather about 8%. However, this loss is so small as to hardly enter in comparison with the gains that accompany corona loss, which are that a lower factor of safety of insulators will suffice and disturbances due to switching and other causes tending to pile up potential will be more rapidly dissipated, thus reducing system troubles and dangers to apparatus. Incidentally, the corona may be found a valuable agent when it comes to protection.

Heavy investments in transmission lines necessitate high load-factors for maximum return upon the investment. And the higher the load-factor tends to be, the more numerous the markets linked up together. Higher load-factors and the greater the interconnections or linking up, the greater the opportunity for employing large generating units, which means economy in use of water and low unit cost of machines. The Big Creek 150-kilovolt line cost about $6,000,000 to construct. By an expenditure of about 30% more, required to change over to 220 kilovolts, it is claimed the capacity of this line could be doubled. Obviously such an expenditure is worth while.

Almost every feature of the proposed bus strikes one at first as very extraordinary, but the engineers that present the details of the scheme are not promoters nor visionary enthusiasts. They are farsighted enough to plan now for meeting economically the greatly increased power demands of the near future.

Dr. George Otis Smith, director, Geological Survey, pointed out in his masterly address on "Planning for Power" before the N. E. L. A. convention this spring the great desirability of conserving water power, reducing the waste and use of coal by interconnecting and connecting up power plants and power resources on the Atlantic Coast. In veiled words he advocated something similar to this development now advocated for California. We hope that California goes ahead rapidly toward the ambitious scheme proposed and that the states along the Atlantic will give California a strenuous race for the glory of being the first to place in service a 220-kilovolt bus.

Current Events

Electrical Convention Season at Its Height — Gatherings Being Held and Projected in All Parts of the Country

EDISON ILLUMINATING MEN ADVOCATE ENDING FREE LAMP RENEWALS.

Spirited Discussion of Lamp Renewals, Rates and Fuel Marks Annual Convention of Association of Edison Illuminating Companies.

The thirty-eighth annual convention of the Association of Edison Illuminating Companies was held at the Hotel Griswold, New London, Conn., on Sept. 16 to 18. About 300 members and guests were in attendance, the gathering being quite representative of the long established central-station companies, and including nearly all of the pioneers of the association excepting Samuel Insull, of Chicago, and Joseph B. McCall, of Philadelphia. The three-day gathering comprised a full program of papers and discussions together with an interesting entertainment program including several golf contests as the principal attraction.

In the technical sessions three questions received chief attention, these being retention of the long established policy of free lamp renewals, central-station rates, and the fuel situation. The first of these subjects formed the principal topic for the Tuesday sessions, the discussion being carried over to the evening and continued until after midnight. Both sides of the argument were presented very completely. It was estimated, however, that fully 75% of the association membership is in favor of dropping the policy of lamp renewals and charging full list price for lamps. All of the technical sessions were as usual held behind closed doors and the conclusions reached have at this writing not been disclosed by the publicity committee.

An interesting feature of the meeting was the successful demonstration of radio communication between a naval hydroplane some 2000 ft. in the air and a submerged submarine located at Fishers Island, six miles from the New London harbor. Radiotelephonic communication was freely kept up between plane and submarine and was listened to by a large party of delegates to the convention.

INDIANA CENTRAL-STATION MEN DISCUSS FACTORS OF INDUSTRY.

Papers Presented Bring Out Points on Merchandising, Service Connections, Rates, Public Policy and Finance.

The annual convention of the Indiana Electric Light Association was held at French Lick Springs, Ind., Sept. 11-12. Representatives from a majority of central stations in the state were present and enjoyed a comprehensive program which included papers on such topics as merchandising electric appliances, service extension policies, rates, public utility policies, and financing utilities.

Pres. Thomas A. Wynne, Indianapolis, opened the convention on Thursday with a review of the association's activities and of the progress made by the central stations during the past year. In spite of wartime and so-called reconstruction conditions the load on Indiana central stations is steadily increasing, making it difficult to keep pace with the calls for energy and for line extensions.

The first paper presented was on "Should Central Stations Sell Electrical Merchandise?" by Charles B. Hart, Ft. Wayne & Northern Indiana Traction Co. In view of the fact that central stations, as a general rule, were first to institute the sale of electrical appliances and since their dealings with customers made it natural that they should sell appliances, it was argued that they should remain in the field until dealers were able to adequately handle merchandising alone. The financing of a successful range campaign was also discussed in Mr. Hart's paper, by which it was shown that the proper co-operation between central stations and dealers produced results entirely satisfactory to all.

In his paper on "The Future of Electric Utility Extensions in Indiana," H. O. Garman, chief engineer of the Indiana Public Service Commission, told of the change in policy made by the commission with regard to regulation of extensions of public utility service in municipalities and also the formulation of standards of service. In the past the commission has assumed more or less jurisdiction in these matters, but in the future the municipalities must assume these responsibilities. Referring to service standards he quoted from the new act, which gives municipalities the right to determine by contract or ordinance the quality and character of service furnished, and to require such additions and extensions to the central station's physical plant as shall be reasonable and necessary in the interest of the public. Controversies will be referred to the commission. Mr. Garman quoted proposed rules regarding extensions. These are given in another section of this issue.

"Power-Factor Correction and Its Relation to Electric Power Rates" was the title of an interesting paper presented by R. H. Carlton, Schenectady, N. Y.

At the Friday session J. W. Robb, Wabash Valley Electric Co., Clinton, Ind., read a paper on "Minimum Rates for Residential Lighting," in which he outlined methods of dealing with this class of business.

In a paper on "Public Policy in Utility Operation," E. J. Condon, Indiana Utilities Co., Angola, Ind., brought out points in regard to lowering generating costs and linking transmission lines, educating men in the electrical industry, municipal ownership, public service commissions, rates, water power, and financing public utilities.

Alex R. Holliday, Indianapolis, presented the last paper on the program. It was on "Financing Utilities" and gave comparisons of the purchasing power of the dollar of 1914 and the "dollarette" of 1919 and concluding with statement that the only solution of the financial problems of the central station will be increased charges to the consumer if they are to receive service commensurate with their needs.

The following officers were elected: K. H. Palmer, Kokomo, president; F. J. Hass, Evansville, vice-president; Thomas Donahue, LaFayette, secretary-treasurer, the last named being re-elected. The following men compose the executive committee: Thomas W. Wynne, Indianapolis; P. J. Ohmer, Elkhart; S. W. Greenland, Fort Wayne; E. J. Condon, Angela; E. M. Walker, Terre Haute, and G. O. Murphy, Indianapolis. J. W. Robb, Clinton; Thomas F. English, Muncie, and M. D. Plain, Hammond, compose the advisory committee. It was decided to hold all future meetings at French Lick Springs.

MUNICIPAL ELECTRICIANS WILL HOLD CONVENTION IN CHICAGO.

Papers by Dr. Steinmetz and W. D'A. Ryan Are Features of Program to Be Given Sept. 23-26.

The twenty-fourth annual meeting of the International Association of Municipal Electricians will be held at the Auditorium Hotel, Chicago, Sept. 23-26. Indications are that there will be an unusually large attendance at this meeting, for which an ambitious program has been arranged. W. D. A. Ryan will present one of the leading papers, his subject being "History of Illumination," which will be illustrated with colored slides.

Tuesday Morning Session.—Address of welcome, Mayor William Hale Thompson; response, Dr. Charles P. Steinmetz; president's address, C. E. Diehl; report of executive committee, Jacob Grimm, chairman; report of secretary; report of treasurer; report of auditing committee; appointment of committee on exhibits; appointment of committee on resolutions; address, "Chicago's Novel Fire Alarm System," Wm. G. Keith, commissioner of gas and electricity, Chicago, Ill.; address, "Regulating Motion Picture Theaters," Washington Devereaux, chief of the electrical department, Philadelphia Fire Underwriters' Association, Philadelphia, Pa.

Tuesday Afternoon Session.—Address, "Protection for Fire Alarm and Police Signal Circuits," J. Tyler Green, city electrician, Toledo, Ohio; address, "Planning and Layout of Flashlight Signal System," G. F. C. Bauer, inspector, police signal system, Buffalo, N. Y.; address, "Reminiscences of a Superintendent of Fire Alarm Telegraph," Adam Bosch, Wyoming, N. J.; address, "Municipal Electricians in Relation to Electric Power Engineering," Dr. Charles P. Steinmetz, General Electric Co., Schenectady, N. Y.

Tuesday Evening.—Complimentary dinner and smoker, Auditorium Hotel.

Wednesday Morning Session.—Report of standardization committee, R. A. Smith, chairman; address, "High-Voltage Pole-Line Construction for City Streets," Dr. Morton G. Lloyd, Bureau of Standards, Washington, D. C.

Wednesday Afternoon.—Laboratory test of electrical fittings and fire test of wired glass windows at Underwriters Laboratories; fire pump test at Chicago municipal pier.

Thursday Morning Session.—Address, "History of Illumination," W. D'A. Ryan, director, illuminating engineering laboratory, General Electric Co., Schenectady, N. Y.; address, "Effective Lighting for Streets," Wm. G. Keith, commissioner of gas and electricity, Chicago, Ill; address, "Relation of Fuses to Knife Switches and Service Wires," E. Zynmeyer, Frank Adam Electric Co., St. Louis, Mo.

Thursday Afternoon.—Automobile trip over Chicago boulevards.

Thursday Evening.—Dinner, vaudeville and dance at the Congress Hotel.

Friday Morning Session.—Address, "Industrial Motion Pictures," F. A. Barron, engineer, wiring sales department, General Electric Co., Schenectady, N. Y.; address, subject to be selected, William F. Devlin, Belden Manufacturing Co., Chicago, Ill.; report of committee on exhibits; report of committee on resolutions; election of officers.

Friday Afternoon.—Visit to plant of Kellogg Switchboard & Supply Co.

PROGRAM OF APPROACHING CONVENTION, AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS.

Ambitious Program, Diversity of Subjects and Many Trips Are Salient Features.

The one-hundred and twentieth meeting of the American Institute of Mining and Metallurgical Engineers will take place in Chicago during Sept. 22 to 26, the headquarters for the convention being the Congress Hotel. There will be 17 sessions, dealing respectively with non-ferrous metallurgy, mine taxation, coal and gas, geology, milling, industrial organization, iron and steel, oil, sulphur in coal, mining and local resources, pyrometry with special reference to iron and steel metallurgy, symposium on pyrometry.

A number of interesting trips of inspection have been arranged for those members who are desirous of undertaking them. These include a visit to the famous steel plant at Gary, Ind., a tour of the zinc smelters, coal mines, cement works, permanganate works and varied industries around La Salle, Ill.; coal fields at Franklin and Macoupin; the lead refinery and oil refinery at East Chicago and Whiting; many and varied metallurgical plants in vicinity of Chicago and the tungsten and molybdenum reduction plants at North Chicago and Milwaukee, Wis.

The papers of most interest to electrical men are those by H. W. Young on "Outdoor Substations in Connection with Coal-Mining Installations"; "Engineering Features of Modern Large Coal Mines," by C. A. Herbert and C. M. Young; "Electric Resistance Furnace of Large Capacity for Zinc Ores," by Chas. H. Fulton; "Chemical and Electrochemical Problems Involved in New Cornelia Copper Company's Leaching Process," by H. S. MacKay; "Electrolytic Zinc," by C. A. Hansen; "Fundamentals of Pyrometry," by C. E. Mendenhall; "Thermoelectric Pyrometry," by Paul D. Foote; Potentiometers for Thermoelement Work," by W. P. White; "Self-Checking Galvanometer Pyrometer," by H. F. Porter; "Some Factors Affecting the Use of Base-Metal Thermocouples," by O. L. Kowalke; "Resistance Thermometry," by F. W. Robinson; "Resistance Thermometry for Industrial Use," by Chas. P. Frey; "High Temperature Control," by C. O. Fairchaild and Paul D. Foote; "Alloys Suitable for Thermocouples and Base-Metal Thermocouple Practice," by J. M. Lohr; "Temperatures of Incandescent Lamp Filaments," by B. E. Shackleford; "Applications of Pyrometry to Problems of Lamp Design and Performance," by I. H. Van Horn.

The Fifth National Exposition of Chemical Industries will be in progress at the Coliseum and First Regiment Armory during the same week, and the members of the American Institute of Mining and Metallurgical Engineers are welcomed. On Wednesday a joint session of the above institute and the Electrochemical Society is planned.

NORTHWEST ELECTRIC LIGHT AND POWER ASSOCIATION TO MEET.

Program of Twelfth Annual Convention, to Be Held at Seattle, Wash., Sept. 24-27.

The Northwest Electric Light and Power Association, which is a geographic section of the National Electric Light Association, will hold its twelfth annual convention at Seattle, Wash., on September 24, 25, 26 and 27, in the Press Club rooms. The program, in brief, is as follows:

Wednesday Morning, Sept. 24.—Welcoming address by the mayor of Seattle; address by H. J. Gille, president of the association; reports by various committees and other addresses.

Afternoon.—Report of technical committee by G. E. Quinan, chief engineer of Puget Sound Traction Light & Power Co., chairman; "Accounting," by J. S. Simpson, of Washington Water Power Co.

Evening.—Lecture, "Electricity Today," by Dr. W. H. Easton, of Westinghouse Electric & Manufacturing Co.

Thursday Morning, Sept. 25.—Round-table conference on "Improving Electrical Merchandising," L. A. Lewis, of Washington Water Power Co., chairman; discussion to be participated in by speakers, assigned by the chairman, from among central-station men, jobbers, contractors, and dealers.

Afternoon.—"Ranges and Water Heaters," a round-table conference, with A. C. McMicken, of Portland Railway, Light & Power Co., as chairman, and J. F. Roche, of Montana Power Co., as vice chairman; all phases of subject will be discussed by other speakers to be assigned.

Friday Morning, Sept. 26.—"Value of Public Utility War Experiences and Their Effect on the Future," a paper by W. H. McGrath, of Puget Sound Traction, Light & Power Co.

Afternoon.—"Industrial Electric Heating," a paper by C. A. Winder, of General Electric Co. This will include the electric furnace as a feature. It will be followed by the reports of nominating and other committees, and the election of officers.

The closing day will be devoted to a large extent to trips of inspection and entertainment.

PRESIDENT BALLARD OF THE N. E. L. A. STARTS ON TOUR OF COUNTRY.

Will Attend Conventions of New England and Southeastern Sections and Committee Meetings in New York and Chicago.

President R. H. Ballard of the National Electric Light Association left Los Angeles, Cal., Sept. 12, on a second eastern trip in the interests of the organization. He will attend a meeting of the Public Policy Committee, which has been called by Chairman John A. Britton, to be held at Association headquarters in New York on Oct. 1. Both Mr. Ballard and Mr. Britton will be in attendance at this meeting. A meeting of the Executive Committee is called for Oct. 2, when the Southern California city, at which the convention of 1920 will be held, will probably be selected, and a general meeting of the Committee on Geographic Sections which has been called by Chairman R. F. McClelland, and Vice-president Bump on Sept. 29. It is expected that this meeting will be in session for two days, as the general question of dividing the country into geographic sections will be taken up and thoroughly discussed, and some definite program will be agreed upon.

Taking advantage of President Ballard's presence in the East, a general meeting of the Membership Committee has been called by Chairman Walter Neumuller of New York, and of the Company Sections Committee by Chairman Frank A. Birch of Philadelphia. Both of these meetings will be held in New York.

Conferences have been arranged between President Ballard and Vice-president M. R. Bump, of New York, and Chairman I. R. Moultrop of Boston, on affairs relating to hydroelectric generation and technical sections; with Vice-president Walter H. Johnson, of Philadelphia, and Chairman John G. Learned and George B. Foster, of Chicago, on matters connected with the Commerical and Electric Vehicle Sections, and also with Vice-president Frank W. Smith, of New York, and Chairman R. W. Symes, of Detroit, concerning matters appertaining to the Accounting Section.

Mr. Ballard will stop in St. Louis on Sept. 15 for a discussion of Association affairs in that section of the country with company executives residing in that region.

The convention of the Southeastern Section will be held at Asheville, N. C., Sept. 17 to 19. President Ballard will address the convention on the morning of Sept. 18.

The convention of the New England Section will be held at New London, Conn., Sept. 22 to 24. President Ballard will speak at the banquet on the evening of Sept. 23.

At the close of the New England convention he will return to New York arriving there the evening of Sept. 24, and plans to be at headquarters for the following two weeks.

Returning to the Pacific Coast in October, President Ballard's tentative itinerary provides stops at Detroit, Chicago, Minneapolis, Butte, Seattle, Portland and San Francisco.

COMPREHENSIVE PROGRAM ARRANGED FOR INSPECTORS' CONVENTION.

Topics of Interest to All Branches of Electrical Industry to Be Discussed at Springfield, Mass.

A tentative program for the reconstruction convention of the National Association of Electrical Inspectors, which is to be held in Springfield, Mass., Oct. 13-14, has been completed. It consists of a number of forums which will be led by men who have made a life study of the subjects assigned to them.

These subjects will concern the personal accident and fire hazards and will be of interest, not alone to electrical inspectors, but to fire, life, accident, liability, casualty and compensation insurance interests, electrical transmission companies, electric light and power companies, electrical contractors and wiremen, water companies, fire departments and municipal officials. They will be for the single purpose of explaining how electrical hazards may be safeguarded and will be open for a liberal discussion on the part of all who may attend. For this reason a general invitation is extended to the allied electrical interests to be present and take part in the proceedings.

The Hotel Kimball will be the convention headquarters and those intending to be present are urged to make early reservation for hotel accommodations. The Chamber of Commerce of Springfield is sending out letters, accompanied with a list of the hotels in Springfield, together with the prevailing rates. The banquet committee announces that ladies will be permitted to attend the banquet, which will be held Monday evening, Oct. 13.

PROGRAM:

Opening of the Convention—Allen W. Hopkins, past president, Western New England section, National Association of Electrical Inspectors.

Address of Welcome—Hon. Arthur A. Adams, mayor of Springfield.

Response—Washington Devereux, president, National Association of Electrical Inspectors.

"The Beginnings of the National Electrical Code," F. Elliott Cabot, the first chairman of the electrical committee.

"Radio Developments and Their Relation to the Code," Clarence D. Tuske.

"Electrical Inspections and the Electrical Contractor," J. S. Smith, Philadelphia.

"Electrical Inspections and the Power Company," P. H. Bartlett, engineer of installations, Philadelphia Electric Co.

"Electrical Inspections and Their Value to the Fire Insurance Interests," Ralph Sweetland, secretary of the electrical committee.

"Some Code Problems of Present Interest," Dana Pierce, chairman of the electrical committee.

"Insulating Joints—What of Their Future?" Joseph C. Forsyth, Board of Underwriters, New York City.

"High-Potential Wiring," G. C. Lawler, electrical engineer, Associated Factory Mutual Fire Insurance Companies, Boston.

"The National Electrical Safety Code," M. G. Lloyd, Bureau of Standards.

"A Uniform Type and Design of Attachment Plugs—Is Such a Device Needed and Is It Possible to Achieve?" speaker to be announced.

"Polarization and Protective Grounding," W. J. Canada, Stone & Webster, Boston.

"Interbuilding Service Connections," H. S. Wynkoop, Bureau of Gas and Electricity, New York City.

"The Visual Marking of Fuses," Thomas H. Day, past president National Association of Electrical Inspectors, Hartford.

There will be a session, for members only, the morning of Oct. 15, the room and time to be announced during the convention. All other sessions will be open.

THIRD EDITION OF MANUFACTURERS' ACCOUNTING SYSTEM READY.

Standardized Accounting and Cost System Prepared by Joint Committee of Electrical Manufacturers Now Widely Used.

Joseph C. Belden, president of the Belden Manufacturing Co., Chicago, Ill., and a member of the Committee on Standardized Accounting and Cost System of the Electrical Manufacturers' Council, announces the following in reference to this system:

"The third edition of the Manual of Standardized Accounting and Cost System of Electrical Manufacturing Industries will be issued about October 1. In 1916 the Electrical Council appropriated funds for this work and appointed a committee consisting of executives and accountants from 15 representative manufacturing companies which has done a large amount of work since then.

"This manual is really a complete specification of modern factory accounting on practical lines. Standard rates of depreciation and methods of charging depreciation into costs are given. The correct manner of handling experimental and development charges is given and charges are segregated so that only proper overhead gets into costs. Comprehensive definitions are given throughout.

"The importance of correct accounting is today clearly recognized and 80 electrical manufacturers are now using this system. It can be used by any electrical manufacturer, regardless of size. Edwin M. Hurley, former chairman of the Federal Trade Commission, and Secretary Wilson of the Department of Commerce have both officially endorsed this system."

This manual is sold only to electrical manufacturers. Members of the Associated Manufacturers of Electrical Supplies, Electrical Manufacturers' Club and the Electric Power Club can obtain the manual of this system for $2.00, and other electrical manufacturers for $2.50. Address S. L. Whitestone, General Electric Co., Schenectady, N. Y.

INDIANA COMMISSION FORMULATES RULES FOR EXTENSIONS.

Rules Proposed to Eliminate Unreasonable Demands of Consumer and Unfair Refusal of Extensions by Utility Companies.

The Indiana Public Service Commission has formulated new rules which are proposed to govern extensions of electric utility service. These rules, which are given below, are to be used as guides for municipal governments in handling these matters and are indicative of the commission's attitude when ruling upon such when brought to it on appeal.

Jurisdiction.—The Indiana Public Service Commission law contains the following provisions:

> "Sec. 110. Every municipal council shall have power, . . . to require of any public utility by ordinance or otherwise such additions and extensions to its physical plant within said municipality as shall be reasonable and necessary in the interest of the public, and to designate the location and nature of all such additions and extensions, the time within which they must be completed and all conditions under which they must be constructed subject to review by the commission . . . ."

In the matter of extensions of facilities for utility service the commission exercises only appellate jurisdiction. In case of appeal to the commission it will be guided somewhat as outlined in the following paragraphs.

Free Extensions.—Each utility should upon written request for service by a prospective consumer or a group of prospective consumers located in the same neighborhood, make free of charge a line extension necessary to give service and furnish free service connection when the income for the first year from the prospective consumer or consumers is equal to one-third (1/3) to one-fifth (1/5) the direct cost of the extension.

Extension Above Free Limit.—If the line extension required in order to furnish service at any point within the corporate limits of any city or village, or for any adjacent suburb of a city or village, is greater than the free extension specified above, such an extension should be made under the following conditions: The utility may require a deposit of the cost of the extension above the free limit and should, in such a case, refund an amount equal to the cost of the free main extension for each additional consumer whose service shall be taken off of the entire extension within a period of ten years from the making of such an extension, but at no time shall the rebate made exceed the original deposit. If the extension is of such length and the prospective business which may be developed by it is so meager as to make it doubtful whether the business from the extension would ever pay a fair return on the investment, the facts may be reported to the commission for investigation and determination as to the reasonableness of such extension. If at any time the utility desires to purchase an extension to its distribution system which was built in whole or in part, by the consumer or consumers it may do so, subject to the approval of the commission, after making payment of a fair and reasonable price fixed by the commission, due allowance being made for depreciation and previous payments made thereon.

This rule shall not be construed as prohibiting any utility from making free extensions of lengths greater than above specified, or from providing a method of return of deposits for extensions more favorable to consumers, so long as no discrimination is practiced between consumers whose service requirements are similar.

Contract for Service.—Utilities should not be required to make line extensions as described in this rule unless those to be served by such extensions shall contract to use the service for at least two years.

Example: Assume a proposed $800 extension. Assume that we have 10 consumers who will pay at least $18 per year each, 10 times $18 times 5 equals $900 in five years. This extension will pay and should be made free of charge, because the estimated revenue in five years exceeds the direct cost of the extension. Now if we do not have ten consumers, but only two, namely, A and B, the revenue from them for five years at $18 each equals $180. It is seen that this proposed extension would not be remunerative and if constructed would become a burden to the older consumers, and if there were too many of such non-remunerative extensions then the rates would have to be raised. If, upon investigation, it appears that this extension would ultimately have to be made but that it would require a period of ten or twelve years to become remunerative then the utility should make the extension if the proposed consumers will deposit with the utility at 6% interest an amount equal to the direct cost of the extension less what the proposed now consumers are entitled to as a free extension.

Example: Assume the proposed extension will cost $800. A and B wish to be consumers at $18 per year each, $18 times 2 times 5 equals $180, or A and B are entitled to $180 of free extension, they therefore make a deposit of $800 minus $180 or $620 with the utility at 6% interest. Suppose at the end of the fifth year C comes on at $18 per year the utility will pay back to A and B each one-half of 5 times $18 or $45. The utility now has three consumers, A, B and C, and a deposit of $530. At the end of the sixth year assume D comes on as a consumer at $18 per year, he like the others is entitled to $90 of free extension, so the utility pays again to A and B each $45, so the utility now has 4 consumers, A, B, C and D, and a deposit of $440. At the end of the ninth year assume E and F come on at $18 each per year and they are also entitled to their free extension of 2 times 18 times 5 equals $180, so the utility takes on E and F and pays A and B each $90, reducing the deposit to $260, and has connected consumers A, B, C, D, E and F. At the end of the ten-year period assume that no additional consumers come on, then the utility pays to A and B what interest remains due to them at 6% and keeps the $260 remaining of the original $800 deposit as part compensation to the older consumers and the utility for making an extension which was not remunerative during its earlier days.

No extension should be made where it does not give promise of being compensatory some time.

CHICAGO ELECTRIC CLUB TO MEET AT ELKS CLUB.

At a meeting of the Board of Managers of the Electric Club of Chicago, held on Sept. 8 it was decided to change the place of the Club's weekly meetings from the Hotel Sherman to the Elk's Club where excellent facilities are available for such luncheons. The day of the regular meeting was also changed from Thursday to Tuesday.

The first meeting in the new location was held on Sept. 16 at which John J. Garrity, general superintendent of police of Chicago, was the principal speaker.

The Electric Club has been holding its meetings at the Sherman for a number of years.

ELECTRIC CLUB TO BE A FACTOR OF CHICAGO ELECTRICAL SHOW.

At the Chicago Electrical Show, to be held at the Coliseum, Oct. 11-25, the Electric Club of Chicago will have a booth at which it will maintain a general information bureau as well as a registry center for out-of-town guests. Those in attendance at the booth will be ready to offer whatever service they can to visitors who should register.

One day of the show is to be called "Electric Club Day" and the club's regular meeting will be held in the Coliseum on that day. Samuel Insull will be the speaker.

TO HOLD INTERNATIONAL TRADE CONFERENCE AT ATLANTIC CITY.

Plans have been made by the Chamber of Commerce of the United States for an international trade conference at Atlantic City, N. J., Sept. 30. Business representatives from all over the country and from England, France, Italy and Belgium will meet to discuss problems of domestic and foreign trade.

CHICAGO ELECTRICAL CONTRACTORS HAVE FIELD DAY.

The Electrical Contractors' Association of Chicago held a field day at the new Evanston Golf Club on Sept. 18. The day was largely devoted to golf, there being no meetings scheduled. Manufacturers and jobbers were also in attendance.

Commercial Practice

Home Economy Bureau — Contracts for Rural Lines—Irrigation Service in Montana — Other Commercial Events

LOUISVILLE UTILITY COMPANY INAUGURATES HOME ECONOMY DEPARTMENT.

Louisville Gas and Electric Co. Adopts Co-operative Bureau for Housewives.

A new field of activity has been opened for the commercial department of the Louisville Gas & Electric Co. with the inauguration of its Home Economy Bureau. The innovation will be in charge of Miss Grace Otter, under the supervision of Robert Montgomery, manager commercial department of the company, who is responsible for the idea. Miss Otter is a graduate of the Kentucky College at Danville, has completed a course in home economics and is a specialist in dietetics.

If a Louisville housewife finds herself confronted with a dinner or luncheon party and a lack of ideas as to menus, table arrangements, or the proper way to cook a dish she need only telephone Miss Otter who will immediately respond with suggestions and will lend every possible assistance to make the affair a success. If a housewife is puzzling over the problem of relative food values with an eye to economy or health, the home economy bureau will solve her problems upon request.

If it is a problem of house management, for example, the task of finding the simplest and easiest way of arranging the housework, or the quickest and best way to wash the clothes or iron them, or to clean house or cook a meal, Miss Otter and her bureau is available free of charge to assist the housewives of Louisville and vicinity.

The home economy bureau will be fitted up with all the important gas and electric labor saving appliances for demonstration purposes. A series of newspaper advertisements have been started in the Louisville daily papers concerning the "New Service." These include feature photographs of Miss Otter demonstrating various appliances, and invite requests for her new booklet "Economy Helps for the 20th Century Housewife, with Tested Recipes." The booklet contains besides menus and recipes, many suggestions for the saving of money, time and labor in household management.

CONTRACT SUITABLE FOR FARMERS' LINES.

Form of Agreement Used for Farmers' Co-operation in Construction of Farming Community Lighting and Power Lines.

The accompanying agreement for the use of farmers requiring the construction of a transmission line through their properties by the central station is one that has been drawn up and found very satisfactory by the Greenville Electric Light & Power Co., of Greenville, O. According to D. L. Gaskill, president of the company, this agreement answers the purpose admirably, since it covers the construction of the line, provides for the equitable payment by the various subscribers to the line and takes care of the disposal of the line after its construction.

AGREEMENT.

In relation to the construction and use of an electric transmission line extending from the 2300-volt distribution line of ....Company, on.................. in ...., on and along the following territory: (Describe route).

Whereas, a considerable number of residents along the above described road in .... Township, of .... County, desire to use electric current for supplying their homes and buildings,

And, whereas, it is necessary that such line be constructed at the expense of those who desire to use said current,

It Is Therefore Agreed to by the signers to this instrument that such line shall be constructed upon the following terms:

First. The construction of said line and the making of the contract therefor shall be placed in a committee of three of the shareholders hereto, and which committee shall have full power to make contracts and look after all things necessary in the construction of said line. Such committee shall keep account of all the cost of the construction of said line and shall collect the sums necessary from each of the shareholders hereto to pay the entire cost of construction of said line, the same to be divided equally among shareholders in proportion to the number of shares for which he subscribes and owns.

Second. The line to be constructed shall be capable of transmitting 2300-volt single-phase 60-cycle electric current and shall be of sufficient capacity to serve all of the residents along the highways in which such line is constructed. All material and the plans and specifications for said line and the construction of said line are to be subject to the approval of and to be of the kind specified by The.................. Company, of ....

Third. It is understood that this agreement shall cover only the 2300-volt transmission line and shall not cover transformers or service lines to serve any of the shareholders to this agreement, each shareholder being required to provide his own transformer and service line from the 2300-volt transmission line herein provided for. Payment for the construction of said 2300-volt transmission line to be made as follows: 50% of the estimated cost thereof to be paid to the committee before the work is undertaken; 25% to be paid to the committee when the poles are erected, and the balance upon the completion of the line.

Fourth. It is further understood and agreed that upon said line being completed a bill of sale for the entire line, not including transformers and service lines, but to include the 2300-volt transmission line only, is to be made out and turned over to The .... Company, the consideration for which transfer of ownership of said transmission line to be that The .... Company shall maintain said line and assume full ownership of the same from the time of its completion and the turning over to it of said lines and to be responsible in every way for the ownership of said line the same as if it had originally constructed it.

Fifth. The committee in charge of the construction of said line shall keep an accurate account of the entire cost of the same and such cost shall be apportioned equally among the shareholders hereto in proportion to their shares, and in case other shareholders are created within ten years from the date of the construction of said line along the highway then such users of current from said line shall pay to the committee in charge of the shareholders' interest an amount equal to the amount which was paid by each shareholder originally in the construction of said line and the committee in charge of such collection shall pro rate to the original shareholders equally in proportion to the shares held by them any amounts that may be received from subsequent users on said line.

Sixth. It is understood that the share spoken of in this agreement applies to the property rather than to the individual and that in case any shareholder shall dispose of his real estate such right to the use of said line shall pass with the real estate to the subsequent purchaser thereof. It is further understood and agreed that The .... Company, in addition to approving the plans and specifications and construction of said line, shall have the right to extend such line from its terminus to points further beyond without objection or hindrance from the respective shareholders to this agreement.

Seventh. It is understood that the signing of this agreement by us constitutes a contract between the signers and the balance of the shareholders to carry out the terms of this agreement and by signing of the same we do hereby bind ourselves, our heirs, administrators, and assigns.

In Witness Whereof, We have hereunto set our hands this .... day of ...., 19...

WIRING OLD HOUSES PROGRESSING STEADILY IN BOSTON.

Statistics to July Show Satisfactory Progress—Revenue Expected.

For the month of July 47 wiring agreements were signed for wiring of houses already built without wiring, by the Edison Electric Illuminating Co. of Boston. These contracts represent about 52 kw., with an estimated income of $1160. The total cost of this wiring amounted to $7881.25 or an average per house of $167.68.

For the four months ending July 31, 271 housewiring agreements were signed, totaling 263 kw. anu an estimated income of $6384. The total wiring expense was $37,716.16, or an average of $139.17 per house. The above contracts were distributed among 36 contractors, the highest contract amounting to $14,155.50, the second highest to $4274.81 and the third highest to $2700.90.

The above only serves to emphasize the very great help that utility campaigns are to the local contractors where the campaign is carried on. Moreover, the value of co-operation of utility and contractor-dealer should be obvious to all those who have at heart the mutual welfare of these two forces in the electrical industry.

IRRIGATION IN MONTANA IS PROVING A PAYING PROPOSITION.

Service from Mountain States Power Co. Brings Farmers Big Revenue.

The subject of irrigation is receiving more and more attention in Montana. Recently an investigation trip was made in the Flathead Valley district by business men, farmers and others interested in increased crop yields under the auspices of the Kalispell Farm Bureau. A number of farms which are irrigated by means of electric power furnished by the Mountain States Power Co. were visited. It was shown by W. B. McDonald, manager of the Kalispell Division of the company, who accompanied the party and explained the advantages of electric power pumping, that at an expense of approximately $14.00 per acre (depending on the size of the farm) an electric irrigating system could be installed which would insure an abundant supply of water at all times. It was further shown that the increased crops as a result of the irrigation more than pay for the installation in a single year. In one instance two crops of alfalfa brought the owner $100 per acre. An editorial in the Kalispell Interlake of August 25 is quoted:

"Today a well known local farmer who has been practicing irrigation for several years, makes the statement that returns from his alfalfa fields will this year yield returns equivalent to going rates of interest on land valued at $1000 per acre.

"This isn't a theory but a fact determined by actual practice. Of course, prices of hay are high this year and have been for the past three years, but even in an average season it has been found that the plant has paid a big return on the investment."

NORTH DAKOTA FARMER ENTHUSIAST FOR UTILITY SERVICE.

Threshing and Other Work All Done Electrically on Fargo Dairy Farm.

According to M. L. Hibbard, manager, Union Light, Heat & Power Co., Fargo, North Dakota, there are a number of farmers in his territory who have found central-station service so beneficial as to become enthusiastic regarding its convenience, its reliability and low cost when such factors as readiness to serve, availability, lack of trouble are taken into consideraion.

Mr. Hibbard cites one farmer in particular, A. D. Scott, who operates a large dairy farm about two miles southwest of Fargo. This farmer is doing his entire threshing with electric power, and for the past two years had done most of the work around the farm electrically. It is found that the work can be done for much less cost when done electrically than when done in any other way attempted.

GROWTH OF NEW BUSINESS IN MINNEAPOLIS UNPRECEDENTED.

Minneapolis New Business—Power Output Increased 23.8 Per Cent.

The new business being connected to the lines of the Minneapolis General Electric Co. in Minneapolis is increasing at an unprecedented rate, according to reports coming from Minneapolis. Total contracts for the week ended August 29 numbered 80, with 751 kw. of lighting and 268 hp. in motors—a total of 1269 hp. for the week. Connected load gain (net) included 204 customers with 161 kw. of lighting and 128 hp. in motors. Appliance sales 97. Electric energy output was 33.8% greater than for the same week of 1918. For the year to date it is 23.8% ahead of the same period last year.

WATER POWER IN JAPAN.

In common with other countries, Japan is making a survey of its available water power. The investigation, which began in 1918, will be completed in about five years, and all power sites where there is a prospect of more than 1000 hp. being developed will be fully investigated. It is stated that at present about 1,000,000 hp. are being developed, while 2,000,000 hp. are awaiting exploitation.

Operating Practice

Fighting Turbogenerator Fires—Coal Consumed by Banked Fires — Combustion of Coke — Economizer Maintenance

COMPANY OPINIONS AS TO MEDIA FOR FIGHTING TURBOGENERATOR FIRES.

Water Finds Greater Favor Than Steam Among Thirty Operating Companies.

A number of central-station companies have quite recently, during the last two years, adopted some definite method of fighting internal fires in their turbogenerators, recognizing that this form of apparatus does catch fire and once afire may be difficult to extinguish.

With the advent of permanently-installed fire extinguishing provisions in generators, the use of steam has received very serious consideration, and there is at the present time a wide difference in opinion as to the relative merits of water and steam for this purpose. Of the thirty companies reporting to the Committee on Electrical Apparatus, N. E. L. A., the use of water is definitely favored by nine and opposed by eight, and the use of steam favored by seven and opposed by twelve. Eighteen generators of four companies are now provided with permanent steam equipment, as against nine units of three companies with water equipment.

The principle of operating in using steam differs from that in using water primarily in that displacement of air in the generator by steam is very largely depended upon to smother the fire. It is extremely important, however, in using steam to shut off the supply of air to the generator as completely and promptly as possible, and some means of facilitating this operation should be provided. It would seem that the air damper could be placed more effectively in the outlet rather than the inlet wherever the design permitted. The wetting of the generator windings from condensed steam may also be helpful. In using water, the idea is to wet the windings as far as possible, this being aided by the natural ventilation of the machine.

EXPERIENCES OF COUNTIES GAS & ELECTRIC CO. WITH COAL CONSUMED BY BANKED FIRES.

Influence of Careful Operation Upon Coal Consumption Shown by Actual Tests.

The coal consumed by banked fires acts to materially increase the coal consumption of a plant compared to the coal consumption as based upon water evaporated at so many pounds of water per pound of coal. As a matter of fact, many of the smaller companies do not realize the large amount of coal used up for banking fires, nor do they appreciate the importance of making the bank carefully and the proper adjustment of dampers.

In a very interesting paper entitled, "Economical Boiler Room Operation for Medium Sized Plants," presented before the Pennsylvania Electric Association recently by Henry B. Bryans, chief engineer, Counties Gas & Electric Co., figures were presented to show what amount of coal was being consumed by banked fires at this company's generating station. The station uses underfeed stokers with high-grade, low-volatile bituminous coal. There are 13 boilers of a total capacity of 5420 b-hp.

Tests made by this company show that on a Sunday when fires may be banked for 24 hours, the coal consumed by a banked fire may reach as high as 18%. A careful investigation was made, and among others the following results covering the banking of two batteries of two 500-hp. boilers may be of interest. The period is for 24 hours:

Boiler numbers.	Fuel used— Total amount, lbs.	Rate per boiler hp. per hr. in lbs.	Rate per retort per hr. in lbs.
8 and 9	5,405	0.23	19.0
11 and 12	8,000	0.33	27.0

It will be seen that it took almost 50% more fuel to bank the second battery than it did the first. Investigation revealed the fact that dampers were not closed as tightly as indicated from outside of the breaching and also that one damper was badly warped and could never be closed. These conditions were corrected and the standby losses were materially decreased.

EXPERIENCES IN THE COMBUSTION OF COKE UNDER BOILERS.

Experiences Obtained in Germany During the War Indicate Measures Necessary for Success.

Experiences in the burning of coke under steam boilers are related in the February 28 issue of Zeitscrift fur Dampfkessel and Maschinenbetrieb. It is pointed out that a clear distinction should be made between gas coke and metallurgical coke. Gas coke is easier to ignite because its structure is less compact, while coke from coke ovens, especially that made from fat coals, has a compact structure and is less easy to ignite.

When burned, coke keeps the shape of the lump longer than coal; it is more difficult to bring to the state of incandescence, but it burns slower. It does not give off its heat with the same speed as coal and because of this, in order to burn the same weight of fuel one has to employ a larger grate and use a deeper fuel bed; its lower specific weight as compared with coal also makes a larger grate necessary.

The size of the lumps is essential. If the lumps are too large, the surface subject to the action of the air is too small to maintain the combustion process, if the draft remains within the same limits. The limits of size are indicated by the author as 0.4 in. minimum to 1.6 in. maximum.

The finer sizes, and in particular coke breeze, make too dense a layer and with ordinary draft do not provide for a sufficient contact with the air. Their combustion on a plain grate is possible only when special appliances are used.

As a rule, coke requires a stronger draft, which is due to the greater depth of the fuel bed and the resulting increased resistance to the flow of air.

It is a fact that with coke a boiler cannot deliver as much steam as with coal, especially when working at overload. This is due to the unsatisfactory flame formation resulting from the lack of volatile compounds (1 to 2% in coke as compared with 20 to 30% in coal) and also to the slower combustion of coke equivalent to a lower grate output. Hence, when it is impossible to increase the grate area, the output of steam is apt to fall off.

Likewise, lower superheater temperatures have to be taken into consideration, as the exhaust gases enter the superheater at a lower temperature than when coal is used, due partly to the shorter flame and partly to greater excess air.

Coke firing makes greater demands on the fireman. It is recommended that in large plants those boilers that carry normal load be fired with coke, while the peaks of the load curve should be taken care of by boilers equipped for mixed or straight coal firing.

As regards the grate construction it was obvious that the traveling grates designed for coal would not do for coke. This problem was solved by subjecting the coke to a generator action. This means that the coke was brought to a bright glow in a separate hopper and from there delivered on to the traveling grate in a layer from 1.31 to 1.64 ft. deep, depending on the size of the coke. On the grate the coke was burned in a gradually decreasing depth, Fig. 1. At the end of the grate slag pockets were provided to prevent too much air from entering.

That the combustion should go on properly, it is important to maintain a powerful fire in the lower part of the auxiliary hopper, the purpose of which is to ignite the mass of coke lying above it. A sort of hearth is employed, so arranged that it has nothing to do with the advance of the fuel toward the traveling grate proper, but lies more or less at rest on an inclined grate (Fig. 1) while the fuel for the traveling grate moves over it. In this connection, the angle of inclination of the inclined grate is of material importance. If it is placed at too sharp an angle, the purpose desired will not be achieved and the fuel layer from the contact hearth will be carried away by the

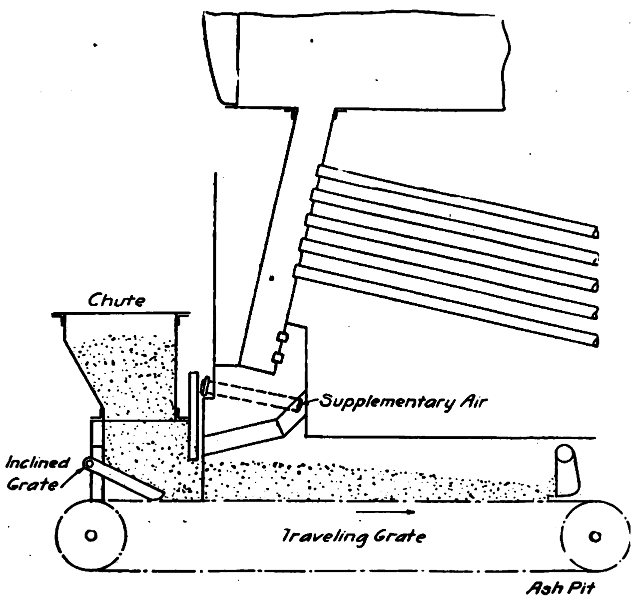

Fig. 1.—Traveling Grate With Producer Hopper.

moving mass of coke, which will result in stopping the ignition of the coal in the hopper and "freezing" the latter.

The producer action of the auxiliary hopper, to-

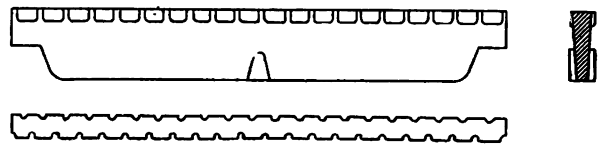

Fig. 2.—Nozzle Grate Bar.

gether with the deep layer of fuel, favor the production of carbon monoxide and hence flame formation, which is highly desirable. In order, however, to bring about a complete combustion of the gases, it is necessary to admit fresh air directly into the combustion space, which can be done most simply by means of tubes passing through the fire arch.

Experience shows that operating boilers at high ratings leads to an excessive wear of the grates, which cannot be maintained for any length of time. On the other hand, it appears that coal-firing installations can be converted to coke firing with comparative ease by the employment of steam jets as auxiliaries in the production of draft.

This arrangement can be used particularly well

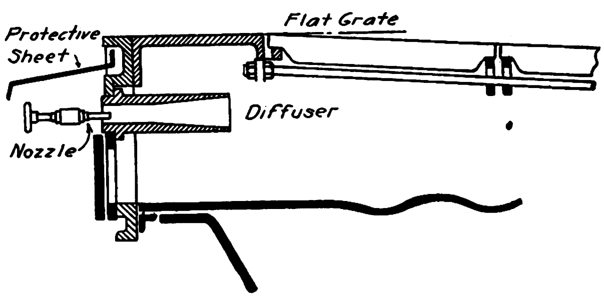

Fig. 3.—Steam-Nozzle Underfed Stoker.

with fine coke, when either a grate with small interspaces may be used or, preferably, a so-called nozzle grate bar designed substantially as shown in Fig. 2.

In order to raise the air pressure under the grate the steam nozzle is led into the smaller end of a conical tube, a diffuser, whereby the air compression is raised from 0.6 in. to 0.8 in. of water. As shown in Fig. 3, the air suction occurs through the ring-shaped space between the nozzle and the tube. In accordance with the size of the furnace, one or more nozzles may be used side by side.

MAINTENANCE COSTS OF ECONOMIZERS A SMALL MATTER.

The economizer is finding rapid application in power plants since the fuel economy accompanying its use comes to be better appreciated. Central stations where the load-factor is relatively high, where higher steam pressures are in vogue and high rates of steam making are employed and special attention is being given to economical use of station auxiliaries, especially are taking to the economizer.

In some quarters there seems to be a misapprehension as to the cost of economizer maintenance. As a matter of fact the cost of maintaining economizers has been found to be remarkably low. One of the largest economizer manufacturers recently made the statement that covering one million dollars' worth of economizers, the average cost of maintenance for the first ten years was believed to be well under one-half of one per cent of the investment.

Contractor-Dealer

Suggestions for Boosting the Sales of Electric Sewing Machines — Details of Window Displays Deserve Attention

SPEEDING UP SALES OF ELECTRIC SEWING MACHINE MOTORS.

Timely Suggestions for Stimulating Interest in Sewing Machines and Other Electrical Devices.

It will soon be the season for the annual fall sewing. It is a time of worry and confusion for the average housewife, and anything that will lighten her labors at this busy period is sure to receive careful consideration. This, then, is the time to push the electric sewing machine motor and by means of catchy ads, supplemented by window displays that show the advantages of this convenient device, work up a satisfactory business in them.

One of the cleverest of electric sewing machine ads noted recently was that of Eatons, the Big Store, of Toronto, Canada. At the top was the cut of a young woman operating a motor-driven machine and beneath it:

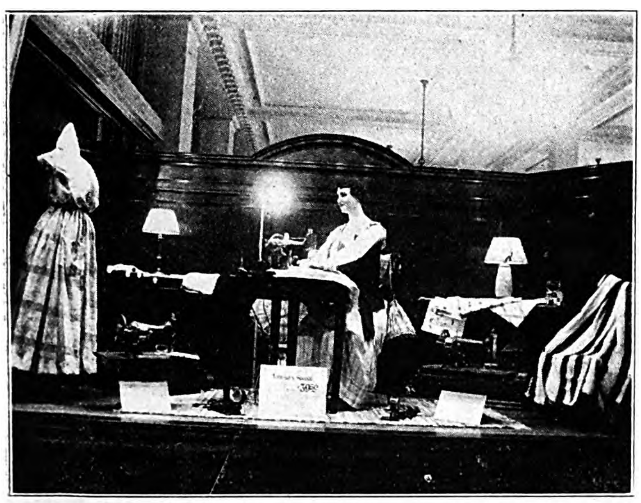
> IF THE MAN FROM MARS MET SISTER SUSIE
>
> the chances are he would demand to know why she carried such a monstrous hand bag. And casting about for an answer that would satisfy this most curious individual, it is as likely as not that dear Susie would reply that the ELECTRIC SEWING MACHINE at her sewing society turned out such a quantity of garments per hour that it was necessary to have a receptacle as big as Aunt Samanthy's carpet bag to take home an afternoon's work for the finishing stitches.
>
> Nor would she be wandering far from the truth in making such a statement, for truly it is the achievement of one of these popular portable ELECTRIC SEWING MACHINES which makes it so popular.

The window display that would complement this ad very effectively was arranged by the Philadelphia Electric Co. The window represented a sewing room, floored with a rag rug. In the background was a clothes chest covered with cretonne, and near it a chair over which was thrown a new fall frock. At one end of the room, on a dress form, was a creation in the process of making. Close by was a table on which lay a paper pattern, several partly cut out garments and an electric pressing iron, together with an electric lamp with adjustable shade. Down front center was an electric sewing machine operated by a young woman in smart frock, and at either side of her were other electrically operated machines. Several cards scattered through the window called attention to the advantage of the motor driven sewing machine: "The cost of electric current for operating this machine continuously for an hour is one-half cent," "This electric sewing machine is guaranteed for five years." Such a display would be easy to arrange, borrowing the dresses from any convenient dry-goods store.

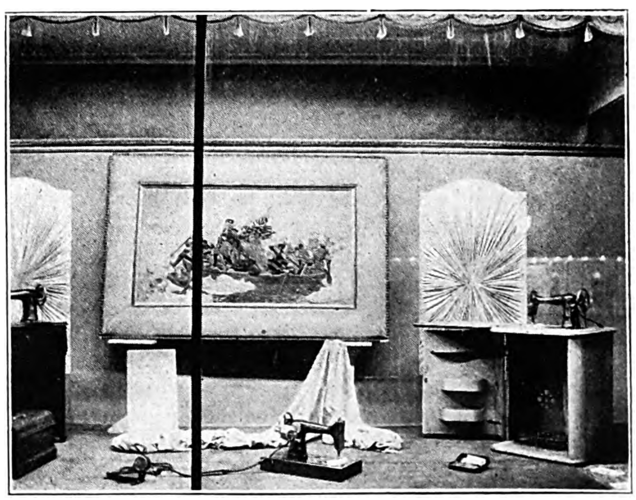
At this season of the year the housewives are thinking not only of fall sewing but fall house cleaning, and a campaign showing the value of electric aids is therefore decidedly timely. Barker Bros., Los Angeles, Cal., conducted a very successful one. In order to arouse interest in the start, they placed a small ad in the paper:

> HOW MANY TIMES CAN YOU WRITE OUR NAME ON A CARD?
>
> A series of prizes will be given to the persons writing it the greatest number of times, in a legible manner, without writing over or across other letters. Come in and ask us about it.

This announcement piqued the curiosity and scores came to the store to learn about the offer. Each inquirer was handed a card with the name of the firm printed at the top, the remainder of the space being left free for the contestant to exercise his skill. On the opposite side was printed: "Write the names of three electrical household appliances which you do not possess." The rules of the contest were simple. All writing must be done with ink; all words must be



Clever Sewing Room Display Used to Show the Utility of Electrically Operated Household Devices.



Picture Made on Motor-Driven Sewing Machines Attracts Attention to Display.

legible: all cards must bear the name and address of the writer, together with the names of three electric household conveniences. These addresses were tabulated and the writers circularized with pamphlets describing the advantages of the electric articles mentioned on their cards. The prizes were electric household necessities, which were displayed in the show window.

This contest was followed by a series of concise pointed newspaper advertisements, adorned with cuts of a vacuum cleaner, a sewing machine motor and an electric washing machine operated by young matrons in morning dresses. Their forceful ad follows:

LET MODERN ELECTRIC EQUIPMENTS MAKE MORE SPARE HOURS FOR YOU.

This, of all times and seasons, is ideal for the outfitting of your home with modern household machinerey that will make life easier and happier, save time and strength, conserve food and fuel, facilitate your spring house cleaning and help you to work longer and more zestfully.

COME TO BARKERS.

Let us show you how quickly, easily and pleasantly you can do all your housework with better equipment—electrical, of course.

THESE ARE THE IMPORTANT TIME-SAVING NECESSITIES.

Electric Sewing Machine Motors.
Electric Vacuum Cleaners.
Electric Washing Machines.

The window was fitted up as a sewing room, in which sat a woman busily engaged making a child's dress, using an electric motor to operate the machine. A card suggested, "One can run this sewing machine all afternoon without fatigue, as it requires head power instead of foot power to operate it."

Another excellent display of the use of the motor-driven sewing machine was arranged by the W. C. Munn Co., Houston, Texas. This showed a room with buff background and gilded fixture molding all around the wall. Set in the wall at either side were two panels of shirred silk of steel gray. At one end was a long French window with similar shirred panels. In the center background set on two gilded supports was a huge picture of brocade bound in gold, containing a picturization of "Washington Crossing the Delaware." A card advised, "Picture done entirely in colored silk thread and make on a regular sewing machine." At either side were sewing machines and cabinets and down in front a sewing machine with motor attachment.

Perhaps the most striking of any of the recent displays, however, was that of the Brush Power Co., Galveston, Texas. The two glass sides of the window had painted on them a succession of red interrogation points a foot high. A sign suspended above the heads of spectators inquired, "Which way do you sew?" First was shown an old-fashioned sewing machine run by foot power, with a card, "The Old Way—Pedal, pedal, on the treadle. Tires you out and makes sewing a drudgery. The machine is heavy, takes up valuable room and is always in the way." By its side was shown a portable electric motor sewing machine and case, likewise with a card, "Portable sewing machine, no bigger or bulkier than a typewriter. Easy to operate. Out of the way when you are not using it—unobtrusive when you are." Other catchy cards were scattered through the window and shown inside the store, where a demonstration was given twice daily of the beautiful, easy and rapid work done on this modern sewing machine. The cards stated, "The modern way." "With an Electric Sewing Machine you can sew in any room of the house, upstairs or down." "It requires no effort—makes sewing a real pleasure." "Just attach the cord of the motor to your electric light socket and you are ready to work." Attention was called to a speed device by a red cardboard arrow pointing to it on which was printed in black letters, "This is the speed treadle—You work it with your foot—Just press a little harder when you wish to sew faster." Outside the window was a little rack containing folders describing the new machines in detail and a card above the holder gave the invitation to "Take One."

WHY WINDOW DISPLAYS SHOULD BE COMPLETE.

The Skeptic Is Always Ready to Grasp Any Opening and Spoil Effect.

In every crowd of people there is always one loud-mouthed skeptic who is sure to voice his sarcastic opinions, whether they are correct or not, in an endeavor to create a doubt in the minds of the rest of those present. On the other hand the average person who is ready to accept things at their face value until he is convinced otherwise is very slow to voice his opinions or take up sides with the skeptic unless he is absolutely sure of his convictions and has some personal interest at stake.

This condition especially applies to window displays and advertising. Here the skeptic holds forth in all his glory confident that no one will contradict him. The dealer is busy inside the store or the advertiser miles away and the skeptic's arguments stand alone. Moreover the impression created by his insidious remarks are very difficult to overcome unless corrected on the spot.

The influence of such persons was demonstrated recently at a display of gas appliances. The display was both unique and attractive and drew quite a crowd before the window at all times. It was arranged so that the apparatus shown inside the windows could be operated by anyone in the crowd from the outside and the actual operation of the device could be watched. At this particular time the traffic along the street was very light, but still a crowd of about 10 people were in front of the window, all interested in the device being displayed.

Then the skeptic came. He operated the device once, watched the responding action of the apparatus on the inside and then exclaimed in a voice loud enough to be heard by all, "It looks all right, but it would eat you out of house and home to use it. I know, you can't show me." and walked scornfully away. Immediately all but two in the crowd assumed the same expression and left the display.

One of the two that remained turned to the other and said, "That fellow's all wrong. I own one and the service cost is nothing when compared with the convenience afforded, but, I'm not selling them." The other laughed, he was interested but not a prospect. However, it is reasonable to assume that some of the others were prospects who would require some real salesmanship and a great deal of trouble to convince them now that the skeptic was wrong.

Had the window decorator inserted a small card in the window stating the approximate cost of operation there would have been no argument and probably some sales would have been made that were otherwise lost.

New Appliances

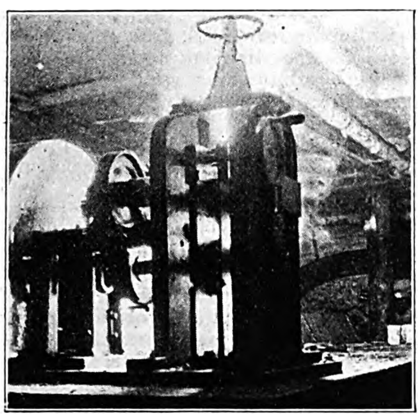
Machine for Stripping Scrap Power and Light Cables Increases Salvage Value Greatly — Electric Stucco Machine

Cable-Stripping Machine Lowers Labor Cost.

The cable-stripping machine illustrated herewith is used by one of the largest central-station companies in the Middle West in reducing its junk cable to marketable form. Prior to its design and use this work had been done by hand labor which was slow and rapidly becoming too expensive, due to increased labor costs. The necessity for a more efficient method of doing this work resulted in the planning and construction of a machine for the particular purposes of cable stripping.

Large companies have found that the "pull in" and "pull out" method, with respect to their transmission and distribution cables, is best both from an economic as well as an operating standpoint. Naturally a large amount of wire and cable finds its way to the scrap pile, which should be turned into money with very little delay.

The disposition of the lead and copper at the best market values then becomes a matter of consideration. It has long been known that in selling mixed lots of copper and lead, the return is apt to be disappointing unless the exact amount of each is known. This can rarely be stated to the satisfaction of both buyer and seller when the lead, copper and insulation are combined in the cable. At the same time advantage cannot be taken of market conditions which at any particular time might be low for lead but high for copper and vice versa. Unless the cable can be separated into its several parts the selling must be done at a loss.



Cable-Stripping Machine.

Fortunately this new machine separates the parts into almost the pure form which allows them to be disposed of advantageously. It cuts the lead and insulation from the copper conductor, by means of two circular knives or cutters, the distance between their centers being adjustable. They are set to cut two slits in the cable, on opposite sides of it as it passes between the cutters. These knives are keyed to the shaft, can be taken off, sharpened or renewed whenever necessary. The distance between centers of the knives is adjusted by means of the hand wheel on top of the machine, and it is necessary to adjust this according to size of the cable which is being stripped. On both sides of each cutter separate cylinders are mounted which support short prongs for the purpose of digging into the cable sufficiently to pull it through the machine. Single-conductor cables are disposed of by passing through once only, but with three-conductor cables the first cut takes off only the lead and the outer belt of insulation. Each insulated conductor is then passed through to separate the copper from the insulation. It has been found that lengths of cable not over 10 ft. can be handled easiest, and where necessary it is the work of a few seconds to cut a cable into 10-ft. lengths. The lead and copper can then be stacked up separately ready for sale.

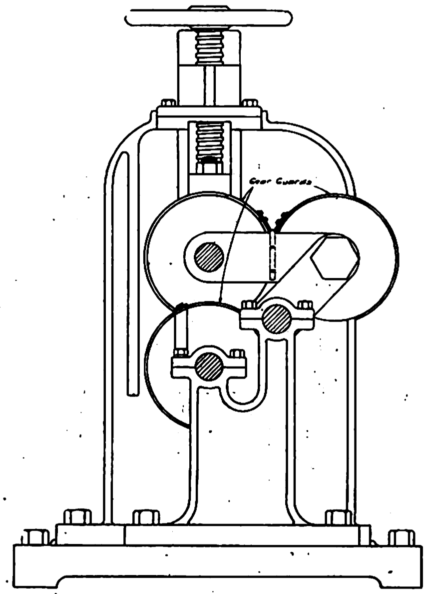
Cambric insulation, or oil-impregnated paper is used in the heating furnace and makes excellent fuel.

No cable smaller than No. 0 is put through the machine, because of the extremely small saving in the case of smaller cables makes it appear doubtful if there is any economy at all in stripping them. They are sold as junk lead.

This apparatus can be located at a central tool room where help is obtainable at odd times and where extra supervision is not necessary. Two, three or four men can work efficiently with this machine. A larger number are apt to interfere with each other and raise the unit cost somewhat. Where four men work at it, two men ordinarily carry up and feed the cable through the machine. One of the other two takes care of the lead and the fourth man carries away and stacks up the copper.

The machine is mounted on a table about 3 by 10 ft. by 30 ins. high. It receives its power from a 2-hp. d.-c. shunt motor mounted on the underside of the table, and belted to the stripping machine. A belt guard absolutely encloses the pulley and the belt so there is no danger of clothing getting caught and accidents happening through negligence. Guards enclose the other gears making the machine very safe even with help unaccustomed to working around machinery. A starting box and safety enclosed switch are included in the outfit and are mounted so as to be immediately at the hand of the man who is feeding the cable into the machine.

For centering different sizes of cable with respect to the knives, two guides were found necessary. They consist of flat plates hinged at the bottom, the distance between them being adjusted by means of a small hand wheel at the side of the machine.



Side Elevation of Cable-Stripping Machine.

The copper which is used in the manufacture of cable is pure to a high degree and when separated by this process is, with the exception of a small amount of oil adhering to the copper, as pure as the original. It is sold for the same price as scrap copper, which is approximately 85% of the market price for ingot copper. The lead is sold without further treatment at about 75% of market price for pure lead.

Electric Stucco Machine.

Putting on stucco with an electric machine now makes easy work of what is usually regarded as a difficult and tiresome job. With the help of an assistant who attends to the supply of stucco in the hopper, the operator can cover space rapidly with the Hodges stucco machine. The spider blades revolve at the rate of 1500 r.p.m. The force with which the material is thrown brings to the surface of this material an ooze of moisture or film of water that causes a skin or enamel to form, leaving a surface impervious to moisture.

Trade Activities

Hemingway Glass Combines Offices — Holtzer-Cabot Employes Receive Gift for Ten Years' Service — Literature

The Trumbull Electric Manufacturing Co., Plainville, Colo., is sending out circular No. 39, containing data on Circle "T" wire connectors for stranded, and solid and stranded cable.

Chicago Mica Co., Valparaiso, Ind., has recently acquired the services of L. T. Frederick as consulting engineer and production manager. Mr. Frederick was formerly process engineer of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., and has had a broad experience in the manufacture and application of all lines of electrical insulation.

Beardslee Chandelier Manufacturing Co., Chicago, is sending out a new trade discount sheet, effective Sept. 15, and applicable on catalogs S-5, No. 20, No. 22 and S-4. Due to the continued advance in all commodities used in the manufacture of chandeliers, the company has been compelled to withdraw all previous prices, discounts and quotations. While the new discounts are subject to change without notice, the company is reasonably sure, with the work being done to reduce costs, that there will be no further advance in prices this year.

American Steam Conveyor Corp., Chicago, in its latest illustrated folder asks its prospective customers the pertinent question, "Have you ever counted the cost of moving ashes from boiler plant to bin or pile?" The folder advances in a very logical way, arguments favoring the use of an American steam ash conveyor in power plants, and shows the savings that can be accomplished through its use. The company has also published a book of 160 pages on "Modern Methods of Ash Disposal," which contains much valuable engineering data and should be of special interest to engineers, superintendents or owners of power plants.

The Holtzer-Cabot Electric Co., Roxbury, Boston, Mass., recently presented a gift of $100 to every man and woman who had been in the employ of the company for ten years or more, and in recognition thereof they presented a testimonial to the president. It contains an expression of thanks of the generous recognition and the good feeling that has always existed between the officials of the company and its employes. The testimonial bore the signatures of all who were recipients of the gift and also recorded the number of years of service of each employe. Heading the list of male employes was the name of J. George Rick with 44 years of service with the company, and Miss Jennie L. Conroy heading the list of ladies with a record of 31 years.

Engineer Co., New York City, is distributing a 15-page book which has for its title "The Development of an Idea." This publication, 8x11 ins. in size, is devoted to a discussion and explanation of Turner baffle walls and shows installations of these baffles. It is well illustrated and includes an efficiency chart showing the savings that may be secured by the improvement of CO_2 and of flue gas temperatures.

Berthold Electrical Manufacturing Co., Chicago, has recently issued a new folder on its electric washing machine, and offers a solution to the problem of "Blue Monday," lessening the drudgery of washday which has ever been a source of work and worry to the housewife. Not only is this machine claimed to wash clothes but to launder them like new. The Berthold electric is a compact, motor-driven machine operated on the revolving cylinder plan, made possible by reversing mechanism. This the company claims is a big feature and the result of the continual reversing is that a washing is completed in a time much shorter than that required by many other machines on the market today.

Buda Co., Railway Exchange building, Chicago, manufacturer of "Buda" motor and supplies for mill, mine and railroad, has issued a very interesting booklet entitled "The Buda-Ross Electric Light Plant." The booklet shows in an attractive and instructive form, the one kilowatt and the one-half kilowatt steam turbogenerator electric light plant manufactured by the company for lighting small industrial plants using a steam boiler, small steam boats, dredge boats, steam shovels, well drilling rigs, small mines, small saw mills, cotton gins, and any other industry using a steam boiler where the lighting requirements do not run over one kilowatt. The Buda Co. began the manufacture of small steam turbogenerators for locomotive headlight service about six years ago. It has been adopted by many industries and the demand for this kind of a lighting plant has grown to such an extent that the company has made some recent improvements in it, enlarged the facilities for production, and will market it generally through dealers as one of the main lines of Buda products. This booklet will be furnished upon request to the company.

Major Equipment Co., Inc., Chicago, Ill., is distributing a 16-page booklet which has for its subject "Better Lighting Effects in the Theater" as provided through the application of Major pre-selection system of remote control. This booklet presents a description of the elements of the Major system, which meets the most rigid safety rules of municipal authorities and safety boards, and explains the operating mechanism of this equipment. The system is recognized by theater authorities as one of the highest developments offered for producing lighting effects and giving the service required by present-day theaters. A number of the installations of Major boards and control are described in detail in this publication.

Hemingway Glass Co., manufacturer of glass insulators, which heretofore mantained a factory at Muncie, Ind., and offices at Covington, Ky., has combined the Covington offices with the office located at the factory at Muncie, effective Sept. 8.

E. B. Badger & Sons Co., American Spray Department, Boston, is distributing Badger Service bulletins Nos. 100 and 102. The first deals with the cleaning and cooling of air with sprays as applied to the generator, laying particular stress on the advantages from an operating standpoint of a supply of cool, clean air for generator use. The second publication has for its subject "Cooling Water with Sprays" and describes a spray cooling system which meets the demand for an efficient dependable and inexpensive method of cooling water for condensers, ice plants, cotton and cement mills, or in fact, any industry requiring an abundant supply of cold water. Detailed and illustrated descriptions of this equipment are contained in both publications and views of typical installations are shown.

Roller-Smith Co., 233 Broadway, New York, is distributing new publicity matter describing a number of its products. Bulletin sheet No. 96, revised May 1919, contains a detailed description of the Columbia induction watt-hour meters for alternating current, switchboard type, and switchboard type instrument transformers. Another bulletin (No. 100) has for its subject Roller-Smith electrical instruments for signal system testing, including direct and alternating current portable volt-ammeters and direct reading portable ohmmeters. In this publication is introduced the new "Handy S. S." type of direct-current volt-ammeter. This instrument is small, compact and entirely self-contained, and is recommended for maintenance work where cost and size are paramount. Large numbers of these instruments are in constant service, and they are looked on with increasing favor because of their dependability. They are of rugged construction and will withstand much abuse without losing their accuracy.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

New Bedford, Mass.—In connection with the construction of the proposed hotel building by the New Bedford Hotel Co., to be located at Middle, Pleasant and Foster streets, to cost $1,000,000, considerable electrical equipment will be required. Clinton & Russell, 32 Nashua street, New York, are architects for the company.

Watertown, Mass.—Engineer F. D. Smith, Ashburton Place, Mass., has prepared plans for $15,000 improvements for water system. Electric pumping apparatus will be purchased. Metropolitan water and sewerage board, Ashburton place, Boston, owner.

Hartford, Conn.—Hartford Electric Light Co. has commissioned Stone & Webster, Boston, to prepare preliminary plans for a generating plant station with a capacity of 100,000 kw. or 125,000 hp. to be located on the Connecticut river in that city. The proposed plant is to be more than three times the size of the present plant at Dutch Point.

South Norwalk, Conn.—In connection with the new plant to be erected by Crofut & Knapp, South Norwalk, on Van Zandt street, East Norwalk; plans have been prepared for the construction of a power plant, 60x150 ft. for factory operation. Ground has recently been broken for the initial work on the main manufacturing building, which will be a five-story structure, about 60x300 ft. It is understood that upon completion of the work the company will concentrate operations at the new plant.

Binghamton, N. Y.—Work has recently been completed and operation inaugurated on the new electric street-lighting system extending from Court to Lewis street on State street. Lighting units of 250 cp. are utilized.

Binghamton, N. Y.—Bids have been taken by the State Hospital Commission, Albany, E. S. Elwood, secretary, for the construction of the proposed power plant at the Binghamton State Hospital.

Binghamton, N. Y.—Paul A. Hilbert Co., Newark, N. J., operating an electrical contracting establishment, has completed plans for the opening of a new local branch.

Central Islip, N. Y.—State Hospital Commission has awarded a building contract to Benjamin Rayner, Locust Avenue, Islip, L. I., for the construction of the proposed power house at the State Hospital, Central Islip. The structure will be about 80x120 ft., and is estimated to cost, with equipment, about $150,000. Lewis F. Pilcher, Capital building, Albany, is state architect.

Lockport, N. Y.—Lockport Light, Heat & Power Co., 111 Main street, has filed application with the Public Service Commission for permission to revise its rates for electric lighting and power service.

New York, N. Y.—In connection with the proposed four-story and basement plant, 90x200 ft., of the Mint Products Corp., 949 Broadway, to be erected at Port Chester, N. Y., at a cost of about $350,000, considerable electrical and mechanical equipment will be required.

New York, N. Y.—Victory Battery Co., Inc., 30 West Houston street, has filed notice with the Secretary of State of an increase in its capital from $20,000 to $30,000, for business expansion.

New York, N. Y.—Board of Managers of the Fordham Hospital, South boulevard, have had plans prepared for the construction of a new one-story brick power plant, about 46x86 ft., at the institution, estimated to cost $5000.

New York, N. Y.—Wilson Maulen Co., 781 East 142nd street, manufacturer of pyrometers and kindred specialties, has had plans prepared for the construction of a new three-story brick plant, about 50x100 ft., for increased operations.

Poughkeepsie, N. Y.—Smith Bros., North Hamilton street, are taking bids for the erection of the proposed plant at Michigan City, Ind., estimated to cost $250,000. The works will comprise main manufacturing building, supplemented by a power plant for factory operation. William P. Field, 763 Broad street, Newark, N. J., is architect for the company.

Utica, N. Y.—Board of Managers of the Utica State Hospital, State Hospital Commission, E. S. Elwood, secretary, is having plans prepared for the construction of a new power plant at the institution. Lewis F. Pilcher, Capitol building, Albany, is state architect.

White Plains, N. Y.—American Traction Ring Co. has filed notice with the Secretary of State of an increase in its capital from $10,000 to $150,000.

Bloomfield, N. J.—Sprague Electric Works of the General Electric Co. has recently inaugurated work on the construction of a new addition to its plant on Lawrence street. The structure is estimated to cost about $15,500. Salmond Brothers, Elm street, Arlington, have the erection contract.

Butler, N. J.—Borough Council is planning for the installation of a new electric lighting system along Carmonton road, Bloomingdale. Plans for the proposed work are now being prepared.

Irvington, N. J.—Yocum Chemical Co., 325 Academy street, Newark, has awarded a contract for the construction of a new one-story factory and boiler plant, about 40x117 ft., to be located at 168-78 Coit street, Irvington.

Kearny, N. J.—Contract has been awarded by the Ford Motor Co., Detroit, Mich., to the Lord Electric Co., 105 West 40th street, New York, for electrical work in connection with the construction of its large new local assembly plant.

Newark, N. J.—J. Brochie & Co., Inc., 8 Railroad place, is having plans prepared for alterations and improvements in its boiler plant and works at Llewellyn avenue and Fulton street, Bloomfield, to cost about $30,000.

Trenton, N. J.—Harry E. Stahl, Trenton, has submitted a low bid to the city commissioners for the installation of electric, steam and hydraulic apparatus in the municipal pumping station of the city waterworks on Calhoun street, at $108,941.

Wanaque, N. J.—Active plans are in process of formation by the Borough Council for the installation of the proposed electric street-lighting system throughout the borough. Contract for furnishing service for operation was recently awarded to the Tri-County Electric Co., Pompton Lakes.

Allentown, Pa.—In connection with the plans and specification now in course of preparation by the City Council for the installation of a new sewage disposal plants, pumping stations, etc., considerable new electrical and mechanical equipment will be required.

Allentown, Pa.—Lehigh Navigation Electric Co. has filed with the Public Service Commission a new schedule of rates for service, effective Oct. 1, 1919. The new tariff eliminates from the schedules for wholesale power at 110,000 volts, and for service to public service electric light and power companies, the "coal clause" making corresponding changes in energy rates.

Catasauqua, Pa.—A street lighting system will be established. Address Daniel Gillispie, Borough Secretary.

Gettysburg, Pa.—At the November election the question of issuing $50,000 municipal light bonds will be submitted to vote.

Harrisburg, Pa.—Western Union Telegraph Co. has filed application with the Public Service Commission for permission to remove the overhead wires in the central and eastern parts of the city by way of Cameron and Paxton streets, and the installation of underground conduit system to replace the present facilities.

Kittanning, Pa.—Public Service Commission has denied the application of the Borough Council for permission to construct a municipal water plant. It is held that the building of a new plant would be a duplication of the facilities of the Armstrong Water Co., and would necessitate the expenditure of about $300,000, which would exceed the limit of indebtedness allowed the municipality.

Morrisville, Pa.—Mechanical and electrical machinery will be installed in the new sewerage disposal plant to be constructed by the Borough Council, at an estimated cost of about $200,000. Thomas F. Bovie, engineer, will prepare plans and specifications.

Morrisville, Pa.—Plans are under consideration by the Borough Council for the issuance of bonds for $40,000 for the installation of a new municipal water supply and distributing system. The State Board of Health is interested in the proposed work.

Philadelphia, Pa.—Rockland Hosiery Co., Kensington avenue, is taking bids for the erection of a new boiler plant and factory building, for increased operations. It is understood that an administration building will also be constructed, the entire work being estimated to cost $100,000.

Philadelphia, Pa.—Wirt Co., Arma and Lena streets, manufacturer of electrical specialties, has prepared plans for a new plant, two stories, 62x158 ft., to cost $60,000. Charles Wirt is president.

Philadelphia, Pa.—Department of Public Works has received bids for the furnishing and installation of four new turbo-centrifugal pumping units at the Queen Lane pumping station of the city, to have a capacity of 40,000,000 gals. each every twenty-four hours. The new units will replace the present equipment comprising one pump, 25,000,000-gal. per day capacity and four pumps of 20,000,000 gal. each installed some few years ago. It is also proposed to make other extensions and improvements in the municipal water system.

Reading, Pa.—It is interesting to note that the Metropolitan Edison Co. has received contracts for the wiring of 145 old residences for electric service during the month of August.

York Haven, Pa.—York Haven Water & Power Co. has been granted permission by the Public Service Commission to construct a new electric transmission line from Middletown to Annville.

Wilmington, Del.—Sun Telephone & Telegraph Co. of Mississippi, a Delaware incorporation, has filed notice with the Secretary of State of an increase in its capital from $50,000 to $150,000, to provide for general business expansion.

Wilmington, Del.—Delaware Marine & Motor Co. has had plans prepared for the construction of a new machine shop at the foot of Commerce street, for increased operations.

Wyoming, Del.—Wyoming and Camden have voted unanimously for a $10,000 bond issue for the purchase jointly of the water works and electric light plant.

DATES AHEAD.

Iowa State Association of Electrical Contractors and Dealers. Annual convention, Sioux City, Iowa, Sept. 22 and 23. Secretary, F. Bernick, Jr., Oskaloosa, Iowa.

New England Section, N. E. L. A. Annual convention, New London, Conn., Sept. 22-24. Headquarters, Hotel Griswold. Secretary, Miss O. A. Bursiel, Boston, Mass.

Association of Iron and Steel Electrical Engineers. Annual convention, St. Louis, Mo., Sept. 22-26. Secretary, John F. Kelly, Empire building, Pittsburgh, Pa.

American Electrochemical Society. Fall meeting, Chicago, Sept. 23-26. Headquarters, Congress Hotel. Secretary, Prof. Joseph W. Richards, Lehigh University, Bethlehem, Pa.

International Association of Municipal Electricians. Annual convention, Chicago, Sept. 23-26. Secretary, Clarence R. George, Houston, Tex.

Northwest Electric Light and Power Association. Annual convention, Seattle, Wash., Sept. 24-27. Secretary-treasurer, George L. Myers, Portland, Ore.

Empire State Gas and Electric Association. Annual meeting, Buffalo, N. Y., Oct. 24. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

Baltimore, Md.—Baltimore County Electric Co. plans the immediate construction of a new one-story pumping plant at Towson, Md., to cost about $15,000.

Baltimore, Md.—Maryland Casualty Co., Baltimore street and Guilford avenue, is having plans prepared for the construction of a new electric power plant to be used for operation of its printing works.

Baltimore, Md.—In connection with the proposed plant of the Eastern Rolling Mill Co., estimated to cost in excess of $5,000,000, all equipment throughout will be electrically operated, power to be supplied by the Consolidated Electric Light, Gas & Power Co. The company has awarded a contract for the main manufacturing building of the initial unit, to be about 360x1000 ft., estimated to cost $500,000. It is proposed to have an annual capacity of about 60,000 tons of steel sheets, to be used mainly for the production of automobile bodies, as well as for manufacturing stoves, etc.

Baltimore, Md.—Baltimore Gas & Electric Co. is operating its various electric plants at capacity. The company is making extensive improvements and additions at its generating station at Westport to increase the present capacity from 80,000 to 160,000 hp.

Chesapeake City, Md.—United States Government is considering plans for the construction of an additional pumping plant for the Chesapeake & Delaware Canal, to provide sufficient water for the dredges operating in the canal and for the additional locks. At the present time one pumping station is already in operation at the site, but it is proposed to utilize two hydraulic dredges which will require a larger quantity of water than now supplied. The new plant will be designed to have a capacity of 50,000,000 gal. of water daily, and will be electrically operated.

Union Bridge, Md.—Union Bridge Electric Manufacturing Co. is understood to be considering plans for the extension of its transmission lines to New Windsor, Taneytown, Legore, Key Mar, Middleburg, and New Midway, to provide for increased operations.

Richmond, Va.—Tower-Binford Electric & Manufacturing Co., Fourth and Cary streets, is planning for the erection of a new one-story building, 90x116 ft., for the manufacture of electrical fixtures, to cost about $35,000.

New Cumberland, W. Va.—West Virginia-Pittsburgh Coal Co. is considering plans for the construction of a new electric power plant at its local properties. In connection with other improvements to be made at the works, the total cost is estimated at approximately $100,000.

Greensboro, N. C.—North Carolina Public Service Co. is considering plans for the installation of new ornamental street-lighting standards. The removal of the present overhead wires is included in the plans.

Murphy, N. C.—City has approved a bond issue for $100,000 to cover the cost of the installation of a new electric lighting system.

Laurens, S. C.—An election will be held to vote on the question of issuing $25,000 water, light, and school building. Address mayor.

Sumter, S. C.—City has recently completed negotiations for the purchase of a number of buildings to be used as a site for the electric light and ice plants for municipal service. It is proposed to make extensive improvements followed by the installation of turbine, condenser, stoker, boiler and spray cooling equipment, as well as boiler feed pumps and auxiliary apparatus, the entire work being estimated to cost about $90,000.

Varnville, S. C.—F. L. Moxon, Varnville, is said to be considering plans for the construction of a new local electric light plant.

Daytona Beach, Fla.—Nelson Mounts has received an electric light and power franchise.

NORTH CENTRAL STATES.

Minerva, Ohio—Architect Froelich-Emery, 412 Second National Bank building, Toledo, has prepared plans for $50,000 power plant to be erected by village of Minerva. The building will be 40x120 ft. in dimensions, brick and concrete construction, steam heating, brick interior finish, electric lighting. Address R. A. Penneth Mayn, Minerva.

Anderson, Ind.—Union Traction Co. of Indiana has arranged for improvements totaling $100,000 at the Anderson central power station. New boilers are being placed in service and the turbine electric elevators are being overhauled.

Brazil, Ind.—Prox & Burgett, Terre Haute, Ind., have the contract for the lighting and heating systems for the new high school building at Bridgeton, Ind. Urban & Apple, Brazil, Ind., have the contract for the general construction of the building for $38,000.

Indianapolis, Ind.—J. D. Hunt Manufacturing Co. has increased its capital from $7000 to $15,000.

Indianapolis, Ind.—State purchasing committee has awarded to the Indianapolis Electrical Supply Co. a contract for providing the state institutions with electrical apparatus for the coming year. The contract is drawn up on a cost plus 11% basis. The state purchases about $11,000 of electrical supplies annually.

Logansport, Ind. — Logansport Utilities Co. has been formed for the purpose of taking over the Logansport Heat & Power Co., which is now in the hands of a receiver. This company will provide heat for many of the business houses, electric light for commercial and residential use and power to industries.

Chicago, Ill.—Architect Charles W. Kallal, 1012 City Hall, has prepared plans for $300,000 electric plant to be erected by the city. The building will be 80x86 ft. in dimension, steam heating, plumbing, fireproof roofing, fireproof interior finish, engine and transformer, electrical equipment. Address R. F. Francis, 401 City Hall.

De Kalb, Ill.—The contract for the installation of a boulevard system of lighting in the Horsech addition, which includes that part of the city from Locust and Linden around College was let to Philip Swanson for the sum of $5444.30, the cost to be covered by special assessment.

Galena, Ill.—A new 33,000-volt transmission line will be built to connect the lines of the Interstate Light & Power Co. at Shullsburg with the lines of the Lena Electric Light & Power Co. near Apple River, a distance of about 10 miles. Under a ten-year contract electric energy will be furnished the Lena company for distribution in Apple River, Warren, Nora, Lena, Pearl City, Shannon and Lanark, Ill.

Hillsboro, Ill.—Engineers have been engaged at the Hillsboro plant of the Southern Illinois Light & Power Co. with plans for the installation of additional machinery to double the capacity of the plant.

Marseilles, Ill.—Latimer & Hoenshall have opened a new electrical merchandise store in this city.

Port Byron, Ill.—Coe Light & Power Co. has petitioned for authority to issue $6000 of capital stock and to construct a telephone line. Address S. L. Woodford, Port Byron.

Rock Island, Ill.—City will install 11 additional street lamps at a rate of $21 a year each. The new lamps are to be tungsten in variety and will be installed as a result of a contract made a few months ago with the Peoples Power Co. for arc street light service for $55 instead of $60 each year as was paid under the old contract.

Rock Island, Ill.—Rock Island Brake Shoe & Foundry Co., with capital of $100,000, has been organized by M. I. Morris, Hyman Lewis and Simon Lewis.

Taylorville, Ill.—The council is considering the matter of establishing a municipal light plant, unless the Central Illinois Public Service Co. does something that is in some degree satisfactory to the committee of the city council and the citizens heat committee. Further definite steps will be taken. Address Mayor Downee.

Urbana, Ill.—The contract for the ornamental lighting system in the southwest part of the city, adjacent to the campus of the University of Illinois, has been awarded to Freeman Sweet Co., of Chicago, at a bid in excess of $26,000.

Woodstock, Ill.—The Woodstock municipal lighting plant for the year 1918 showed profits of $11,774.69 at a selling figure of 6.429 ct. per kw-hr. The plant in 1917 showed a profit of $13,767.30 at a selling rate of 5.914 ct. per kw-hr.

Flint, Mich.—Lot owners on the new Flint Country Club voted to proceed immediately with the installation of water, sanitary sewers, storm sewers, gas, electricity, and telephones, the work to be done under the supervision of the city engineer and the public utilities company at an estimated cost of $226,000. The estimated cost of the various improvements are, gas, $25,000, electricity, $50,000, telephones, $30,000.

Adams, Minn.—The city will vote at special election for electric light plant. B. H. Carr, village clerk.

Alden, Minn.—At a special election held recently $8000 were voted and carried for electric light and power for village of Emmons. Contracts made with Minnesota Gas & Electric Co.

Jackson, Minn.—Jackson Light & Traction Co. will improve its railway and electric light plant. Address L. O. Gordon, general manager.

Minneapolis, Minn.—The new 33,000-hp. steam turbine which the engineering department of H. M. Byllesby & Co. has been installing in the Riverside Station of the Minneapolis General Electric Co. has been completed and turned over to the operating department. This generating unit brings the capacity of the Riverside Station up to 70,000 hp., or more than four times as great as in 1911. The business of the company has grown so rapidly that the peak load at the present time often exceeds the greatest peak in the company's history which occurred last December.

St. Paul, Minn.—It is reported that a $150,000 paint factory will be constructed by the Mutual Paint Co. on land recently purchased. The capacity of the plant will be about 5000 gals. daily.

La Crosse, Wis.—Western Wisconsin Telephone Co. will install copper metallic circuit from Centerville, Minn. to Winona, Minn., and contemplates extending lines to Trempealeau Valley and Beaver Creek Valley. Address L. H. Dodge, manager, 127 North Fourth street.

Racine, Wis.—Racine Auto Tire Co. will build a power house to generate current for its factory. Address Menzel & Becker, Baker building.

Grinnell, Iowa—Iowa Light, Heat & Power Co. will extend its electric transmission lines to points in O'-Brien county.

Ottumwa, Iowa—Agency, Iowa, has been added to the lines of the Ottumwa Railway & Light Co. The service was inaugurated on Aug. 28.

St. Charles, Iowa—Gibson Electric Co., Des Moines, will make improvements to its power plant. Three fuel-oil engines, three 10 hp. to 50 hp. generators, from 8 kw. to 35 kw. and four switchboard panels complete. Overhead material for 10 to 20 miles of overhead line. G. F. Gibson, Box 408, Des Moines, in charge.

Independence, Mo.—A special election was held recently to vote on the question of issuing $65,000 electric light bonds. Address city clerk.

Maryville, Mo.—The city will install two 600-gal. per min. motor-driven centrifugal pumps, one 700-gal. per min. low service pump and other equipment. E. E. Harper, Kansas City, Mo., engineer; A. D. Hewitt, clerk.

St. Louis, Mo.—United Railway Co. will ask bids for building and repairing 21 miles of line. R. Wells is receiver.

Auburn, Neb.—City will hold an election for a bond issue to enlarge municipal light plant. Address Mayor Dovel.

Lincoln, Neb.—The State Railway Commission has asked the Omaha & Council Bluffs Street Railway Co. to extend its lines eight blocks in South Omaha.

Omaha, Neb.—Omaha Flour Mills Co. will erect seven story concrete grain elevator to cost $600,000. The new elevator will put out 2500 bbls. of flour daily and has space capacity of 300,000 bu.

Gregory, S. D.—At a special election $122,000 bonds were voted and carried for electric light plant and sewerage system.

Mitchell, S. D.—City contemplates traffic lights at Main street. J. E. Wells, mayor.

Anamoose, N. D.—Anamoose Electric Light Co. burned. Loss, $25,000.

SOUTH CENTRAL STATES.

Carrollton, Ky.—City is considering plans for the issuance of bonds for $25,000 to provide for new municipal electric light and water systems. J. E. Gullion is mayor.

Newport, Ky.—City Commissioners are planning for the construction of a new local electric light plant to furnish electric energy for municipal service, as well as to Bellevue, Dayton, Ft. Thomas, Highlands District, Clifton and Southgate.

Dawson Springs, Ky.—United States Government has awarded a contract to the Brandenburg Construction Co., Chicago, Ill., for the installation of a new electric plant at the local Government hospital site.

Louisville, Ky.—During the week ended Aug. 29 the commercial department of the Louisville Gas & Electric Co. received contracts for 59 electric customers with 33 kw. of lighting and 216 hp. in motors and took orders for wiring 13 already built houses. Connected load gain (net) for the week included 43 customers with 23 kw. of lighting and 17 hp. in motors. Electric energy output for the week was 10.2% greater than for the same week of 1918.

DeRidder, La.—City has approved the issuance of bonds for $100,000 for the installation of new municipal electric light and water systems. C. C. Davis is mayor.

Natchez, Miss.—National Box Co. will install electric power and make improvements at its plant.

Yazoo City, Miss.—City Council is having plans prepared for the installation of a new double-unit electrical system for municipal service, estimated to cost $20,000.

Greenfield, Tenn.—A special election will be held to vote on the question of issuing $700,000 in bonds for water system and power house. Greenfield is supplied electric current and water by a private corporation.

Rutherford, Tenn.—Sept. 22 an election will be held to vote on the question of issuing $15,000 municipal light plant bonds. Address village clerk.

Afton, Okla.—$10,000 will be expended improving light plant. Address mayor.

Miami, Okla.—Additional light and water bonds have been authorized. Equipment will be purchased. Address mayor.

Minco, Okla.—City Council is considering plans for the issuance of bonds for $11,000 to provide for the installation of a municipal light and water plant.

Ponca City, Okla.—Plans are under consideration by the city for extensions in the municipal electric light plant. It is understood that bonds for $25,000 will be voted on to cover the cost of the proposed work. W. H. McFadden is mayor.

Sapulpa, Okla.—Sapulpa Electric Co. is supplying electric energy amounting to 100 hp. in motors to the Bartlett Collins glass plant which has just been opened for the season. This is double its former requirements.

Bryan, Tex.—City has voted a bond issue for $75,000 to provide for the purchase of the local electric light plant. It is proposed to make extensive improvements and alterations in the plant to increase the present capacity.

Houston, Tex.—Houston Lighting & Power Co. has awarded a contract to Horton & Horton, Houston, for the construction of a large new extension to its boiler plant, at estimated cost of $75,000.

Dallas, Tex.—The city secretary has been instructed to advertise for bids for incandescent lights for the city.

San Angelo, Tex.—The city commissioner has authorized the erection of an electric light, power and water plant for which $500,000 has been appropriated. Address mayor.

Wichita Falls, Tex.—Wichita Falls Electric Co. is having plans prepared for the construction of a new electric transmission line to the Burkburnett field.

WESTERN STATES.

Colorado Springs, Colo.—A large hotel capable of accommodating several hundred guests, a pavilion, costing approximately $25,000, electrical power, plant and lighting of the roadway and park, opening the park for cabin sites, and improvements to the auto road leading to the park, are planned for Crystal Park. W. C. Dotterer, president, Crystal Park Mountain Auto Road Co.

Pueblo, Colo.—During the week ended Aug. 29 the Arkansas Valley Railway, Light & Power Co. added 72 electric customers to its lines with 52 kw. of lighting and 911 hp. in motors; also 87 household electrical devices including 56 electric flat irons.

Millville, Utah.—The Town Council has perfected plans for the installation of a municipal electric light and power distributing system, covering all principal sections of the municipality. It is proposed to secure power at wholesale rates from the Utah Power & Light Co.

Hardin, Mont.—Mountain States Telephone & Telegraph Co. will construct telephone line from Billings to Hardin. Work will start soon.

Libby, Mont.—In connection with the construction of a proposed 200 concentrating works, the Lukens-Hazel Mining Co. is planning for the construction of an electric power plant for works operation. The proposed structure will be located in the vicinity of the local properties, with pipe line extending from Granite Creek for operation. The entire project is estimated to cost about $200,000.

Florence, Ore.—The electric plant burned. G. G. Bushman, Eugene, Ore., is owner.

Hoquiam, Wash.—Plans have been completed by the local Commercial Club for the installation of a new street-lighting system on Eighth and Ninth streets.

Seattle, Wash.—The City Council has approved an appropriation of $1,520.335 for the purchase of new equipment and supplies for the municipal lighting department.

Seattle, Wash.—Pacific Coast Coal Co. is planning for the construction of a new high-tension transmission line from a point near Renton, following along the Renton-Newcastle County Road. A permit for the work has been granted by the County Commissioners.

Seattle, Wash.—The City Council has authorized the preparation of plans and specifications for the construction of a new electric generating plant on Lake Union, adjoining the present power station of the city at this point. The plant will be of reinforced concrete, 80x120 ft., and with generating equipment and auxiliary operating machinery is estimated to cost $1,250,000. J. D. Ross is superintendent of lighting. Daniel Huntington, city architect, will be in charge of the work.

Avalon, Cal.—The Common Council is planning for the early construction of its proposed municipal electric light and power plant, and waterworks system, bonds aggregating $88,000 having recently been voted.

Fresno, Cal.—San Joaquin Light & Power Corp. has commenced the erection of its proposed new hydroelectric power plant at Auberry, Fresno county. The station is estimated to cost more than $1,200,000. The installation will comprise turbines, generators and other prime moving apparatus; transformers and other electrical equipment. A. D. Wishon is manager.

Marysville, Cal.—Marysville & Nevada Power & Water Co., with headquarters at Marysville, is planning for the construction of a new hydroelectric power plant at Bullard's Bar, with transmission and distributing system to furnish service to Marysville, Sacramento and other points in this district. The territory is now served by the Pacific Gas & Electric Co. and the Great Western Power Co.

Healdsburg, Cal.—The Common Council is planning for a bond issue of about $20,000 for improvements and extensions in the local lighting system.

Riverside, Cal.—Southern Sierras Power Co. has completed work on the "stepping up" of its high-tension transmission line from Bishop to San Bernardino, a distance of about 240 miles. The work has been under way for the past twelve months and represents a cost of about $250,000. A voltage of 2200 volts is maintained at the power plant and this is now increased to 87,000 volts for long-distance transmission. The change increases the horsepower from 25,000 to 60,000, or about 2¼ times.

San Francisco, Cal.—Great Western Power Co. is rushing construction work on its new Caribou electric generating plant, near Oroville, to insure the completion and operation of the plant in 1920. The company expects to inaugurate service at the station about six months in advance of the time initially anticipated. E. W. Beardsley is superintendent.

Stockton, Cal.—Western States Gas & Electric Co. is arranging to furnish increased power service to the National Paper Products Co. The company's present load aggregates about 1100 hp., and new motors and other electrically operated equipment will be installed.

Visalia, Cal.—The Commercial Club in co-operation with the local

Board of Trade is planning for the installation of a new ornamental street lighting system in the business section, to form a uniform system of electroliers. New lamps will be investigated for the proposed installation. J. D. Allen is secretary of the Board of Trade.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Supplies (30,5663).—The electrical engineering department of a municipality in South Africa requires different kinds of electrical supplies, such as twin conductor lead-covered cable, triple concentric cable, boiler tubes, centrifugal pump and motor, recording ammeters, single-phase transformers, sundry supplies, etc. Inquiry forms and blue prints were forwarded and may be examined at the bureau of its district offices. (Refer to file No. 123150). Tenders should be forwarded by mail at the earliest possible moment, so that it may arrive by Oct. 1, 1919, if possible.

Electrical Articles. (30,567).—An agency is desired by a man in Italy for the sale of cameras and photographic supplies, cinema supplies, electrical articles and accessories, and general technical articles. Correspondence should be in Italian or French. References.

Friction Winches. (30,599).—Cable quotations f. o. b. New York are desired by a man in Australia on two steam hammers of 3000-lb. blow for driving wooden piles and two electric pile-driving friction winches for the same purpose.

Transmission Machinery. (30,609).—The development of new coal mines is planned by the government of a country in the Far East, and the chief engineer desires to receive catalogs of electrical transmission machinery, mining machinery, machine tools, etc. A complete list of what will be required may be obtained on application to the Bureau or its district offices.

Wireless Telegraphy Outfits. (30,614).—A commercial agent from Chile is in the United States and desires to secure agencies for the sale of artificial leather, wireless telegraphy outfits and supplies, and building and construction materials and supplies. Reference.

PROPOSALS

Wire, Generators, Etc.—Bids will be received at Flagler, Colo., on Sept. 29 for the construction of a municipal water system. The specifications include one carload of poles, 5000 lbs. No. 8 braided weatherproof wire, one 35-hp. oil engine, one 75-hp. oil engine, and suitable generators for above engines, one switchboard, etc. These are to be in accordance with plans and specifications prepared by Royal S. Salisbury, consulting engineer, 1415 East Colfax street, Denver, Colo. Address William Knies, clerk and recorder.

Power Plant.—Bids will be received at New Castle, Ind., Sept. 23 for a laundry and power house at the Indianapolis Building for Epileptics. Specifications include two 75-kw. generator. Address Dr. W. C. Van Nuys. Contracts wlil be let by Herbert Foltz, Indianapolis, architect.

NEW PUBLICATIONS

War Minerals, Nitrogen Fixation and Sodium Cyanide is the title of Bulletin 178-B by Van H. Manning, consisting of an advance chapter from Bulletin 178 War Work of the Bureau of Mines. The term war materials has been applied to those ores and minerals that were largely imported before the war, included in which are chromite for tool steel, for tanning leather, and as a refractory lining in furnaces; magnesite, for refractory linings; mica, as insulating material; platinum, for the manufacture of sulphuric acid and for electrical apparatus. When the United States entered the war it was clear that every ship would be needed and that the number available for importing minerals would be small, and hence a quick and thorough survey of domestic resources was necessary. In this publication are presented the results of the investigation conducted by the Bureau. The price of the paper is 5 cts. a copy and may be obtained by addressing a request to the Superintendent of Documents, Government Printing Office, Washington, D. C.

INCORPORATIONS

Logansport, Ind.—Logansport Utilities Co. has been incorporated with capital of $60,000 to supply light, heat and power by O. H. Binns, Frank B. Wilkinson, William R. Casparis and William O. Taylor.

Kyle, Tex.—Kyle Light & Power Co. has incorporated with a capital of $7000. Incorporators: C. F. Maindrich, J. D. Winder and others.

New York, N. Y.—S. G. V. Electrical Co. Capital, $10,000. To manufacture electrical supplies, etc. Incorporators: J. and M. Knapp, and J. Goldfarb, Jr., 136 Broadway.

New York, N. Y.—Eureka Lighting Supply Co. Capital, $8000. To manufacture electric and gas fixtures, etc. Incorporators: I. J. Shirmel, S. Geller, and H. M. Feuerstein, 11 Graham avenue, Brooklyn.

New York, N. Y.—United Electric Stores, Inc. Capital, $50,000. To deal in electrical goods, etc. Incorporators: P. McGeavy, K. R. Schuslstrom, and J. W. Flint, 947 Sixth avenue.

Syracuse, N. Y.—Doman Development Corp. Capital, $100,000. To engage in a general electrical engineering capacity. Incorporators: A. E. Doman, W. H. Fleisch, and L. Will.

East Orange, N. J.—Wizard Light Co. Capital, $500,000. To engage in a general electrical and mechanical engineering capacity. Incorporators: Albert K. Porter, William H. Wagner, and Arthur A. Fisher.

Newark, N. J.—American Consolidated Electric Co. Capital, $100,000. To manufacture incandescent electric lamps. Incorporafors: Frederick A. Schiller, John H. McCaulley and Davis Lesnik.

Washington, D. C.—Randall X-Ray Co. Capital, $100,000. To manufacture X-Ray equipment, etc. Incorporators: George T. Parker, William A. Randall, and Willis W. Parker, Washington.

Wilmington, Del.—Mohr Co. Capital, $55,000. To manufacture lighting, heating and power machinery. Incorporators: S. E. Dill, T. L. Croteau, and H. E. Knox, Wilmington.

New York, N. Y.—American Refrigeration & Insulation Co. Capital, $55,000. To manufacture refrigeration machinery and insulation equipment. Incorporators: R. H. Brenner, N. Dacimto, New York; and A. G. Concolte, Brooklyn.

Topeka, Kans.—The Pierson Co. Incorporated under Delaware law with a capital of $5,000,000. To manufacture telegraph transmitters and telegraph apparatus. Incorporators: Edwin H. Pierson, Topeka; C. H. Gaunt, Chicago, Ill.; and Paul P. Sweet, New York.

Indianapolis, Ind.—Federal Steel Products Co. has been incorporated with capital of $100,000 to manufacture steel articles by William A. Epperson, Joseph B. Wilkins and John Glava.

Indianapolis, Ind.—The F. & W. Manufacturing Co. has been incorporated with capital of $30,000 to manufacture mechanical devices by George F. Frisz, James D. Wiltshire and L. R. Zapf.

Norfolk, Va.—Hester Electric Co. Capital, $50,000. To manufacture electric fixtures, etc. Incorporators: H. H. Hester and J. G. Good.

New York, N. Y.—Matthews Lighting Co. of New York, Inc. Capital, $150,000. To operate a local light and power plant. Incorporators: J. Speer, and W. N. and C. F. Fabell, 706 Riverside Drive.

Buffalo, N. Y.—Carter-Hager Electric Corp. Capital, $10,000. To engage in a general electric construction and contracting capacity. Incorporators: L. E. Carter, Henry J. Hager, and John J. Askey, Buffalo.

Wilmington, Del.—Phix Light Co., Inc. Capital, $100,000. To manufacture electrical and power machinery, engines, etc. Incorporators: H. E. Knox, T. L. Croteau, and S. E. Dill.

Paterson, N. J.—Silk City Lighting Co. Capital, $15,000. To engage in the manufacture of electrical fixtures, etc. Incorporators: John Cooke, B. Clark, and Fred Braun, Paterson.

Personal

John Kelly New Sales Manager of Edison Storage Battery —W. D. A. Peaslee Joins Jeffery-Dewitt Insulator—Changes

O. A. JENNINGS has become connected with the Oklahoma Gas & Electric Co., in charge of the electrification of oil well pumping, with headquarters at Oklahoma City.

V. ST. C. MONTIETH, Martinsburg, W. Va., for the past two years superintendent of the local plant of the Potomac Light & Power Co., has been appointed general superintendent of the entire system of the company.

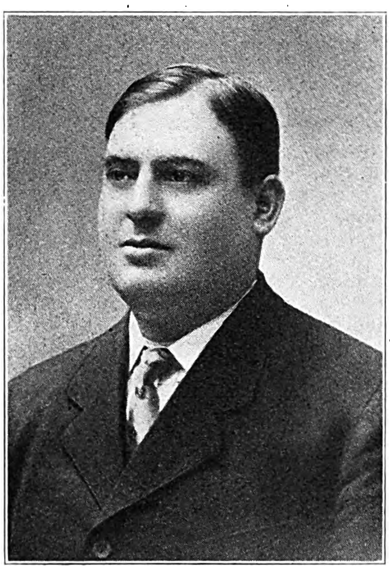
JOHN F. EAGAN, formerly superintendent of the eastern division of the subway and elevated lines of the Brooklyn Rapid Transit Co., Brooklyn, N. Y., has been appointed superintendent of transportation of the company. Mr. Eagan succeeds John J. Dempsey, formerly vice-president and superintendent of transportation, recently resigned.

F. H. VAN GORDER, power apparatus specialist at the New York office of the Western Electric Co., has been appointed manager of the Newark store. Mr. Van Gorder entered the employ of the company in the spring of 1907 as a salesman connected with the Chicago branch. In 1914 he became sales manager of the Detroit store and in June, 1918, took up the duties of power apparatus specialist, which position he held until his recent promotion.

A. A. GUARDIA, sales manager of the Pelouze Manufacturing Co., Chicago, has recently been appointed general manager and assistant to the president of the company. Mr. Guardia has been associated with the company for 15 years, beginning as a salesman and in this capacity made hosts of friends in the industry. He has taken a prominent part in the activities of the electrical industry and for three years has served as statesman-at-large of the Jovian Order.

BERNARD J. DILLON, who for the past year has been on the staff of the ELECTRICAL REVIEW, has resigned to enter the advertising department of the Hurley Machine Co., Chicago, manufacturer of electric washing machines, vacuum cleaners and other household appliances. Mr. Dillon has given particular study to contracting-construction problems and the merchandising of electrical appliances, and his intimate knowledge of these subjects will prove of considerable value to the Hurley company. Mr. Dillon is a native of Pittsfield, Mass., where he served in the works of the General Electric Co. in transformer tests for about three years. In 1912 he came to Chicago and joined the Commonwealth Edison Co. For several years he was a district inspector, later becoming supervising inspector of this central-station company. Leaving the Edison company he became assistant editor of the ELECTRICAL REVIEW, taking charge of the Contractor-Dealer and Construction Departments. Mr. Dillon possesses a very pleasing personality, which has won for him many friends in this organization, and we trust this friendship will be established in the company with which he is now associated.

JOHN KELLY, who for a number of years was New York district manager of the Edison Storage Battery Co., has been appointed general sales manager of the company, with headquarters at Orange, N. J. This promotion for Mr. Kelly follows closely upon his promotion, on July 1 of this year, to the



John Kelly.

position of assistant general sales manager. Mr. Kelly brings to his new position the experience of a long and varied career in the storage battery, electric vehicle and accessory business. For nine and one-half years he was district manager of the New York office of the Edison Storage Battery Co. Prior to that time he had been a salesman for the Westinghouse Storage Battery Co. for two years, for the Swinehart Tire & Rubber Co. for three years, for the Firestone Tire & Rubber Co. for two years and for the New York Edison Co. for nearly four years.

W. D. A. PEASLEE, consulting engineer, and formerly assistant professor of electrical engineering at the Oregon Agricultural College, Corvallis, Ore., has become associated with the Jeffery-Dewitt Insulator Co., Huntington, W. Va. During the war Mr. Peaslee served with the Engineers in the trenches as liaison and reconnoissance officer with the rank of captain and later was on the staff of the First American Army as motor transportation officer, chief engineer. After the signing of the armistice Mr. Peaslee was appointed an executive officer of the information and liaison department of the American Peace Commission. He studied high voltage and ceramics in France and holds the degree of Deplome d' Etudes Superieurs from Sorbonne University, France. Mr. Peaslee has made extensive studies in high-voltage work and insulators, and his papers on this subject have been published in the A. I. E. E. Proceedings and other publications.

F. T. BANGS has left the advertising department of the Belden Manufacturing Co., Chicago, and rejoined the editorial staff of the ELECTRICAL REVIEW. Mr. Bangs is a graduate of Armour Institute of Technology course in electrical engineering, class of 1913. After spending three years in engineering work he joined the staff of the ELECTRICAL REVIEW, leaving a year and a half later to enter the advertising department of the George Cutter Co., South Bend, Ind., and last year that of the Belden Manufacturing Co.

PETER JUNKERSFELD, formerly assistant to the vice-president in charge of contract, operating, construction and electrical departments of Commonwealth Edison Co., Chicago, and now engineering manager for Stone & Webster, Boston, was recently the recipient of a Distinguished Service Medal presented by the Secretary of War in his office in Washington. The following quotation is taken from the citation: "By his unremitting industry and energy, sound judgment, and knowledge of men he was of the most material assistance in the accomplishment of the construction program of the Army. He performed notable service as executive, organizer, and administrator."

H. P. HARRSEN has been appointed general superintendent of the Michigan Railway Co., an interurban railway, Grand Rapids, Mich., succeeding C. E. Morgan, resigned. Mr. Harrsen is a native of St. Louis, attended the Washington university and served apprenticeship in St. Louis. He later went to northern Mexico as assistant engineer in an extensive electrical development, and subsequently removed to Mexico City to accept the appointment of secretary to the manager of the Mexico Street Railway Co. Resigning this position, he became associated with the Toledo Railways & Light Co., with whom he remained for eight years. He then returned to Mexico City as general superintendent and later as general manager of the street railway system, and also was general manager of an extensive chemical works controlled by a Canadian syndicate. This syndicate undertook extensive hydroelectric developments at Barcelona, Spain, and Mr. Harrsen was sent to Spain to take charge of the work. In Spain his health failed and he returned to America.

Electrical Review

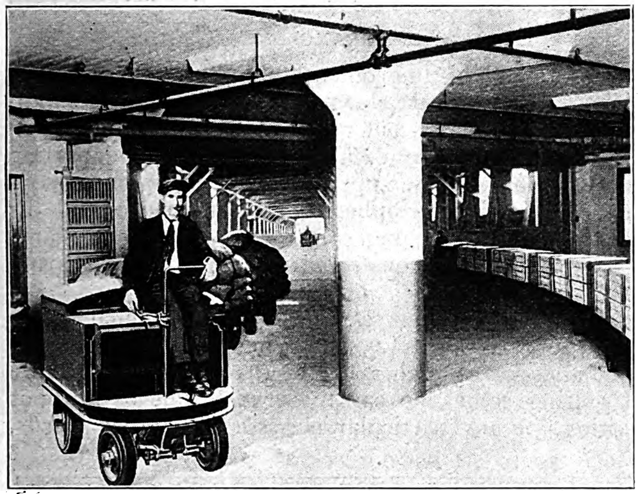
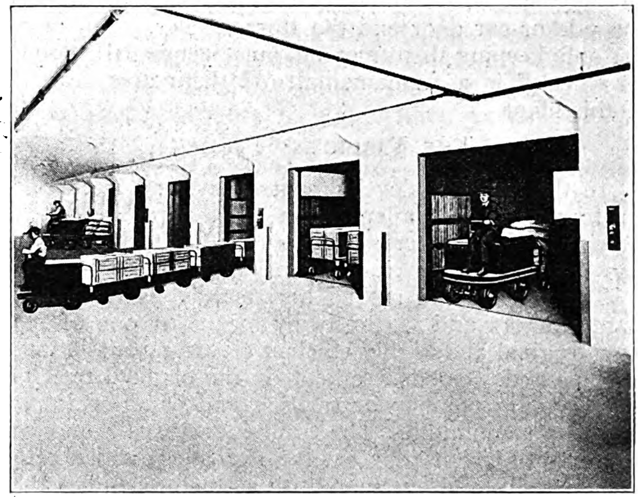
WITH WHICH IS CONSOLIDATED WESTERN ELECTRICIAN AND ELECTROCRAFT.

VOL. 75—NO. 13. CHICAGO, SATURDAY, SEPT. 27, 1919. PAGE 509.



View of Runway and "Trackless Trains" in Operation at the Brooklyn Army Base.



View of Group of Ten "Operatorless" Elevators Which Are Controlled by Electricity at Central Point.

Electrical Features of the Brooklyn Army Supply Base

Utilization of Electric Tractors and of Group-Controlled Operatorless Elevators Form Important Links in Operation of World's Greatest Terminal and Distributing Warehouse

RISING in impressive magnitude on the waterfront of New York bay, constructed under the stress and secrecy of war, is the world's greatest single terminal and distributing warehouse plant. It is known as the U. S. army supply base, Brooklyn, and is the largest of the great receiving and distributing bases erected by the government.

These bases claim our attention as timely examples of what and must be done at our great coastal, lake and river ports and rail centers if not only the opportunities but the actual and urgent requirements of the very near future are to be all adequately met, and our new-born merchant marine properly supported.

Not only in size do they dwarf kindred commercial developments of the past, but in them have been incorporated the practical working out of so many of the latest and best ideas of architects, engineers, warehousemen and material-handling machinery manufacturers that they demand the closest scrutiny and consideration of those concerned with provisions for meeting commercial developments which the competent and keen visioned tell us are soon bound to far exceed anything in our previous experience.

The Brooklyn army base embraces about 100 acres from landward line to pierhead, over 15 miles of railroad tracks, which include storage for 1300 freight cars and 8000 ft. of available string-piece intended for loading simultaneously a dozen deep-draught ocean freight carriers.

There are two main warehouse buildings, "A," 200 ft. by 980 ft., and "B," 240 ft. by 980 ft., a mechanical and repair building, a four-story administration building, and three "transfer sheds" or pier houses, 150 ft. by 1350 ft. each, which function in the transfer of freight to and from the water carriers.

The warehouse floors contain over 4,000,000 ft. of floor space and the transfer sheds 1,250,000 ft., or a combined total of 116 acres. Including the transfer sheds for transient use, this affords actual storage space for about 15,000 carloads of goods.

Handling 15,000 carloads, or 300,000 to 400,000 tons of freight, on a 30-day turnover basis, particularly in these times of labor shortage, requires the utmost possible conservation of time and effort. The whole handling system of the Brooklyn plant is calculated to meet those big problems in freight and merchandise handling which begin and end at the shipside or car door and involve loading, unloading, plant movement, both horizontally and vertically, and tiering.

In addition to the size of the plant there are several outstanding features which mark a great advance in merchandise and freight-handling equipment as well as in methods employed, and the progress in the art of vertical transportation as applied thereto.

The utmost practical utilization is made of various devices for the reduction of manual handling. There are automatic elevators, cranes and derricks, lifting trucks for picking up whole loads with one single operation and shifting to other locations, trailer trucks and both gravity roller and portable power conveyors.

It is an old warehouse maxim to "keep the goods moving," and here too they are kept going between shipside or car door and the storage piles. However, not only keeping them moving, but "keeping the goods on wheels" is a fundamental and distinctive feature of this plant.

The Trackless Train.

In this modern development everything is carried on four-wheeled trailer trucks, and here the goods which are carried across country by the trainload are also handled by the truck trains through the plant.

The trailers are moved horizontally by industrial plant tractors and vertically by means of one of the most original and highly efficient elevator installations ever devised. Goods are kept on the original trailers from loading point to destination and handling is reduced to a minimum. The trailers are usually moved in trains of from four to five if loaded, and six to eight if light, and one man with a tractor handles the train. This should be contrasted with the string of handlers which would be necessary to move an equal tonnage with the old two-wheeled "baggage" trucks.

The tractors and trailer trucks are, of course, narrow gauge, and the trains are easily handled in the aisles and around the turns. For short trailer movements tractors are not used, as one man readily handles on a four-wheeled truck two or three times the average load of a two-wheeled hand truck.

The whole plant is laid out in definite one-way traffic lanes, carefully calculated to afford maximum access and minimum congestion.

In addition to the yard movement, this traffic system includes communication between the transfer sheds and warehouse "A" via three bridges which connect the second pier level with the third warehouse level, while additional bridges and subways under streets connect warehouses "A" and "B." This practically eliminates the necessity for tractors and trailers to cross the railroad tracks in the yard or streets, as the goods moving between the first pier shed level and the warehouse floors travel via the pier elevators, the bridges, subways and the warehouse elevators.

Ninety Operatorless Elevators.

Speeding up and controlling the horizontal movement on one level, however, is not the most serious problem confronting most plant and warehouse managers. Comparatively few executives conceive the extent to which indifferent elevator service affects plant turnover, but as a matter of fact as the number of levels or stories increases the elevators become more and more as the spout of the funnel and their efficiency the measure of the rate of the flow of goods.

This fact was given a great deal of consideration in planning the Brooklyn army base, with the result that an elevator plant with many original and ingenious features was devised.

There are in all 96 elevators, of which 90 are for freight and six for passenger service.

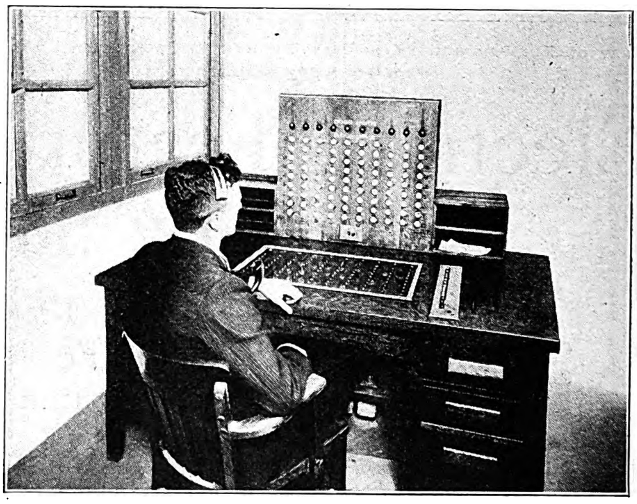
The 90 freight elevators are of 10,000 lbs. capacity; 18 are located in the pier sheds, serve two floors, and have a speed of 100 ft. per min. Seventy-two are located in the warehouses, serve nine floors, and have a speed of 150 ft. per min.

Each elevator platform is 9 ft. 4 in. by 17 ft. in the clear and intended to carry four trucks. Automatic stops are accomplished wherein the elevator platforms register accurately with the landing sills by means of automatic levelling devices, and the landing or hoistway doors are opened automatically when the elevator reaches the floor to which it has been dispatched. Operators on the cars are not used.

Elevators Arranged in Groups.

In a few old-time office buildings and hotels one finds the passenger elevators scattered about individually or in pairs, but modern practice groups them to secure the minimum waiting time between departing cars and to facilitate supervision. This same reasoning unquestionably applies to freight service, and the advantages of grouping elevators in industrial plants is conclusively demonstrated in the Brooklyn army base.

From seven to ten cars make a group which serves a "section," or some 325 ft. in length, of each building unit, and out of such a group one is reasonably sure of getting some one car to serve his needs without waiting for any particular elevator. In other words,



Dispatcher's Desk for "Operatorless" Elevator System. This One Man Operates Ten Elevators, Each Covering Eight Floors and Basement.

with ten cars in a group, the average waiting time will obviously be just one-tenth of what it would be if each car was placed separately.

Central Dispatch Control.

In the Brooklyn army base each group of elevators is handled entirely by a central dispatcher, who is located in a small office placed for convenience a short distance from the group. Before him is a table not unlike a telephone switchboard, with one upright and one horizontal panel. In the upright panel is a column of white lights for each elevator, each light representing a floor. At the top of each column is a colored light which indicates, when lighted, that all hatchway doors are closed and the elevator can be operated. The operating buttons are placed in rows in the horizontal panel.

The group system, in which the elevators are operated by a central dispatcher instead of each elevator being placed separately and operated individually, gives the least waiting time and maximum service out of a given number of elevators. A central dispatcher with a group of elevators under his control and knowing all the requirements can get better service than can be obtained from the same or even a greater number of elevators placed singly and subject to both the varying intelligences and the loading tendencies of as many individual operators.

In general or miscellaneous service, which is the most difficult to handle, the dispatcher receives calls for cars from the various floors. As an example, the dispatcher gets a call for a car from the seventh floor to take goods to the third floor. A quick glance at the vertical panel shows that car No. 5 is standing idle at the sixth floor, since its "6" white light is burning. The colored lamp at the top of the row is lighted, indicating that all doors are closed. The central dispatcher then touches "7" button and the white light disappears as the car leaves the sixth floor, and shortly signals arrival at the seventh floor by means of a light in bulb "7." As the doors open automatically the colored light is extinguished and the car is out of the control of the dispatcher and cannot be run until some one on the seventh floor touches one of the seventh floor "door closing" buttons, of which one is on either end of the car and two others alongside the opposite entrances. As soon as the load has been run on and the door button pushed the doors close and the colored light again appears, signaling to the dispatcher that all is clear to go ahead. He then touches "3" button, thereby dispatching the car to the third or destination floor.

When certain elevators have been assigned by the dispatcher to regular or fixed service for a time, such as handling a trainload of flour going from the first level to the seventh, individual calls are not needed, for the lights alone tell the story, the appearance of both a colored and a white light in the same panel then indicating that the car is loaded, the doors closed and the elevator ready to be dispatched.

The central dispatcher can readily detach any elevator of his group from the operating board. It then can be operated directly from the car switch provided therefor, and still retain its automatic door opening and automatic leveling features. Until disconnected from the central board, however, the car switch remains inoperative.

Excepting for convenience, or when goods are being sent to a floor where no one is working at the time, no one needs to ride on the elevators for the purpose of operating the elevator or its doors.

The Micro-Leveling Elevator.

The elevator equipment described in this article is an epoch-making development in the field of vertical transportation. It represents the product of years of experience in elevator design and manufacture, and is the result of the combined genius of engineers and inventors. It is a well-known fact that with an automatic push-button elevator, in order to be adaptable for freight service where trucks are used for handling goods, the car platform must be brought to an accurate level with the landing and maintained there under all conditions of loading and unloading.

A push-button-controlled elevator has recently been developed which stops the car automatically with any desired accuracy and with any load within its capacity. When the position of the car changes during the loading and unloading, due to the lengthening or shortening of the cables, the car is automatically and quickly restored to the landing level. This remarkable accomplishment made it not only possible but more advantageous in this case to operate the freight elevators by a central dispatcher than by individual operators on each car. This new automatic elevator is known as the "micro-leveling elevator."

The hoisting unit consists of the main driving machine and the micro-drive mechanism. In the Brooklyn army base the main machine is of the worm gear type and is driven by a two-speed alternating-current motor giving full and one-third speed. The "micro-drive" consists of motor, brake and worm gearing of about one-tenth of the speed and power of the main machine. The micro-drive is mechanically connected to the main machine through the revolving electro-mechanical main brake. The slow motion of the micro-drive through the final few inches of travel in connection with a novel system of control, results in the car stopping level with the landing with any load to the full capacity of 10,000 lbs. Since the leveling is accomplished at slow speed and by means of the small motor, there is less wear and tear of mechanical and electrical parts than with an elevator of the ordinary type and the amount of power required for leveling is reduced to a minimum.

Micro operation is applied to car switch as well as automatic push-button control. In this case the operator throws his switch to the stop position on approaching the floor just as in the operation of the ordinary car switch control. If the car is within the micro zone, the micro-drive functions and stops the car level with the floor. Although the micro or leveling zone extends 8 in. above and below floor levels, in actual service the average micro movement is usually not more than 3 in.

Selective Automatic Door-Opening and Closing Machines.

The doors are operated by an ingeniously arranged mechanism which automatically opens the doors at the floor to which the car has been dispatched and as the car approaches that floor. As the door-operating machine starts to open the doors when the leveling zone is reached by the car, it is obvious that the leveling is accomplished while the doors are being opened and therefore no additional time is required for leveling.

The door-closing operation can be initiated only by touching a closing button either on the car or alongside the door opening on the floor.

Hatchway Doors.

The doors themselves represent a radical development in elevator hatchway doors. Consideration of the trailer truck problem pointed the way to doors of maximum height and rising from fixed sills. Due to the high door openings and limited story height it was necessary that the door-operating mechanism be so arranged as to first move the door horizontally into the hatchway a sufficient distance to clear the sill and door above and then to raise the door vertically to clear the opening.

These doors are made of a steel frame with panels ¾-in. thick of sheet steel and asbestos composition.

In case of emergency the cars can be run with the doors open.

Piershed Elevators.

Ships are unloaded in part on both piershed levels and goods in transit between the warehouse and first transfer shed level reach or leave the latter on trailer trucks via the eighteen automatic elevators with which the sheds are equipped. These elevators are operated individually by means of buttons on each floor and in the car. In all other features they duplicate the warehouse elevators.

The army supply base was constructed for the traffic storage and purchase division of the War Department. Quartermaster General Goethals, director of this division, appointed Cass Gilbert as architect thereof, under whose direction and supervision the original conception was fostered and developed. The actual construction was carried on by the Turner Construction Co. under the construction division of the War Department, under the command of Brig. Gen. R. C. Marshall, Jr. Lt. Col. H. S. Crocker was constructing quartermaster.

Much credit is due both the Turner Construction Co., general contractor, and the many sub-contractors, who have made a wonderful record in bringing the plant to a state of practical completion in the limited time at their disposal. The elevator installation was made by the Otis Elevator Co.

While designed and built primarily for government service, a prominent warehouse and terminal operator who has been identified with the Brooklyn army supply base has recorded his belief that the solution of some of the most difficult problems confronting operators of commercial enterprises of this class lies in following the government lead here, inasmuch as he considers the Brooklyn base in every way an ideal plant.

WESTINGHOUSE WAR MEMORIAL SCHOLARSHIPS AWARDED.

Four Young Employes Win Competitive Tests for Memorial Scholarships and Select Engineering Courses at Prominent Technical Colleges.

The awards of the four annual War Memorial Scholarships of $500 each, established by the Westinghouse Electric & Mfg. Co., have just been announced. These awards were made by competitive examinations and the following men were successful:

Herbert S. Pahren, Cincinnati, O., employed as order clerk in the Cincinnati office of the Westinghouse company, and a graduate of the Hughes High School, who has selected for his scholarship a technical engineering course at the University of Wisconsin.

Arthur Marthens, of East Pittsburgh, began work as a messenger boy before completing his studies in the Turtle Creek schools. Mr. Marthens, while working in the cost department, prepared himself in the Casino Technical Night School to enter college. He has chosen a course in electrical engineering at the Carnegie Institute of Technology.

Paul O. Langguth, a graduate of the Wilkinsburg High School and employed as draftsman in the engineering department at East Pittsburgh, has selected as his award an electrical engineering course at the University of Pittsburgh.

Andrew P. Lesniak, a graduate of the Union High School, Tuttle Creek, Pa., and employed in the production department at East Pittsburgh, has selected a course in mechanical engineering at the University of Pittsburgh.

Two classes of scholarships are provided:

(a) For sons of employes of the company or its subsidiaries who have been employed for five years or longer. (b) For employes of the company and its subsidiaries who have been continuously employed for at least two years and who had not, on Sept. 1, exceeded the age of 23. Not more than two class B scholarships will be awarded in any year.

Each scholarship carries with it an annual payment of $500 for a period not to exceed four years, the payment to be applied toward an engineering education in any technical school or college selected by the successful candidate with the approval of the scholarship committee.

These scholarships have been established as a memorial to those employes of the company and its subsidiaries who entered the service of their country during the war. Four awards will be made each year, so that after three years this company will be maintaining 16 of these scholarships in the best technical schools of the United States.

CHICAGO'S NEW ENGINEERING ADVERTISING ASSOCIATION.

Advertising Managers of Engineering Manufacturers Form Body to Improve Advertising Methods.

The Engineering Advertisers' Association of Chicago is a new organization whose membership is limited to advertising and sales executives of concerns engaged in the manufacture of engineering products.

This association was organized by a group of men actively engaged in the production end of advertising work, including H. L. Delander of the Crane Co., P. A. Powers of the Benjamin Electric Manufacturing Co., Glenn H. Eddy of the Green Engineering Co., J. J. Arnsfield of Fairbanks, Morse & Co., and Albert H. Hopkins of the C. F. Pease Co.

It was the judgment of these men that the advertising activities of manufacturers of engineering products have assumed such magnitude as to necessitate an independent organization devoted exclusively to this special field.

P. A. Powers, one of the directors, outlined the purposes of the Association as follows:

"We seek to improve present methods of advertising and selling engineering products by trying to bring the truth to bear upon our problems; by each one laying down his own methods and submitting to friendly criticism; by co-operating in various active efforts and by the interchange of ideas and experiences."

The committee in charge of the winter program has arranged for a comprehensive series of lectures which will be delivered at the monthly meetings by men who are recognized authorities on the subjects assigned. Such questions as better typography in engineering advertising, the use of art in advertising technical products, markets and their analysis, the kind of data which should be accumulated by advertising managers, and other very practical topics will be discussed by experts.

The membership now includes a great many of the members of the advertising profession who are prominent in their work. The control of the association is vested entirely in advertising and sales directors as it is the intention to limit the membership to men actively engaged in advertising and selling engineering products.

GLASGOW CORPORATION ORDERS EIGHT ELECTRICS.

The Municipal Corporation of Glasgow has just ordered 6 two-ton electric vehicles at $6520 each from Edison Accumulators, Ltd., and 2 electric vehicles at $5600 each from Electric Vehicles, Ltd.

Central-Station Rates in Theory and Practice

Twelfth Article — Discussion of the Results of the Mathematical Study of Price Splitting—Comparison of Different Modifications of the Value-of-Service System

By H. E. EISENMENGER

This is the twelfth article of this series, which began in the issue of July 12. The first seven articles, constituting Part I, discussed the cost of central-station service, a knowledge of which is necessary before any rate system can be intelligently selected. In the two following articles were outlined the three general principles on which is determined the extent to which the different classes of customers shall contribute to the profit of the undertaking. Two and one-half articles were then devoted to Insert IX, which was a mathematical study of the relations between selling prices and earnings. The present article gives a summary of the conclusions derived from this study and shows some of their applications. This will be continued in the next article and then rate systems will be taken up in the remaining articles, which will continue throughout practically all this volume.

PART II—THE PRICE OF ELECTRIC SERVICE—Continued.

III.—The Value-of-Service Principle.

A. Advantages to the Public and to the Producers (Continued).

THE principal results of the investigations in Insert IX about price splitting are in brief words the following (Sections 81-86):

81. If we determine the prices for *every particle* of the service separately[1] in accordance with the value which the respective customer attaches to that particle, but with the restriction that the prices shall never be raised above the original price, this operation (price splitting downward) *must always* result in an increase of the earnings (whether gross income, net income or dividend), provided that no particle of service is sold at a price below a certain minimum. The amount of this minimum depends on the kind of earnings we have in view (gross income or net income or rate of return) and it is identical with the values given as lower limits in Section 74 (a), (b) and (c) for the "What-the-traffic-will-bear" system with the three kinds of earnings. These values are of necessity always lower than the original price, provided the latter has been chosen so that it does not result in negative earnings. (The above is proved in Sections 10-13 of Insert IX.) *Therefore profitable price splitting downwards will always be possible.*

This method of price determination would mean not only that the prices vary between different kinds of service and between different customers, but different particles of the same service would be charged differently to the same customer. For instance, every customer would have to be charged slightly differently for the first kilowatt-hour supplied to him for a certain kind of service than for the second one, and for the second differently from the third, etc. (see Section 73). The same would apply to the kilowatts of demand. The theory would, moreover, require that the kilowatt-hours used for kitchen lighting, for instance, be charged differently from those used for the lighting of the living room, and those used at 6 p. m. differently from those used at midnight because the valuation of these particles by the customer will probably be different.

[1]For instance every kilowatt, every kilowatt-hour and every individual customer, respectively.

82. As this theoretical method of charging is obviously impracticable we will in practice try to approximate it as closely as we can. We will combine into one group or class of service, or of customers, large numbers of such units of service of which we expect that there is approximately the same valuation on the part of the customer or customers. We then charge all units in the same class or group at a uniform price. Price splitting downwards will then mean lowering the prices for all units in one or more of the groups in such a manner that the prices remain equal amongst one another for all units in the same group, but they will differ between groups. We have therefore in this practical value-of-service system a hybrid between the theoretical value-of-service system and the cost-of-service system. We may, for illustration, charge all kilowatt-hours for heating service at the same price and differently from the kilowatt-hours for other than heating service. Or we may charge the first 50 kilowatts demand of wholesale power at certain fixed demand charges which are higher than those for the following kilowatts, etc. The more uniform the valuation is by the customer of the units within every group, that is, the more intelligently we select the groups and the larger we choose the number of the groups the more closely will this method and the results therefrom approximate the method of Section 81 and the results of that method.

This method of varying the prices, not between individual units but between groups, will be called "price splitting between groups."

83. The latter part of Insert IX (beginning with Section 15 of that Insert) contains a detailed investigation of the conditions under which price splitting downwards between groups is of advantage to the three different kinds of "earnings" (gross income, net income and rate of return).

The principal results of these investigations are the following:

1. The necessary and sufficient condition that

price-splitting downwards between groups shall increase the earnings is that the number of units sold in the group (or groups) for which the price is being lowered, increases more rapidly than the "profitable portion of the price" is being diminished by the price reduction[2]. The term "profitable portion of the price" means the excess of the price over the cost increment per unit[3] provided that the term "cost" (see Section 2) is defined in each case in the same way as in Section 75 (where we dealt with the lower limit of the prices permissible under the maximum earnings principle), that is:

Gross income...	Cost = 0; cost increment = 0.
Net income....	Cost excludes capital expenses.
Rate of return..	Cost includes capital expenses; cost increment includes the capital expenses of the increment capital figured at the same rate of gross interest which is obtained for the rest of the capital.

Other interesting and fundamentally different ways of stating the same law are found in Sections 16-19, 29-30 and 37-38 of Insert IX.

2. It follows from condition 1 of this Section that the prices can in no case be profitably reduced below the "cost" (as defined above), although we can find or construct special cases of sales curves[4] which bring the range of profitable price reductions as close down to that "cost" as we desire. In other words, the "cost" is the lower limit to which the price can profitably be reduced under any circumstances. With a given sales curve we can not reduce the price profitably lower than to a certain lowest limit which is greater than the "cost."

3. Condition 1 *must always* be fulfilled (this means price splitting downwards between groups is *always* of advantage to the earnings), if the price of the original cost-of-service system is at least as high as the price which results in a maximum of the respective aggregate earnings of all groups under the cost-of-service system. Condition 1, on the other hand, *may* be fulfilled if the price of the original cost-of-service system is lower than the above limit.

84. Stating the above laws in still shorter terms (which of course implies a corresponding further reduction of the accuracy) we can say: A lowering of the prices will improve the earnings if the price is lowered in those groups for which the sales rise sufficiently rapidly as the prices decrease. This means that price splitting downwards between groups is of advantage if one or certain ones of the groups show a comparatively heavy percentage of increase of sales in the range where the price is lowered. If the term "price splitting downwards" is to be understood in such a manner that the prices are reduced to one or more of the groups, whereas they are kept at the original value in at least one of the groups, we have to add the condition that at least one of the groups increases its sales only comparatively slightly for the price reduction in which the others show a heavy percentage of increase of sales. In other words, the groups must show a good differentiation between the shapes of their "sales curves," at least in the range of prices below the original price in which the price reduction will take effect. An instance of this kind is furnished by the two groups of lighting and heating service. If we reduce the price, the consumption of heating current and the heating demand will rise more rapidly than that for lighting service and therefore a reduction of the rates for heating current below those for lighting current will be proper, a thought which is borne out in a large number of rate schedules.

85. It will be the easier to classify the service and the customers into such well differentiated groups the more groups we have.

At the same time we can expect that under a cost-of-service system of charging, which has been intelligently devised from the producer's point of view, the price will be such as to furnish a maximum of earnings or at least that the price will not be far away from that value. With reference to Section 83, condition 3, we can therefore say that even under a system of price splitting by groups it will always be possible to increase the earnings by means of price splittings downwards.

It should be kept in mind that an ideal analysis of the total service into groups of service will be identical with a separate determination of the price for every particle of service and, as stated in Section 81, and proved in Insert IX, this will under any practical circumstances result in the possibility of increasing the earnings by price splitting downwards.

86. We can thus say generally: If the original cost-of-service system has been intelligently devised from the producer's point of view and if the classification into groups is intelligently made, *it will practically always be possible to raise the earnings by the introduction of price splitting downwards.*

87. Whereas we have seen (Sections 81 and 83) that price splitting can be carried out with advantage to the earnings as long as the prices do not reach below a certain lower limit, this must not be interpreted by any means to imply that we reach a maximum of the earnings by lowering the prices to that limit. On the contrary, carrying the prices down to that level would mean that we have lowered the prices so far that all the advantages gained by the reduction of the prices have been gradually reduced to zero and we are back at the same point—as far as the amount of the earnings is concerned—as before price splitting began. In order to obtain a maximum of the earnings the lowering of the prices must not be carried to that extreme but must be stopped earlier. (The exact amount to which the prices are to be lowered in order to procure the maximum of the earnings is discussed in Insert IX). In order to reach a maximum of the earnings the prices should in general be changed to a different level in every group. Where we are interested in price splitting downwards only, we effect a change of prices in those groups only where they should be lowered and in the other groups we leave the prices at their original level.

88. We go back now to our original problem of Section 78 and assume that we have had a system of charging under the cost-of-service system with the prices regulated in such a manner that the earnings are just what is considered fair, not so high that the public might be justified in demanding a reduction of the rates, nor so low that that part of the public which has invested its savings in the public service corporation finds the return for its capital and risks insufficient so that capital would be driven away to other more lucrative enterprises which would result in the ultimate damage to the consuming part of the

[2]If, for illustration, we contemplate a price reduction which reduces the profitable portion of the price to 2/3 of its original value, the number of units sold in the respective group must increase to at least 3/2 of the original amount (that is, to the reciprocal of 2/3) to make this price reduction advisable. The profitable portion of the price has then been reduced from 150% to 100% and therefore the amount of the sales must be increased from 100% to at least 150%. If the profitable portion of the price is reduced to 1/2 (200% to 100%), the number of sales must at least be doubled (100% to 200%), etc.

[3]See the first footnote of Section 75.

[4]For explanation of the term "sales curve" see Section 73.

public as well. Then we change over to the value-of-service principle by price splitting downwards only (and not upwards). According to what has been said in the preceding Sections (see Section 86) it will practically always be possible to do this in such a manner that the earnings are increased thereby[5]. We arrive thus at a system of charging which will be called for the sake of convenience "the first value-of-service system" or for short *"the first* system."

The upper part of Fig. 3 shows how the various consumers are affected by this change of charges. Fig. 3 refers to the sale of a certain particle or group of service, for instance to the first 50 kw-hr. of lighting service, or it might refer to the demand charges, for instance of the first 10 kw. of power service, or to any other reasonable subdivision of the service. This particle of service will be worth different amounts of money to different consumers, which means different consumers will be able and willing to pay different amounts for the respective particle of service. These amounts will be called hereafter the consumer's *"limiting price"* for that particle of service. This "limiting price" (in dollars or cents), which varies for the various consumers between zero and a certain maximum, is stepped off in horizontal direction in the various parts of Fig. 3 from the line *OO* to the right. Every consumer is charged a certain percentage of his "limiting price" and these percentages which the consumers are charged actually under the various systems represented in Fig. 3 and to be discussed presently, are stepped off upwards from the respective horizontal base line in vertical direction. Where that percentage is 100% or less the consumer will purchase the respective particle of service to which the diagram refers, otherwise he will stay away and not avail himself of the benefit of the central station's electric service. For those consumers who are buying the service under the various systems the area of the diagram is shaded, for all the others it is left empty, so that the shading shows at a glance how far the benefits of the electric service reach the different classes of the population.

In the cost-of-service system (top diagram) one price only is charged to all customers, therefore only one certain class of prospective customers will be charged just their limiting price (100%), all the others are charged either less (to the right of *PP*), or more than 100% of their limiting price (all prospects to the left of *PP*). The latter will stay away and not become customers under this system of charging.

If now price splitting is introduced within a certain range from the original price *OP* downwards, for instance in such a manner that the lowest price to be split off reaches as far down as P_1P_1, all customers whose limiting price is in that range will be charged their limiting price. Thus (see the second diagram from the top in Fig. 3), all customers whose limiting price is large enough as to reach beyond the line P_1P_1 but not large enough to reach beyond the line *PP* are charged just their limiting price (100%), those to the right of P_1P_1 are charged a smaller percentage, and the prospects to the left of P_1P_1 would be charged more than 100% of their limiting price and will therefore not be customers. Under this system which will be called *"the first value-of-service system"* we have added as customers all prospects whose limiting prices are in the range between P_1P_1 and *PP* (compare the shaded ranges of the two top diagrams in Fig. 3).

[5]It will be shown later (last sentence of Section 92) that this fact, though helpful for the understanding of the evolution of the value-of-service principle, is not altogether essential.

If now the splitting of prices for the "first value-of-service system" has been made in such a manner that the total earnings of the company are increased thereby (see Section 86) and if, on the other hand, we want to preserve the amount or percentage of earnings which has been considered fair before price splitting was put into effect, we will have to modify this "first value-of-service system" by introducing price reductions.

89. We might reduce *all* prices in the same fixed ratio so long until the excess of earnings has disappeared. In that way every one of the consumers would be positively benefited by the introduction of the value-of-service system. Let this be called the *"second system."*

This reduction would mean that certain customers at the lower end of the scale would be added which could not be reached under the former prices. The customers added will be those whose limiting price is greater than the lowest one of the new prices, but smaller than the lowest price of the first value-of-service system (see Fig. 3, System 2, shaded portion to the left of P_1P_1).

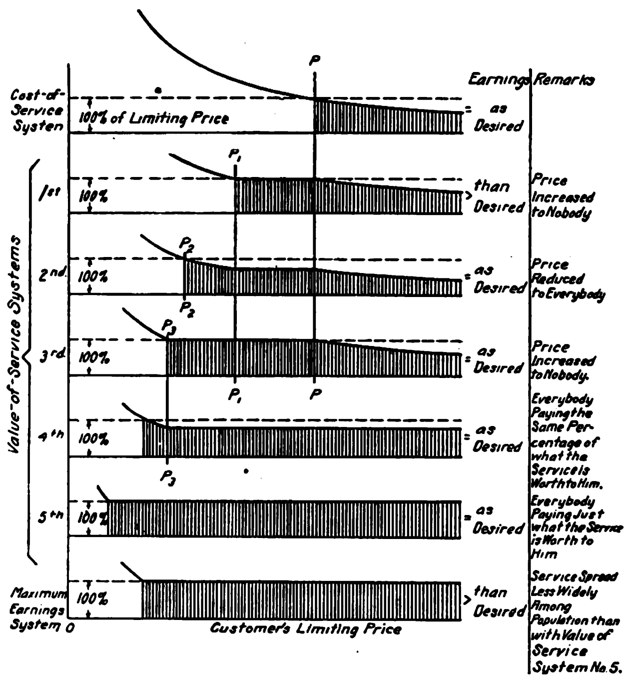


Fig. 3.—Comparison Between Cost-of-Service System, Value-of-Service Systems, and Maximum Earnings System.

90. Or *("third system")* we might leave unchanged the prices that are charged to the existing customers under the "first system" and add new lower prices for those customers only who have not been able and willing to pay the prices of the first system for the respective service. This means that those consumers who had been customers under the cost-of-service system (that is, the customers to the right of *PP*) are not benefited by the introduction of this (third) value-of-service system, but neither do they lose. They simply continue to pay the price they were charged under the original cost-of-service system (and under the first value-of-service system). This is the disadvantage of the third system compared to the second where all customers are positively benefited by being allowed a price reduction. The advantage over the second system is that a certain por-

tion of the public can be supplied with service that had to forego the benefits of electric service under the second system[6] (between P_2P_2 and P_3P_3 in Fig. 3).

In this third system all consumers pay for their service just as much as they are able and willing to pay, with the exception of those consumers who are charged the highest price, that is the price of the original cost-of-service system. These customers pay less than 100% of their "limiting price." (See Fig. 3, to the right of PP.)

91. Unless we insist that the changeover to the value-of-service system shall avoid raising the price to any customer over the price paid under the original cost-of-service system there is no logical reason why those customers who are reaching up to that arbitrary dividing line PP of the original "cost-of-service price" should be exempted from the rule which applies to all other consumers, namely that each consumer shall pay not more and not less than what the service is worth to him. Under the "third system" those customers who would be willing and able to pay the highest prices of all are charged less than their limit (whereas all the others are charged just their limit). We can therefore go another step forward and *raise* the prices to that class of consumers so that every customer has to pay just what the service is worth to him. This permits of a subsequent further reduction of the prices and, if the earnings are, as assumed, to be kept constant, such a reduction is even necessary.

We can again choose two methods for this subsequent reduction, in analogy to the two methods applied in developing the second and the third system. Either we reduce all prices by the same percentage, so that each customer[7] pays the same percentage of what the service is worth to him *("fourth system")* or we add another set of prices at the lower end of the scale extending this set downwards so long until the excess of the earnings has been swallowed *("fifth system")*. This means new consumers are taken on for the service in question for whom even the lowest prices charged heretofore have been prohibitive.

It should be noted that if we carry the value-of-service principle in this manner to its ultimate consequences (fourth and fifth systems) this amounts to a "maximum-earnings system" (see Section 65) with these modifications (compare Fig. 3):

(a) In the fourth system the prices are reduced to all consumers[8] by a certain fixed percentage below the price charged under the maximum-earnings system. This percentage applies alike to all customers so that every customer has to pay the same percentage of what the service is worth to him. The minimum price must not be identical with that of the maximum-earnings system; it may be higher or lower.

(b) In the fifth system every customer has to pay 100% of what the service is worth to him, but the prices reach further down than with the maximum-earnings system. Under the maximum-earnings system we must refuse to make any sales at prices so low that they would reduce the total earnings (see Sections 72 and 74), whereas under the fifth system we go deliberately below that limit with the intention of reducing the earnings to the desired limit.

92. It is of interest that with none of the five systems are we bound in any way by considerations of the cost, as far as the individual price is concerned. The individual price may reach down even below the increment cost; with the fifth system the prices are even bound to reach below that limit. The consumers for whom the service is of higher value make up for the reduced profit or even loss caused by others.

Each one of the six systems (original cost-of-service system and five value-of-service systems) in the order named carries the benefit of electric service further into the population than the preceding system.

We see also from the above deductions and from the diagram Fig. 3 that, unless we want to avoid raising the prices to any customers (Systems 1 to 3) we arrive at the same ultimate systems (4 or 5) regardless of whether it is possible to employ price splitting downwards with an increase of the earnings, or not.

93. The beginner should clearly understand that the above is a theoretical investigation based on the assumption that we have a full and definite knowledge of how the sales vary with the prices. Its object is to get an insight into the general effect and the possibilities of an intelligent value-of-service system (see Section 67). The five systems are five steps or stopping points, chosen with a certain degree of arbitrariness to explain the evolution and the effects of the value-of-service principle. But in practice the knowledge referred to above is a thing not to be thought of. We can therefore in practice not distinguish between the five systems as clearly as we can in theory. Practical price-making in general is necessarily always based on business instinct and even guesswork, and so is the practical application of price splitting in particular.

All we can do in practice is to grant lower prices to those groups of service which, as for instance heating and cooking service, can be expected to increase their sales with decreasing prices much more rapidly than others, for instance lighting service. At the present average price which is charged for general lighting we have reached a certain degree of saturation of lighting service. Although a reduction of the price for lighting current to one-half or one-quarter of its present average value would undoubtedly increase the use of electric light, yet it would not increase it by nearly as much as a reduction to the same price would increase the use of electric heating because the present *lighting* rates are almost prohibitive for electric heating and cooking, except for some small appliances, largely as a luxury or convenience rather than a necessity. Therefore we will conclude that a reduction of the price—or rather of the percentage profit—for heating and cooking below that charged for lighting service is generally advisable. There are of course other considerations, such as the complication of the rates or the necessity of a separate meter, which may make it undesirable to create a separate rate for heating and cooking (to remain at the example chosen) and all this requires good judgment on the part of the rate maker to decide whether he should use under the given local conditions a separate rate or one of the other methods for the same purpose (Wright rate, number-of-rooms rate, etc.) to be described and discussed in the following

[6] That System 3 must actually bring service to such customers as have lower limiting prices than the lowest served under System 2 (in other words that P_3P_3 must be situated to the left of P_2P_2) becomes evident if we imagine System 3 to be developed out of System 2 by raising all prices between P_2P_2 and PP to 100% of the limiting price and raising all prices to the right of PP accordingly until they reach the corresponding prices of System 3. These increases of prices without any accompanying reductions must necessarily result in an increase of the earnings because none of these price increases has been carried beyond the 100% limit so that all the consumers who have been customers under System 2 will remain customers under System 3. To offset this increase of earnings and to bring the earnings down to the desired normal height we have to add new customers to the left of P_2P_2. by offering prices to them which are low enough to attract them.

[7] With the exception of those added at the lower end of the scale by the last reduction. (See Fig. 3. System 4.) Those customers pay a higher percentage.

[8] With the exception of those who are paying the very lowest prices (see diagram).

ones of this series of articles, or whether it might not be better to entirely forego a diversification of the profits. The latter practice is found as a rule more in smaller companies where simplicity of the rates is paramount, but as the knowledge of the principles of rate making is spreading this practice has a tendency to disappear.

B. Factors Determining the Customer's Valuation of the Service.

94. It has been said above that the value-of-service principle distinguishes between different kinds of service according to the monetary value attached to the service by the customer. This monetary value constitutes the upper limiting value for the price, and the value-of-service principle endeavors to make the charges with due consideration of this limiting value for the various parts of the service and the various customers.

Now this limit of the monetary value beyond which the customer will not purchase the respective part of the service depends on two factors: (1) The value he places on the service, that is the degree in which the service is necessary, useful, profitable or convenient to him; and (2) the value he places on money.

The first factor is determined by a variety of circumstances, among which the possibility of obtaining a similar service from some other source and the quality and price of such competitive service are prominent. This factor can vary for the same customer between different parts of the same service. Thus, for instance, a customer will generally value artificial heating service more in winter than in summer. (In the latter case he will even place a negative value on it as he would pay for having heat removed.)

The second factor is to a large degree determined by the amount of money which the customer is able to spend (and is willing to spend). That is, it depends—apart from the customer's ecónomic inclinations—on the degree in which the customer (or the class of customers) is blessed with worldly goods.

(To be continued.)

PUMPING WATER FOR IRRIGATION MAKES IMPORTANT POWER LOAD.

Hundreds of Orchards in Washington Watered by Pumping Plants Supplied by Hydroelectric Power—Types of Pumps Used.

By W. A. Scott.

The Wenatchee Valley Gas & Electric Co., of Wenatchee, Wash., operates a 2-unit 1500-kw. hydroelectric plant on the Wenatchee river at Dryden, and a similar plant of 1025 kw. on the Entiat river. Its system is supplemented by the 800-kw. hydroelectric plant of the Chelan Falls Power Co., on the Chelan river at a point above where that stream empties into the Columbia.

The Dryden plant is equipped with S. Morgan Smith water turbines and Westinghouse generators, operating under a head of 55 ft., the water being delivered through 6100 ft. of canal and two penstocks 100 ft. long. The Entiat plant has two units; this plant operates under a 78-ft. head, the water being carried to the turbines by 6800 ft. of canal and through a penstock 1750 ft. long. The Chelan Falls plant contains an Allis-Chalmers generating unit, driven by a turbine of the same type as the others. The 800 kw. here is developed by water pressure at 35 ft. head. The transmission line by which the Chelan Falls energy is tied in with that of the Wenatchee system is 20 miles long, the connection being made at Entiat. The three plants have a combined capacity of 3125 kw.

This output appears to be fully consumed, especially during the five months from May to September, inclusive. During the spring and summer seasons there is a load of about 1200 hp. in electric centrifugal and triplex pumps to raise water from the rivers and canals for irrigating land. There are at least 150 pumps on the company's lines, of which 36 take irrigating water from the Columbia river. Pumps on that stream make an average lift of about 125 ft., and some of them are of a capacity to deliver 1000 g.p.m. In a river installation the pump has to be set in a pit inclosed by a concrete wall to protect it from being submerged during high water, and so that the suction will not average greater than 15 ft.

Besides the pumping and lighting service, the company has a connected load on its lines of 200 hp. for motors in shops and small factories in Wenatchee.

Relative to pumping service for irrigation in the Columbia, Wenatchee, Entiat and Chelan valleys, in Chelan and Douglas counties, it may be observed, of course, that such service is for benches of land not under gravity canal systems. The orchards thus irrigated contain from 50 to 100 acres each, and with the permanent water supply afforded by a river it is considered that pumping water to a maximum height of 400 ft. is economically permissible. But the electric power lines by no means cover this field. There are a great many triplex and centrifugal pumps being driven by oil and distillate engines in upriver localities outside the range of the electric power lines. Hydroelectric possibilities on all the streams which enter the Columbia between Wenatchee and the international border are practically unlimited, and as such development goes on the use of motors for driving pumps will take the preference over other kinds of power as a matter of convenience and economy. Regardless of the installation of systems for delivering water by gravity canals, there will always be in this valley a great deal of pumping for irrigation to cover tracts of land on benches not reached by gravity supplies. Then, the orchardist who has his own pumping plant on a river enjoys a certain independence, even though the cost by pumping is greater.

Pumping requirements, whether with electric motors or oil engines, consist of a 500-gal. pump for a 50-acre tract and a 700 to 1000-gal. pump for a 100-acre tract. But, it is observed, the tendency is to use the centrifugal rather than the triplex pump for high-head operations. The triplex is belt-driven, whether operated by a motor or an oil engine; and among the great number of motor-driven centrifugal pumps in this field, those direct-connected and those belt-connected are about equal. On pumps requiring belt drive the balata belt is largely used. For installations in which the motors are direct-connected to centrifugal pumps the speed is about 800 r.p.m. on those of small capacity, while on larger units the speed is usually about 1200 r.p.m.

A motor-driven, belt-connected, 10 by 10-in. triplex pump of the capacity of 500 g.p.m., delivering water against a head of 350 ft. through a 10-in. discharge pipe, requires a 50-hp. 2200-volt motor. These specifications apply to an installation considered typical. Another installation, considered typical, is one in which a 40-hp. 2200-volt motor is direct-connected to a 600-g.p.m. centrifugal pump operating against a 127-ft. head through a one-mile line of 10-in. pipe.

Electric Trucks and Tractors in the Iron and Steel Industry

Industrial Electrical Apparatus Offers Many Advantages for Use in Smelting Plants, Foundries, Etc.—Handling Problems of This Industry — Need for Employing Good Operators

By BERNARD J. DILLON

THIS is the fourth of a series of articles dealing with the application of electric industrial trucks and tractors in representative industries. In this their application in foundries, smelters, etc., is described. This is generally regarded as the greatest of all industries and its widespread adoption of electric handling apparatus indicates the reliability and desirability of such devices. Although the operating conditions are unusually severe and exacting, practically every installation has proven successful and resulted in substantial savings. On account of the present disturbed labor conditions of this industry the problem of increasing the use of labor-saving appliances takes on special timely importance.

THE use of electric industrial trucks and tractors by the iron and steel industry began when this apparatus was first introduced and has grown rapidly ever since. Beginning with the application of a single machine, in most cases its reliability and the advantages which it offered for this class of work were quickly recognized and now many of the largest and most successful installations are in use by this trade.

Growth of the use of this apparatus has, of course, been particularly rapid during the past few years. During this period the iron and steel industry was called upon to produce to its utmost capacity in spite of the extreme labor shortage that existed. As a result, electric apparatus was introduced into practically every kind of handling by concerns in this industry and the results have exceeded all expectations. At present it is largely a matter of the extent of their possible application rather than a question of whether or not they should be employed.

The general handling problems of this industry are especially adaptable to the use of electric trucks or tractors. The plants usually are composed of a number of long one or two-story buildings and cover a large area. This greatly increases the average hauling distance, which gives the electric a decided advantage.

The class of material handled also adds to the desirability of the electric. Generally, it is very heavy and cumbersome and cannot be readily loaded on the ordinary two-wheel hand truck. Nor can dollies or flat trucks be used due to the rough passages and the great weight of the loads. For the smaller pieces a wheelbarrow is usually used as a carrier. This is, of course, a very strenuous and tiresome method and it is difficult to get labor to perform it. For the larger and heavier pieces cranes or hoists are used, but it has been found their field is limited when compared with the truck or tractor for many classes of work. This phase of handling is discussed further on in this article.

Saving in labor and production cost, however, is the principal advantage offered by the electric apparatus. There is no question now but that this apparatus saves a large amount of labor which enables it to pay for itself in a short time. The labor problem generally has affected this industry more than any other. In the first place, a large amount of unskilled help is required for certain operations that cannot be replaced by mechanical devices. The scarcity of this class of labor has made it necessary to employ automatic machinery as extensively as possible and free as much of this help as could be obtained for this other work. In addition, the wages demanded by this labor have greatly increased, which has also been an important factor in stimulating the introduction of labor-saving devices. Moreover, the introduction of such apparatus has a certain moral effect which causes the employes to be more satisfied and contented, for it indicates a desire on the part of the management to make the work as easy as possible and the savings effected enable it to grant higher wages.

Handling Problems of Foundries, Smelting Plants, Etc.

The amount of handling and trucking entering into the operation of foundries, smelters, etc., is considerable. The raw material and fuel must be brought to the furnaces, taken from the furnaces to the moulds or mills and dumps, and from the moulds or mills through a series of mechanical operations to clean and finish it before it can be delivered to the machine shops or shipping room. Numerous other materials must also be handled, such as sand for the moulds.

Traveling cranes and hoists are used extensively for this work in many places. Where the materials handled are heavy and must be piled or placed upon machines or cars higher than the floor level, these are indispensable and their only competitor is the electric truck equipped with a gantry crane similar to the one shown in one of the accompanying illustrations, which can often be used to advantage for handling objects of medium weight. The operations of a crane or hoist, however, are generally confined to one building or area and outside of that place some other method of handling must be employed. They are also limited by the fact that volume of handling cannot be increased beyond a certain amount and still handled efficiently. Moreover, they are expensive and not adaptable to all classes of buildings and cannot be moved to another building easily. As was stated, they are indispensable for certain classes of work in the performance of which the ordinary electric truck or tractor offers no competition. Before installing additional crane equipment, however, it is often advisable to study the situation and find out how much of the work now being handled by the crane can be handled by a truck or

Electric Truck and Trailers Hauling Materials in Foundry.

tractor. It has often been found that by using this apparatus for as much of the work as possible in conjunction with crane facilities, an extra crane will not be required.

The trucking conditions in the iron and steel industry are unusually severe. Passageways are narrow, congested and rough. Most of the material handled is by no means fragile, yet it cannot be subjected to unnecessary roughness, and in addition much of it, the moulds for example, must be handled with extreme care. Speed, of course, is an important factor in many of the operations and accurate running and spotting are also essential.

All these requirements and conditions can be met better by the electric than hand labor by reason of its greater power and better control. The laborer pushing a heavily loaded truck or even a wheelbarrow can not be expected to slow down and ease its load over a bad spot in the passage nor can he guide it accurately through a difficult narrow passage. The electric truck or tractor operator, however, has perfect control of his machine and its load at all times and has all its power at his disposal. He can slow down at a bad spot and start up again without exerting any extra effort and by means of the flexible steering arrangements now installed on such machines can negotiate narrow passageways easily and quickly. In addition, the congestion and confusion caused by the use of large number of hand-operated trucks is considerably relieved when all the work is done by hand.

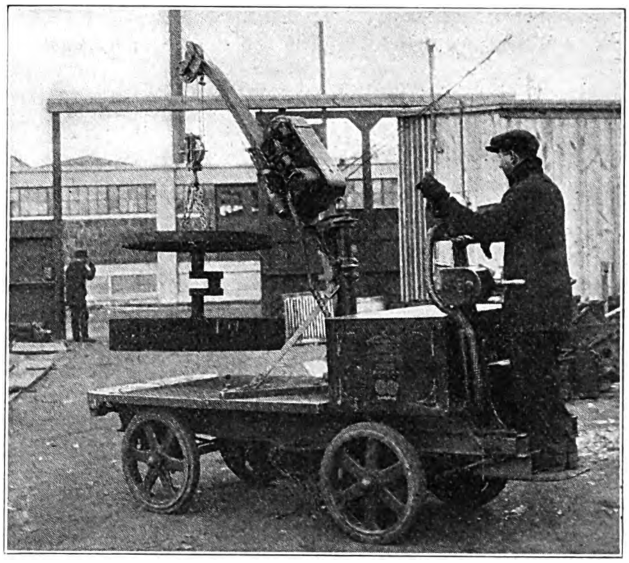
Advantages of Electric Industrial Apparatus for Various Handling Operations.

The raw material or ore and the fuel for the furnaces is usually dumped directly from cars or boats onto piles or into a suitable storage place. This is usually quite a distance from the furnaces, and for transferring it to the furnaces the electric tractor and trailers offer many advantages. Trains of trailers can be loaded at the storage piles, picked up by the tractor and taken to the furnace. When they are unloaded they can be taken back to the fuel piles again or loaded with by-products or ashes to be taken to the dumps. In the meantime other trailers can be loaded. In this way the loading or unloading operation is continuous and the tractor can be employed all the time.

Trailers can also be equipped with metal ladles for carrying the hot metal from the furnace to the moulds. These can be hauled by the tractor to the different places and the pouring operation completed quickly and efficiently. This method is also very safe for the operator can stop and start very quickly and is able to avoid obstacles much easier than a crane.

For hauling the castings from one operation or department to another, except in the larger plants where this distance between the departments is very great, the elevating platform or lift truck is generally preferred. The moulds when they are formed are set upon suitable skids. After the metal is poured these skids are lifted up by the elevating platform and taken to the point where the sand is knocked off. As the sand is removed, the casting is placed upon another skid which in turn is taken to the next operation, usually a saw. Here the process is repeated—that is, casting is taken from one skid, the necessary work done and either placed upon another skid or replaced upon the same skid. If the castings are not small, two skids are used in order that the operator will not have any extra handling. This process is repeated through the tumbling, polishing, finishing and other operations until the casting is ready for shipping or machining.

The advantages of the lift truck for such work can be readily appreciated. Not only is the trucking cost greatly reduced but the maximum manufacturing efficiency can be obtained. The operators can be kept constantly supplied with material and no time is lost by the operators in getting or waiting for work. The machines can also be kept in constant operation. As the skids can be placed in the most advantageous position by the truck, all unnecessary handling is elim-



Combination Electric Truck and Hoist for Handling Heavy Materials, Such as Large Castings.

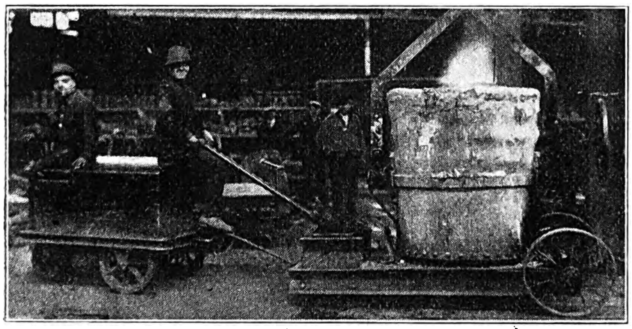
inated. Electric tractors can also be used with trailers in place of skids but a certain amount of extra handling is involved as the trailers cannot be spotted as accurately as the skids.

The amount of actual savings effected by either the truck or tractor will, of course, vary, depending upon local conditions. Even in the smaller plants, however, this saving is considerable. In many plants the saving in increased production alone is sufficient to more than cover the expense of the apparatus, leaving the entire labor saving as profit.

In the handling of moulds, etc., where special care must be taken to avoid any unnecessary jars, a special skid has been designed which is in use by many concerns. This skid is equipped with springs which relieve the mould of all the jarring and make it comparatively easy and safe to transport them.

Good Operators Especially Desirable for Such Work.

It is particularly desirable that good operators be employed to handle the trucks or tractors used in this industry. As has been stated, the handling conditions are unusually exacting and severe. A careless, inefficient operator not only reduces the value of the machine but he is unsafe and apt to cause more damage than can be saved by its use. Moreover, the management of concerns in this industry must realize that although the machines are easy and simple to use and their operation can be learned by anyone in a short time, they are nevertheless valuable machinery and proper results can only be obtained by employing conscientious, careful, reliable operators. The operators should be carefully selected and the entire responsibility of the apparatus should be assumed by them. In return, they should be given a satisfactory wage. In addition, there should be a rigid rule enforced prohibiting anyone, except the operator, to use the truck or tractor.



Electric Tractors Prove Useful In Handling Foundry Ladles.

It should be remembered that these machines replace a large amount of hand labor but in any case this handling must be done. If the operator through carelessness puts his truck out of commission, the old handling methods must be resorted to, which is not always easy because such laborers have usually been discharged or put upon other work. It is also advisable to keep on hand a supply of extra parts and have someone in the plant who is familiar with the operation and construction of the apparatus in order that no time may be lost in making the necessary repairs.

MODERN SHINGLE MILL REQUIRES MOTOR DRIVE THROUGHOUT.

Features of a Seattle Plant in Which Electric Power Is Produced—Machines of Rapid Speed and High Capacity.

The modern shingle mill in the Northwest is characterized by electric drive, rapid speed and high capacity. The machines employed are easily adapted to motor drive and in the case of a number of such mills the electrical energy is produced at the plant by steam-driven generators.

A good example of the up-to-date shingle mill is found in that of the Phoenix Shingle Co., situated on Washington ship canal, Seattle, in which there are 12 Sumner upright shingle machines of a total capacity of nearly 400,000 shingles in 8 hours.

The power house contains two horizontal, tubular boilers of 150 hp. each, in which mill refuse is used as fuel. The steam produced is utilized in driving the turbogenerators and for seasoning shingles in the dry kilns. A General Electric 300-kw. turbogenerator, operating at 3600 r.p.m., produces energy at 480 volts, which is transmitted through overhead cable to a junction box in the shingle mill, and is distributed thence to 440-volt motors. In addition to this, the turbine room contains a 35-kw. turbine and a small motor-generator set, for excitation of the large generator and to supply direct-current energy for a motor that drives an air pump. The 300-kw. turbogenerator runs condensing, the exciter unit running noncondensing.

The 260 motors in the mill represent a connected load of 501 hp. The largest motor is of a 75-hp. machine which operates an 86-in. cutoff saw at 600 r.p.m., and the chain-belt log-haul by which the logs are brought from the canal up to the mill deck. The motor is belted to a lineshaft which is belt-connected to the cutoff saw, with another belt connecting with the log-haul mechanism. The cutoff saw and log-haul are not operated in unison, but alternately. A system of conveyors for moving shingles and disposing of mill refuse requires four belt-connected motors, the belt pulleys being of sizes to reduce the speed of conveyors. Practically all other motors are direct-connected to the driven machines by means of flexible couplings.

Following the cutoff saw in proper sequence is the bolter saw, or splitter, driven by a 35-hp. motor, and knee-bolter, driven by a 25-hp. motor. The material thus prepared goes to the shingle mills, each machine consisting of a shingle saw driven at 1800 r.p.m. by a 20-hp. direct-coupled motor, and a clipper saw driven at like speed by a 3-hp. motor. Both motors in the unit are controlled by one starter. The 12 machines arranged in a row and running in unison at this high speed give an interesting demonstration of their capacity for turning out shingles.

Each shingle machine produces a considerable amount of fine wood dust, which if not disposed of becomes very injurious to the operators. The dust generated by all the machines is drawn away through 4-in. metal ducts by a 72-in. suction fan, driven at 500 r.p.m. by a 20-hp. motor, the latter having a speed of 1200 r.p.m. The fan discharges the dust into a conveyor through which it passes to the refuse burners under the boilers.

The file room is served by a 5-hp. motor, belt-connected to a lineshaft from which one large machine for filing the cutoff saw and two smaller shingle-saw machines are operated, an emery wheel on each machine being driven at high speed in filing operations. The mechanism and automatic action of these machines in filing one sawtooth after another in rapid succession are examples of ingenuity which the needs of this industry has developed. All electrical equipment was furnished by the General Electric Co.

The red cedar shingles, which are the products of this mill, are kiln-dried for 10 to 12 hours prior to marketing them, the kilns in this case consisting of four compartments of brick construction, each 124 ft. long and 17 ft. wide.

Phoenix Shingle Co. is controlled by F. E. Ward, W. A. Batley and J. L. Batley.

Editorial Comment

Era of the Electric Furnace

THIS is the era of the electric furnace and the present is only the beginning of that era. During the World War the electric furnace for the making and refining of steel came apace in every country making steel for bellicose purposes because steel so made enables difficult conditions to be met more readily than steel made in any other way. It was likewise during the war that the electric furnace for brass melting made its appearance upon a practical scale. Considerable work had, of course, been prosecuted for many years previously on electric brass-melting furnaces, but it was during the war that this work culminated in the development of a furnace that could be called practical enough for commercial application.

When the war came, the price of zinc soared many hundred per cent, and the large waste of this metal as volatile matter gave great impetus to the perfection of a suitable electric furnace because of the very much smaller loss of zinc as compared to other methods of melting. In some quarters the high price of oil was also a factor. Today, the activity in the electric brass-melting field is as great as ever. Whereas, the steel industry—hence the electric steel furnace—is suffering somewhat from the reaction of its former activity, and the unsettled labor conditions, the electric brass furnace is still in such demand that that demand can not be filled. This is a form of load that central stations should find easy to acquire today. And it is a form of load that is usually well worth while.

Apart from those furnaces employing the higher temperatures, there are furnaces that might perhaps properly be called ovens, where the temperature is high, but not so high as that required for melting of steel. For example, there are the soaking pits and the annealing ovens of the steel mill, some of which are already heated electrically. Here is another phase of the electric furnace that is predestined to play a large part in the central-station industry and the steel industry in time to come.

Another opportunity that awaits the electric furnace is that for the melting and refining of glass. In such a furnace the difficulties would seem to be those of refractories and contamination of the glass charge rather than of anything else. When the urgent need for pure glass for optical purposes came with the coming of war and the supply of German and Austrian optical glass was interrupted, Great Britain, and later this country, turned to the electric furnace as one of the possible solutions to the problem of pure glass. Experiments are still being carried on in many different quarters, but it may probably be safely said that to date no practical form of electric glass-melting furnace has made its appearance for commercial use. Meanwhile, the work of inventing and investigating still goes on and will go on until the electric furnace for melting and refining of glass can be classed with the electric furnace for the making of brass and steel. This is but the beginning of the electric-furnace era.

The Storage Battery for Stand-by Service

VISITORS to the vast systems of the large central-station companies are shown the boilers and their stokers, the turbogenerators and the aisles of their control apparatus, the manholes and the steel towers and the substations of converting equipment. But it is not often, unless special request is made, that the storage battery for stand-by service is seen. And yet the stand-by storage battery is the watchdog of many a system, safeguarding a direct-current network or an exciter system.

Every large city with its congestion and dense population and buildings operating Edison three-wire networks has its stand-by batteries. Every large generating station has its batteries, a last reserve should their exciters fail. They are indispensable. Yet one hears little of this important piece of apparatus, although on a unit cost basis it is an expensive one. The reason for this is probably that the stand-by storage battery does its work without noise, without commotion and directly it is called upon to do so. Moreover, those that know are often not anxious that it be known that anything had happened to necessitate falling back on the stand-by capacity. It is not spectacular, even if it comes to the rescue stupendously. The storage battery is to the direct-current network or the exciter system what the reserve troops are to the attacking army. It saves the day, however unexpected it be, when the need arises.

All the large cities have their storage batteries for stand-by service. Detroit, with its largest storage battery in the world; Chicago, Brooklyn, New York, Philadelphia, Boston, Baltimore, Rochester, Cleveland, and in far-off Los Angeles and Spokane, all having direct-current networks have stand-by batteries. In checking up the capacity of these batteries, on the basis of percentage of maximum direct-current peak, it is found that there is a great difference in the different installations. In one case it may be that the battery is intended to take the place of an entire station taken out of service. In another it may be that the battery or batteries are sufficient to carry load that might be served over cables traveling a certain route. In other cases attempt is made to have even a higher factor of safety. In all cases the battery capacity, amperes discharged for one hour, is only a small percentage of the total capacity it would be called upon to replace.

Just what percentage of stand-by capacity is justified depends of course upon conditions of transmission, of distribution, of generation, the importance of the load served, and the estimated time and magnitude of the shutdown during which the battery would be called upon to play its part. However, something happens somewhere every now and again that emphasizes the soundness of the investment in a stand-by storage battery. Because an emergency may appear remote there may be a natural tendency to reduce the investment in batteries; as deterioration occurs the factor of safety originally existing is lowered. Such a policy may be a very unwise one from every aspect.

Many power contracts include a forfeiture clause in case of cessation of service. An extended cessation may easily approach if not exceed in this item of cost alone the investment for one year upon a stand-by battery. The storage battery for stand-by service is really an emergency investment.

The stand-by battery may be an emergency measure. But it is doubtful if under conditions as they exist in many of our largest cities a central station would be justified in foregoing such a reserve capacity, however remote might be the emergency. It is not a question of prestige. It is not simply a matter of agreement to maintain uninterrupted service. It is not merely a matter of dollars and cents. It is the moral responsibility for safeguarding public safety. When the lights go out, when the ventilating fans and the elevators cease to move, and the fire pumps become useless things in the department store with its several hundred employes and its several thousand patrons, fire hazards threaten and the horrors of panic come nearer. A storage battery may save all these things and more.

Low Rates for Electric Cooking Found Profitable

It has long been known that to make electric cooking on a large scale economical to the average residence customer of central-station companies the latter must offer a much lower rate for cooking service than for lighting service. Those companies that have been lukewarm in their support of electric cooking have contended that the low rates that were evidently necessary could not be profitable and that a very considerable portion of the cooking load would overlap the lighting load in winter and therefore make the peak load still more formidable. If these contentions were true, they would warrant the companies in going slowly and justify their Missourian attitude of "Show me."

There has just come to hand copy of a paper on electric cookery presented last week before the convention of the Colorado Electric Light, Power and Railway Association by Mr. Pierre L. Miles, who has devoted many years to actively pushing electric range sales and studying the possibilities of cooking service as a central-station load. As the result of extended investigations he finds that the diversity-factor and load-factor of the electric range load are far better than those of the residence lighting load and that only 10 to 15% of the total connected range load will fall on the present station peak in the winter months. Further he finds that a certain station generating capacity will serve ten times as large a connected range load; likewise a distributing transformer of 15 kv.-a. will serve a group of 20 ranges having a total connected load of 120 kw. These figures show extraordinarily favorable diversity-factors and lead him to assert that 200 electric ranges can be installed in nearly every small town without increasing the present generating capacity. The investment to serve a range customer is not as great as that required for a lighting customer.

As regards the profitability of this load, Mr. Miles finds that it is much more profitable than residence lighting and that the yearly revenue per kilowatt of generating capacity for range service is also greater than that serving a small-motor load. He states that there is more profit in selling cooking service at a profit of one-half cent per kilowatt-hour than in a profit eight times as great per kilowatt-hour for residence lighting service. He also says that a three-cent cooking rate can be justified against a five-cent small-motor rate on the basis of being more profitable.

These statements are such striking refutation of the arguments often advanced against the range load that we repeat them here because we know they were not made without careful investigation. They show conclusively that it will pay every central-station company to give renewed consideration to the advisability of pushing the electric cooking business. We believe that there are but few companies that will not find it a profitable load, these including combination gas and electric companies and those forced to compete with natural gas or cheap artificial gas. We have discussed herein only the question of economy to the range user and profitability to the central station. The other benefits of electric cooking of course add to its value very greatly, but cannot be readily evaluated when the question resolves itself exclusively to one of relative economy and profit.

Incidentally the findings of Mr. Miles bear out very strikingly also the conclusions of Mr. H. E. Eisennenger in his articles on "Central-Station Rates in Theory and Practice," that are appearing weekly in our columns. He shows mathematically that it is often profitable for a central station to reduce rates for one class of service without raising them for any other class and that all classes are decidedly benefited thereby. His conclusions in this regard are explained more in detail (and in simpler language than the mathmatics of his last few articles) in the article appearing this week.

Current Events

Municipal Electricians, Electrochemists, Central-Station Managers and Steel Industry Electrical Engineers Convene

MUNICIPAL ELECTRICIANS HAVE SUCCESSFUL CONVENTION.

Timely Papers, Interesting Addresses and Inspection Trips Make Meeting Very Profitable to Delegates.

An attractive program taken with the fact that after-the-war conditions permitted a large attendance of delegates resulted in making the twenty-fourth annual convention of the International Association of Municipal Electricians, held at Chicago Sept. 23-26, one of the most successful ever held by that organization. Papers of timely interest to their profession, interesting inspection trips and good entertainment formed the program, the feature of which was an address by Dr. Charles P. Steinmetz and an illustrated talk by W. D'A. Ryan.

The title of Dr. Steinmetz's address was "Municipal Electricians in Relation to Electric Power Engineering." He stated that a municipality has a great deal in common with its public utilities, that its interest in the central station or the street railway system is akin to that of the stockholders because the city loans part of its property to the utilities and because their success is necessary for the progress of the community. It is necessary for municipal electricians to study this situation, especially in view of the fact that specialization is becoming more distinct in electrical matters in order to gain efficiency. For this reason electric power generation is becoming a separate industry. Civilization demands materials and their distribution. These will be secured by electricity and the outcome will be vast networks for electric power distribution and of railways. In the discussion Dr. Steinmetz indicated the Bureau of Standards would be greatly instrumental in drawing up rules for standard electrical construction and operating practice since the generation and distribution of electric power was assuming national and in some cases even international characteristics.

W. D'A. Ryan illustrated his address on "History of Illumination" with several hundred colored stereopticon slides which gave a picturization of the art of lighting from primitive to modern times. The development in illuminating methods and facilities was illustrated by a group of pictures taken at the Panama-Pacific Exposition, Mr. Ryan explaining the means employed to obtain the many different lighting effects produced there. These are noteworthy because they show the possibilities that exist for using artificial light in conjunction with art. Slides showing the street-lighting systems at San Francisco and other cities were also shown, and stress was laid upon the point that municipalities should endeavor to have their street lighting beautify the community as well as illuminate it. He concluded with the statement that cities having systems of luminous arc lamps should not be hasty in displacing this equipment because of its utility and efficiency. The address was warmly received and at its close Mr. Ryan was made an honorary member of the organization.

In his presidential address, C. E. Diehl reviewed in detail the work of the organization during the year and congratulated the membership on its loyalty during the war-time period.

Dr. M. G. Lloyd, electrical engineer, Bureau of Standards, Washington, D. C., in speaking on "High-Voltage Pole-Line Construction for City Streets," stated that there is undoubtedly a tendency toward the use of higher voltages because of the manifest economies resulting therefrom, some of which, however, are offset by the necessity for more expensive construction. City authorities are likely to receive more frequently requests for permission to have high-tension lines of 11,000 volts or higher pass through city streets. Such permission may well be granted on account of the economic advantages, provided that proper measures are taken in the construction of these lines to safeguard against their attendant hazards. Careful provision must be made against contact with persons, with low-tension circuits, such as telephone, signal and lifting circuits, and with grounded metallic structures of any kind.

Dr. Lloyd said that the types of construction called for in Part 2 of the National Electrical Safety Code meet all these requirements, and this part contains a mass of information that city electricians can well afford to make themselves familiar with when called upon to pass on any proposed line. He worked out in detail the method of determining the stresses on a typical heavily loaded pole, this having been taken from actual data from a line in one of the Chicago suburbs. Not only must the pole be of ample strength to withstand the wind and storm stresses under the most unfavorable conditions, but guy wires must have ample strength to carry the entire strain. In all cases the stress must not exceed one-half of the ultimate strength of the pole or wire. Dr. Lloyd also referred to the survey conducted this summer on typical heavily loaded poles in many parts of the country; this was made jointly by an engineer of the Bureau of Standards and one representing the National Electric Light Association, and secured data covering conditions as they actually exist prior to the revision of Part 2 of the Safety Code. Many poles were found overloaded, many underloaded, but in general the construction seemed to be well proportioned for the loads imposed.

In the report of the Standardization Committee, Chairman R. A. Smith, Norfolk, Va., resubmitted the revised reports on Class A standards dealing with fire-alarm telegraph systems and Class B on police signaling systems. The committee has found that 85% of American and Canadian cities are using equipments as described in the reports on these two classes, which had been reported at the convention last year. He, therefore, urged that the association accept these standards as recommended or good practice. On motion this was done. Mr. Smith also submitted standards for Class C—being regulations covering the construction and repair of installations for heat, light and power. This consisted chiefly of a summary of important features that should be included in municipal ordinances covering these matters. Under rules for inspections, it is recommended that the National Electrical Code be followed respecting fire hazard, and the National Electrical Safety Code followed as to life and accident hazard. The committee has in mind the preparation for standards for Class D dealing with electric lighting, and Class E dealing with electrolysis and metering.

In presenting a paper on "Electricity in Police Work," W. L. Potts, Detroit, outlined the important functions of electrical apparatus in police signaling and told of methods used in his city.

The paper on "Chicago's Novel Fire Alarm System," by W. G. Keith, commissioner of gas and electricity, Chicago, disclosed that the system is very antiquated, some of the apparatus in use having been installed just after the fire of 1871. It is proposed that the old system will be displaced by a dual system of police and fire-alarm apparatus, the principal features of which were outlined. The discussion was concerned with the construction and operation of the boxes, which will be of special design to accommodate both police and fire-alarm signals.

R. J. Gaskill, Fort Wayne, Ind., past-president of the association and a captain in the Signal Corps, A. E. F., read a paper giving first-hand statistics regarding the work of the Signal Corps during the war. He emphasized the importance of signal work in the winning of the war.

Inspection trips included visits to the Underwriters Laboratories and to the plant of the Kellogg Switchboard & Supply Co. Fire pump tests were conducted at the municipal pier for the benefit of the delegates.

A report of the concluding sessions of the convention will be made in next week's issue.

ELECTROCHEMICAL ENGINEERS HOLD THIRTY-SIXTH GENERAL MEETING IN CHICAGO.

Large Attendance and Pleasing Blending of Business and Pleasure Mark Convention.

The thirty-sixth general meeting of the American Electrochemical Society was held at the Congress Hotel, Chicago, during September 23 to 26 inclusive. The society held several joint meetings with the American Institute of Mining and Metallurgical Engineers, also convening at the Congress Hotel where the Electric Furnace Association also had a meeting.

A number of interesting inspection trips to steel mills in the vicinity of Chicago were postponed on account of the situation created by the strike of steel workers. On the afternoon of September 23 the A. E. S. held a joint meeting with the A. I. M. & M. E. at which was taken up matters pertaining to iron and steel. The papers presented were those on "Blast-furnace Refractories" by Raymond M. Howe, "Determining Gases in Steel and the Deoxidation of Steel" by J. R. Cain, "Effect of Time and Low Temperature on Physical Properties of Medium-carbon Steel" by G. A. Reinhardt and H. L. Curtis. Papers by H. D. Hibbard, Albert Sauveur, A. E. Bellis and G. F. Butterworth on "Effervescing Steel," "Aircraft Steel," "Erosion Tests of Rifle Barrels," and "Metallography of Rifle-barrel Steel" respectively, were read by title only.

In the evening a joint session was also held when papers by T. W. Robinson on "Industries of the Chicago District," "Manufacture of Steel Rails" by Robert W. Hunt, and "The World's Largest Plate Mill" by C. L. Huston, all of the A. I. M. & M. E., were presented.

Wednesday morning a meeting was held at the Exposition Auditorium at which several papers were presented. These consisted of a paper on "Manganin" by M. A. Hunter and J. W. Bacon; "Depreciation of Small Dry Cells with Age," by A. J. Helfrecht; "The Effect of Amalgamation Upon the Single Potential of Aluminum," by Louis Kahlenberg and J. A. Montgomery; and "The Effect of Amalgamation Upon the Single Potentials of the Binary Alloys of Aluminum with Copper, Zinc and Nickel," by Louis Kahlenberg and J. A. Montgomery.

The Wednesday afternoon session was devoted to a joint session with the A. I. M. & M. E. devoted to the general subject of ferrous and non-ferrous metallurgy. Of the A. E. S., F. A. J. Fitzgerald presented a paper entitled "Radiant Resistor Furnace," and "Electric Furnace for Experimental Work"; A. M. Clark one on "Electric Heat" and H. G. Weidenthal on "A Square Deal for the Electric Furnace." C. H. Fulton and G. P. Hulst, of the A. I. M. & M. E. presented papers entitled respectively "Electric-resistance Furnace of Large Capacity for Zinc Ores" and "Treating Antimony Ores." A number of other papers were presented by title only. Abstracts of the above articles on electric furnaces and dry cells will appear in the ELECTRICAL REVIEW at an early date.

Wednesday evening was devoted to an inspection of electric furnace exhibits at the Coliseum where the Fifth National Exposition of Chemical Industries was held during the week. At the Auditorium a moving picture show was a feature of the evening. One series of pictures showed the resistance type of electric furnace melting non-ferrous metal. Another reel supplied by the Electric Furnace Co. showed the electric furnace in the heat treatment of essential war materials, while another film furnished by the Detroit Electric Furnace Co. depicted the Detroit rocking furnace in operation melting brass. Still another film showed the power development and industries that have sprung up around the system of the Shawinigan Water & Power Co., Canada.

SYSTEM TROUBLES CAUSE UNPRECEDENTED SHUTDOWN IN CHICAGO.

Series of Troubles Cause Extensive Damage and Derangement to Vast Network.

What was the most serious shutdown in the history of the Commonwealth Edison Co. occurred on the afternoon of Sept. 18. The exact cause of the origination of the trouble has not been given out, if it is definitely known. Indications are, however, that line trouble caused a surge to start, which persisted for considerable time until it had assumed such magnitude as to necessitate taking out of service what generating units had not already tripped out on the section of bus affected.

At 3:45 p. m. a severe disturbance occurred on the 25-cycle system. Three 9000-volt transmission lines opened automatically at the Fisk Street station, and three 10,000-kw. turbogenerators tripped out. The behavior of another 10,000-kw. unit and a 20,000-kw. unit operating on the same bus section was such that they were taken off the bus by the operator. Two 25,000-kw. turbogenerators at the Northwest station also tripped out and a 35,000-kw., 60-cycle unit at the Fisk Street station then had to be taken off the system because its 25-cycle auxiliaries had dropped out following the loss of the machines previously placed *hors de combat.*

The severe jolt to the 25-cycle system and the loss of 25-cycle generating capacity resulted in practically all the synchronous converters supplying the "loop" or downtown territory with direct current shutting down. What machines did not fall out of step due to the severe jolt, shut down because of lack of alternating-current supply. The shifting of load from station to station, voltage drop and current surging in the direct-current network caused a very large number of fuses to blow. At Randolph Street substation one converter failed to open automatically and its armature was burnt up, causing a fire and such quantities of smoke that the operator was unable to resume operation again until 5 p. m., while fire fighters had to wear gas masks in fighting the fire. At the Plymouth Court substation one converter regulator burnt up and converters at the East Madison Street, West Division Street and Ohio Street substations were slightly damaged. During this time a number of railway substations were shut down from 2 to 14 minutes. Several manholes in the downtown district caught fire, in one case the cover being blown off with considerable concussion. The tie lines and several feeders between the Adams Court and East Madison Street substations were burnt open.

Service in the "loop" or downtown district was interrupted in some places where fuses had blown. In others the voltage was low and very badly unbalanced. The 23 standby storage batteries installed in the Commonwealth Edison Co.'s various downtown substations were called upon for high rate of discharge, in an emergency unprecedented in the history of the company. These batteries, having a rating exceeding 95,210 amperes for 1 hour at 250 volts, saved the day until those stations shut down only because of the system disturbance could start their synchronous apparatus again or obtain transmission lines. However, the storage battery capacity was only a drop in the bucket and low pressure could not be prevented entirely. Nevertheless they prevented complete interruption of service where fuses held intact.

At about 5:30 p. m. another disturbance occurred when three high-tension underground transmission lines opened automatically at Fisk Street. A number of railway substations were shut down at this time until they could get started again, while three distant substations served by 20,000-volt underground cables were shut down about three hours. After this second trouble occurred it was found that two underground lines had broken down in a manhole close to Fisk Street station and that one of these and another line had also broken down between the generator bus and their current transformers, a condition which prevented the circuit-breakers from functioning, and it was necessary to open these lines by hand. The breakdown in the manhole was so severe that all the 18 transmission lines passing through it had to be taken out of service. It was later found that several bus insulators at Fisk Street were cracked.

None of the generators were damaged. Synchronous converters, as already mentioned, suffered somewhat. A number of high-tension lines and direct-current feeders were burnt and a large number of fuses had to be replaced. The derangement of service was surprisingly small, likewise the damage suffered to equipment. The trouble or series of troubles gave the severest test to the company's relay protection system, its distributing system and also to its efficiency in personnel. All met the test and it is this fact that enabled service interruptions to be localized, the time of interruption minimized and practically all apparatus to be placed back in service again.

TIMELY TOPICS DISCUSSED AT EDISON ILLUMINATING COMPANIES' MEETING.

Many Important Questions Brought Up at Annual Convention of Association at New London, Sept. 16-18.

As announced in our last issue, the 38th convention of the Association of Edison Illuminating Companies was very successfully conducted at New London, Conn., on Sept. 16-18 of last week. Being the first gathering of this body since the close of the war, a large attendance was present and took active part in the proceedings.

In opening the convention on Tuesday morning, President L. L. Elden, of Boston, made an address reviewing the work of the association and commenting on the importance of the principal topics to be presented at the convention. He dwelt especially on the present chaotic condition of rates with their various coal clauses and surcharges to cover increased operating costs, and on the advisability of offering off-peak rates for secondary service. Other features mentioned by Mr. Elden were the labor situation, interconnection, water-power legislation and development, and standardization of equipment.

After the reports of the Executive Committee and treasurer were presented, Wm. C. L. Eglin, of Philadelphia, read the report of the Committee on Standards, of which he was chairman. This discussed chiefly the pending revision of the National Electrical Safety Code and advocated delay therein to give those interested a better opportunity to study the proposed changes. The conference on industrial safety codes held at the Bureau of Standards last January was also reviewed, together with the two proposed methods of drawing up safety codes for different industries. The report of the Committee on Metering and Service Methods, O. J. Bushnell, Chicago, chairman, was presented. It dwelt principally on some new developments in demand meters; the desirability of issuing more complete customers' handbooks or service leaflets was also pointed out and an outline of subjects therefor suggested.

D. S. Boyden, of Boston, presented a paper on "A Uniform Policy for Making Distribution Circuit Extensions and Service Connections to Consumers." This gave a summary of a questionnaire among member companies as to their practices and showed widely differing policies and procedure in this regard. The tenor of all replies indicates that the policy in making extensions and service connections is much less liberal than before the war, and that at the present time they are passing through a transition period and, with few exceptions, have not yet reached any definite policy for normal times. It therefore seems psychological that there should at this time be advocated a uniform policy covering extensions and service connections to consumers. The foregoing does not apply to street lighting or large consumers supplied from unregulated transmission lines. Development of good will should result from a more uniform policy in this regard.

"Dielectric Power Loss and Ionization Voltage in Underground Cables," was the title of a paper presented by F. M. Farmer, of New York City. The origin and significance of dielectric losses were discussed, also conditions affecting this loss and methods of measuring it. Similar treatment was given to the subject of ionization voltage. The power loss should be as low as feasible, since this permits a higher rating. Change of the dielectric loss with temperature should be a minimum in order that the critical temperature where the normal conditions become unstable will be as high as possible to permit of emergency overloads. The ionization voltage marks the limit of the voltage at which a cable can be operated without risk.

Tuesday evening was devoted to a discussion of lamps and central-station lamp practice. The report of the Lamp Committee, J. W. Lieb, chairman, was the annual compilation rich in original data of the quality and performance characteristics of incandescent lamps, large quantities of which are purchased by members of the association under test. Following the report there was a symposium on central-station lamp-renewal practice participated in by the following: Louis A. Ferguson, vice-president, Commonwealth Edison Co., Chicago; J. T. Hutchings, president, Rochester Railway & Light Co.; Robert Lindsay, vice-president and general manager, Cleveland Illuminating Co. (presented by Dr. McClellan); W. F. Wells, vice-president, Brooklyn Edison Co. The four companies represented by executives in this symposium have adopted different attitudes toward the supply of lamps to their customers. These papers were discussed by J. W. Lieb, Walter H. Johnson, T. I. Jones, C. L. Law, Alex Dow, C. L. Edgar, John W. Howell and others. The advantages and disadvantages of the several plans of lamp handling were put forward in the course of these discussions which extended until the midnight hour. There was a practical consensus, however, in favor of vigorous educational activity with a view to demonstrating the advantages to the public as well as to central stations of the more intelligent and liberal use of light, and it was emphasized that whatever the practice of the company in the handling of lamps, considerable advance can be made along this line.

At the Wednesday morning session the report of the Committee on Rates, Alex Dow, of Detroit, chairman, was presented and discussed. This report covered chiefly power rates, rates for interchange of power between companies and rates for resale of power by customers. A supplementary paper was presented at the request of the committee by James V. Oxtoby, of Detroit, on "Status of the Customer Whose Service Requires Large Investment," this dealing with the legal phases of the question and commenting on court and commission decisions on this matter.

Wm. C. L. Eglin, of Philadelphia, read a paper on "The Personnel of the Industry." A plea was made for more systematic development of all plans relating to the compensation and general welfare of the personnel. Among topics discussed were hours of labor, wage rates, collective bargaining, trade unions, employment of women and minors. Establishment by each company of a personnel bureau was advocated.

The report of the Committee on Electricity Distribution and Use, R. F. Schuchardt, Chicago, chairman, discussed in a general way possibilities for development of the industry along these lines. Among subjects commented on were interconnection to secure conservation of resources, the necessity for a single frequency for this purpose (the committee finds no real objection to making 60 cycles standard), preference of alternating-current extensions instead of direct current, timeliness of taking up power-factor correction seriously, application of electric supply to electric vehicle and railroad service, to industrial, domestic, and agricultural service, and the necessity for industrial research.

On Wednesday evening a session was held at which three papers of general interest were presented. The first was "Lessons of the War in the Conduct of Government Business," by M. O. Leighton of Washington, D. C. This paper dwelt at length first on the gross inefficiency of our Federal Government in normal times with its numerous duplications of work by different departments and bureaus, general inertia and lack of modern business methods. When we entered the war in April, 1917, not only were we unprepared but the Government machinery was utterly unadapted to handle the big emergency and the extraordinary work it involved. After a few months of chaotic floundering, the necessity for calling on the American business men familiar with handling large affairs was realized and the War Industries Board and other similar bodies presently began to function, building up an efficient and co-ordinated organization capable of doing the work promptly and economically. Mr. Leighton mentioned instances, notably the Construction Division of the Army, wherein civilian engineers housed a million men in three months although the military men said it was utterly impossible. Since close of the war, the departments and bureaus are languishing back to their former inertia and inefficiency and the lessons of the war are apparently being forgotten. In closing, Mr. Leighton made a strong plea for support of the proposed Department of Public Works, which should take over all of the engineering and scientific activities of the present Federal departments.

An address on "War Undertakings and Developments in the Industry During the Past Three Years" was presented by Francis Pratt, vice-president of the General Electric Co., in which were reviewed the principal developments and contributions of that company. On account of lack of space this address will be summarized in an early issue.

F. Darlington, of the Westinghouse Electric & Manufacturing Co., presented an address on "Vision in Power Development and the Test of War." This dealt with the National Government war-time point of view regarding utilization of power, which was that the expansion of centralized electric power systems was the only effective and efficient way of securing increased power. Central-station development has reached a stage where the best and most economical method of supplying power for practically all purposes is by large interconnected central electric systems covering interstate areas which constitute natural power-service districts. The Government vision of unified power supply does not contemplate radical departures from latest technical practice but rather a new view of the utilization of power. The paper also considered financial, political and social conditions resulting from such a unified plan.

At the concluding session on Thursday there was presented the report of the Committee on Steam Plant, H. P. Liversidge, chairman. This included an extended discussion on steam-turbine reliability and considerable matter dealing with boiler-room practice. A paper by Geo. A. Orrok on "Some Phases of the Fuel Problem" was presented, also one on "The Supply and Distribution of the Fuel of the World, Particularly of the United States," by Prof. L. P. Breckenridge; one on "Fuel Oil," by C. R. Weymouth, and one on "Pulverized Fuel," by Fred A. Scheffler of the Fuller Engineering Co. The latter discussed the use of pulverized coal by central station and other power plants and clearly demonstrated the fact that there is nothing mysterious about such applications. There are now in daily operation over 100 boilers in the United States using pulverized coal and the same equipment can use and has used such different fuels as Texas and Colorado lignite, Wyoming Oklahoma and British Columbia coals, Illinois screenings, bituminous and anthracite slack.

The election of officers of the association for the ensuing year resulted in the choice of the following:

President, W. H. Johnson, vice-president Philadelphia Electric Co., Philadelphia, Pa.

Vice-president, M. S. Sloane, Brooklyn, N. Y.

Secretary, Percy Miller, New York, N. Y.

Treasurer, Ernest A. Edkins, Chicago, Ill.

Executive Committee; Charles L. Edgar, Boston, Mass; W. W. Freeman, Cincinnati, Ohio; Samuel Insull, Chicago, Ill.; John W. Lieb, New York, N. Y.; Joseph B. McCall, Philadelphia, Pa.; and the president, vice-president, secretary and treasurer, ex-officio.

PRESIDENT BALLARD ON ACTIVITIES OF THE N. E. L. A.

In Letter to Northwest Association He Reviews Current Central-Station Problems and What N. E. L. A. Is Doing to Help Solve Them.

President R. H. Ballard of the National Electric Light Association on Sept. 6 sent to H. J. Gille, president of the Northwest Electric Light and Power Association, a letter regretting his inability to attend the annual convention of the latter organization at Seattle, Wash., this week and incidentally discussing what the N. E. L. A. is doing to help solve present-day central-station problems. The Northwest Electric Light and Power Association is a geographic section of the N. E. L. A., and Mr. Ballard's letter, which was read before the Seattle meeting, was in line with his policy of having the national association represented directly, if possible, at each of the geographic gatherings so that the latter may know what is being done by the national organization. Mr. Ballard's letter contains so much of interest that it is reproduced below substantially in full.

Mr. Ballard's Letter.

It is with keen regret that I am compelled to advise you of my inability to be present at the annual convention of the Northwest Electric Light and Power Association to be held in Seattle, Sept. 24 to 27.

Conventions of geographic sections are of particular interest to me and I had looked forward to an instructive and enjoyable visit with you all at your meeting, especially in this, the Pacific Coast year of our National Association. We are pulling so strongly together to assist in solving some of the big national problems confronting our industry that a personal visit would have given me the keenest pleasure.

Engagements to attend the conventions of the Southeastern Section at Asheville, N. C., and the New England Section at New London, Conn., both of which are scheduled for this month, together with meetings of the Executive and Public Policy Committees in New York require my presence in the eastern part of our country for the next six weeks.

President A. Emory Wishon of our Pacific Coast Section and some other prominent Californians are planning to be with you at your convention, and I am asking Mr. Wishon to represent me officially.

It has been said that the reconstruction period through which we are now passing is even more trying than the five years of actual world warfare. The effects of the war are being felt now from both economic and psychological standpoints. Economically the operation of the law of supply and demand would work out the situation were it not that this law is obstructed by certain unpatriotic action, familiarly known as profiteering. Psychologically, the public mind is still affected by five years of anxiety and it is but natural for it under these circumstances to react to all kinds of extremes. It seems to me that the need of the time is for us all to go forward with courage in the regular pursuit of our business, laying stress upon the necessity for more production, more economic saving and more conservation.

Water-Power Development.—One of the big conservation measures is the development and use of water power, thus serving the double purpose of securing an additional and inexhaustible supply of electric energy for new industries and releasing for other purposes an exhaustible supply of fuel.

Our Association has appointed a new general committee to deal with this question of water-power development. Mr. Franklin T. Griffith, president of the Portland Railway, Light & Power Co., has accepted the chairmanship of this committee.

Electrification of Railroads.—Another conservation measure which will come more gradually is the partial electrification of steam railroads, especially over mountain passes. Our central stations must be prepared for this when it comes, in order that the best economy may be attained by combining the electrical demands of the railroads with the regular commercial demands of central stations, thus securing the maximum benefits of diversity and putting the generating stations to their greatest use during all hours of the day. A strong committee is being organized to deal with this subject.

Municipal Ownership.—Interconnections of transmission systems traversing large areas irrespective of political subdivisions, cities, or even counties, has demonstrated the fallacy of municipal ownership of electric systems with their lines confined to single municipal areas. It is this broad distribution and these conditions of diversity which make possible the substantially lower average rates to consumers from large privately owned systems, and in a measure account for the development and use of electric energy from privately owned systems being some twenty times that consumed from municipally owned systems in our country.

Reliable statistics of these conditions will be compiled by a committee of our national organization, and this service should be of great value to members of the Association.

Service and Public Information.—With the regulation of electric utility rates to provide only sufficient return on capital investment to attract new capital to meet the constant demands for expansion and development, and with a courageous attitude on the part of state regulating bodies to see that such reasonable return is allowed to utility companies, the electric industry is free from politics and may devote its entire energies to its duty of adequate and comprehensive service to the public. Broad, honest and courteous service at every point of contact with the public makes for contented and satisfied consumers. We all know that a sound, substantial income, as the result of good service to contented patrons, is much more to be desired than income based on unnecessary consumption of energy and indifference to the real interests of our consumers.

That the general public may be better informed regarding this attitude of electric utility companies, a Committee on Public Information is being organized. Mr. John F. Gilchrist, vice-president of the Commonwealth Edison Co., of Chicago, has accepted the chairmanship of this committee.

Mr. S. M. Kennedy, general agent of Southern California Edison Co., will contribute much to the year's work in the capacity of chairman of the Committee on Service.

Co-operation in the Industry.—There never was a time in the history of our industry when harmony and earnest co-operation between all of its branches was more to be desired than now. Mr. Lee H. Newbert, commercial manager of the Pacific Gas & Electric Co., of San Francisco, has accepted the appointment as chairman of the Committee on Co-operation in the Industry, and will associate with him on this committee representatives from all branches of the business to outline a plan under which the maximum results of general co-operation may be obtained.

Welfare of Employes.—Employes' participation and the possibility of the workers becoming part owners in our industry is now a recognized fact in the electrical business as well as in the industrial life of America. No general plan or universal scheme of participation seems possible or practical for the reason that the conditions of no two undertakings are identical. A plan which has been very effective in practice provides for the purchase by employes on small installments of capital stock or securities of the properties with which they are identified. Interest on deferred payments is generally carried by the concern at ordinary interest rates, but the employes receive dividends at a higher rate in proportion to the earnings of the properties and consequently acquire a vital interest in the success of the business. In this wav thrift is combined with ownership and participation and a strong incentive is given for increased production, accompanied by saving. Enduring benefits resulting from the participation of workers in the business in which they are engaged cannot go beyond the sharing of profits or earnings. To place the management of the industries in the control of those untrained in the administration of such affairs would result in disaster, frustrating the very ends which co-operation is seeking to achieve.

The granting of pensions on retirement of the workers in old age, and for disability benefits to those who have served well, but may have become disqualified for service, is another great feature of employes' welfare.

Geographic Sections.—In our Geographic Sections, the greatest opportunity is offered for personal contact and interchange of ideas between executives and employes and all others interested in the electrical industry within a given territory where conditions are frequently identical and usually similar. From these, ideas naturally germinate and spread to the National Association, which are becoming transcontinental policies and aims. In the Geographic Section opportunity is offered men to think in broader terms, and for cementing all branches of the industry in one harmonious whole by a complete understanding between central stations, manufacturers, jobbers and contractor-dealers, as to the rightful place occupied by each group, and especially the relations of one branch of the industry to the other. The Geographic Section is the place where misunderstandings, frictions, petty jealousies and fancied injuries can be ironed out and adjusted. It also opens ample opportunity for constructive initiative and a medium of crystallization, demonstrating and applying locally when local, and making universal when universal, all of the constructive and creative forces that exist in the minds of the great membership of the National Electric Light Association.

SOUTHEASTERN SECTION, N. E. L. A., HOLDS MEETING AT ASHEVILLE.

Addresses, Papers and Trips Make Pleasing Convention for Delegates.

During Sept. 17, 18 and 19, the Southeastern Section of the National Electric Light Association held its annual convention at Asheville, N. C. About 200 members were in attendance.

The convention opened its first session with about 100 present. A feature of this session was the address of Mayor Gallatin Roberts, who reviewed the history of transportation and lighting, going on to relate the manner in which Asheville and the local power and light company had grown up together. He laid special emphasis upon the friendly co-operation accorded the city by H. W. Plummer, manager of the Asheville Power & Light Co. C. D. Flanigen, president of the association, then reviewed the work of the association during the last year, stressing the importance of labor policies and other public policy questions.

C. Murphy Candler, chairman, Georgia Railroad Commission, in a very clever manner told of what utility supply really means and some of the difficulties under which utilities may have to operate. He emphasized two points—that it is the solemn obligation and high duty of a public utility to render good service and that the public should accord the utility fair treatment and just compensation. The very object of a utility is to serve. Tact, courtesy, discretion are virtues. Good service is more important than low rates, and there is less objection to rate increases when the service is good. Mr. Candler then explained that his commission had fixed maximum rates and minimum service, leaving leeway for the utilities to lower rates and improve service when they can.

"The servant is worthy of his hire," said Mr. Candler, as proving that every utility is entitled to a reasonable return upon its service—what it accomplishes. That means that the charge must not exceed the value of service rendered. Some of the difficulties in rate making were outlined, as some of the reasons why rates have had to be changed because of unprecedented and unforeseen conditions that have arisen. Efficient and adequate service goes hand in hand with reasonable and just rates, and together they mean a satisfied public, a fairly compensated and contented force of employes and a fair return upon the value of property dedicated to public use.

T. F. Johnson then presented a paper entitled "Live Line Maintenance." This paper was accompanied by a supplement showing the various tools and methods discussed. The buzz stick method of locating defective multiple-part pin-type insulators, how to feel out an insulator, testing out suspension insulators, feeling out a string of insulators, method of determining number of insulators required in a string for any voltage, number of men in crew for testing a line, various tools and their use, were each taken up in turn. Methods of changing insulators, making ties on live lines, etc., were also described.

In the evening the report of the Public Policy Committee was represented by W. H. Glenn, chairman. This was followed by F. G. R. Gordon's able and sensational address upon "The World Menace of State Socialism."

At the Thursday morning session, R. H. Ballard, president of the N. E. L. A., made an address upon the pensioning of retiring employes when they have qualified by long service and loyal effort. Mr. Ballard said that action taken by the California Railroad Commission had annunciated a new principle in the jurisprudence of the country. One of the largest electrical companies in that state had applied to the regulating body for authority to put into effect a pension contract, granting pensions to all of its employes upon reaching the age of 60 years, after a 20-year period of continuous service. The commission in confirming this application gave the pension plan the force and effect of a contract binding and collectible at law, and permanent beyond the power of any future management of the corporation to eliminate and beyond the power of any future regulating body to abrogate.

After quoting to some length the ruling of the commission, Mr. Ballard said: "Such a pension plan as has been given legal status by the Railroad Commission of California is the best thought-out plan of which I can conceive to drive away from our minds the goblins of dread, and give to the loyal worker the fullest opportunity to develop his initiative and achieve his highest potentialities."

Following Mr. Ballard, F. C. Hamilton presented a paper entitled "Rate Reduction in the Last Three Years," in which it was shown that after considering the lack of a standard measuring stick of value, the intrinsic value has not changed the depreciation of the purchasing power of money, that a reduction in utility rates has actually occurred. The necessity of rate restoration instead of rate increase was advanced by Mr. Hamilton, he then pointing out that labor unions appreciate fundamentals that utility men neglect and why electric utilities have been late to suffer from time lag of rate change to care for conditions as they exist today. A number of court decisions are given bearing upon property value of public utilities. It is stated that the trend of prices upward is permanent and that with the purchasing power of money declining, there is no choice but to raise the selling price of the finished product or face bankruptcy.

"Safeguarding the Employe" was the title of the next paper, presented by H. L. Parish, Durham Traction Co. Mr. Parish discussed the past and future safety movement and explained the manner in which this work should be taken up by companies. General points for safety are then given, safety records are reviewed and the awarding of prices advocated, as are also medical examination, physical exercises, lectures and meetings.

J. Prince Webster then gave his interesting talk on "The Smiling Complaint Man," a talk that contained from beginning to end pithy and sound advice as to the manner of handling complaints. Several different methods of handling complaints by different companies were described and the morals pointed out. This paper will be abstracted in a future issue of the Electrical Review.

Thursday afternoon and evening were devoted to recreation, there being wide choice in the way of golf, a visit to the Country Club, a tea dance, a band concert and an airplane trip for those that wished to go. In the evening there were moving pictures and a dance.

On Friday morning the business and final session was held. A paper on "The Grounding of Secondaries" was read by L. V. Sutton, Carolina Power & Light Co., who explained the present status of grounding secondaries, why it is done and how it should be done. Comparative advantage of different ways of grounding, the copper plate, iron pipes, etc., and methods of testing the resistance of grounds were given. Specifications for making and maintaining grounds were presented. W. M. Stearns then read a paper upon "The Marsh Patent and Its Effect on the Heating Appliance Industry" in which the litigation, the agreements between the Hoskins and the General Electric interests and their influence upon the heating industry were explained.

A meeting of Class A members and of the Executive Committee was then held, after which the session was adjourned and the convention came to an end.

ACTIVATED-SLUDGE SEWAGE-TREATING PLANT TO REQUIRE MUCH POWER.

Langdon Pearse Describes Problem of Treating Chicago Packing-House Wastes and Plans Proposed for Its Solution.

A general summary and details of one of the most acute problems in sewage disposal were explained to the Western Society of Engineers, at a meeting in Chicago on Sept. 22, by Langdon Pearse, engineer of the Sanitary District of Chicago. Mr. Pearse's talk was entitled "The Packingtown Waste Problem" and dealt with the very aggravated situation in the Union Stock Yards of Chicago where in an area of a little over one square mile there is formed as much sewage as by a city of over 1,000,000 inhabitants. The solution proposed is a treating plant to be operated exclusively by electric power and involving a connected load of about 12,000 hp. and using approximately 38,500,000 kw-hr. annually.

Mr. Pearse stated that the Chicago stock yards had been established in 1865, growing steadily until now over 12,000,000 cattle, hogs and sheep are slaughtered annually. From the cattle pens and slaughtering houses from 50 to 75 tons of solid organic matter are discharged into the sewers daily, consequently the sewage is very "strong." Up to the present time the scheme of diluting this sewage on its discharge into the Chicago river and Sanitary canal has been followed, but on account of national and international questions involving control of the levels of the Great Lakes, it is anticipated that the dilution method has reached the limit of its capacity and, therefore, sewage treatment must be inaugurated. The stock yards area constitutes the most difficult problem in the entire Chicago district if not in the country. Study of this problem was begun in 1911 when a testing station was established. Investigations were made of the discharge from each of the principal packing plants to find out its quantity, nature and variation from time to time. It was found that the sewage was about eight times as "strong" as domestic sewage. Various schemes of treatment were tried on an experimental scale, including the Imhoff tank method, sprinkling filters and the recently developed activated-sludge method. The latter was looked upon with much interest and extended experiments carried on. It depends on the property of the depositing sludge of oxygenizing and nitrifying the dissolved organic matter as air is blown through the sewage. Part of the sludge is used over and over again. The experiments were continued with various types of tanks, quantities of air and time of treatment. It was found that the process could be employed both in summer and winter, but was more efficient in summer.

As the result of these studies a plant was designed to consist of fine screens (20 to 30 mesh per inch), a grit chamber to remove grease, aeration and settling tanks besides sludge dryers, power house, etc. It was found that the sludge at the end of the process ran about 98.5% water, so that filter presses would be required to reduce this to about 75% water and form a cake. Further treatment of this material by dehydrating and finally grinding would convert it into a commercial fertilizer of a fair value depending on market prices, but offsetting a considerable part of the operating costs. The plant is proposed to have a capacity of handling about 50,000,000 gal. a day and would include the domestic sewage of the 60,000 employes as well as the industrial sewage of the district. The sewage will enter the plant through coarse bar screens followed by fine screens in the grit chamber, which should remove about 25% of the suspended matter. It will then pass through the grease-skimming tanks, from which it is expected that over 1000 lb. of grease should be collected daily. It then enters the aeration tanks where about 4 cu. ft. of air per gallon of sewage is blown through continuously for about eight hours, this being the active part of the process. From these tanks it passes into settling tanks where the sludge slowly settles. The effluent is clear and almost sparkling, entirely free from odor and stable in character. The tanks will be built of concrete.

For power equipment there will be needed a number of air compressors, pumps, filter presses, dryers and cranes, for all of which it is proposed to use electric motors. Assuming a power rate of 0.7 cent per kw-hr., the power cost for the year will be about $270,000. The labor cost is estimated at about $75,400, supplies and repairs $98,000, superintendence, etc., making the total operating $455,700 per year. Adding interest and depreciation, the total annual cost figures out about $822,000. The first cost of the plant is estimated at about $3,750,000 on 1917 prices. Recoveries, depending upon the quantity and market price, should range from $192,000 to $462,000 annually, thus reducing the net operating cost in a very substantial degree.

At the present time this project, which was held up on account of the war, is being revived and its execution is delayed only by the negotiations between the Sanitary District and the stock yards interests as to the proportion of the initial and annual cost to be borne by each of these parties. Early agreement on this matter is anticipated so that the work may proceed. It is planned to erect the plant in unit sections so that the experience gained in operating on a large scale in some of the earlier sections may be used before deciding on the details for the remaining sections. The plant will be unique in being the largest one yet operated on the activated-sludge process and also in being the largest sewage-treating plant using electric power.

PROGRAM FOR CONVENTION OF ILLUMINATING ENGINEERING SOCIETY.

Papers Are Grouped so That Each Session Has Special Appeal to a Definite Division of the Lighting Profession.

It is the plan of the Papers Committee of the Illuminating Engineering Society to have each of the five sessions of the 1919 convention at Chicago, Oct. 20 to 23 inclusive, so arranged that all topics discussed at the session will have a bearing on some particular phase of the lighting industry. Monday afternoon's session will be devoted entirely to opening addresses and reports of committees; Tuesday morning's session to street lighting, searchlighting and photometry; Wednesday morning to glare, and industrial code symposium; Wednesday afternoon to papers of interest to commercial men, and Thursday morning session to papers on the design of interior illumination. Visits to the Chicago Electrical Trade Exposition and other entertainment features will occupy the time not taken up by covenant sessions and inspections.

The program as arranged by George H. Stickney, Harrison, N. J., chairman of the Papers Committee, is as follows: Presidential address, Dr. George A. Hoadley, Swarthmore, Pa.; report of Committee on Automobile Headlighting Specifications, Dr. C. H. Sharp, chairman, Electrical Testing Laboratories, New York City; report of Committee on Lighting Progress, F. E. Cady, chairman, National Lamp Works, Cleveland, Ohio; paper on "Lighting in England," by F. W. Willcox, British Thomson-Houston Co., London, England.

Paper on "Street Lighting with Low-Mounted Units, Kensico Dam Drive," by J. Howard Williams, former engineer New York Department of Water Supply, New York City, and C. A. B. Halvorson, engineer, General Electric Co., West Lynn, Mass.; "Recent Developments in Electric Street Lighting," by C. A. B. Halvorson, West Lynn, Mass.; "Recent Developments in Gas Street Lighting," by F. V. Westermaier, engineer, Welsbach Street Lighting Co., Philadelphia, Pa.; "Searchlights in the War," by Capt. Chester Lichtenberg, office of the chief of engineers, War Department, Washington, D. C.; "A Universal Photometric Integrator," by F. A. Bendford, illuminating engineering laboratory, General Electric Co., Schenectady, N. Y.; "Photoelectric Photometry," by Dr. A. H. Compton, Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.

"Glare," by Ward Harrison, illuminating engineer, National Lamp Works, Cleveland, Ohio; Symposium on Industrial Lighting Codes: (a) "Introduction," by L. B. Marks, consulting engineer, New York City; (b) "The Code in Wisconsin," by J. A. Hoeveler, electrical engineer, Wisconsin Industrial Commission, Madison, Wis.; (c) "The Code in New York," by J. H. Vogt, director of industrial hygiene, State Industrial Commission, New York City; (d) "The Code in New Jersey," by R. H. Leveridge, chief of Bureau of Electrical and Mechanical Equipment, Department of Labor, Trenton, N. J.; (e) "The Code in Pennsylvania," by J. S. Spicer, Department of Labor, Harrisburg, Pa.; (f) "Insurance Inspectors and the Code," by R. E. Simpson, engineer, Travelers Insurance Indemnity Co., Hartford, Conn.

"Opportunities for Extending Lighting Through New Applications," by R. M. Searle, vice-president, Rochester Railway & Light Co., Rochester, N. Y.; "Factory Lighting as a Central-Station Problem," by O. R. Hogue, head lighting agent, and J. J. Kirk, illuminating engineer, Commonwealth Edison Co., Chicago; "A Survey of Industrial Lighting in Fifteen States," by R. O. Eastman, of Fuller & Smith, Cleveland, Ohio.

"Artistic Illumination of Interiors Without Use of Pendent Ceiling Fixtures," by A. D. Curtis, president, and J. L. Stair, illuminating engineer, National X-Ray Reflector Co., Chicago; "Principles of Interior Illumination," by Bassett Jones, consulting engineer, New York City; "Co-efficients of Lighting Utilization," by Ward Harrison and E. A. Anderson, Cleveland, Ohio; "Tests of Lighting Units," by Van-Rensselaer Lansingh, engineer, Cincinnati, Ohio.

IRON AND STEEL ELECTRICAL ENGINEERS DISCUSS VITAL PROBLEMS.

Thirteenth Annual Convention Held in St. Louis Sept. 22-26 Brings Good Collection of Papers and Active Discussion.

A very successful convention was held by the Association of Iron and Steel Electrical Engineers at St. Louis, Mo., on Monday to Friday of this week. The program was somewhat ambitious in the number of subjects presented, but each of these received careful attention and many of the papers were actively discussed. The attendance was about 250, this being slightly under expectations but due somewhat to the disturbed conditions in the industry.

President Petty in his annual address outlined the work of the association during the past year, laying special emphasis on the work of the sections and committees of the association, particularly the Standardization Committee. There are now five sections at Birmingham, Chicago, Cleveland, Philadelphia and Pittsburgh, all of which are very active in the work for which they were organized. Mr. Petty referred to the satisfactory growth of the association from 28 members in 1907 to 1020 in 1917, and expressed the belief that at the end of the present year the membership would be 1200, as there had been a gain of 206 in the first eight months of 1919.

Space does not permit review of the papers and discussions, which will be presented in our next issue.

The newly elected officers for the ensuing year are:

President—B. W. Gilson, Youngstown, Ohio.

First vice-president—H. C. Cronk, Cleveland, Ohio.

Second vice-president—F. G. Wiley, Chicago, Ill.

Treasurer—James Farrington, Steubenville, Ohio.

Secretary—John F. Kelly, Pittsburgh, Pa.

Directors—R. F. Gale, Philadelphia, Pa.; J. E. Fries, Birmingham, Ala.; W. S. Hall, Chicago, Ill., and C. E. Bedell, Wheeling, W. Va.

RED CROSS TAKES UP FIRST AID AND ACCIDENT PREVENTION WORK.

American Red Cross Ready to Loan First-Aid Specialists to Utility and Industrial Companies.

It is stated that accidents cause 9.3% of the deaths in the United States. Part of these occur in industrial plants, and again part of these occur in electrical industrial plants. Looking at the situation from a humanitarian viewpoint and also from an economic standpoint it would seem that methods and systems should be devised and utilized to reduce the number of accidents to a minimum and to provide more ready medical means to relieve those who are injured.

With the latter as an object the American Red Cross has organized a first-aid division which employs a staff of field representatives trained in accident prevention and first-aid to the injured, the members of which are loaned, under virtually agreeable conditions, to factories, mills, mines, railroads, etc., for the purpose of instructing their employes in this important work.

SEATTLE SECTION A. I. E. E. CONVENES.

Annual Meeting and Dinner Devoted to Organization Problems of the Institute.

The annual meeting and dinner of the Seattle Section of American Institute of Electrical Engineers was held Sept. 16 at Hotel Butler. One of the principal features was the report of Chairman John Harisberger of his trip to Lake Placid, in attendance at the national convention of the Institute. He reported in detail on the work of the development committee, which he thought would be adopted by the board of directors.

On motion, the section proposed Dr. Magnusson as vice-president for the coming year of the Pacific Coast association, the recommendation having been wired to the convention which met in Los Angeles Sept. 18.

Much discussion followed relative to the report of the development committee. There was also discussion of the proposal of G. E. Quinan to have associate members transferred to higher grades. It was brought out by F. D. Nims that many associate members could not meet the qualifications required for higher rating. A committee was appointed to deal with this subject and report to the executive committee.

A. J. HIXON SPEAKS AT MEETING OF MASSACHUSETTS CONTRACTORS.

At a meeting of the Boston district of the Massachusetts State Association of Electrical Contractors and Dealers held Sept. 18 at Boston, A. J. Hixon, state committeeman of the national organization, was the principal speaker. He took up the formation of the national association and showed its progress step by step to the adoption of the Goodwin plan at New Orleans, and then explained in detail the resolutions adopted at the Milwaukee convention. He made the statement that that meeting was to the electrical industry what the Declaration of Independence was to the counry.

ELECTRICAL MANUFACTURERS SCHEDULE SECTION MEETINGS.

Many of the Sections to Meet in New York and Chicago On Oct. 14-16.

The Associated Manufacturers of Electrical Supplies will hold the following section meetings at its rooms, 30 East 42nd street, New York City: Oct. 14—Signalling Apparatus Section, Lamp Receptacle and Socket Section, Industrial Lighting Fixture Section, Snap Switch Section, and Attachment Plug Section. Oct. 15—Outlet Box Section, Fuse Section, Knife Switch Section, Insulating Materials Section, and a meeting of chairmen of Section Tariff Committees. Oct. 16—Panelboard and Switchboard Section, Moulded or Formed Insulation Section, Line Material Section, and Air Circuit Breaker Section. A meeting of the Heating Appliance Section will be held in Chicago, Oct. 14.

CHICAGO CONTRACTORS DISCUSS COST SYSTEMS AND HOUSE WIRING.

At a meeting of the Chicago district of the Illinois State Electrical Contractors' Association, held in Chicago, Sept. 19, A. R. Nordlie was elected chairman; F. L. Butler, vice-chairman; G. G. Pedley, secretary, and L. M. Kahn, treasurer. The feature of the meeting was a blackboard analysis and discussion of cost systems, with J. W. Collins at the blackboard. It was announced arrangements had been made with a Chicago bank whereby contractors completing house-wiring contracts could obtain full payments for their contracts at a discount of 6%, the bank to make the collections on the part-payment plan.

JOINT MEETING OF A. I. E. E. AND I. R. E. AT NEW YORK.

A joint meeting of the American Institute of Electrical Engineers and the Institute of Radio Engineers will be held in the auditorium of the Engineering Societies Building, 33 West 39th street, New York, on Oct. 1, at 8:15 p. m. The following papers will be presented: "Trans-Oceanic Radio Telegraphy," by E. F. W. Alexanderson, General Electric Co.; "Telephone Repeaters," by F. B. Jewett and B. Gherardi, Western Electric Co., and "Principles of Radio Transmission and Reception with Antenna and Coil Aerials," by J. H. Dellinger, Bureau of Standards.

CENTRAL STATION ESTABLISHES LIBRARY.

The Rochester (N. Y.) Railway & Light Co. is planning the establishment of a new library consisting of books, reports, etc., issued by engineering and technical societies, and pamphlets, publications and literature in general relating to electric and gas lighting, for the use of its employes. The library will be located in the offices of the company, 34 Clinton avenue, North, and will be in charge of a competent librarian.

Commercial Practice

Electro-Culture for Fruit—Value of the Electric Range as Central-Station Load—Advantage of Off-Peak Rates

EFFECT OF ULTRA-VIOLET RAYS UPON BANANAS, SUGAR CANE, ETC.

Experiments Indicate Increased Yield from Use of Ultra-Violet Rays.

Experiments carried on in Hawaii upon the effects of darkness, sunlight and quartz-lamp light upon bananas, pineapples and sugar cane have brought out some interesting facts, according to a recent issue of Louisiana Planter and Sugar Manufacturer.

Normal sugar-canes kept in the dark in Hawaii at 22° grew, but became pale; exposed to the light from a quartz-mercury lamp they turned green in 2½ hours, while sunlight had no effect. Of three other lots, one was grown under colored glass, the second in normal sunlight, the third exposed to sunlight and to the quartz-lamp light rays; the second gave 30% more sugar than the first, the third 8% more than the second, and therefore 38% more than the first. Pineapples exposed to the ultra-violet rays for 40 minutes every morning were found to give riper and superior fruit. The same effect was obtained with bananas; cut banana-leaves and stalks, moreover, kept fresh in water for two weeks, after having been radiated upon by the quartz-mercury lamp; without this treatment they faded in one week. Thus fruit might be preserved for export, but great care is required to secure the proper radiation treatment. Mention is made of experiments with arc-light carbons, impregnated with sodium tungstate, uranium nitrate, ammonium molybdate, and titanium chloride, for the production of ultra-violet rays.

VALUE OF ELECTRIC COOKING AS CENTRAL-STATION LOAD.

Striking Summary of Its Profitableness Presented by Pierce L. Miles Before Colorado Central-Station Men.

The advantages of electric cooking have frequently been presented and are fairly well known among progressive central-station men. Many of these are still far from being convinced as to its practicability and profitability as a central-station load, however. Of special interest, therefore, to such men should be a paper on "Electric Cookery" presented last week before the Glenwood Springs, Colo., convention of the Colorado Electric Light, Power and Railway Association by Pierre L. Miles, of the Edison Electric Appliance Co. His paper consisted almost entirely of the following terse statements summarizing his conclusions as to the electric range, cooking rates and range-modernizing methods, based on many years' experience and investigation among central-station men, who are today successfully exploiting the sale of electric ranges.

The Electric Range.

The electric range is the best cooking apparatus on the market. It will (a) boil, (b) fry, (c) roast, (d) bake, (e) broil, better than any fuel.

The initial cost of the range is not retarding the rapid introduction of electric cookery, as is sometimes claimed.

The cost of operating an electric range is purely a matter of educating your customers to the proper use of the range. All the cooking for a family of five may be done with 100 kw-hr. per month, and current in excess of this amount is unnecessary.

Electric range is *not* slow and if properly employed compares favorably with other fuels wherever speed is necessary.

Even though the heating of a large amount of water for bath purposes is not practical on an electric range, this will not be a deterrent to the sale of ranges if the subject is properly handled.

The fact that the electric range will not heat the kitchen in the winter months is an advantage rather than a disadvantage.

The electric range has more points of superiority (talking points) than has electric lighting.

The Rate for Electric Cooking Service.

There is more profit in the electric cooking load than in the lighting business.

Only 600 watts of station generating capacity is necessary to serve a 6000-watt range.

The electric range load is sometimes more profitable in a small town than in a large one.

With a 3-cent cooking rate and with fuel costs of 1 cent per kw-hr., lighting companies can afford to spend at least $100 in order to connect a range to their lines.

A 3-cent electric cooking rate can be justified against a 5-cent small-motor rate on the basis of being a more profitable load.

The electric range load should not bear the same expense of distributing current as does the present lighting load.

A 15-kv-a. transformer will serve a group of 20 ranges, having a connected load of 120 kw., because of the high diversity-factor.

The yearly revenue per kilowatt of generating capacity serving the electric range load is greater than that serving a small motor load.

The investment required to serve a range customer is not as great as originally required to serve a lighting customer.

There is more profit in selling 1500 kw-hr. per year at a profit of ½ cent per kw-hr. (your range load) than in a profit eight times as great per kw-hr. for the lighting load.

There is more profit in a 1½-cent water-heating rate than in a 3-cent cooking rate.

Two hundred electric ranges can be installed in nearly every small town, without having to increase the present generating capacity.

Only 10 to 15% of the total connected range load will fall on present station peak.

The diversity-factor and load factor of the electric range load is far better than that of the lighting load.

Electric Range Merchandising Method.

It is not necessary for a lighting company to make any investment for the selling or advertising of electric ranges.

With proper methods between 3 and 5% of residential customers may be sold an electric range during the first year of electric range sales work.

Advertising alone will not sell electric ranges.

A low rate for electric current will not in itself sell electric ranges.

A display and description of what the electric range is will not sell ranges.

Even a small-town company can employ an electric range salesman, as well as a range demonstrator, at no expense to itself.

The campaign on electric ranges should consist of two parts, educational and sales.

The cost of the inside wiring should be included in the selling price of the range.

Time payments are an esential part of a successful electric range business.

The manufacturer's system of discounts provides for compensating the central-station man for the cost of retailing.

If the lighting company does not engage in the water-heating business, it should be in a position to offer suggestions to its customers regarding the best method of doing this work, as well as that of heating the kitchen in the winter time.

The sale of an apartment-house installation offers one of the most profitable loads for the central station at the least sales expense.

Mr. Miles said in conclusion: The time is coming, and it is not so very far distant, when the central-station man responsible for sales will be called upon to show a yearly increase in kilowatt-hours delivered. The electric range load offers the golden opportunity to meet this demand.

Now is the time when farsighted men are breaking the ground for this future business. They are placing their quota for the coming year. They intend to jump in and by aggressive sales and advertising methods reach their goal. They have carefully considered the following two basic factors in this field of central-station activity.

First, is the electric range a satisfactory article to recommend to the public? Will the purchaser be compensated and fully satisfied with his investment?

Secondly, is a rate for cooking profitable to the central station? A comprehensive study of the question will reveal that it is.

Once these two points have been settled the sales manager must not allow any of the annoying details, incident to any new business, to swerve him from the purpose of building up this phase of his business.

Water heating, initial cost, installation expense, time payments, heating of the kitchen, costs of selling, maintenance, are some few of the problems which are bothering central-station men today. They are merely the details of the two basic facts. With earnest application they can and will be solved. But not by sitting back and hopelessly repeating "Electric ranges cannot be sold, because of this or that reason."

The building of the range load is hard—sometimes very hard. But it can be done. It takes both brains and live sales energy. It takes the pioneer quality of stick-to-it-iveness, which made a success of the telephone, the automobile, the electric light, and every other new device brought onto the market.

First, be sure you are right in the first two points. Then go ahead, assured of success in the knowledge that if your fundamentals are correct, all other questions and conditions are capable of being solved and overcome. Serious as they may sometimes appear to be, they are relatively unimportant, and require only serious application in order to find the way through, over, around, or under.

VALUE OF OFF-PEAK RATES IN IMPROVING LOAD-FACTOR.

President Elden of Association of Edison Illuminating Companies Recommends Greater Use of Off-Peak Service.

At the annual convention of the Association of Edison Illuminating Companies held at New London, Conn., Sept. 16-18, L. L. Elden, of Boston, in his presidential address had this to say on off-peak rates and service:

"Two years' experience in the application of an 'off-peak rate' for secondary service has clearly demonstrated the economic value of such a rate, if service is supplied under suitable restrictions. Broadly speaking, with a rate based upon supplying service only when available, it is usually possible to secure nearly 90% of a consumer's total business on a secondary rate without incurring an expenditure in excess of a small fraction of that required to supply his total service requirements. The effect of such business on the investment, income and operating accounts is obvious, increasing, as it does, the income, while reducing the average amount of capital required per kilowatt of capacity or consumer served, and further reducing the cost per kilowatt-hour delivered through improvement in load-factor."

DEVELOPING GOOD WILL THROUGH NEWSPAPER ADVERTISEMENTS.

Nebraska Power Co. Presents Some of Its Central-Station Problems for Consideration by the Public.

The Nebraska Power Co., of Omaha, Neb., is appealing to its customers through well written newspaper advertisements for careful consideration of the problems of the company. Facts are stated in a plain manner, with every appeal to the better business judgment of the customer and no appeal whatever to sympathy. In its "Talk to Our Customers No. 1" the company asks consideration of the load equivalent to 75,000 electric lamps being suddenly thrown upon the company on account of a thunderstorm which practically darkened the skies on the afternoon of Monday, April 21, 1919. If one person turned on the lights in his home, office or store, it is only probable that in a city the size of Omaha that thousands did the same. For that reason many thousand dollars' worth of machinery, with its attendant labor, fuel and other supplies, must be held continuously in reserve to care for storms which may occur only two or three times a year, so that when a consumer presses a switch, electric service will instantly be available.

Operating Practice

Suspension Insulator Failure—Reducing Converter Flash-Overs—Generating Switchgear—Substation Temperatures

PUNCTURE OF SUSPENSION INSULATORS.

From Paper on "Symposium of Operating Difficulties," Before Pacific Coast Section, A. I. E. E.

By Clem A. Copeland,

Technical Assistant, Bureau of Light and Power, Los Angeles.

The trouble dealt with here occurred on a 110,000-volt, 3-phase, 50-cycle line with neutral of transformers grounded at both ends, and two vertical circuits of 300,000-cir. mil., 19-strand copper cable, steel towers, 44.13 mi., with no branches, at a point 29 miles from San Francisquito Power Plant No. 1 on the summit of the Newhall Hills, at an altitude of 2350 ft. The weather was foggy and wet but calm. The temperature was about 55° F.

The single suspension middle crossarm string on the east circuit of 7 insulators failed by the 6 lower insulators puncturing between pin and cap forming a crater from ½ to ¾-in. in diameter, all craters being approximately in the same vertical plane at right angles to line direction on the leeward side of the string away from the tower. The tower is at a sharp vertical angle, therefore the strain is great. The six lower insulators which failed were manufactured in 1912, but were not put in service until February, 1917. The top insulator was made in 1915 and put in service in February, 1916.

The same tower on July 17, 1919, the top strings on the same circuit failed in a similar manner at 4:30 a. m. during a heavy wet fog. On April 1 and on July 19 the same trouble happened on single dead-end strain strings of two of the same kind of insulators on 33,000-volt lines of No. 2 solid wire in Los Angeles.

The cause of the trouble is obscure, but several theories have been advanced:

(a) Sharp ridged corrugation on pin form rings of high electrostatic density and strain.

(b) Unyielding cement between metal of one coefficient, in conjunction with

(c) Heavy strain due to vertical angles in line.
((c) does not seem to be borne out in the case of 33,000-volt lines.)

(d) Flat top of insulator under cap and flat top of pin cavity may be of a form to introduce shrinkage strains in cooling.

The remedy is implied in the above analysis of causes.

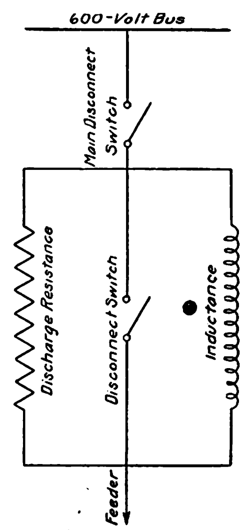
ARRANGEMENT OF FEEDER INDUCTANCE TO REDUCE CONVERTER FLASH-OVERS.

Selective Action Enables Feeder Breakers to Open Before Machine Breaker.

In a substation supplying 600-volt direct-current power to a railway terminal by about 6000-kw. in synchronous converters, considerable trouble was being caused on account of short circuits on the third rail in the terminal yard. Many of the feeders between station and third rail were of very short length and of large cross section, hence a short circuit on the third rail was almost equivalent to a short on the station 600-volt bus.

When two synchronous converters were operating and pulling a heavy load due to many of the feeders being well loaded, it often happened that one machine breaker would open, shifting the total load to the other machine which likewise immediately dropped its load. Another form of trouble was that when one machine was operating alone, as during the early morning and later evening hours, a short circuit in the terminal yard usually caused the machine breaker to open up.

The accompanying diagram shows the method proposed, by which nearly all such trouble as mentioned above would be eliminated. This diagram shows that an inductance has been inserted in the short feeder between substation and third rail. Reactance so located reduces the severity of the short circuit, thus preventing the machine and station bus from receiving as severe a jolt as they otherwise would.



Arrangement of Reactance and Discharge Resistance by Which Flash-Overs and Opening of Machine Breakers on Short Circuits Was Overcome.

Apart from the cushioning effect of the inductance, the time lag or time constant of the circuit or feeder enables the feeder breaker to open before the main or machine breaker has time to function. Such an arrangement therefore not only tends to reduce interruption of service that may follow the opening of a machine breaker but also reduces the likelihood of flashover of the synchronous converter when a heavy load suddenly ceases.

In the installation it will be noted that a disconnect switch has been installed so as to permit short-circuiting or eliminating the influence of the reactance during such times as more than one machine is in service.

This was done because it had been found that it was when one machine was on the bus alone that flash-overs and opening of the main breaker occurred. A discharge resistance is also inserted in parallel with the reactance to prevent piling up of voltage due to sudden current rush. The discharge resistance was made up of several sections of cast-iron railway grids. The reactance was composed of 400 ft. of 500,000 cir. mil, lead-covered cable. This length of cable was wound upon its reel, the reel being fastened in place. The cable was connected up in circuit through lugs, an arrangement that would permit removing the cable, undamaged, on short notice, should it be necessary to use this length of cable elsewhere.

CHOICE OF SWITCHGEAR FOR MEDIUM-SIZED GENERATING STATION.

Reasons for Choice of Truck Type Switches by Lycoming Edison Co. Are Given.

The Lycoming Edison Co., Williamsport, Pa., found it necessary to enlarge its generating capacity by installing two 6600-volt, 7500-kw., 3-phase generators and one 2500-kw., 2300-volt, 4-phase generator in a station designed for an ultimate capacity of 30,000 kw. These sources of power are interconnected by means of 6600-volt 3-phase and 2300-volt 4-phase transformers. In a paper read before the Pennsylvania Electric Association at Bedford Springs, Pa., recently, G. E. Wendle discussed the selection of switchgear for power plants of moderate size, his experience and remarks being based upon the installation of the above station.

As a necessary preliminary, the ultimate station capacity, the maximum size and voltage of generating unit, and the probable number of feeders were carefully estimated upon the operating data of the present equipment and the anticipated development of our tributary territory. The figures assumed for these several items were as follows: 30,000 kw.; 7500 to 10,000 kv-a., at 11,000 volts; and 16 3-phase and 10 single-phase feeders in addition to the present lines. These estimated additions actually provided for three times the present capacity and between four and five times the present output. The choice of switchboard and control was confined to three systems, namely, the usual panel type, consisting of a pipe framework which supported the various apparatus, etc., and on which was mounted the marble or slate panels with operating handles, instruments, etc.; the cell type with bench board control; and the safety enclosed removable truck type with remote control of all main or master trucks.

After a short study of the panel type, it was eliminated because of the large number of exposed high voltage parts, difficulty in meeting the present and anticipating the future requirements in the state safety code in the matter of isolation of dangerous parts.

The matter of selection was thus reduced to the cell and the safety enclosed truck types, and as these two types were available in units of ample size and were practically equal in cost for equal number and subdivision of units, the final choice was made after careful consideration of the relative merits of these types under local conditions in favor of the truck type.

The cell and the truck types of switches appeared to have about the same reliability, taking into consideration the investment warranted by revenue. Regarding safety the truck type was considered preferable, since it is absolutely safe. Facility of installation was entirely in favor of the truck type switch, while facility of inspection and maintenance between the two types is on a par with the former and in favor of the latter for maintenance. The truck type was thought to have somewhat the advantage as regards operating economy. Localization of faults and isolation of trouble seemed about the same with the switch in a cell and the one on a truck.

Tests were made to determine the time required to remove a truck type switch as follows with men of ordinary physique and average intelligence but without special drilling or experience in handling the trucks. The series of operations were as follows:

(a) Go to a designated faulty truck and remove that truck from its cell.

(b) Go to the spare truck, remove it from its usual cell, move it into proper position to enter the faulty truck's cell, and push the truck home.

(c) Close the oil switch, thereby locking the truck in place and resuming service.

The time required for the smaller feeder truck, 30 seconds; and for the main trucks, 1 minute 45 seconds. These tests indicated clearly the great advantage of the truck type when emergency conditions must be handled quickly and surely by men of average capacity.

For the same number and subdivision of generating and distributing units, the cell and truck types were estimated as approximately equal in cost. The cell type cost was definite as far as the apparatus and appliances, but there was a large estimated portion which was subject to considerable doubt because of the fluctuating labor and material costs and existing uncertainties. It was concluded that a cell type installation would certainly cost as much and probably would cost more than a truck type.

INFLUENCE OF SUB-BASEMENT SUB-STATION TEMPERATURES UPON MACHINE INSULATION.

Mica Insulation Advocated Where High Summer Temperatures Exist.

It is a fact long since appreciated by operating engineers that the ambient temperatures of sub-basement substations may be very high. This condition may exist the year round, but it is more marked during the summer months. In sub-basement substations 35 ft. below the sidewalk and containing two or more 2000-kw. synchronous converters or units of 4000-kw. it is a difficult matter to carry off the large heat losses and the temperature tends to be high regardless of practical precautions.

The loads on sub-basement substations is often such that the load-factor on individual machine is high, and this coupled with high operating temperatures results in shortened life of the insulation of machines so operated. In fact it has been the experience of several companies that the insulation of machines in sub-basement substations becomes cooked and frequent rewinding is necessary. In one recent case, a 2000-kw. synchronous converter had been subjected to heavy loads for long periods, with resulting high internal and ambient temperatures, with the result that it was necessary to re-insulate it about every fifteen months. The company in question aims to overcome this objection, not of cost alone, but loss of capacity also, by adopting mica insulation for machines that are to operate in their sub-basement substations.

Contracting-Construction

Contracts on Fee Basis, Developing Repair Service, Cost Accounting and Other Points on Squire Co. Organization

BUILDING UP A LARGE CONTRACTING AND REPAIR BUSINESS.

Progressive Methods Used by Kansas City Contractor to Establish Growing Institution.

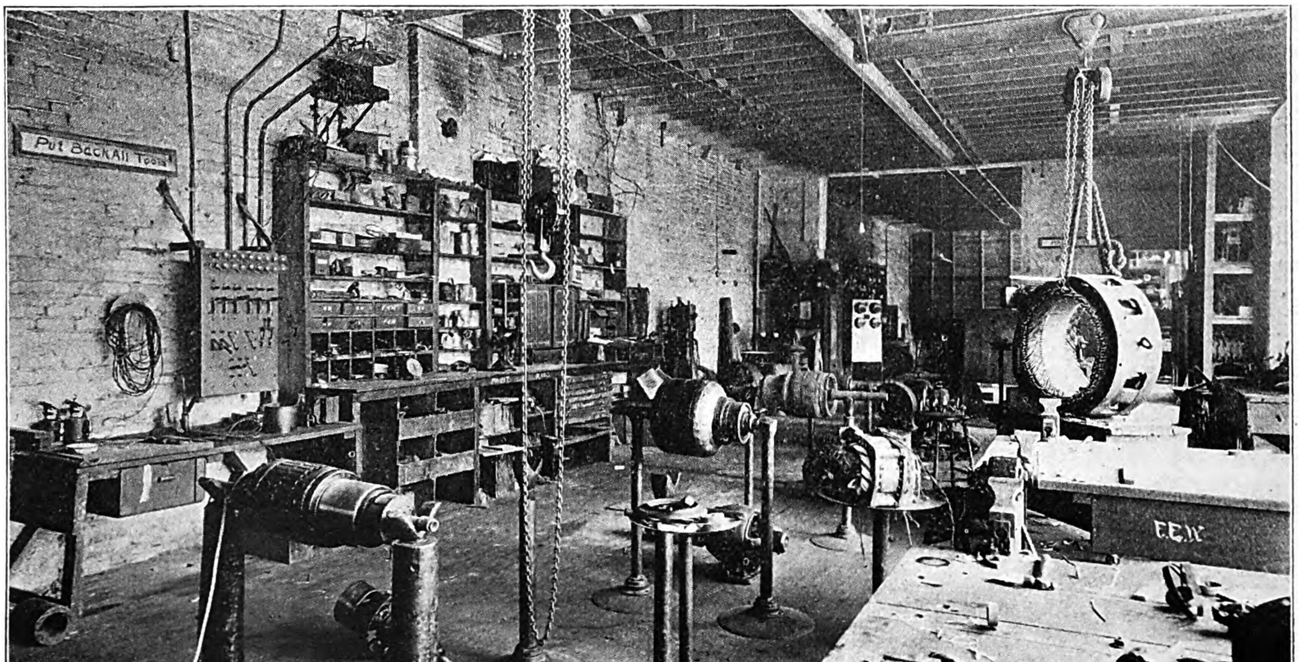
Developing co-ordinately a large construction and a large repair business has been the aim of the Squire Electric Co., of Kansas City, Mo. Some of the methods employed in building up the present volume of business may be interesting and helpful to other contractors and repair shop managers.

The plan of taking contracts on the basis of a flat bid for the engineering, the customer to pay all labor and material costs, has been used by the company to a great extent. "The letting of contracts on the engineering fee basis, which is cost plus a definite amount, puts the contractor on the same basis as the owner with reference to the job," said Mr. Squire, president of the company. "The owner sees clearly that it is to the interest of the contractor to shorten the time, the chief element of cost, as much as possible. Under this plan, the controversies over extras are avoided, since the contractor is not compelled to fight against elements that will reduce his profit. Our experience has been that owners work with far better co-operation with the contractor under this plan. And we, knowing closely what the overhead on a job should be, are sure we are going to get it."

An instance of the operation of this plan was the installation of conduits, wiring, converters, auxiliary motors and switchboard and like items, in the new plant of the Kansas City Light & Power Co. The plant was erected to meet an emergency; time was the chief factor. The company was willing to pay for overtime, and the Squire organization therefore worked under high pressure. Foremen and some workmen got in 81 hours a week, counting time and a half and double time on nights and Sundays. The extra time chargeable to overhead was absorbed by the reduction in the total time consumed on the job.

During the past summer the Squire Electric Co. has had 80 to 100 men on its payroll. The conduit, wiring and switchboard installation in the new Western Union Building in Kansas City, wiring and installation of motors for ice companies and mills, the half-million dollar job of the St. Joseph central station, and similar contracts in the past year or so have enabled the company to build up its large organization and hold it together.

The basis of the organization, however, developed during the war period when construction work was lacking, has been repair work. Having facilities and workmen, the company was able to extend valuable aid to electric railway companies in the repair of equipment, winding of armatures, rebuilding of generators and motors. The company has devised and built special machines, such as one for the making of coils of uneven legs, for the handling of such work. This service to electric railways was the more welcome, since many railway companies found it impossible to maintain their own shop organizations at the



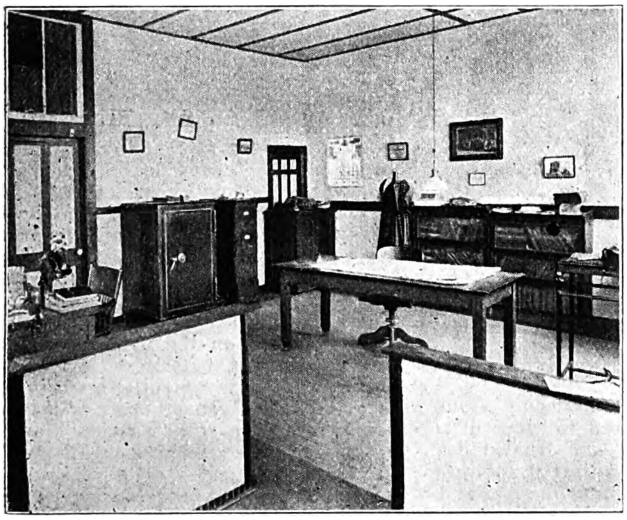
View of Squire Electric Co. Shop, Kansas City, Mo., Showing Longitudinal Overhead Hoist Track, in the Path of Which Are Set the Winding Racks. At the Left Is a Testing Rack of 5000-Volt Capacity.

desired level of efficiency. Many of the smaller electric railway shops lacked expert electrical mechanics; the expense of handling repair jobs in such plants was only less troublesome than the inability to get the work done properly.

The success of Mr. Squire in holding his organization together through those trying times is noteworthy. Several of his employes have been with him since he went into business ten years ago. A majority of his regular men have never worked in any other shops. This result surely has a reason; there are, in fact, two or three reasons. One is the fact that Mr. Squire has so painstakingly maintained a high standard of workmanship; this is appreciated by the better workmen, who take pride in their efforts and have a permanent satisfaction in knowing that the good work they do will not be disparaged by the poor work of a fellow employe. In a plant where high standards of product are maintained each workman is keyed to his best efforts, and in consequence his ideals are dominant; he is not led into complaints and dissatisfaction by handicaps to his professional advancement.

Another factor is the complete equipment of the plant. There are all the incidental as well as the principal items for facilitating work—overhead tracks, hoists, well built furnaces, drills, lathes, etc. The workman is not handicapped by the need of getting along with inferior tools of his trade. Encouragement has resulted in devising new methods and machinery for performing regular tasks, and these, in turn, have enabled the workmen to bring about a more satisfactory result on each job in hand.

A factor which operates less directly—though quite as surely—for maintaining the integrity of the organization is the cost accounting system, including the system of estimating and of figuring prices on supplies which has been developed. There is no guesswork as to the price at which stock should be

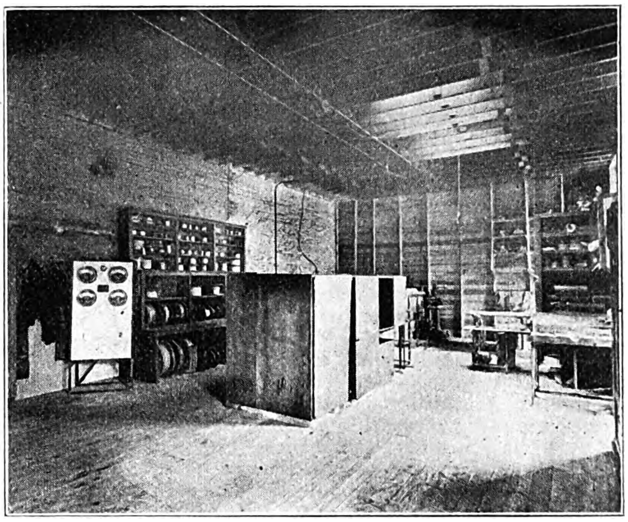


Office of the Squire Electric Co.

entered in a contract or estimated on a repair job; price lists are prepared in a simplified form which has proved so useful that many contractors have adopted it.

The effect of this certainty as to costs on the morale is more important than may sometimes be realized. There is an atmosphere of honesty and square dealing which the workmen are convinced extends to appreciation of their own services. Aside from their own judgment as to whether they are getting a square deal they feel a confidence in the fidelity of the employer. This confidence is, of course, augmented by the obvious confidence of the customer who seems to be turning his affairs over to the contractor, making the latter his full agent in the performance of the contract.

The large variety of work received is also an incentive to the electricians to remain with the company.



Electrical Oven and Coil-Winding Department, Squire Electric Co.

The motors and generators received for repair and rebuilding range from the tiniest to the largest. The repair work on electric railway equipment has also been a factor in maintaining the organization. The work turned out has been similar to much work that heretofore has been done only at the plants of manufacturers. The employes realize, therefore, that they are getting the opportunity for advancement in expertness in their trade that they would get only at the big factories.

It may be said that the present large business is due directly to the ambition to serve when service was most needed. Mr. Squire built most energetically and patiently, when building was most difficult, during the war period. He evidently had taken to heart the appeal for unusual effort to keep the wheels of industry moving. Hundreds of electrical repair shops in the vicinity of Kansas City have been able to keep the motors in their communities operating because they could send the motors to the Squire shop and receive prompt service.

Incidentally, Mr. Squire has always been a leading member of the Kansas City and the state electrical contractors' associations, and has steadily passed along to other contractors ideas and methods that have been helpful to him.

PENNSYLVANIA ASSOCIATION OF CONTRACTORS AND DEALERS TO MEET.

The next quarterly meeting of the Pennsylvania State Association of Electrical Contractors and Dealers will be held in Scranton, Pa., Oct. 7, with headquarters at the Hotel Casey. The program includes business sessions, noon-day "Howdy" luncheon, entertainment, and banquet. An invitation is being extended to representatives from all branches of the industry to attend. M. G. Sellers, 1518 Sansom Street, Philadelphia, is secretary.

New Appliances

Volt-Ammeter—Armature-Winding Machine—Light Steel Transformer Case—Reel-Type Fixture—Motor Generator

Handy Direct-Current Volt-Ammeter for Railroad Signal Testing.

The electrically controlled and operated signal apparatus which is installed on modern railroads inevitably involves the employment of a considerable number of elements which must be maintained in proper adjustment and for each of which there must be an appropriate current source. In order that the correctness of adjustments and readiness of current supply may be properly determined, it is necessary to have accurate means of measuring resistances and electric currents and potentials. Electrical instruments having the required accuracy may be obtained from a variety of sources, but ones which combine with accuracy the ability to withstand the extremely rough handling which is encountered in this field and ones which combine in a reasonable bulk and weight the large number of different ranges which are likewise requisite are a different matter.

Roller-Smith Co., 233 Broadway, New York City, has developed a number of portable instruments for this work, of which what is known as the "Handy S. S." type volt-ammeter is a recently added instrument. It is especially suited for maintenance work. With the exception of one particular pattern including a 0-300 volt range, these instruments are self-contained; they are compact, to be put in the pocket or in a small tool kit, and meet in a satisfactory manner the needs of this service.

The mechanism is of the same D'Arsonval type as in the portable standard instrument made by the company, so that scale divisions are uniform and indications dead beat. The case is a brass stamping, or black enamel finish, and of waterproof construction. There is a wood plate on the bottom of the base for insulation purposes. Terminals take the form of appropriately numbered binding posts with nonremovable tops. Each instrument has a convenient zero adjuster. A leather carrying case can be furnished if desired.

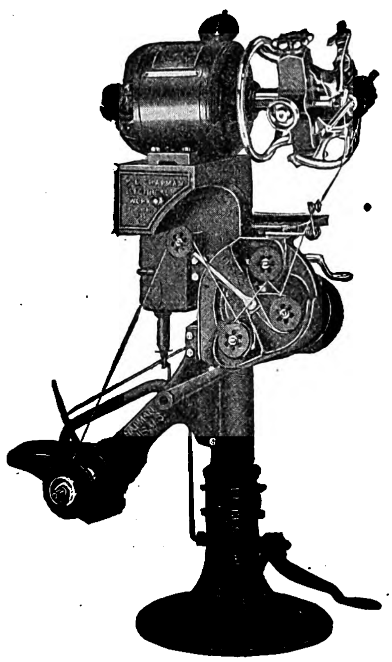
These instruments are made with two or three current and voltage ranges each. Current ranges from 0-0.03 up to 0-30 amperes are obtainable and voltage ranges from 0-1.5 up to 0-300 volts. Six ranges is the largest in a single instrument.

New Style Chapman Adjustable Armature-Winding Machine.

The P. E. Chapman Electrical Works, St. Louis, Mo., announces a much more complete model of the Chapman adjustable bipolar drum armature-winding machine, in style 3 as shown herewith. This model, in addition to being adjustable in a few minutes for any style and size of random wound bipolar drum armatures and any size of wire from No. 20 to No. 36, has some special features enabling it to wind a very great amount of wire into armature slots without pounding the wire, and also has some unique lead forming and handling features reducing the labor on this part of armature winding.

Driving motor, controller, turn counter and other necessary parts are all integral parts of the machine, in fact, the machine is complete in itself.

A new automatic dynamometer-controlled reel holder and tension device has been perfected, which it is claimed stops all spool troubles and enables quick starting, high speed, great tension and quick stops, so that only about five seconds are required to wind in a coil. This reel holder and tension device is simultaneously adjusted for any sizes of wire by a simple crank, and once adjusted needs no further attention until the reel is empty. It is said that the announcement of this device has been held back long enough to prove the machine a success in actual practice. In one case an output of nearly 600 per day was obtained where the estimate was 200 to 250. It is claimed that the output of the machine runs into hundreds of armatures per day on many sizes and kinds of armatures; that the saving over hand winding is usually anywhere from 10 up to 30 to 1 or even better. It is claimed that the machine is easy to operate, well and strongly built: that it is useful both in the job shop and in the factory. The machine is also useful for winding field coils, smaller armature coils, etc.



Chapman Style 3 Armature and Field-Coil Winding Machine.

Steel-Clad Transformers—An Important Development in Transformer-Case Construction.

Announcement is made of an improved line of distribution transformers, the chief advantage claimed being a reduction in weight of over one-third by the substitution of a welded sheet-steel case for one of cast iron.

This new line is designed as the steel-clad type S transformer and is manufactured by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. No change has been made in the coil construction and insulation of the type S design, which has been on the market for many years, but an improvement has been effected in the tank construction which is the result of seven years' experimentation and development and it is claimed that a construction has been achieved which combines the light weight desired with the requisite degree of strength and rigidity and, furthermore, includes a treatment and finish of the tank surface which renders it thoroughly weatherproof.

The ease and cheapness with which distribution transformers can be shipped, handled and installed, is to a large degree a question of weight. Further, since distribution transformers are usually mounted on the line poles, heavy transformers are particularly objectionable, not only because of the difficulty involved in raising them into position for hanger-iron mounting, but also because of the strain that is put upon the pole and crossarms. The distance from the center of gravity of the transformer to the center of the pole is a matter of almost as much importance from the point of strain on the pole and crossarms as the weight itself.

The reduction in weight effected in the steel-clad transformers permits of mounting larger transformers directly on poles without building a platform. The new 10, 15 and 50-kv-a. transformers are about the same weight as the old 5, 7½ and 25-kv-a. transformers, respectively, which shows that between these limits of capacity with the same strength of support the transformer capacity can be doubled with the new line of transformers.

Desirability of reducing the weight of the transformer suggested the use of the sheet-metal cases and end frames, but while the advantages of such a construction were apparent, it is claimed that it has been adopted only after very thorough tests have demonstrated its suitability.

The material selected for the manufacture of the tanks, covers, and end frames of the steel-clad type S transformers is a special grade of sheet-steel particularly adopted to the conditions of manufacture and service. It can be readily drawn, and in addition it has inherent rust-resisting qualities. This, combined with an extremely good finish, is claimed to have resulted in the production of a tank which is permanently weatherproof.

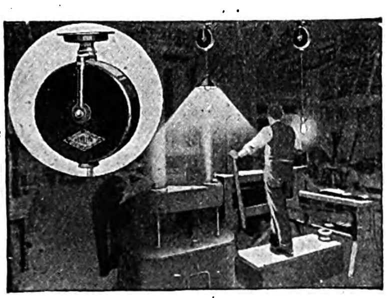
Weatherproofing of the steel-clad type S transformer cases consists of the following operation: (1) Sandblasting to remove the scale and dirt and to roughen the surface; (2) applying and baking on a coat of priming paint; (3) applying and baking on a finishing paint. The priming coat is a special grade of paint which it is claimed, when applied to clean metal, forms one of the most effective coatings known for its preservation. The finishing coat is heavy in oil and is designed to withstand the wear of the elements. Its function is to protect the first coat which is adjacent to the metal and which gives the real protection to the tank surface.

The color of the finishing coat is a battleship gray, giving a smooth attractive finish. This pleasing gray color from the standpoint of civic pride is an improvement, it is claimed, over the former black that has hitherto been used for distribution transformers and has contributed to the unsightly appearance of streets and alleys.

A complete steel-clad transformer case is made from five different parts. The rim and base of the tank are drawn and cut from a single piece of sheet steel. The tank wall is formed from two sides which are drawn and welded and the rim and base are welded to the tank wall. Thus, four parts complete the tank and one part the cover. Much heavy equipment in the way of shears, braces, molds and dies is employed in the manufacture of the case. It is claimed that no expense has been spared to secure a transformer tank which is satisfactory, even to the smallest detail, and the manufacturers claim that the steel-clad type S transformer represents the last word in modern distribution transformer construction.

Anderson Reel-Type Extension Fixtures.

Occasions frequently arise in machine shops, erecting shops, assembling plants, garages, etc., where light is needed locally to permit examining the inside of some machine or casting, or the underside thereof. A new type of fixture has been developed to supply this need.



Anderson Reelite Fixture in Use in a Machine Shop.

The Anderson "Reelite" consists of a reel unit carrying approved portable reinforced cord. The cord-winder is of the four-spring type insuring long life even under severe usage. The base of the device is designed to attach to any 4-in. outlet box, or direct to the ceiling. To operate it is necessary merely to raise or lower like an ordinary window-shade.

This "Reelite" fixture is made in two types: The drop-cord type, with 12 ft. of cord and a 660-watt key socket, for

Anderson Reelite Fixture—A Hand Portable Trouble or Inspection Lamp—Can Be Used in Place of the Key Socket.

use in machine shops, providing flexible lighting to a degree impossible with ordinary local lighting fixtures; the portable type, with 25 ft. of cord and a hand portable, making it invaluable in garages, erecting shops and the like. It is said the outfit saves its cost even in a few months as with the Reelite only the actual length of cord required is unreeled so that it does not lie on the floor subject to the abuse ordinary portables receive. A suitable reflector can be attached to the socket to prevent glare from the lamp.

These fixtures are made by the Anderson Electric Specialty Co., 118-24 South Clinton street, Chicago.

Motor-Generator Set for Electric Meter Testing.

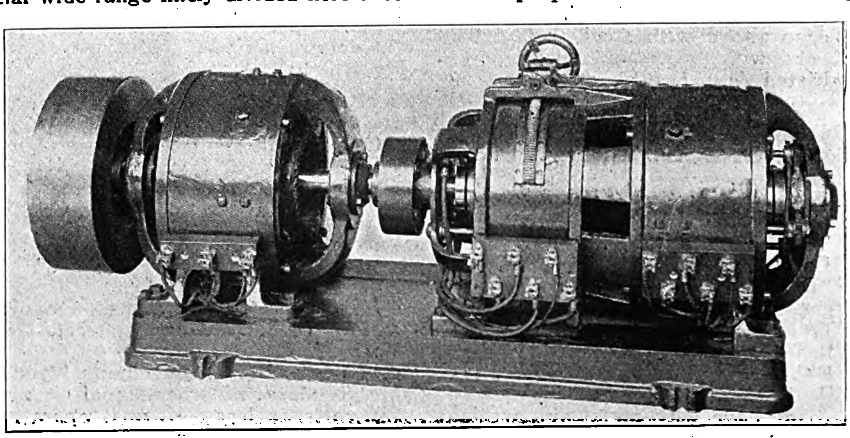
The three-unit motor-generator set illustrated herewith is manufactured by Roth Brothers & Co., 1400 West Adams street, Chicago, Ill., for use in meter-testing laboratories and for other alternating-current testing. This set consists of a direct-current motor driving two alternating-current generators. The motor has a speed range of 1750 to 1850 rpm., and is provided with a special wide-range finely divided field rheostat to obtain very close speed regulation. The use of ball bearings throughout in connection with the heavy fly-wheel insures steady speed, despite fluctuations in the supply voltage. Each of the two generators is of the four-pole, four-ring type, giving single-phase and three-phase current at 60 cycles.

The larger generator has a stationary field frame, and is wound to furnish current at any voltage between 110 volts and 240 volts, the special field rheostats provided giving this voltage range with a large number of steps. This generator is rated 7½ kva., 240 volts, 1800 rpm., 60 cycles. The smaller generators, that is the one next the motor, is provided with a movable field frame that may be rotated through a distance of 180 electrical degrees to either side of the center position relative to the position of the field poles of the larger generator. This adjustment is made by means of a wormgear operated by the handwheel shown. This smaller generator is rated 24 to 28 volts, 80 amperes, and it is furnished with a separate, noninductive loading resistance with 12 switches by means of which the current output can be varied by fine increments from 1/20 ampere to 85.9 amperes. This generator is also provided with a concentric type, finely divided field rheostat.

In testing meters, either single-phase or three-phase, current is supplied to the voltage coils of the meter from the larger generator, while the current coils of the meter are supplied from the smaller generator. Then the wormgear handwheel is operated to give any desired phase relation between the voltage and the current; in this way a load of any power-factor may be simulated.

In designing this set, certain limitations were observed, based on the latest standardization rules of the American Institute of Electrical Engineers. The wave shape of either generator at full noninductive load may vary from the sinusoidal by not more than 5%. The full-load efficiencies are as follows: motor 87%; each generator 80%. The generator field windings are excited from 230 volts direct current, and are tested at 1500 volts alternating current. The motor and the armature of the larger generator are tested at 1500 volts alternating current and the armature of the smaller generator at 1100 volts alternating current.

This type of set has so far been developed in only one size, which has proven satisfactory in two important laboratories where it is used for other purposes besides meter testing.



Roth Three-Unit Motor-Generator Set for Meter Testing and Other Similar Service.

Lately Approved Appliances

Attachment Plug, Fuseless.—The Yost Electric Manufacturing Co., Toledo, Ohio.
"Lockfast" nonseparable attachment plug, 660 watts, 250 volts.
Listed July 21, 1919.

Cabinet and Cutout Boxes, Sheet-Metal.—Sprague Electric Works of General Electric Co., 527-531 West 34th street, New York, N. Y.
Listed July 8, 1919.

Circuit-Breakers — The Automatic Reclosing Circuit Breaker Co., Columbus, Ohio.
Single-pole automatic circuit-breakers for protection of low-potential circuits and arranged for automatic reclosing of circuit under certain conditions. All capacities 600 volts or less. Types ARL, CRL, DRL, LRL.
Listed Aug. 6, 1919.

Conduit Boxes.—The Adapti Manufacturing Co., 919-25 West street, Cleveland, Ohio.
"Adapti." Pressed-steel and cast-iron conduit fittings for use in concrete construction, Catalog Nos. 2CO, 3CO.
Box extension, Catalogs Nos. 498 and 499.
For use with flexible tubing, with or without clamps, Catalog No. 0260.
Covers, Catalog Nos. 17-19 inclusive, 25, 46-49 incl., 86-89 incl.
Also above with steel or porcelain covers, with or without bushings.
Listed July 31, 1919.

Conduit Boxes.—The Adapti Manufacturing Co., 919-25 West street, Cleveland, Ohio.
"Adapti." Cast-iron conduit fittings for use as outlet and junction boxes. Types 7113-15 inclusive, 7223-25 incl., 7263-65 incl., 7333-35 incl., 7273-75 incl., 7443-45 incl., 32170, 33170, 34170, 53202-292 incl., 53303-393 incl., 53404-494 incl., 53505-595 incl., 53606-696 incl., 72373-75 incl., 72383-85 incl., 73393-95 incl., 74493-95 incl., 541010, 542020, 542121, 543030-3232 incl., 544040-4343 incl., 545050-5454 incl., 546060-6565 incl., 547070-7676 incl., 548080-8787 incl., 549090-9898 incl.
Also above with steel or porcelain covers, with or without bushings.
Listed Aug. 1, 1919.

Conduit Boxes.—Electrical Fittings Co., Ltd., 331 King street, West, Toronto, Ont.
Pressed-steel conduit boxes and cast-iron conduit fittings.
"Diamond B" boxes.
Catalog No. 6359D.
"Diamond R" conduit fittings, Types DF, HA, LBA, LBV, LF, PL, PT, PM, PMC, PML, PMT, S, SC, TB, TL, TR, V, VA, VC, VH, VHA, VHC, VHL, VHT, VL, VT, W, WC, WL, WT.
Also above with metal or porcelain covers with or without bushings.
Listed Aug. 6, 1919.

Underwriters' Laboratories, established and maintained by the National Board of Fire Underwriters (for service—not profit), have examined, tested and listed these electrical appliances in accordance with the Laboratories' Code for Construction and Test of Electrical Appliances. Copies of complete lists of standard applances may be obtained from local inspection departments or from offices of the Laboratories in the principal cities.

Conduit Boxes.—The Pratt Chuck Co., Frankfort, N. Y.
Pressed-steel conduit boxes. Types AA, BBA, DAO, WA, YA, ZA, 100 and telephone box. Also above types with steel covers or covers with smooth, well-rounded outlets for flexible cords.
Listed July 18, 1919.

Conduit Boxes.—The Toledo Metal Products Co., 956 Spitzer building, Toledo, Ohio.
"B-G." Pressed-steel conduit boxes for use with steel conduit.
Catalog Nos. 900-0, 901-0, 906-0.
For use with flexible tubing and steel conduit, Catalog Nos. 902-R, 902-RW, 903-R, 903-RW.
Above provided with depression to admit of special fixture stud, Catalog No. 1001, which may or may not be used.
Covers, Catalog Nos. 800-807 incl., and brass covers, Catalog Nos. 800-B-807-B incl.
Listed Aug. 9, 1919.

Conduit Boxes, Service-Entrance.—Electrical Fittings Co., Ltd., 331 King street, West, Toronto, Ont.
"Diamond-B." Cast-iron service-entrance fittings with porcelain bushings. Types F, FE.
Listed Aug. 6, 1919.

Current Taps.—The Bryant Electric Co., Bridgeport, Conn.
"Bryant" or "Perkins." Multiple type.
Keyless, 660 watts, 250 volts, Catalog No. 102.
Listed July 2, 1919.

Current Taps.—Harvey Hubbell, Inc., Bridgeport, Conn.
"Hubbell." Multiple type.
Pull, 250 watts, 250 volts, Catalog No. 3190.
Listed July 10, 1919.

Electromechanical Gongs.—Stanley & Patterson, 23 Murray street, New York, N. Y.
"Faraday" electromechanical gongs for fire-alarm or other signal circuits, 125 volts or less. Normal operating current 100 milliamperes.
Listed April 9, 1919.

Fixtures.—The Cohen Co., Inc., 9-17 East Broad street, Richmond, Va.
Listed June 28, 1919.

Fixtures—W. F. Mahoney, 523 East Main street, Richmond, Va.
Listed June 28, 1919.

Fixtures, Show-Window.—Pittsburgh Reflector & Illuminating Co., 3117 Penn avenue, Pittsburgh, Pa.
Listed June 24, 1919.

Fixture Fittings. — George Cutter Co., South Bend, Ind.
Holder sockets and receptacles for "Sol-Lux" and other standard heel-reflector fixtures.
Medium base, porcelain shell, keyless, "Cutter." Catalog Nos. 30684-85, 30693-94.
Mogul base, porcelain shell, keyless, "Cutter," Catalog Nos. 30772-73, 30980-81.
Listed May 13, 1919.

Fuses, Cartridge.—Commercial Enclosed Fuse Co., 1317 Willow avenue, Hoboken, N. J.
Cartridge enclosed fuses, 0-600 amperes, 600 volts.
Listed May 21, 1919.

Lamp Adapters.—Pass & Seymour, Inc., Solvay, N. Y.
"P. & S." Medium to candelabra, 75 watts, 125 volts, Catalog No. 1262.
Listed April 29, 1919.

Lamp Guards. — Flexible Steel Lacing Co., 522 South Clinton street, Chicago, Ill.
Portable split wooden handle for "Flexco" or "Flexco-Lok" lamp guards. "Flexco Split Handle."
Listed May 14, 1919.

Motion-Picture Machine, Miniature.—The Pathescope Co. of American, 33-35 West 42nd street, New York, N. Y.
Portable miniature motion-picture machine, with incandescent lamp for illuminating element, 4.75 amperes, 110-120 volts.
For use only with slow-burning film supplied by manufacturer.
Listed May 21, 1919.

Outlet Plates.—Cameron Overbagh & Co., 231 North Wells street, Chicago, Ill.
Catalog Nos. 401, 403.
Listed June 24, 1919.

Panelboards. — Large-Dail Manufacturing Co., 114 North 13th street, Philadelphia, Pa.
Consisting of assembly of busbars, with or without standard cutout parts, of with or without standard switches mounted on insulating bases. Designed for use on low-potential circuits.
Listed June 23, 1919.

Trade Activities

Worthington Pump Acquires Epping-Carpenter Interests —Westinghouse Exhibits—Signal Electric Organized

S. V. George, electrical contractor-dealer, 8416 18th avenue, Brooklyn, N. Y., after an absence of a year and a half in Government service, has resumed business at the above address. In addition to general electrical work Mr. George will handle electrical household appliances and also repair appliances.

Ivanhoe-Regent Works of General Electric Co., Cleveland, Ohio, is sending out to the trade, a new discount sheet (Form 299). The discounts shown apply on Ivanhoe metal reflectors and fittings (Schedule R) and Anderson self-adjusting arms (Schedule T). The discounts on Schedule R are effective Sept. 5, and those on Schedule T effective Aug. 15.

Western Electric Co., New York City, according to official advices from Denmark, has received orders for two automatic telephone exchanges from the Copenhagen Telephone Co. It is stated that this will be the first introduction of an American telephone system into northern Europe, where Germany and Sweden formerly enjoyed a monopoly in this trade.

Jeffrey Manufacturing Co., Columbus, Ohio, manufacturer of coal-mining machinery, electric locomotives, etc., is sending out Bulletin No. 270 comprising eight pages. It is well illustrated and is descriptive of ventilating fans, giving tables of dimensions and capacities. Particular emphasis is placed on the subject of mine ventilation, one of the most important considerations in mining.

Worthington Pump & Machinery Corp., 115 Broadway, New York City, has purchased the plant and other assets of the Epping-Carpenter Pump Co., Pittsburgh, Pa., and will operate it as the Epping-Carpenter Works. Orders and contracts now on hand will be completed, and the regular business of the company continued. All correspondence should be addressed to the Worthington Pump & Machinery Corp. at the Epping-Carpenter Works, 10 43rd street, Pittsburgh.

General Electric Co. has sold to the White River Lumber Co., Enumclaw, Wash., a 2000-kw. turbogenerator and other equipment for installation in the latter's lumber mill, which is being rebuilt in accordance with plans requiring complete electrification. Another lumber mill order placed with the General Electric Co., recently, was for two turbogenerators of 750-kw. each and one of 1500-kw. for installation at the mill of the Unalaska Lumber Co., at Unalaska, Wash., in the vicinity of Napavine. The plant is being rebuilt for electric drive, which will require 3000 hp. in motors.

The McCord Manufacturing Co., Detroit, Mich., has published a catalog completely describing and giving the specifications for all the various copper-asbestos gaskets which it manufactures. Included are spark plug gaskets, exhaust and flange type gaskets, exhaust manifold gaskets, cylinder head gaskets for passenger cars, cylinder head gaskets for trucks, valve plate gaskets and Ford gaskets. An assortment of shim stock is also shown as well as miscellaneous gaskets of open and closed types.

Electric Furnace Construction Co., Philadelphia, Pa., has received from the Vancouver Engineering Works, Ltd., Vancouver, B. C., an order for a "Greaves-Etchells" furnace. The Vancouver company made an extensive investigation of the various types of electric furnaces and after a visit to the U. S. Navy Yard at Puget Sound, where a six-ton "Greaves-Etchells" furnace is in operation, made its decision in favor of that type of furnace.

McGill Manufacturing Co., Valparaiso, Ind., announces the purchase of the Despard & Gordon Co., Chicago, manufacturer of the "Levolier" pull-chain socket and other electrical wiring devices. The two companies will be merged into one organization whose personnel will be composed of the following: J. H. McGill, president; V. R. Despard, vice-president, and H. W. Harrold, secretary-treasurer. The main sales office and factory will be located at Valparaiso, Ind. Plans for increasing production are already under way, as it is stated that orders are coming in far in excess of its present output.

The Milliken Brothers Manufacturing Co., Inc., Woolworth Building, New York, has published a new catalog (No. 10) descriptive of Milliken buildings. Structures of this type are built under the Standardized Truss Unit System, designed by the company. It makes use of a small, interchangeable, standardized structural steel unit, and the buildings are all-steel, permanent and fireproof; they are furnished complete with sash, doors, skylights, etc. These buildings are suitable for all classes of industrial and manufacturing structures, plantation buildings, warehouses, etc. The system makes possible low transportation and erection costs, allowing the choice of a thousand buildings, all constructed under the same unit type. The catalog is 8½x11 ins. and profusely illustrated with buildings of this character erected for the United States Government and other important interests. Space is also given to the transmission towers, radio towers and special poles built by the company. A companion book of like size, known as catalog No. 11, has been issued as an erection handbook; this forms a complete guide to the construction of any Milliken building from foundation to roof. Copies of these catalogs may be obtained free from the company by those interested.

Interstate Electric Co., New Orleans, La., reports that it will establish a branch in Shreveport which it claims will represent the largest jobbing house of its kind in the South, exclusive of New Orleans. A stock of automobile and electrical accessories valued at $200,000 will be carried at the Shreveport branch. The firm will supply the accessory trade of north Louisiana, half of Texas, southern Oklahoma and Arkansas.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis., in addition to other dealer's helps, has prepared for use in connection with the national advertising on the C-H 70-50 switch, two new four-color display cards. One shows an electric iron and cord with a young woman in the act of pushing the switch "on." The other carries a striking illustration of a toaster and cord equipped with one of the switches as part of a typical breakfast setting. Each has a prominent legend stating that "the buttons tell when the current is on or off." When used solely for street car advertising, these cards are imprinted with the dealer's name and address, and whenever they are desired for use as window or wall display cards, a suitable legend is imprinted in the space provided for the dealer's name and address.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., is planning for the comfort of its 20,000 employes a modern cafeteria and restaurant, seating over three thousand persons and providing well prepared food on a "service at cost" basis. The three-story, buff brick building that will house the new eating place is already under construction. The first and second floors, seating 2500 people, will be devoted solely to cafeteria service while the third floor will have a modern table service restaurant, as well as the kitchens and an auditorium seating over 1000, which will be used for meetings of the various organizations and committees. Only the most modern conveniences of culinary art will be employed. The cafeteria counters will have moving belts to carry the trays of food placed on them, allowing the passing diner to have his hands free to select food. A huge refrigerating plant on the first floor will not only cool all foodstuffs in the refrigerators, but will also provide cold drinking water at the numerous fountains scattered through the cafeterias as well as manufacture ice and make the frozen dainties appearing on the menu. Work on the new structure is progressing rapidly under the direction of Bernard H. Prack, the architect in charge of the job, and it is expected the new restaurant will be opened by the first of the year.

Pittsburgh Transformer Co., Pittsburgh, Pa., is distributing a 23-page bulletin (No. 2000) devoted exclusively to excellent views of installations of Pittsburgh transformers, many of which are operating on the largest and best managed transmission systems in the United States, others are in large steel mills and industrial plants. The development of the Pittsburgh mill-type transformer has resulted in one of the strongest mechanical structures yet produced, and together with the high efficiency inherent in these transformers, the great mechanical strength of the Pittsburgh mill-type transformer has given them the prominent position they occupy today.

Edison Electric Appliance Co., Inc., Hotpoint Division, 5660 West Taylor street, Chicago, is sending to its customers its first Fall Hotpoint broadside, in which are reproduced two of its October advertisements on Hotpoint appliances, appearing in the *Ladies' Home Journal* and *Saturday Evening Post.* These are very attractive advertisements and are certain to increase the already marked demand for these electrical appliances. Included in this broadside is a letter which will acquaint dealers with the critical situation in which the company finds itself in an effort to meet the unusual demand for its products. In many instances the company has trebled its output and has made every possible plan to take care of its Fall and Holiday trade. It is strongly urged that dealers of Hotpoint appliances anticipate their requirements and place their orders sufficiently in advance to enable the company to produce the goods in time for early delivery.

Signal Electric Manufacturing Co., Menominee, Mich., with a capitalization of $150,000, has been incorporated to take over the Menominee interests of the Tideman Electric Manufacturing Co. Henry Tideman, president of the Tideman organization, will devote his attention to the Cairo works, which the company just recently completed. His sons, Harold and William Tideman, in association with Fred A. Roper, Charles D. Hammond and George Fussner have organized the Signal Electric Manufacturing Co. as a separate enterprise and will continue operation of the plant at Menominee. Included in the products of the new organization are electric fans, blowers, and other industrial and domestic appliances and devices. Ralph W. Wells is president of the company; John E. Henes, Jr., vice-president, and Charles E. Hammond, secretary and treasurer.

Robbins & Myers Co., manufacturer of electric motors, generators and fans, Springfield, Ohio, has inaugurated operations in its new branch factory at Xenia, Ohio. The new plant consists of buildings leased from the Aetna Explosives Co., and constitutes a highly desirable location for the plant. It is under the supervision of L. W. McIntire, formerly assistant superintendent of Plant One. The first work at the Xenia plant will consist of alternating current stator winding, and will take care of only the production which cannot be obtained at the Springfield factories. The leasing of these quarters has been necessitated by the fact that it proved impossible to obtain sufficient female help at the Springfield plants to take care of the rapidly expanding business and the constant need for greater production. The company will begin construction shortly on its new office building at Springfield. An extension of the switch track to the Robbins & Myers property is now being built, preparatory to transporting materials for the building.

Bussman Manufacturing Co., St. Louis, Mo., has issued the second edition of the valuable booklet called "Fuse-ology." This is a 24-page pubication of which ten pages are devoted to valuable information in regard to what fuses are used for, how they operate, where they should be used and similar information that electricians and electrical men in general often do not know too much about. There is no doubt but that a great deal of misinformation exists in the minds of electrical men respecting the matter of fuses, and this booklet is of special value in pointing out features that every electrical man should know regarding the use of fuses. For instance, there is a discussion of exactly what takes place when a fuse blows, a similar one on the danger and expense of using fuses of unreliable type. Suggestions are made as to when it becomes desirable to use renewable fuses, and finally, information is given on the much disputed subject of fuse protection for motors. The remainder of the booklet is devoted to data, descriptions and illustrations of the company's renewable and non-renewable cartridge fuses.

Westinghouse Exhibits at Important Conventions.—One of the very interesting features at the Inter-Allied Foundrymen's Congress and Exhibit to be held at Philadelphia, Sept. 29 to Oct. 3, will be the splendid exhibit of electrical apparatus of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. This will include the latest scientific development in the art of arc welding, which relates directly to the foundrymen's business. The arc welding equipment consists of one 500 amp. arc welding motor generator set and is made up of three-phase, 440-volt, 60-cycle Westinghouse type "CS" motor mounted on a common shaft and bedplate with a 500-amp., 60-volt arc welding generator, which is large enough to supply energy for several electrode welding circuits if no carbon electrode welding is performed. The accessories exhibited consist of operator's hood and shield, graphite electrode holder, metal electrode holder and an adapter for equipping the metal electrode holder for light graphite electrode welding. A feature of the graphite electrode holder is its ability to remain in continuous service for long periods of time without heating up to a degree uncomfortable to the operator. The exhibit further includes electrically heated metal pattern plates on molding machines, which provide one of the most convenient, up-to-date methods of heating; also standard a. c. and d. c. industrial motors, starters and controllers, outdoor fuse boxes, type A and C knife switches, oil and carbon break circuit-breakers, Frankel connectors, standard line of meters, stationary and oscillating fans, bayonet immersion heater, glue pots, solder pots, steel clad heater, type C, oven heater, rectangular electric stove, electric range, domestic heating devices.

The Westinghouse Company will exhibit at the congress of the National Safety Council to be held in Gray's Armory, Cleveland, Ohio, Sept. 29 to Oct. 4, safety devices or models designed by men of that company for use in the various departments of the Westinghouse works where over 30,000 men and women are regularly employed. The exhibit includes such items as rip and crosscut saw guards, punch press guards, safety tongs, cable connectors, acid jugs, screw drivers, ladles, belts, vacuum lifter and pickers for punched sheet metal, glass lamp reflector guards, floor mats, locking devices for belt shifter, milling cutter guards, low-head room elevator guards and other devices of a similar nature. Certain products which contain safety features will also be exhibited, among them being arc welding helmets and shields, elevator safety devices, auto lock switches, motor starting switches, multiple circuit safety lighting panels, safety car panels, safety platform panels and auto starters. W. G. Mayer, supervisor of safety appliances for the Westinghouse company, will be in charge of the exhibit, and in addition C. B. Auel, director of standards, processes and materials for the company will be in attendance at the congress.

Beardslee Chandelier Manufacturing Co., 216 South Jefferson street, Chicago, is sending to department stores all over the country a well illustrated folder emphasizing the great improvement in illumination which modern light sources and lighting units can bring about in department stores and other stores. The store-lighting field is one to which few electrical dealers devote sufficient attention. Every intelligent merchant knows the importance of having his store well lighted, but many do not realize the surprising improvement which has been made in lamps and lighting fixtures. If dealers would take the trouble to bring this to their attention, they would find in many instances that the merchant is glad to avail himself of the opportunity to secure better illumination in his store. Denzar, the lighting unit manufactured by the Beardslee company, has proved especially efficient in store lighting, and dealers are urged to put a little intelligent effort back of it and secure the profits which are to be made in this productive field. Copies of the folder are also available to electrical contractor-dealers.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Rutland, Vt.—Rutland Railway Light & Power Co. is understood to be negotiating with the Clarendon Marble Co., West Rutland, for the furnishing of increased electric service in connection with the proposed expansion program of the Clarendon company. It is said that several large additions to the mill are proposed, including the opening of another marble quarry and additions to the marble finishing department.

Springfield, Vt.—Colonial Power & Light Co. has completed the erection of its new substation at Springfield, and it is planned to remove headquarters to the new location. It is understood that practically the entire distribution system of the company will be changed to provide for the furnishing of electric energy to the municipality by the new substation.

Bridgeport, Conn.—Bryant Electric Co. will build a four-story addition to its plant to cost $125,000.

East Norwalk, Conn.—Crofut & Knapp Co., South Norwalk, plans the erection of two plant additions, five stories, 60x300 ft., and three stories, 210x300 ft. A power plant, 60x150 ft. will also be erected.

New Britain, Conn.—Trumbull Electric Co., Plainville, has awarded a contract to Louis A. Miller, 68 Wilcox street, Meriden, for the erection of two new additions to its plant at Plainville, for increased capacity. The structures will be four-story, about 50x106 ft., and one-story, 50x100 ft.

Belmont, Mass.—New England Telephone & Telegraph Co., 50 Oliver street, Boston, has broken ground for the construction of a new two-story and basement telephone building on Leonard street, Belmont, about 36x 56 ft., for increased operations. D. L. Shepard, 46 Cornhill street, Boston, is the contractor.

Albany, N. Y.—Henry Ford, of the Ford Motor Co., is understood to be negotiating with the Government officials for the purchase of electric power from the Government power project near Albany for the operation of his local plant.

Canandaigua, N. Y.—Steps are being taken by the Canandaigua Business Men's Association for the installation of a new and improved lighting system throughout the business section of the city.

Cuba, N. Y.—Cuba Electric Light Co. has filed application with the Public Service Commission for permission to acquire the local power plant for increased service.

Hudson Falls, N. Y.—Max Kurtzrook Co., 12 Maple street, Glens Falls, has awarded a contract to the Glens Falls Electric Installation Co., 2 Maple street, Glens Falls, for the installation of a new lighting system in its local plant in connection with other alterations and improvements, the entire work to cost about $10,000.

New York, N. Y.—New York Central Railroad Co. has had plans prepared for alterations and improvements in its one-story brick power house, about 166x236 ft., located on 149th street, near Long Island Sound, to facilitate operations.

New York, N. Y.—New York Edison Co., 30 East 15th street, has commenced active work in connection with the construction of a large new administration building, at Hester and Norfolk streets. Contracts for erection has been awarded to the George Sykes Co., 70 East 45th street.

Utica, N. Y.—Utica Heater Co., manufacturer of heaters, heating equipment, etc., has awarded a contract to John U. Schmidt, 1505 Weston avenue, Utica, for the erection of three new one-story additions to its plant at Whitesboro, to provide for increased capacity. The structures will cost about $20,000.

Watertown, N. Y.—Engineer Sam M. Green, of Springfield, Mass., has prepared plans for a $600,000 municipal power plant to be built here in spring.

Dover, N. J.—New Jersey Power & Light Co. has completed negotiations for the sale of its old Rockaway electric plant to the Standard Oil Co.

Newark, N. J.—American Transformer Co., 178 Emmet street, has awarded a contract to the Salmond Brothers Co., 526 Elm street, Arlington, for the erection of a new one-story extension to its plant. The structure will cost about $5700.

Newark, N. J.—Battery & Electric Service, Inc., 487 Washington street. has filed a voluntary petition in bankruptcy. Alexander Lion heads the company.

Newark, N. J.—Public Service Railway Co. has filed application with the Board of Public Utility Commissioners for permission to purchase a tract of land in Warren street, Trenton, for a consideration of about $45,-000, to be used as a site for the construction of a new terminal.

South Plainfield, N. J.—In connection with the construction of a new one-story addition to the plant of the Spicer Manufacturing Co., estimated to cost about $75,000, considerable new electrical and mechanical equipment will be required. Contract for construction has been awarded to Levering & Garrigues, 552 West 23rd street, New York.

Summit, N. J.—Commonwealth Electric Co. has made application to the Board of Public Utility Commissioners to place into effect a new schedule of increased rates for service. The company, in mailing out its monthly bills, attached a circular letter requesting the views of its patrons as regards an increased rate, setting forth that "the Commonwealth company believes that its patrons desire that the company maintain a first-class quality of electric service and that they are willing to pay for that service whatever may be a just and reasonable charge."

Bath, Pa.—A new power plant and waste heat boiler will be installed by the Pennsylvania Cement Co. The Republic Engineers, Inc., 60 Broadway, New York City, engineers.

Carbondale, Pa.—Considerable new electrical and mechanical equipment will be required by the Carbondale Machine Co. in connection with the construction of its proposed one-story machine shop, about 20x220 ft., estimated to cost $60,000. Contract for erection has been awarded to the Hughes Foulkrod Co., Commonwealth building, Philadelphia.

Easton, Pa.—Easton Hospital Association has taken bids for the erection of a new brick and concrete hospital building, nurses' home and power plant for general operation at Lehigh, 20th and 22nd streets, estimated to cost approximately $150,000. William M. Michler, Drake building, is architect; Mrs. Mary Illick, 248 Spring Garden street, is president.

Philadelphia, Pa.—Notaseme Hosiery Co., Mascher and Oxford streets, Germantown, near Philadelphia, has awarded a contract to the Turner Construction Co., 1713 Sansom street, for the erection of the new power house in connection with a new addition to its mill and dye works at Atlantic and I streets.

Philadelphia, Pa. — Philadelphia Suburban Gas & Electric Co. has been awarded a contract for furnishing lighting service to Pottstown for a period of five years. The contract has been approved by the Public Service Commission.

Pittsburgh, Pa. — Westinghouse Electric & Manufacturing Co. has completed the establishment of a new service station on Susquehanna street for the repair of motors and generators both small and large running as large as 40,000 kw. R. M. Rumbel is district service manager.

Pittsburgh, Pa.—H. Kerr Co., 2565 Fifth avenue, has the contract to erect a $45,000 substation for the Duquesne Light Co.

Springdale, Pa.—Progress is being made by the West Penn Power Co. on the construction of its large new local power plant, estimated to cost about $6,000,000. When completed the development of about 16,000 hp. will be the capacity of the plant, which is expected to be in complete operation some time next spring.

Beech Bottom, W. Va.—American Gas & Electric Co. has completed negotiations for the purchase of a large tract of coal properties near Wheeling from the Richland Coal Co., comprising about 4000 acres, to be used by the new owner for the furnishing of fuel for the operation of the large electric power station of the company at Beech Bottom. It is said that the property has an annual production of about 400,000 tons.

Norfolk, Va.—Norfolk Electric Manufacturing Co., 215 Cumberland street, is considering plans for the erection of a new plant to be devoted to the manufacture of induction motors of one to five horsepower rating. Porter O. Sutton is general manager.

Richmond, Va.—Tower-Binford Electric & Manufacturing Co. plans the erection of a one-story building, 90x116 ft., to cost $35,000.

Baltimore, Md.—Bids are being taken by the Consolidated Gas, Electric Light & Power Co., Baltimore, for the erection of a new two-story addition to its Westport service station, about 53x58 ft.

Baltimore, Md.—Maryland Casualty Co., Baltimore street, will build an electric light plant.

Simpsonville, S. C.—Election will be held Oct. 3 to vote on the question of issuing $10,000 municipal bonds for establishing an electric light plant. Address L. L. Richardson, mayor.

Augusta, Ga.—Hulse Steam Laundry Co. will purchase electrical equipment.

Plains, Ga.—Election will be held Oct. 14 to vote on the question of issuing $6500 municipal bonds for establishing electric light plant. Address H. R. McGee, mayor.

NORTH CENTRAL STATES.

Findlay, Ohio—Electric Motor & Construction Co. will shortly commence the erection of a two-story plant, 50x200 ft.

Lebanon, Ohio—$120,000 municipal light bonds will be offered for sale Oct. 3. M. E. Gusten, city clerk.

Norwood, Ohio—Norwood's municipal electric light plant and waterworks, Pine and Harris avenue, was damaged to the extent of approximately $50,000 by fire caused by the explosion of a gas engine used as a power generator in the light plant.

Youngstown, Ohio—Youngstown Sheet & Tube Co. contemplates erecting a high-tension power plant at Alikanna so as to be near the proposed coal fields and in case such plant is built, the coal road will be built up Wills Creek and not up from Reeds Mills to Richmond.

Anderson, Ind.—Union Traction Co. will expend $100,000 on its central power plant, installing boilers and overhauling electric turbogenerators.

DATES AHEAD.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Empire State Gas and Electric Association. Annual meeting, Buffalo, N. Y., Oct. 24. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

Auburn, Ind.—Auburn school board will issue bonds in the amount of $70,000 for completing McIntosh high school and for installing a heating plant therein.

Bluffton, Ind.—Indiana Public Service Commission has granted authority to the city of Bluffton to issue bonds in the amount of $15,000 to apply on the purchase of a new 1000-kw. turbine for the municipal light plant.

Evansville, Ind.—Globe Bosse World Furniture Co. will erect an addition to its factory to cost between $150,000 and $200,000.

Evansville, Ind.—Crown Chair Co. will build factory building to cost $75,000.

Hammond, Ind.—The second battery of 60 coke ovens of the Mark Manufacturing Co., Indiana Harbor, Ind., has begun production with capacity of 1200 tons of coal daily. This makes a total of 120 ovens in operation and two additional batteries of sixty ovens each are planned.

Indianapolis, Ind.—Wheeler-Schebler Carburetor Co. will erect three factory buildings at an estimated cost of $100,000. One building will be 132 x108 ft., and two smaller buildings 20x50 ft. each.

Indianapolis, Ind.—Stickney Color Co. will erect a three-story factory building, brick and concrete over hollow tile, 50x100 ft.

Indianapolis, Ind.—F. J. Groth, Toledo, Ohio, manufacturer of leaf springs for automobiles, will erect a one-story, fireproof building, 500x60 ft., to cost $100,000. The lower part of the building will be of concrete and brick and the upper part of steel construction. Oil burning forges will be used.

Laporte, Ind.—Wanatah Electric Co. has changed its name to the Wanatah-LaCrosse Electric Co.

Logansport, Ind. — Logansport Utilities Co., which has taken over the plant of the Logansport Heat & Power Co. from the receiver, will make improvements costing about $25,000 this fall.

Muncie, Ind.—Ground has been broken for the first of a series of factory buildings for the General Motors Corporation. This building will be 300x500 ft. The corporation is equipping the Interstate automobile factory buildings with machinery and will begin work Nov. 1 with a force of 2000 men.

Shelbyville, Ind.—St. Paul Electric Light & Power Co. has been organized by a number of residents of the town and community. The company will investigate the advisability of constructing a dam across Flat Rock River at St. Paul and the construction of an electric light plant at that point to provide power and light for Shelbyville and Greensburg and towns and farms along the route between the two towns. John T. Guskedon is the president. The directors are L. A. Eckhart, F. M. Howard, George Boliny and Raymond Pleak.

Amboy, Ill.—The city is considering the matter of a new contract with the Northern Illinois Utilities Co. for electric power for pumping city water.

Bement, Ill.—J. R. Boers, T. E. Hughes and J. M. Capel of Champaign, Ill., and Roscoe Lewis and George Neusome of Carbondale, Ill., have purchased the plant of the Bement Electric Light & Power Co. Service will be extended to Sadorus, Ill., 10 miles distant.

Blue Island, Ill.—American Wire Fabric Co. has commenced the erection of an addition to its works. This will involve an expenditure of about $1,000,000 including machinery.

Chicago, Ill.—Arthur Jones Electrical Co., manufacturer of electrical equipment for automobiles, 2837 South State street, has engaged the F. M. Barton Co., architect, to prepare plans for a one and two-story factory, 125x125 ft., to be erected at the northeast corner of Calumet avenue and 29th place. The new structure is to cost $60,000.

Chicago, Ill.—Federal Electric Co. has retained George C. Nimmons & Co., architects, to prepare plans for a one-story factory and boiler house to be erected at the southwest corner of State and 87th streets.

Chicago, Ill.—H. G. Fisher & Co., 2341 Wabansia avenue, manufacturer of X-ray machinery, have arranged for the immediate construction of a three-story plant, 60x110 ft., involving an expenditure of about $70,000.

New Athens, Ill.—East St. Louis, Columbia & Waterloo Railway Co. has been asked to extend its electric lines to New Athens.

Pekin, Ill.—It is proposed to establish an electric lighting plant here.

Rock Island, Ill.—Coe Light & Power Co. will construct and operate electric distribution line in Coe township, Rock Island county.

Detroit, Mich.—Detroit Edison Co. has had plans prepared for the construction of a two-story substation, 25x113 ft., at Connor's Creek, near Six Mile Road. Estimated cost, $40,000.

Peshtigo, Wis.—Contract has been awarded to the Jorgenson Construction Co., Denmark, Wis., for the erection of a two-story brick and concrete mill and factory building by the Peshtigo Pulp & Paper Co. The structure will be 70x242 ft. and cost about $64,000. The paper and pulp machinery will cost about $75,000.

Bucks Grove, Iowa—$6000 in bonds have been voted to secure electric current from Denison.

Dubuque, Iowa—Eastern Iowa Electric Co. wishes to extend its lines from Peosta to points in Vernon, Prairie Creek, Whitewater and New Wine townships.

Palmyra, Mo.—City is having plans prepared for the construction of a new municipal electric light and power plant. Bonds for $10,000 for the proposed work were recently authorized.

Auburn, Neb.—Engineers Archer & Stevens, 609 New England building, Kansas City, Mo., are preparing plans for $100,000 electric light plant. The specifications include generators, transformers, engines, tanks and starters.

Douglas, Neb.—Nebraska Telephone Co., 18th and Douglas streets, is reconstructing line from Holdrege to Elwood.

Guide Rock, Neb.—This town has approved a bond issue for electric lights and power. Address clerk of village board.

McCook, Neb.—Citizens are signing a petition asking the Nebraska Telephone Co., 18th and Douglas streets, Omaha, to place wires underground in paving district.

Plainview, Neb.—At a special election the vote was strongly in favor of issuing $12,000 bonds for an ice plant and $24,000 for the extension of electric light plant, and a new unit.

Parker, S. D.—A new lighting system is necessary. It would cost $40,000 to install a two-unit steam engine outfit. The expense of getting power to the city wires by the Hartford Light & Power Co. would be $25,000. Address City Auditor C. S. Jones.

Wakonda, S. D.—Arrangements are being made for the city to purchase the local electric light plant and operate it as a municipal system. The necessary improvements will be made and the scope of the plant enlarged.

Carrington, N. D.—Mercantile Co. will install a private electric lighting plant to be installed here.

Oneida, S. D.—An election will be held to vote on the question of issuing $30,000 in bonds for municipal light and water system. Address village clerk.

SOUTH CENTRAL STATES.

Gadsden, Ala.—Alabama Power Co., Birmingham, has awarded a contract to the Dixie Construction Co., Birmingham, for the construction of a new 110-kv. line to extend from Gadsden to Huntsville: and a 44-kv. line from Huntsville to Decatur, Ala.

Sheffield, Ala.—Fire has destroyed Warehouse No. 4 of the J. G. White Engineering Corp. at Muscle Shoals, the loss being $2,000,000, mainly on electrical equipment.

Sheffield, Ala.—Permission has been granted the government by the city authorities to erect transmission lines through the city's corporate limits between Nitrate Plant No. 2 in East Sheffield, and Nitrate Plant No. 1 in West Sheffield. The lines will be used to transmit power at the large power plant at Plant No. 1 to Plant No. 2, and the two plants to be operated from one station instead of using the stations at both plants. A 90-day test is in progress at Nitrate Plant No. 2 to determine the actual cost of the production of electrical energy by steam through the medium of one of the largest steam driven turbines.

Paducah, Ky.—City commissioners have called a special election in November for the purpose of voting on the issuance of bonds for $100,000, the proceeds to be used for improvements in the municipal electric light plant.

Campti, La.—The electric plant and garage of J. E. Clontier were destroyed by fire. There was no insurance to cover total loss of $2400.

Lexington, Miss.—City council, which recently voted $20,000 additional bonds, has awarded a contract to Williams & Lebby, Yazoo City, for the installation of a new municipal electric light system. W. L. Jordan is city clerk.

Little Rock, Ark.—Arkansas Hydroelectric Co. has increased the scope of the project to include two dams instead of one, providing a much larger output of electrical energy.

Eufaula, Okla.—City has awarded a contract to Cornstock & Hanson, Tulsa, for extensions in the municipal electric light and water systems. The city recently authorized a bond issue for $25,000 to cover the cost of the proposed work.

Sulphur, Okla.—Sulphur Ice, Light & Power Co. is understood to be considering plans for the installation of a quantity of new machinery in its local plant to provide for increased operations. The work is estimated to cost about $30,000.

Bryan, Tex.—It is stated by City Manager J. W. Greer that he will purchase about $30,000 worth of machinery for the electric power plant here which was recently purchased by the municipal government from the proceeds of a $75,000 bond issue.

Galveston, Tex.—The city commission has instructed W. D. Masterson, city electrician, to compile data and draw plans for a proposed municipal electric light and power plant here. Construction of the proposed plant will be submitted to the people in the form of a charter amendment at the election to be held during the early part of next year.

Houston, Tex.—Houston Light & Power Co., one of the properties of the American Cities Co., has awarded contract to Horton & Horton, Houston, for extensive additions to its plant for increased capacity, estimated to cost in excess of $400,000, including equipment. It is proposed to install a new Westinghouse turbine with oil auxiliaries, new water-tube boilers, steam piping, water screens, etc. Harry E. Badger is engineer for the company.

Lufkin, Tex.—An ornamental lighting system is to be installed here under the direction of City Manager Mitchell.

WESTERN STATES.

Benson, Ariz.—Arizona Smelting & Power Co. will soon install the generators and other equipment for its new electric power plant here. The company has contracted to furnish power for the town of Benson.

Loveland, Colo.—The city will construct a power plant where there will be sufficient water fall to run the plant. Water power with new modern machinery will be used for the distribution of electricity. Address Lewellen Osborne, city engineer.

Missoula, Mont.—Missoula Light & Water Co. will remodel its power dam, this work to cost approximately $85,000. The extensive improvements which are now in progress will make the plant more modern, provide a greater water storage and more power and will furnish a means of regulating the flow of water through the dam.

Brandon, Ore.—The council is considering ways and means to secure an electric power plant. Address mayor.

Florence, Ore.—The Florence electric plant owned by G. G. Bushman of Eugene was destroyed by fire. The plant may be rebuilt.

Everett, Wash.—The commissioners are considering ways and means to secure electric light and power plant, Engineer R. E. McDonnell of Burns & McDonnell, Kansas City, having been instructed to collect data regarding the local holdings of the Puget Sound Power Co. This will be submitted to voters at the November election. Address city clerk.

Montesano, Wash.—The electric generator plant of Northwestern Electric & Water Works, supplying electric energy for this plant and Elma, exploded recently.

Spokane, Wash.—It is probable that the citizens will vote in November on a proposal to amend the city charter to allow the city to purchase the power plants and traction lines of the Spokane & Inland Empire Railway Co. The Great Northern, in such event, may undertake the operation of the Inland Empire's interurban car lines.

Pasadena, Cal.—Warnerlite Co., Davenport, Iowa, manufacturer of lighting plants and electric automobile equipment, is having plans prepared for the erection of a new plant on South Marengo avenue, Pasadena. It will be of reinforced concrete and for initial operation will comprise a one-story factory, 260x300 ft., and administration building, 80x100 ft., with two wings, each 60x80 ft. The cost will be about $100,000.

Richmond, Cal.—Pacific Oil & Lead Co. will install new electric motors and operating machinery at its work to provide increased capacity.

San Diego, Cal.—Electrical apparatus installed in the new stadium provided means for 50,000 persons to hear President Wilson distinctly when he spoke in this city Sept. 19. It was expected that the San Diego crowd would be the largest which would hear President Wilson at any point on his tour.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Apparatus (30,633).—A commercial agent in Czechoslovakia desires to purchase and secure an agency for the sale of electrical measuring instruments, electrical meters, installation material, telephone equipment, bells, etc. Payment United States currency. Correspondence may be in English. Reference.

Electrical Apparatus (30,679).—A firm in Roumania desires to purchase technical articles, such as asbestos packings, hemp packings, rubber articles, transmission belts, cast iron water pipe and ventilators and articles for blacksmiths; articles for cellars and breweries; pumps, agricultural and flour-mill machinery; oil-well supplies, motor machinery; electrical apparatus; machinery and tools for wood working; laundry machinery; ice-making machines, etc. Correspondence may be in English. References.

PROPOSALS

Power Plant Equipment.—Bids will be received until Oct. 22 by the Bureau of Yards and Docks, Navy Department, Washington, D. C., for power plant equipment at Pearl Harbor.

Electric Lighting System.—Bids will be received by the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Oct. 1 for installing electric light, water supply and fire protection systems at Charleston, S. C. Estimated cost $30,000. A deposit of $10 is required for plans and specifications. (Specification 3977A).

Electric Work.—Bids will be opened in the office of the Supervising Architect, Treasury Department, Washington, D. C., at 3 p. m., Oct. 6 for furnishing materials for the construction of the United States Post Office at Marianna, Ark., including materials for concrete, reinforced concrete, stone, granite, brick, structural terra cotta, structural steel, miscellaneous iron and steel work, composition roofing, slate roofing, sheet-metal work, skylights, plastering, interior marble, sanitary slate, lumber, millwork, plumbing, heating, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto. Copies of these may be obtained from the custodian of the site at Marianna, Ark., or at the above office, in the discretion of the Supervising Architect. James A. Wetmore, acting supervising architect.

Boilers, Turbogenerators, Etc.—The Board of Public Works of Seattle, Wash., is asking for sealed bids up to 10 a. m., Oct. 3, 1919, for the furnishing of all labor and material for the construction and installation of an additional unit in the Seattle steam-electric plant at Lake Union, in accordance with plans and specifications on file in the office of secretary of Board. The requirements are as follows: Six water-tube boilers to be set in batteries of two boilers to each battery, each boiler to have approximately 8250 sq. ft. of water-heating surface, and is to be equipped with feed-water regulator, an oil-burning furnace, superheater, and all the specified fixtures and instruments, feed-water heaters and other equipment for a complete installation; also, a steam turbogenerator and exciter, the commercial rating of the generator to be 10,000 kw. at 80% power factor, to operate at 2500 volts alternating current, 60 cycle, 2 phase; the exciter potential is to be 125 volts, and is to be a horizontal, direct-connected unit, consisting of an induction motor, steam turbine and direct-current generator.

INCORPORATIONS

Dixon, Ill.—Lee Power & Light Co. has been incorporated with capital of $10,000 to provide lights for the village of Lee, near this city. The incorporators are David L. Heburg, James E. Johnson and Emanuel Anderson.

Elizabethtown, N. C.—Bullard Telephone Co. has incorporated with a capital of $20,000 to operate a system in Blaiden, Robeson, Sampson, Cumberland and Pender counties.

Ashley, Ind.—Farmers Light & Power Co. has been incorporated with capital of $10,000 to distribute light and power in Ashley and rural districts surrounding. Address I. D. Deller, Ashley, Ind.

New York, N. Y.—Empire Repair & Electric Welding Co. Capital, $1,000,000. To operate a general electirc repair and welding establishment. Incorporators: E. F. Luckenback, R. C. Thackhara, and C. Kuhne, 44 Whitehall street.

New York, N. Y.—Endurance Battery Co. Capital, $25,000. To manufacture electric batteries. Incorporators: J. H. Sweiback, R. Guinzburg. and A. G. Meinecke, 3920 Broadway.

Mountaindale, N. Y.—Subscribers Service Telephone Co., Inc. Capital, $50,000. To operate a telephone system through Sullivan and Ulster counties. Incorporators: P. H. Groginsky, M. Kaplan, Woodridge, and G. Culligan, Mountaindale.

Syracuse, N. Y.—Syracuse Electric Service, Inc. Capital, $50,000. To engage in general electrical contracting, etc. Incorporators: D. F. Costello, G. E. Poseo, and C. E. Cooney, Syracuse.

Syracuse, N. Y.—Myrtle-Siegel, Inc. Capital, $15,000. To manufacture electric lamp shades. Incorporators: F. L. Siegel, H. B. and G. E. Myrtle, Syracuse.

Dover, Del.—Electric Auto Lite Corp., 244 West 49th street, New York, incorporated under Delaware laws with a capital of $100,000.

Philadelphia, Pa.—Fairchance Stove Co. incorporated under Delaware laws with a capital of $200,000. To manufacture electric and gas stoves of all kinds, etc. Incorporators: F. R. Hansell, E. MacFarland, and J. V. Pimm, Philadelphia.

Knoxville, Tenn.—Alamo Knoxville Farm Light Co. Capital, $25,000. To manufacture electrical specialties, etc. Frank O'Connor is the principal incorporator.

Portland, Ore.—Portland, Astoria & Pacific Ry Co. has incorporated with a capital of $5,000,000. David C. Eccles is president of the new company and the bulk of the financial backing of the concern is supplied by the Eccles timber interests. Headquarters have been established at Ogden, Utah, and Charles T. Early, secretary of the company, will have charge of the Portland office. The company proposes to build and operate railroads, telegraph and telephone lines. It has now under construction a line 32 miles in length extending from Wilkesboro.

Dover, Del.—Automobile Burglar Alarm Co. Capital, $1,000,000. To manufacture electrically operated burglar alarm systems for automobile service. W. I. N. Lofland, Frank Jackson, and Charles H. Jones are the incorportaors.

Greensboro, N. C.—Guilford Storage Battery Co. Capital, $25,000. To manufacture storage batteries. J. U. Lindsay is the principal incorporator.

New York, N. Y.—R. W. Lillie Corp. Capital, $25,000. To engage in a general electrical and mechanical engineering capacity. Incorporators: R. W. Lille, Greenwich, Conn.; L. Skipwith, and R. J. Knoeppel, 5 Beekman street, New York.

Sisterville, W. Va.—West Virginia Light, Heat & Power Co. has incorporated with a capital of $75,000. Incorporators: A. R. Lord, T. C. Davidson and others.

New Brunswick, N. J.—Perth Amboy Storage Battery & Electric Co. Capital, $25,000. To manufacture storage batteries, electrical goods, etc. Incorporators: John J. Orsoe, Joseph H. Copeland, and Frederick C. Schreiber, Perth Amboy.

Martinsburg, W. Va.—Martinsburg Heat & Light Co. Capital, $100,000. To operate a local plant. Incorporators: A. H. Ritter, J. Gates, Carl W. Fenninger, Philadelphia; H. W. Comfort, Falsington, Sir John Franklin, and Wilbert R. Goodwin, Millsville.

Personals

W. H. Johnson New President of Association of Edison Companies—E. H. Martindale Leaves National Carbon

ROMAN PODSKI has been appointed recently by the Polish Government to journey to the United States to make a close study of the electrification of railroads in this country.

D. J. KERR, electrical engineer at the Canton (N. C.) plant of the Champion Fibre Co., has been appointed superintendent of the power department in connection with the electrical department.

PROF. ROY KEGERREIS, formerly instructor in electrical engineering at the University of Pennsylvania, has been appointed professor of electrical engineering at the local college at Newark, Del.

WALTER HOWARD JOHNSON, president of the Association of Edison Illuminating Companies, is vice-president of the Philadelphia Electric Co.

Walter H. Johnson.

Mr. Johnson was born Aug. 1863, at Philadelphia and received his education in the public schools of that city. He gained his early business experience in the local mercantile field, and before engaging in electrical work was in the service of the Philadelphia, Wilmington & Baltimore Railroad and later with the Pennsylvania Railroad Co. On Nov. 7, 1887, he accepted a position with the Edison Electric Light Co. of Philadelphia, and has since been continuously active in the affairs of the public utilities enterprises serving Philadelphia and surrounding territory, subsequently becoming secretary of that corporation. In 1898 the company was acquired by the Pennsylvania Manufacturing Light & Power Co., which was taken over by the Philadelphia Electric Co. when the latter was incorporated, Oct. 6, 1899, and it is of this organization that Mr. Johnson is a director and vice-president. He is a member of the Pennsylvania Society of the Sons of the Revolution, a life member of the Navy League of the United States, and a member of the Franklin Institute of Pennsylvania.

H. H. HARDING has been appointed superintendent of the Hudson (Wis.) division of Northern States Power Co., succeeding F. Hardwick, who was transferred to the Stillwater division.

CHARLES H. LEATHAN, Frostburg, Md., formerly manager of the plant of the Frostburg Illuminating & Manufacturing Co., a subsidiary of the Hagerstown & Frederick Electric Co., has been appointed assistant manager of the parent company.

GEORGE W. HARRIS, for the past fourteen years connected with the Bartels Brewing Co. as electrical engineer, has become associated with the Syracuse Cold Storage Co., Syracuse, N. Y., in the capacity of electrical engineer. The latter company expects shortly to electrify its plant and install new equipment.

ARTHUR E. LUBECK, until recently manager of the Detroit office of the Benjamin Electric Manufacturing Co., Chicago, has become associated with the Hart & Hegeman Manufacturing Co., Chicago, manufacturer of electric switches, receptacles and accessories, in the capacity of assistant western sales manager. Mr. Lubeck was for eight years in the service of the Benjamin company, during which time he covered all the central west jobbing territory. For the past two years he has been manager of the Detroit office resigning that position to join the Hart & Hegeman organization.

L. E. STROTHMAN, for several years manager of the steam turbine and pumping engine department of the Allis-Chalmers Manufacturing Co., Milwaukee, Wis., has resigned to become vice-president and general manager of the Richardson-Phenix Co. Prior to his connection with the Allis-Chalmers company he was associated with the Filer & Stowell Co. and the Nordberg Manufacturing Co. Mr. Strothman is well known in manufacturing circles and is prominently identified with various engineering societies.

C. F. UHDEN, Spokane, Wash., formerly chief engineer for Washington Water Power Co., has been appointed to the position of construction engineer for Seattle, to supervise the building of that city's hydroelectric power plant on the Skagit river. The appointment, made by A. H. Dimock, city engineer, and approved by Mayor Fitzgerald, has been accepted by Mr. Uhden, whose salary will probably be $7500 per year. Mr. Uhden was graduated from the State College of Washington in 1903, and soon thereafter entered the employ of Washington Water Power Co., advancing steadily until he reached the position of chief engineer. While serving in that capacity, he supervised the construction of that company's Long Lake hydroelectric plant, which ranks among the best of those in the Northwest.

CAPT. H. G. DAVIS, recently returned from overseas, has joined the staff of Davis & Armstrong, Inc., Minneapolis, Minn., where he will succeed S. L. Sholley, now advertising manager of the Babson Statistical Organization, Wellesley Hills, Mass. Captain Davis was connected with the W. E. Davis Advertising Service before going overseas. He took part in important artillery engagements of the American forces and was decorated by the French government with the Croix de Guerre.

E. H. MARTINDALE has resigned as sales engineer of the National Carbon Co. to accept the position of president and general manager of the Handy Supply & Manufacturing Co., Cleveland, Ohio, in which he has been interested in an advisory capacity for three or four years. Following Mr.

E. H. Martindale.

Martindale's graduation from Case School of Applied Science in 1908, he entered the employ of the Indiana Steel Co., Gary, Ind. In October, 1909, he joined the staff of the National Carbon Co. and has become one of the best brush engineers in the country. He has been a frequent contributor to the technical press, and was the author of a series of articles on the care and operation of motors and generators, which appeared in the ELECTRICAL REVIEW a number of years ago. For two years he was chairman of the Industrial and Domestic Power Committee of the American Institute of Electrical Engineers and is at present a member of the board of directors of that association. During the war Mr. Martin served as a captain of Engineers and spent one year in France. The Handy Supply & Manufacturing Co. handles a line of commutator stones, commutator slotting files, insulating varnishes and other electrical specialties. Its products are used in nine foreign countries as well as in every state in the Union.

NEXT CONFERENCE, CHICAGO, ILL., OCTOBER 30-31, 1919

C. A. TUPPER, Chairman of Conference H. EHRLICH, Secretary

INTERNATIONAL POWER ECONOMY CONFERENCE

OFFICE OF THE EXECUTIVE COMMITTEE

1547 MARQUETTE BUILDING

CHICAGO

SEPTEMBER 23, 1919.

MY DEAR SIR:

During the war, under the whip of stern necessity and moved by a staunchly patriotic impulse, the industrial forces of America joined hands with the Government to co-operate with the representatives of the United States Fuel Administration in conserving the fuel resources of the nation.

Diminution of labor at the mines, through enlistment and the draft, tremendous demand for fuel for industrial power and for ship and rail transportation, congestion of rail and waterway transportation and a winter of unusual severity, all combined to bring about an unprecedented situation as it affected power resources. Out of this emergency was born the United States Fuel Administration, to the personnel of which were drawn many of the most prominent and able fuel engineers and economists of the times.

Study of resources, fuel production, transportation and the operation of power plants brought out volumes of invaluable information, resulting in many suggestions for stimulating production, for regulating transportation, and most important of all, for increasing the efficiency of power plant operations. While the recommendations of the United States Fuel Administration were at all times advisory, they were, for the greater part, complied with the same fidelity as if they were clothed with official authority and therefore mandatory. They were war measures, and the power plant managers of the nation were "for them."

With the signing of the armistice reaction set in. Fuel production was being well maintained, transportation difficulties were being ameliorated, intensive industrial production was being tapered off, measures looking to increased efficiency had been applied, the men who had given freely of their time and energies to the work of the Government were required in office and factory to gather together again the broken threads of their own business—to put their houses in order and to begin again the routine of business and industrial life.

The United States Fuel Administration was a war product. With the coming of peace all signs pointed to its passing. What was to become of the mass of information

that had been gathered? Were the gains in efficiency to be discounted by slipping back into unscientific and wasteful methods? Was all this good work to stop with the demobilization of the United States Fuel Administration?

These were the questions that inspired the getting together at Chicago, Ill., on December 6, 1918, of a number of members of the United States Fuel Administration, power plant operators, manufacturers of power plant apparatus and accessories, and publishers of technical journals to discuss the problem and evolve, if possible, some means for perpetuating the work started by the Fuel Administration.

The meeting resulted in the International Power Economy Conference. Resolutions were adopted, recommending such action by Congress as would result in giving to some Federal bureau sufficient funds and authority to continue the work of the United States Fuel Administration, to the end that the enormous savings in the production and utilization of the fuel resources of the country which preliminary investigation has revealed as possible, might actually be accomplished through the mature study of the subject that a permanent Federal agency could undertake.

An Executive Committee was appointed to devise ways and means for developing interest in the International Power Economy Conference and subsequently committees were appointed to represent various phases of power plant economy. These committees were to analyze the relation of various apparatus and appliances to the general subject and to report in a tentative way upon the part each might play in co-ordinating the efforts of all to bring about a greater appreciation of the advantages which accrue from the scientific application of apparatus designed to increase power plant efficiency.

It has been a busy year for all of us; each has borne a burden which has tested to the limit mental and physical endurance But the ultimate reward for all effort will come only as the problem of increasing power plant efficiency is solved.

We are approaching another crisis in fuel production and utilization. Fuel economy bears a most important relation to the cost of living. And it is necessary now, as it was when war was upon us, to get together and talk it over.

But we must do more than that. Out of the changed conditions that now confront us; out of the experiences of the last ten months, we must determine whether this work shall go on. We must determine whether the International Power Economy Conference has a work to do. If it has a work to do, on what basis may a permanent organization be developed, what will be its affiliations and what measure of financial support may be expected from those in whose interests it will be fostered?

A conference is therefore called to meet at Chicago, Ill., October 30-31, to present reports from such committee chairmen as have had opportunity to complete their analysis of their division of power plant activity and to invite speakers conversant with the factors upon which fuel conservation and power plant economy are based.

Does the matter interest you? Will you come to the conference? Will you come, if only to listen? Will you come and make suggestions, if after listening in, the subject takes hold of you? The Executive Committee will be glad to have advance knowledge to the greatest extent possible of those who will be in attendance. And if you have any ideas on the subject they will be welcome in the formulating of the program.

The place of meeting will be determined and full particulars will be forwarded to you at an early date.

Cordially yours,

C. A. TUPPER,

Chairman of Conference.

Financial News

Effect of Unsettled Conditions on European Production and Credit.

Until peace is definitely concluded by the ratification of the peace treaty, European production will be held back and credit risks will be, to an extent, insecure. In certain parts of Europe, notably eastern and southeastern Europe, armies are not yet demobilized, crops are not up to a safe margin, and economic reconstruction is being postponed. The danger of this situation is cumulative. Bad conditions become worse. Political jealousy and social unrest feed upn idleness and hunger.

The solution of the problem presented by this zone of demoralized life is a definite political settlement and a return to work. You can not work and construct when there are no rules of the game. Reconstruction, moreover, involves raw material and machinery to work with. Most of these upset countries have only Government bonds to offer in payment for goods desired. Before bankers can safely underwrite such loans and offer them to American investors, these countries must have definite boundaries, definite obligations, and there must be a guarantee that the stronger nations will keep the peace in these regions, by moral influence and even by coercive measures if necessary.

The problem of credit to even the strongest nations is difficult until the peace settlement is concluded. Whatever one's views about the proper nature of the peace settlement, all may readily see and agree that foreign credit arrangements are being delayed until a peace settlement assures stabilized conditions. Without adequate provisions for foreign credits there can be no remedy for the exchange situation which is automatically increasing prices foreign purchasers have to pay for American goods. With foreign currencies depreciated as they are today, old-established American businesses abroad are finding in certain cases that they are confronted with lower prices from competing countries.

With the peace settled there is good reason for confidence that the credit situation can be so handled as to assist European nations to restore their production and at the same time assure an adequate market for American exports. Export trade is a source of national prosperity if payment can be secured, either in the form of imports or deferred payment in the form of safe foreign securities. If the unsettled period can be tided over, the United States is faced with a splendid opportunity for service and profit in the world's markets.

Robbins & Myers Note Issue.

An issue of $2,500,000 of 6% notes of the Robbins & Myers Co., Springfield, Ohio, are being offered by Kissel, Kinnicut & Co., New York, and the Maynard H. Murch Co., Cleveland. These notes, dated Sept. 1, 1919, mature $500,000 annually, on Sept. 1, 1920, to 1924, and yield from 6 to 6.35%. They are redeemable on any interest date prior to maturity upon 30 days' notice as a whole or in blocks of not less than $500,000, in which event the company must call for redemption notes of one or more of the series last maturing, upon payment of a premium of one-fourth of 1% for each six months between the date of redemption and the date of maturity, with a minimum redemption of one-half of 1%.

In addition to this issue the company has outstanding $2,395,000 out of $2,500,000 authorized preferred stock and $1,250,000 authorized common stock. The estimated sales in 1919 were $9,000,000, as compared with $6,961,076 in 1918 and $5,758,335 in 1917. The proceeds of the note issue will be used in reduction of floating debt. Average net earnings for the six years ended Dec. 31, 1918, before federal taxes, amounted to five and one-third times and for the calendar year 1918 amounted to over eight times the largest annual interest requirements on the notes. Based on earnings of the first six months of 1919, the estimated earnings for the year before federal taxes will amount to ten times the largest annual interest requirements. Net earnings for 1918 after federal taxes amounted to over five times and estimated net earnings for 1919 are nearly seven times the largest annual interest requirements.

Hurley Machine Plans Capital Increase.

The Hurley Machine Co. of Chicago proposes to increase its common capital stock from the present 15,000 shares of $100 par value to 200,000 shares of no par value, the new capital thus derived to be used in enlarging its plant at West 22nd street and South 54th avenue. It also is proposed to increase the number of directors from five to nine.

Notice of the plan has been given in a call for a special meeting of stockholders on Oct. 2. It is stated that of the new common stock, 100,000 shares will be presently issued, part in exchange for the old common stock and the rest at a price presumably below the current market. The old common stock was quoted recently at $190 bid, with none offered. The subscription rights to the new stock will go to stockholders and a public offering is not contemplated.

The Hurley company at present has outstanding $1,119,900 common stock and $500,000 7% cumulative preferred stock, which was publicly offered in January, 1918, at $100 for each share and 15% of common stock. The preferred stock eventually will be retired through a cumulative sinking fund of 3% of the outstanding issue for each year beginning next January; and also 15% of the net earnings applicable to the common stock beginning Jan. 1, 1918. The company has bought in $14,330 of the preferred. The company has $200,000 bonds outstanding.

The present common stock is on an 8% dividend basis. The company's report as of Dec. 21, 1918, shows current assets of $1,380,654, current liabilities of $519,323, and surplus of $746,938. The value of plant, etc., is placed at $669,472.

The business of the company, which manufactures the "Thor" products, including electric wash.ng machines, ironing machines and vacuum cleaners, is running at a record breaking rate. Proceeds of the stock will be used to erect additional plants.

Eastern Dakota Electric Bond Issue.

The Chicago Trust Co. is offering in denominations of $1000, $500 and $100, $450,000 first mortgage 6% gold bonds of the Eastern Dakota Electric Co. at 97 and interest. These bonds are dated Nov. 1, 1917, become due Nov. 1, 1927, and yield about 6½%. They are a direct first mortgage against all property owned by the company. The company owns and operates under favorable franchises the electric light and power business in Watertown and Yankton, S. D., two of the oldest and most prosperous cities in that state.

Byllesby Bond Department Opens Evansville Office.

The bond department of H. M. Byllesby & Co. announces the opening of an office in Evansville, Ind., in charge of F. W. Lauenstein, who has been connected with banking interests in that city for more than fifteen years. The office is located in the Citizens Bank building. This is one of a number of branch offices which will be opened by the bond department as part of its expansion program and for the purpose of better serving its clientele.

Utah Power & Light Co. has declared the regular quarterly dividend of 1¾% on preferred stock, payable Oct. 1, 1919, to stockholders of record Sept. 16.

Michigan State Telephone Co. has declared a quarterly dividend of $1.50 on preferred stock, payable Sept. 30 to stock of record Sept. 22.

Hydroelectric Plant and Paper Mill at Ocean Falls, B. C.

Interesting Features in the Canadian Properties of the Pacific Mills, Ltd.—Power Generated from Hydroelectric Plant—Unique Electric Drive of Large Paper Machines

By W. A. SCOTT

THE paper manufacturing industry in the Pacific Northwest has grown to important proportions within the last ten years. It is represented by four mills in Oregon, five in Washington, and four in British Columbia. Four plants of the larger capacity are those of the Crown Willamette Paper Co., at West Linn, Ore., and Camas, Wash., and the Powell River and Ocean Falls mills in British Columbia. The Crown Willamette mills at West Linn have a capacity of 400,000 lbs. of paper per day, that of the Camas mills being about 350,000 lbs.

Other smaller, but successful, plants are operated at Oregon City, Lebanon and Astoria, Ore., and at Spokane, Everett, Steilacoom and Port Angeles, Wash., while on the Canadian side there are two other mills and a sulphate plant in operation, in addition to the larger mills referred to. There is a new mill under construction at Salem, Ore., which will be completed within a short time.

All the larger mills use wood in the manufacture of paper, which involves logging and saw-mill operations. The woods mostly used consist of spruce and hemlock, of which the culls and lower grades are selected. While sound timber is required, it may be stated that the pulp and paper manufacturer consumes a good part of that which is rejected by the manufacturer of the first-grade lumber of commerce. The industry is one requiring a heavy consumption of electric and steam power, and provision for an abundant water supply.

POWER PLANT AND MILL AT OCEAN FALLS.

The plant at Ocean Falls, B. C., which was completed late in 1917, is the property of the Pacific Mills, Ltd., and undoubtedly exemplifies the most modern development in paper manufacturing in the Northwest. It consists of hydroelectric and steam-power equipment, paper and pulp mills, with sulphite and sulphate departments, a sawmill, and facilities on the townsite for housing 500 employes. This plant has a producing capacity of close to 200 tons of paper per day, of which about 140 tons consists of news print, the rest being mostly a kraft wrapping paper made from sulphate pulp.

Ocean Falls is situated on the British Columbia coast, about 380 miles north of Vancouver, and depends wholly upon water transportation for receiving supplies and the shipment of its products. Closely accessible are vast forests of spruce and hemlock. The plant was built on a stream that flows into Cousin's inlet from a lake that is situated upon a higher bench farther east.

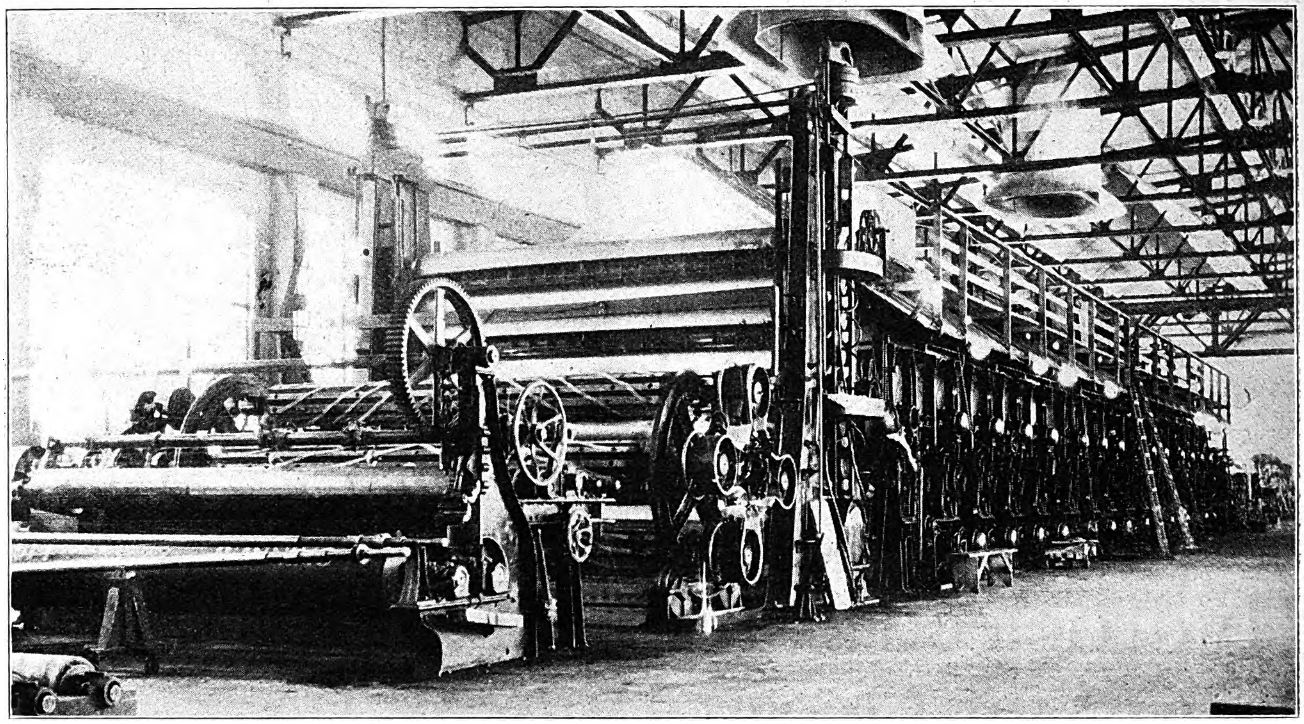
There was an original plant here which was acquired by Pacific Mills, Ltd. It consists of a small hydroelectric development, a saw-mill and a groundwood pulp mill that was operated to utilize the sawmill refuse. The original hydroelectric units were retained intact and they became a part of the larger plant subsequently built by Pacific Mills, Ltd.

The equipment of the old hydroelectric plant consists of three Westinghouse 600-kw., 440-volt generators with which the Francis type of water turbines are used, all operating under a 110-ft. head from penstocks that lead from the original dam. This system of 440-volt energy is tied in with the new 2300-volt system through a bank of transformers by which 2300-volt current is delivered. The 440-volt motors of the original pulp mill, however, were retained and are still in use.

New Hydroelectric Plant.

Construction of the new power plant involved the building of a concrete dam, 650 ft. long and 50 ft. high, giving an average head of 140 ft. at the turbines. It also involved the construction of a reinforced-concrete power house for housing the three new generating units, consisting of two Canadian General Electric 1850-kv-a., 2300-volt generators, each direct-connected to a Pelton waterwheel of the speed of 225 r.p.m.; also, a 3750-kv-a., 2300-volt generator of same make, but driven by a Pelton wheel of the speed of 350 r.p.m. Provision is made in the building for an additional 3750-kv-a. unit. The generators in the new power house are served by a penstock of 12-ft. diameter and approximately 800 ft. long. The three generators in the old power house and six water turbines which drive grinders are served by another penstock 1000 ft. long.

The new paper mill is of reinforced-concrete construction. It houses four paper machines and other accessory equipment. These consist of two 204-in. Bagley & Sewell news machines, a 174-in. machine of same make for producing kraft paper, and a smaller machine of 122-in. size. Within the same building is the sulphite mill for producing pulp from which kraft paper is made. The mill structure, power house and other buildings rest upon foundations of cluster piling, capped at the water-line with heavy concrete blocks.

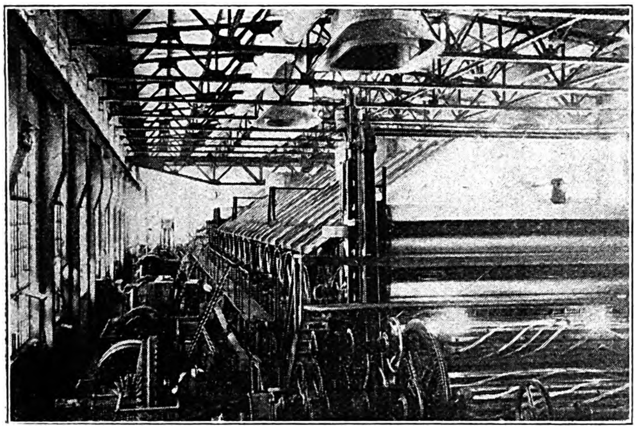


Front of 174-in. Paper Machine, Driven by 600-hp. Motor.

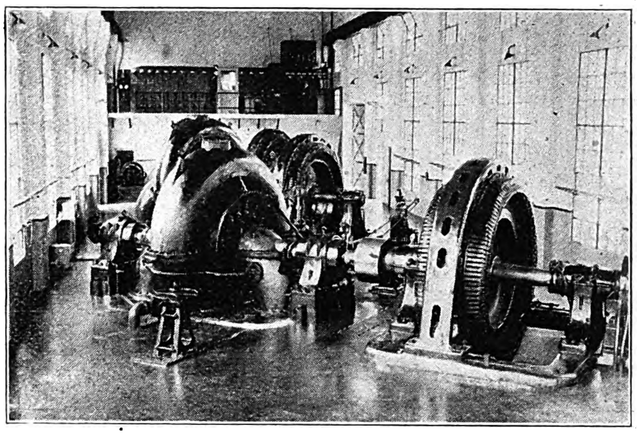
Feeder cables from the power house are carried overhead to the main group of mill buildings, and at this point lead-covered distributing cables are run in conduit. The main feeders, which consist of two three-conductor cables, of 350,000 cir. mil. area, run in parallel, lead to buses in distributing boards from which the circuits to the individual motors are run, each circuit where it leaves the distributing board being protected by a Canadian General Electric K-20 oil switch, equipped with overload protection. At the motors this oil switch, with ammeter in the cover, is cut in the line ahead of the compensator, or the drum controller in the case of wound-rotor motors.

Features of the Motor Drive.

This plant has a total connected motor load of approximately 10,000 hp., the motors varying in size



Driving Side of 174-in. Paper Machine.



View of Power Plant, Showing New Units and Switchboard.

from a 725-hp. synchronous motor down to fractional horsepower motors at low voltage. Practically all of the motor equipment is alternating-current type, except the motors on the roll grinder and the direct-current motors on two of the paper machines, namely, the 174-in. machine and the 122-in. machine, on which the kraft papers are made. These two machines are equipped with Canadian Westinghouse full automatic variable-speed drive, having a 7-to-1 speed ratio. This drive on the 174-in. machine is considered the largest drive of the kind in the world.

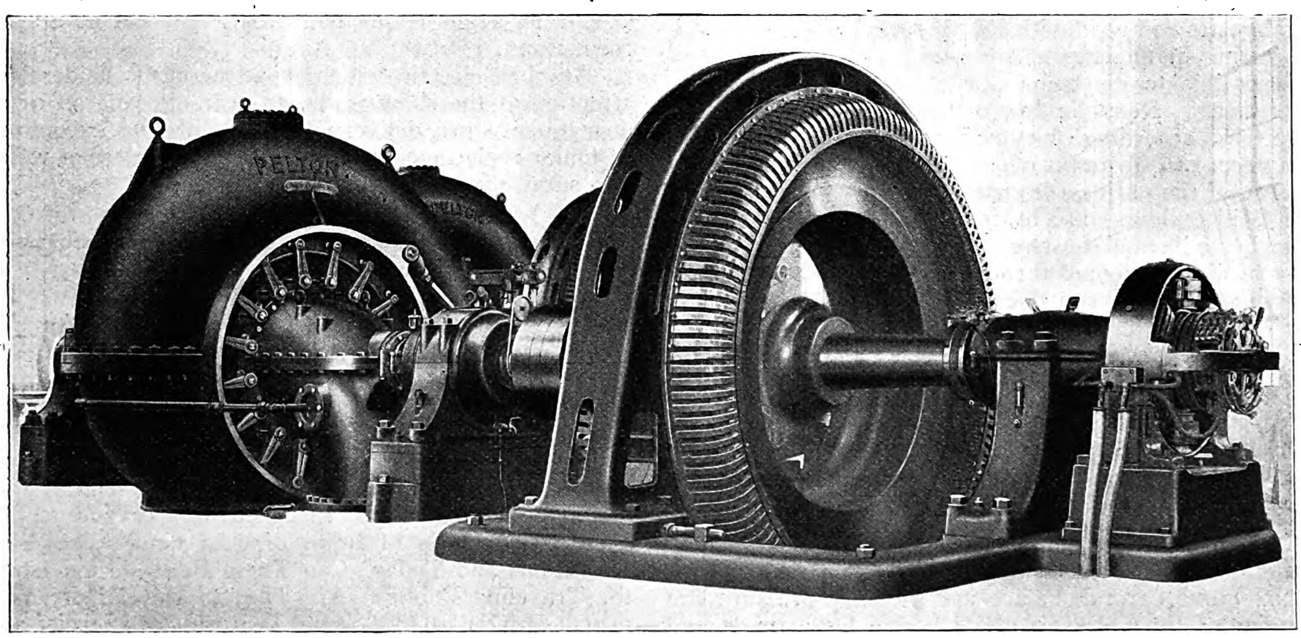
It consists of a 600-hp., variable-speed direct-current motor, direct-connected to the lineshaft, this motor having a speed range from 50 to 350 r.p.m. The direct-current supply for this motor is furnished by a motor-generator set driven by a 725-hp., 2300-volt synchronous motor. Automatic push-button control is obtained by the use of a Westinghouse control panel provided with start and stop contactors, and a motor-operated speed-controlling rheostat, which automatically varies the field excitation of the generator, as well as that of the motor, so as to obtain the total speed range of from 50 to 350 r.p.m. A motor-generator set was used for obtaining the direct current, in view of the fact that steam turbines could not be procured at the time that this installation was being put in.

On the 122-in. kraft machine there is a similar automatic speed control, the direct-current motor of which has a rating of 400 hp. This motor is also direct-connected to the variable-speed lineshaft of the machine, and has the same speed range as the larger unit.

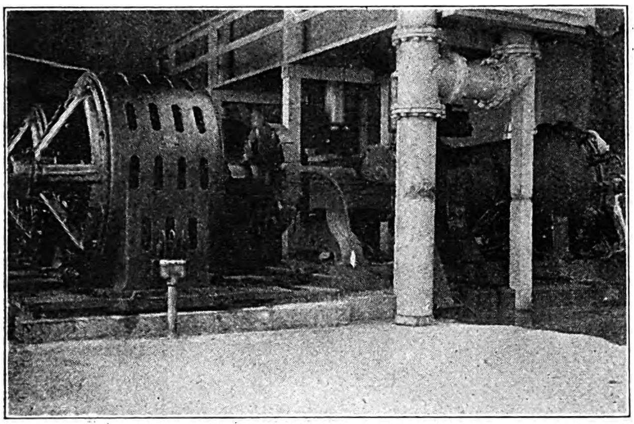
Other interesting motor applications about the plant are the use of 300-hp., 2300-volt, direct-connected motors for paper-machine jordans. These motors are mounted on the same base with the jordan, and are arranged so that the whole motor can move lengthwise of the base along with the jordan plug, as this plug is screwed in or out of its shell. There are three of these jordans on each of the kraft machines and two on each of the 204-in. news machines.

In the beater room the lineshafts are operated by 350-hp., 2300-volt motors, direct-connected to the line, these motors being of wound-rotor type, on account of the better starting characteristics.

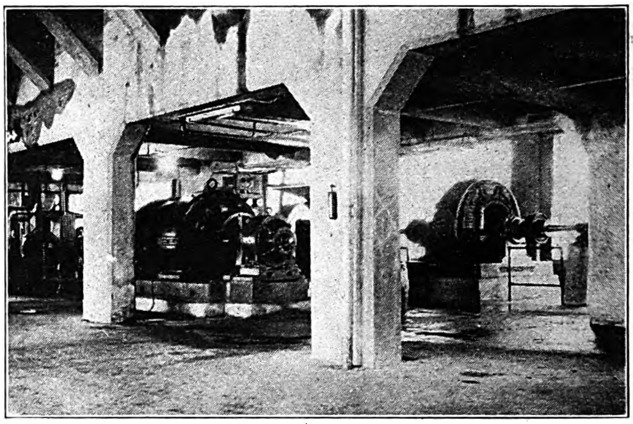
Larger sizes of centrifugal pumps about the plant, used for handling white water, together with groundwood sulphite and sulphate pulp, are driven by direct-connected motors in sizes from 50 to 75 hp., at 900 r.p.m., these pumps being of the paper mill's own design, providing a high-speed, high-efficiency pump, and having ready means for cleaning and unrestricted



Pelton Water Wheel Driving Canadian General Electric 3750-kv-a., 2300-volt at 350 r.p.m. at Plant of Pacific Mills, Ltd., Ocean Falls, B. C.



Motor-Generator Set, the Driving Unit of Which Is a 725-hp. Synchronous Motor.



Three 300-hp., 2300-volt Motors Direct Connected to Paper Machine Jordans.

passages through the pump in order to reduce to a minimum the liability for stoppages when handling pulp.

STEAM-BOILER PLANT.

In addition to the extensive electrical equipment, a modern paper mill requires a large steam power plant, the steam being used in the cooking operations incidental to the manufacture of sulphite and sulphate pulp and for the drying of the paper on the steam-heated dryer rolls of the paper machines.

At Ocean Falls there is a total of about 4500 boiler horsepower installed, twelve of the units being 150-hp. return-tubular boilers, which were a part of the original installation, the new units being 500-hp. units of Badenhausen and Babcock & Wilcox make. Oil fuel is burned in the paper-mill boiler house, while at the sawmill boiler house mill refuse is burned. There is some surplus steam at this house, to take advantage of which a steam line approximately 1800 ft. long is run from the sawmill boiler house to that of the paper mill. This boiler plant was originally laid out so that coal could be burned if necessary, and during the war emergency the prospect of not getting fuel oil became so serious that equipment was bought and installed to enable this plant to burn coal.

This boiler plant is equipped with a 200-ft., 12-ft. diameter Custodis radial-brick stack. All the new boilers are equipped with Foster superheaters. Steam-metering arrangements are very complete, so that it is possible to determine the steam usage in all departments. Republic flow meters of the long-distance electrical recording type are installed so that the chief engineer can, from his office, tell at any time the steam usage of the various departments.

Mill buildings are heated by a hot-air system, the air being heated at two central heating points and warm air distributed throughout the mill buildings in large galvanized-iron ducts.

ELECTRIC TRUCKS MAKE LONG TRIPS TO REACH NEW YORK SHOW.

One from Philadelphia, the Other from Danbury, Conn. Make Journey Under Own Power—Practicability of Electrics Demonstrated.

Two electric trucks which are attracting unusual attention at the New York Electrical Exposition at the Grand Central Palace are the high-pressure fire engine of the Paterson (N. J.) Fire Department and a five-ton vehicle which has been purchased by a concern in Norway. As soon as the show closes the one will go into active fire service and the other will be shipped abroad.

These two trucks were run from their respective factories to New York under their own power, the fire engine covering 90 miles from Philadelphia while the vehicle for Norway made the 69-mile run from Danbury, Conn.

The fire engine is of the high-pressure type and was purchased by the City of Paterson after tests which included speed, hill climbing, speed out of the station, mileage, and general dependability. It is the twenty-first electric that the New Jersey municipality has added to its fire-fighting fleet. The engine is equipped with a chemical tank, carries a complement of ladders, has high-pressure connections and the necessary hose and mounts a searchlight on the dash. Taken all in all it is a combination engine, chemical wagon, hose cart, ladder truck, and searchlight wagon—practically a whole department in itself. It derives its power from an 80-cell battery, and is driven by four powerful motors, one on each wheel. It has a speed of 22 miles an hour and made the trip from Philadelphia at an average speed of 12 miles per hour with two battery boosts, one at Trenton and one at New Brunswick.

The export truck is a five-ton standard chassis. It left Danbury in the morning and reached New York at 4 p. m. after having had a battery boost at Stamford, Conn.

Another electric which is attracting considerable attention at the show is the 15-year old veteran of a department-store delivery fleet. With the exception of minor replacements, it is the same vehicle that went into service in 1904.

AMERICAN ELECTRIC RAILWAY ASSOCIATION TO CONVENE.

The thirty-eighth annual convention of the American Electric Railway Association will be held at Atlantic City Oct. 6-10. The program includes addresses and discussion on the following subjects: "The Public Service Railway Co.'s Zone System," "What Must Be Done with the Electric Railways Before They Can Again Find a Market for Their Securities?" "Labor and the Electric Railway Industry," "The Relationship of Items of Cost Under Pre-War Conditions and Today; Can These Be Collected from the Traveling Public? Are They to Develop Permanent Competition?" "Some Features of Service-at-Cost Plans," and reports of committees on valuation, zone systems and federal investigation.

Central-Station Rates in Theory and Practice

Thirteenth Article—Differentiating Between Classes of Service —Value of Service According to Size of Customers and Use— Isolated Plants and Other Competition in Light, Power and Heat

By H. E. EISENMENGER

This is the thirteenth article of this series, which began in the issue of July 12. Part I consisted of seven articles on the cost of electric service. Part II, which is concluded this week, consists of six articles dealing with the general policy that is to influence selection and preparation of a rate system suitable as to the relative profit contributed by different classes of customers. In Part III, to begin next week, will be taken up consideration of different systems of rates. Other future parts of the series will discuss rate analysis, accuracy of rates, regulation and related topics, the articles continuing throughout the remainder of the volume.

PART II—THE PRICE OF ELECTRIC SERVICE—Continued.

III.—THE VALUE-OF-SERVICE PRINCIPLE (CONTINUED).

C. APPLICATION TO INDIVIDUAL CUSTOMERS AND TO CLASSES OF CUSTOMERS.

SECTION 95. Now obviously we cannot shade prices for each individual customer by determining or estimating the monetary value he attaches to the respective part of a service. This method of applying the value-of-service principle between individual customers is generally considered unfair in commercial practice[1] and respectable retail merchants, for instance, charge the same price for certain goods on a certain day for all customers without exception.[2] Discrimination between individual customers is forbidden to public service corporations by the public utility commissions.

But we can and should make our prices so that different percentage profits are obtained from different *classes* of customers and from different *kinds* of goods or *classes* of service. This kind of differentiation or "discrimination" is recognized as perfectly legitimate by the public utilities commissions and is also probably felt as being fair by the majority of the general public. It is, in fact, fairer than the apparent lack of discrimination, as expressed by charging equal percentages of profit from everybody, whether rich or poor (cost-of-service principle).

In practice we apply the *value-of-service principle* between classes of customers and classes of goods, whereas the strict *cost-of-service principle* is applied to the customers and goods within each class.

As an example of the differentiation of profits between classes of *customers* remember the regular "sales" in department stores on certain *days* of the week. On these days extra low prices or extra high discounts ("double stamp days") are allowed which apply chiefly to those classes of customers to whom the difference in price is important enough so that they are willing to take upon themselves the inconvenience of planning their shopping and delaying their purchases until that particular day arrives, and then of shopping in the crowd. The excursion and holiday rates on railways, etc., are a similar example.

As regards the differentiation between classes of the *commodity* or service we have a well-known example in the discrimination of the post-office charges between letters and printed matter ("first class," "second class" and "third class" mail). It costs the Post Office Department practically the same to transport and deliver a sealed written letter as it costs for printed matter of the same weight from the same sender to the same addressee and yet the charges are 3 to 12 times as high. The chief reason is that senders of a "first-class" letter are able and willing to pay the higher charges, whereas only a small percentage of the newspapers, printed advertising circulars, etc., which are now being sent by mail would be transported that way if the charges were raised to the same amount as the first-class letters, or even to the average between the first, second and third classes. Another example of discrimination between classes of commodities is furnished by the price reduction to every customer (in sales or permanently) of certain *goods* in department stores and other stores (which is not identical with the reduced prices on certain days mentioned above) when it is found out that these goods are not selling rapidly enough.

D. THE VALUE-OF-SERVICE PRINCIPLE IN CENTRAL-STATION SERVICE.

1. General Principles.

96. In determining the cost of central-station service we have found (see Section 10 et seq.) that the cost of production of service consists of three separate items. The lowering or raising, respectively, of the profits from different customers as required by the value-of-service principle should therefore apply theoretically to every one of these three items of cost. We have seen, however, (see Section 57) that the customer cost is of importance only with the smaller customers and is negligible with the large and even with the medium-sized customers. We might there-

[1] There are exceptions, however. For instance, the practice of physicians to make lower charges (or none at all) to indigent people and to indemnify themselves for their time from the pocketbooks of their wealthier patients, is generally not objected against. The amounts expected from the individual as contributions towards charitable and other public purposes (also tips) which, although supposedly voluntary contributions, still frequently are collected and given under a certain pressure, are also in proportion to the individual contributor's assumed financial standing.

[2] The orient has different ideas on this subject. Haggling may go on for hours until the proper adjustment is found between the respective customer's valuation of the goods and his valuation of his money, and this is considered perfectly correct.

fore determine the customer charge of the rate by adding the profit to be collected from the small customers and apply it to all sizes of customers alike.

It will be shown, however, (Part III) that the rates generally do not follow the three-charge system inasmuch as the customer charge is frequently left out altogether. Not even the two-charge system (energy charge and demand charge) is universal, though it is applied in the great majority of rates. We come to the conclusion, therefore, that an exact mathematical application of the value-of-service principle is not feasible—even if we could have the exact foundations for the same in the form of exact data of the valuation of the service on the part of the various customers or classes of customers. We will, in general, have to be satisfied with selecting those of the three charges as we choose to embody in the rates, at such amounts that the average profit is larger or smaller according to what the following investigations (Section 97 et seq.) will show to be desirable.

As the principle of differentiating the percentages of profit refers to classes of consumers or service only and not to individual consumers, the prices must be laid down in hard and fast rules in schedules which leave no room for personal interpretation or for preference to individual customers. If, for instance, we find that the electric light company ought to draw a smaller profit from residential consumers than from commercial lighting consumers (see later, Sections 97 and 98) we will have to have one schedule for residential consumers and another one for commercial lighting.

As regards the raising or lowering of the profits for different classes of consumers and classes of service in the central-station business, we will have to be guided by the same two factors which have previously been mentioned (see Section 94) as being determinative for that discrimination in general business, viz.: (a) the customer's valuation of the service he receives, (b) the customer's valuation of the money he has to give in return for the service. These two factors do not necessarily work in the same direction, one factor may indicate a lowering of the profit to a certain class, the other one a raise.

The classification of the customers for a rate diversification in general and for application of the value-of-service principle in particular is made under two main headings, the "size" of the consumer and the purpose to which electricity is being put. The size of the customer is usually determined by the number of kilowatt-hours consumed per month or sometimes by his maximum demand, or by both. The schedules distinguish accordingly wholesale and retail customers, or the character of the business as such brings the respective customer under a certain class of size. For instance, residential customers are naturally small customers, street railways large ones.

2. *Classification According to the Size of the Consumer.*

a. The Small Consumers.

97. The smallest consumers generally value their dollar higher than the medium-sized and large customers and therefore we must be satisfied with a smaller profit from the smallest customers, otherwise they will turn to other illuminants. This does *not* mean that we will have to charge them lower average *prices* per kilowatt-hour, since the *cost* per kilowatt-hour is very much higher for this class of customers, chiefly on account of the "customer cost" (see Section 57).

b. The Medium-Sized Consumers.

98. Calling medium-sized consumers such consumers as have a connected load somewhere between 5 and 10 kw. as a lower limit and perhaps 30 to 50 kw. as the upper limit, such as medium-sized stores, restaurants, small factories, etc., we find that we cannot claim any special reason why this class should pay especially low profits, whereas such reasons do exist for the small and the large consumer. (See Sections 97 and 99.) The natural inference is that this class of customers must pay a larger profit than the average.

Let it be emphasized again that charging prices to the medium-sized customer which involve higher profits than the average will be of advantage not only to the electric light company, but also to the community of electric light users, possibly including the medium-sized customers themselves. The higher profits from the medium-sized customers do not necessarily mean that these customers have to pay for the others. If we would not grant prices with lower profits to the other customers, for instance the small ones, they would drop out and the profit derived from them would be lost. The prices to the remaining, that is the medium-sized, customers would have to be raised because the cost would have to be so much higher owing to the reduced size of the plant.

c. The Large Consumers—Central Station vs. Isolated Plant.

99. Proceeding now to the third class, the large consumers (for instance, large hotels, department stores, office buildings, theaters, etc.) we find that they too like many medium-sized customers would have to use electricity as a matter of necessity, but here another element enters in. The large consumer is in a position to build his own generating plant and under certain conditions may be able to generate his electricity cheaper than what the electric light company would charge him if it applied average profits in making his prices.

The selling price of the service from the central station is therefore in competition with the output cost of the service from the isolated power plant. This is not *necessarily* a disadvantage to the central station, but it may be so. The central station has the advantage of the bigger plant, which reduces the operating expenses per kilowatt-hour and the capital invested per kilowatt capacity of the power station. The central station further has the big advantage of a diversity-factor larger than unity, which means, as we have seen in Section 45, it can use the same kilowatt of power-house capacity several times over for different customers, one after the other. Also the reserve capacity of the isolated plant is generally a larger percentage.[3]

[3] To illustrate these points: If the isolated plant has a peak load of 1000 kw. we would have to install perhaps two 500-kw. generators to carry the load, whereas if we supplant the service from the isolated plant by central-station service the central station will have to increase its capacity for that purpose by perhaps only 700 or 500 kw. or less, according to the size of the diversity-factor, so that the capital invested per kilowatt of maximum demand is so much smaller. These 500 or 700 kw. are not furnished from 500-kw. generators but from large ones of 5000 or 10.000 or more kw.; this means the capital per kilowatt capacity is still further reduced in case of the central station. Moreover, if the isolated plant is to furnish the service, we will have to install a third generator of 500 kw. there as a reserve for breakdowns, that is 50% of the total capacity, whereas in the central station, where we have a larger number of generators, the size of the reserve generator is a smaller percentage of the total capacity. If we have, for instance, five large generators of 10.000 kw. each, installed in the central station for regular service, the sixth unit of the same size, installed as reserve, will be but 20% of the capacity. (Of course, we might also subdivide the 1000 kw. of the isolated plant into five units of 200 kw. each with a sixth one in reserve, but this would not only fail to bring about a reduction of the capital cost but would also increase the operating cost.)

The difference in the quality of service should not be forgotten in this connection. In many of the hotels and other places which are still operating an isolated plant we can, for instance, notice a rhythmical flicker of the electric light, which is not only annoying, but also very injurious to the eyes.

These are the chief (but not all) of the advantages of the central station over the isolated plant. On the other hand, the isolated plant has a number of economic advantages over the central station. It is not burdened with a high-voltage transmission and a distribution system since the house wiring generally is connected directly to the power-plant switchboard. The advantage sometimes quoted that the isolated plant can in winter be run with the steam from the heating system of the building and with the attendance provided for the heating plant is of questionable nature, since both heating steam and labor are inferior to that desirable for operating a good electric plant.

The question of the relative cost of providing electric power from the central station or from an isolated plant involves too many factors to permit of a general answer which applies to every individual case. But the scrapping of existing isolating plants in favor of central-station service is a frequent occurrence, whereas the opposite is rarely, if ever, heard of in the territory of supply of a well managed central station. This demonstrates that the central station generally has the economic advantage over the isolated plant. This is the consequence of the progress of the central-station business, chiefly of the accomplishments of recent years in filling in the valleys of the central-station load curve, thereby increasing the load-factor and the diversity-factor, and it is also the consequence of the progress made in central-station rates, chiefly brought about by the clear recognition of the value-of-service principle, particularly in its application to the large consumer.

The relative merits of the central station and the isolated plant to the public are clearly brought out to the engineer if he considers the following hypothetical problem: What would we do if we had to supply most economically a large city, where electricity was hitherto unknown, with light and power on a large scale? It would certainly be very, very unusual conditions which would bring the construction of isolated plants even within consideration.

3. *Classification According to the Purpose for Which Electricity Is Being Used.*

100. Whereas we have thus to discriminate between the different sizes of the customers in the application of the value-of-service principle, we must also, according to Section 96, pay due regard in this connection to the purpose for which electricity is being used.

The main uses to which electric central-station service can be put are (a) lighting, (b) motor service[4] and (c) heating[5].

The value-of-service principle requires that the price of electric service be in general not essentially higher than the price of competitive service (competitive sources of illumination, power and heat) because the customer's valuation of the service is largely determined, or rather limited, by the amount of money for which he can get a similar service from other sources. But considering the convenience, cleanliness, relative fire-safety and other advantages of the electric service its price may in many cases be somewhat higher than that of competitive service.

In the following an investigation is attempted of how the valuations of the three main services (light, power and heating) compare with each other.

101. Electricity for power will be valued slightly lower than electricity for light, at least in case of consumers who are not among the smallest. We can easily understand this from the fact that if these consumers would have to make their own light or power it would cost them almost the same amount to furnish a certain load curve for power or for light. The cost for power load will be slightly smaller than for lighting load because the speed regulation need not be as close, both as regards the regulation between full load and no load (governor) and the fluctuations of speed during each revolution (flywheel). Also in those instances where for power load a purely mechanical drive is preferable over electric power transmission, that is, where we have only one power-consuming device, or a very few of them close to each other and to the prime mover, a further relative saving may be made in the generation of power vs. generation of light, because then the electric equipment becomes unnecessary and the operator need have no training in electricity. Power rates should therefore generally be calculated with the same or a slightly smaller profit than lighting rates.[6]

For very small customers who have so little demand for power that they cannot think of installing gasoline or gas engines, conditions are different. The mechanical power they require can be furnished by hand or foot and the electric motor is frequently more or less of a luxury for them (household motors, dentists' motors, etc.).

Where the motor is used as a money-earning element, for instance in workshops of small trades people, the valuation of electric power will vary between different trades with its earning power. The price of electric power will not be of such importance to the jeweler who uses it for polishing jewels as to the man who uses electric power for pumping water or crushing stones. Moreover, in one trade electric power will be more of a luxury whereas in another one it will be a necessity.

The valuation of electric light, as far as the influence of the competitive illuminants goes, will be determined by the price of gas and kerosene. The advantages of the electric light, such as convenience, cleanliness, reduction of fire hazard, absence of pollution of the air, etc., will play a greater part in the customer's valuation if he is well-to-do than if he is poorer, because a wealthier man will generally be more willing to lay out a little extra money for these advantages than the man who has to be careful how he spends his pennies.

For all these reasons no general rules can be laid down for the relative valuation of light and power for smaller consumers. But these small power users receive their power under the lighting rates anyway so that this question is not of great importance.

102. A decided difference in the valuation on the part of the customer is seen when we compare heating service with lighting (or power). This will

[4] Industrial motors, railways, elevators, refrigerating, pumping and irrigating, ventilating, motor-generators for electroplating or telephones, etc. Also battery charging for automobiles as this energy is ultimately consumed in motors.

[5] Industrial heating, such as ovens, and domestic heating, such as cooking, flatirons, radiators, etc. "Heating" may also include electric welding, also electric steel making and other electrochemical processes.

[6] Here again the reader is warned against confusing the question of profit-adding with the question of the price per kilowatt-hour. Power consumers generally are charged much lower prices per kilowatt-hour because they are long-hour users.

be understood from the following. A steam engine or steam turbine, even of the largest and most economical type, utilizes certainly not more than 20% of the heat energy generated in the boiler furnace. The remaining 80% is not converted into mechanical energy and is lost. About one-fourth or one-third of the mechanical energy at the turbine shaft is then lost in the course of converting it into electrical energy and of transforming and transmitting the same, so that even in the most economic cases certainly not more than about 12 or 15% of the energy contained in the coal arrives at the customer's installation. Further conversion from electricity into useful heat then takes place at a very high efficiency, generally near 100%.

Assuming now that a competitive direct-heating device—stove, furnace, etc.—utilizes only one-seventh of the heat contained in the coal and lets the rest escape into the flue, we can see that we use just as much coal for electric heating as for direct heating by fire. If the electric light company under these conditions would charge the heating customer nothing but the bare cost of coal, the consumer would find that the cost to him of heating from both sources is about the same.[7] Now electric heating has not only the ordinary advantages of electric service, such as convenience, etc., mentioned above several times, but also others, such as easy temperature regulation, concentration of the heat at the point where it is needed, or uniform heat distribution, as the requirements of the case may be, absence of contamination by combustion gases, possibility of reaching extremely high temperatures, etc. These advantages make electric heating superior to other methods, for instance in electric steel making. Electric heating can therefore in certain cases compete with direct heating by fire even though the price per heat unit utilized is higher. But even then the above reflections show that we have generally to be satisfied with an extra low profit on heating service if we want to get the business.

(To be continued.)

INTERESTING SAFETY EXHIBITS AT CLEVELAND SAFETY CONGRESS.

Exhibits from Far and Near—Electrical Companies Among the Many Exhibitors.

Safety exhibits from Japan, England and Canada, in addition to commercial and noncommercial exhibits from all parts of the United States, are being shown in Gray's Armory, Cleveland, Ohio, during this week in connection with the eighth annual congress of the National Safety Council.

Though the safety movement originated in England, America has made much greater progress in accident prevent work that the Britishers now acknowledge the leadership of America in this respect and are looking to this country for guidance in organized safety work.

Among the exhibits shown at the Cleveland Safety Exposition is one brought to the general office of the National Safety Council at Chicago recently by Baron K. Uchida, former governor of Formosa, Japan; this exhibit includes pamphlets, posters, bulletins, flags and other advertising matter used during Safety Week which was conducted in Tokio in June of this year almost identically along the lines of the Cleveland Safety Week. It is significant that although this was the first attempt at organized safety work in Japan, Tokio's Safety Week proved to be a "No Accident Week" in fact as well as in name. Tokio has a population of approximately 3,000,000 persons.

It is interesting to note also that the British exhibit at Cleveland defines the safety movement in the words of an American: "This is what 'Safety First,' or being careful, means . . . . and the end is, that the workman shall live to enjoy the fruits of his labor; that his mother shall have the support of his arm in her age; that his wife shall not prematurely become a widow or his children fatherless; that cripples and helpless wrecks, who were once strong men, shall no longer be a by-product of industry."

The exhibits are largely educational and include also many displays of safety devices, guards, safety inclosed switches, lighting equipment to promote safety. etc. Electrical manufacturing companies are quite well represented among the exhibitors as follows:

Benjamin Electric Manufacturing Co., Chicago.
Central Electric Co., Chicago.
General Electric Co., Schenectady, N. Y.
National Lamp Works of General Electric Co., Cleveland, Ohio.
John A. Roebling's Sons Co., Trenton, N. J.
Square D Co., Detroit, Mich.
The Buda Co., Chicago.
The Trumbull Electric Manufacturing Co., Plainsville, Conn.
Thompson Electric Co., Cleveland, Ohio.
Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.

ELECTRIFICATION OF RAILWAY FROM CHRISTIANIA TO DRAMMEN.

The Norwegian Government has recently accepted the bids submitted by three Norwegian firms for the electrification of the railway from Christiania to Drammen. The three companies are: A/S Norsk Elictrisk & Brown Boveri; Norsk Maskinindustri, A/S; A/S Per Kure.

The bids include 18 normal gage electric locomotives, which are to be built at Thunes Mekaniske Verksted at Christiania. This is the first definite step to be taken in the plan for the electrification of the entire Norwegian railway system. The power is to be obtained from the Hakavik power station, which is located not far from Kongsberg, Norway, where can be produced about 25,000 hp.

POWER PLANT DEVELOPMENT ON THE RHONE RIVER PLANNED.

A scheme for the utilization of the water power of the Rhone and other rivers in central France is under consideration by the French Ministry of Public Works. A canal will be constructed which will make the Rhone navigable for ships of 1200 tons capacity from the sea to Switzerland and a number of power stations will be constructed on the river. Concessions for the development will be given to a company which is capitalized at $40,000,000. It is anticipated that 200,000 kw. of the power generated by the Rhone power stations will be supplied to the city of Paris.

[7] In hydroelectric central stations we would likewise have to charge prices with much lower profits than the average for the same reasons, because the total cost of hydroelectric service is of the same order of magnitude as steam-electric service, though the energy cost frequently is lower. Where we have generation from water power in a region where fuel is expensive, such as in certain parts of the West in the United States or in Sweden, the field for electric heating is better than where fuel is cheaper, especially where the heating load is essentially off-peak, so that the increment demand cost is zero.

Development of the Chicago Street-Lighting System

Progress Made by Chicago Department of Electricity — Metallic Flame Lamps—Installation and Operation of Series Group Systems — Paper Before International Association of Municipal Electricians

By WILLIAM G. KEITH
Commissioner of Gas and Electricity, Chicago, Ill.

DURING the year 1887 the first municipal electric light plant for lighting the city's streets was established in the basement of a fire engine house and 105 open arc lamps were placed in service on the river front and downtown streets. Each year thereafter additions were made both in lamps and equipment, until in 1897 a total of 1440 lamps operated from three stations, constituted the municipal electric light plant. This plant was operated as a bureau of the fire department.

In January, 1898, the city council created by ordinance the department of electricity. The report of the city electrician for that year shows that a total of 1710 lamps were maintained at a total cash cost of $68.52 each.

From this time on progress was made as regards extensions to the system and decreased cost of maintenance. The 1908 annual report showed a total of 8602 lamps maintained at a total cost of $45.86 per lamp. During that year the power generated by the Sanitary District at Lockport was made use of to displace the steam engines as a source of energy for street lighting. Extensive alterations were made necessary by this change and the way was opened for future extensions of a magnitude hardly thought possible before.

City Installs 10,000 Additional Lamps.

In October, 1910, a contract was made with the Sanitary District whereby it was to furnish and install on the streets of the city 10,000 arc lamps in addition to those in service at that time (approximately 12,200). They were also to build the necessary substations, conduits and pole lines and supply the energy necessary to operate the total number of lamps. The energy was to be furnished on the basis of $15 per hp-year of 4000 hrs., or ½ cent per kw-hr. In addition, the Sanitary District undertook to operate the substations and plants at a cost to the city of $1 per arc lamp per year. The reason for this last undertaking on its part was that it desired the use of the station buildings and the transmission lines to furnish electrical power and light to private consumers during the time such buildings and lines were not required for city lighting purposes.

The construction contract was mutually advantageous in that the city came into possession of an electric street-lighting system second to none in the world at a cost per lamp as low as any contracting firm could make, and the payments were so arranged that they spread over a period of seven years. The Sanitary District developed a load for the waterpower and equipment then installed and perfected their organization.

During the year 1911 the metallic flame lamp was improved and, as the most efficient source of illumination on the market, was adopted by the city for installation under the terms of the contract. At that time these lamps were the most suitable units for lighting open spaces, but the streets in residential districts with their overhanging trees made the selection of a small unit desirable. The 80-cp. incandescent lamp, operated in series circuits with armored cable laid in the parkway, made an ideal installation for this purpose.

As work on the contract progressed, the need for more lights to make an economical rearrangement of the existing lamps was made evident, and a supplemental contract similar to the original for 1000 lights was executed.

These two contracts for extending and changing the system were so worded as to be interpreted in terms of watts. Use was made of this interpretation to take advantage of the progress in the art of lamp manufacture and after approximately 10,000 flame lamps had been purchased and installed it was decided to adopt the 600-cp., 20-ampere, series, gas-filled lamp as a standard for open space lighting and continue the low candlepower units for residential streets, these units having been increased in candlepower to 100 and reduced in watts from 100 to 75.

All this required a great deal of money as well as careful engineering attention. To handle the contract obligations satisfactorily the city had to perfect an engineering organization. This force of men had to survey the city streets and definitely locate the position of each lamp. They made estimates and specifications for all the varied materials used, both in underground and aerial construction, and they compiled accurate maps and plans from which the Sanitary District did the work. While the work was in progress inspectors watched each detail and reported to their bureau chief.

Monthly reports of materials used and men employed were received by the city from the Sanitary District and these reports after being compared and checked with the inspectors' reports were approved and formed the basis on which payments were made.

To light one mile of street, using 23 flame or 600-cp. lamps, placing all wires underground, cost approximately $9000, while if the wires were placed aerially on steel poles the cost amounted to only $4000.

On some of the residence streets where the trees act as an obstruction to the light from arc lamps, the system of underground cables and tungsten lamps mounted in opalescent globes on the old gas posts has been installed. This type of construction costs $8000 per mile of street lighted, using 75 of the tungsten lamps spaced 140 feet apart on each side of the street.

Approve Bond Issue for Lighting Extensions.

The construction work during the previous years had provided adequate illumination in most of the older parts of the city, few extensions having been made in the newer parts of the city. It was necessary to do this because the system had not kept pace with the increasing need. The demands of the outlying districts for increased illumination were now to be met. To do this the voters, in June, 1916, approved a bond issue of $3,750,000. South Chicago, Englewood, Grand Crossing, Roseland, West Pullman and the Northwest Side north of Diversey avenue were still in comparative darkness and it was in these sections of the city that most of the proposed lights were to be placed.

The value of street lighting as a municipal asset is no longer questioned. Adequate lighting is necessary for the protection and convenience of citizens. Without it no city can attain the highest degree of success. That lights are needed is evidenced by the number of complaints which reach the department daily. In most cases little relief has been given because of the lack of facilities for operation and because of the insufficiency of funds for construction and operation.

An engineering survey of the city was made and it was decided to place low candlepower lights in residential districts mounted approximately 10 ft. above the street level. On those streets used by car lines and for fast moving vehicles, a 600-cp. unit mounted 22 ft. above the street was selected.

In all previous installations of low candlepower lamps a series circuit connecting over 200 of the lamps was laid from lamp to lamp in the parkways. Each lamp was in direct contact with the high-tension source of energy.

Installation of Series Group System Reduces Costs.

To continue placing high potential within reach of the public was not considered safe and to eliminate this hazard it was decided to use individual transformers at each lamp location. Further analysis showed that the placing of lamps in series groups of about 20 to the group and operating these from series transformers located in manholes would reduce the costs by over 13%. Plans were prepared to carry out the work in this way.

The typical circuit for street lighting in Chicago will consist of an impedance regulator in series with a 5050-volt, 60-cycle source of energy, and approximately 22,000 feet of underground conductor insulated for 5050-volt operation. Located in manholes central to the territory to be lighted, with their primaries in series with each other and the high-tension cable, will be series transformers of suitable capacity.

The secondary of each transformer, with a permanent connection to earth at the center of the winding, will be connected to a series circuit of approximately 3800 feet of conductor insulated for 600-volt operation. Approximately twenty 100-cp. 6.6-ampere, type "C" series lamps, equipped with 110-volt film cutouts, will be connected in series with each of these secondary circuits.

The large saving in cost over the individual transformer method is due to the use of low voltage cable in place of high voltage, and the centralizing of the transformer capacity. The transformer vaults tend to offset this saving, while labor is approximately the same, making a net saving of over 13%.

The substation transforms from 12,000-volts, 60-cycle, three-phase delta to 5050 volts to neutral, 60-cycle, three-phase Y, with neutral grounded. Group lighting circuits are run from each phase through a 6.6-ampere, constant-current impedance regulator through the series transformers and back to grounded neutral in the substation. A typical circuit consists of the following items:

(a) A source of 60-cycle, 5050-volt energy.

(b) One overload and underload automatic oil switch.

(c) One 6.6-ampere, constant-current regulator.

(d) 8000 feet No. 8 B. & S. solid copper conductor insulated with a 3/16-in. wall of saturated paper for 5000/8660-volt operation and surrounded by a 1/8-in. lead sheath.

(e) 16 (4 groups of 4) 6.6/6.6-ampere series transformers, each to operate twenty 100-cp., 6.6-ampere series type "C" lamps, in series with 3800 ft. of No. 8 B. & S. gauge solid copper conductor insulated and armored for 600-volt operation.

(f) 3000 feet (3 lengths of 1000 ft.) No. 8 B. & S. copper conductor, armored, 3/16-in. varnished cloth insulation for 5000-volt operation.

(g) 3000 feet of 5000 volt armored cable as item (f).

(h) 8000 feet of No. 8 B. & S. solid copper conductor as item (d). This conductor terminates through an air-brake switch on the grounded neutral bus.

This method of operating street lamps had never been tried on a large installation and several questions arose as to the operating difficulties that might be encountered. A thorough consideration of the subject, supplemented by tests, established the following facts:

Phenomena with Open Circuited Secondary of Series Transformer.

The first consideration is the effect on the operating circuit when from any cause the secondary circuit of any transformer opens.

Practically all the current drawn is due to resistance load, and a sine wave of e.m.f. would therefore send a sine wave of current over the circuit. In the event that one of the group transformer secondaries should open, a full 6.6-ampere sine wave current would be forced through the primary, with the result that a peaked e.m.f. wave would be induced in the secondary and impressed on the open group.

By a graphical method the magnitude of this e.m.f. has been found to be 1.95 volts per turn per sq. in. of core, and the root-mean-square value 0.568 volts per turn per sq. in. of core. As a transformer of this size will have approximately 182 turns secondary and 5¾ sq. in. of core, we can expect a maximum voltage of 2040, or a root-mean-square voltage of 595 volts to be impressed on the secondary circuit until such time as the short circuiting devices provided shall operate.

As the cables are tested for five minutes with a root-mean-square voltage of 1500 volts, or a maximum voltage of 2120 volts, there is no danger of cable failure.

To guard against this potential remaining on the secondary circuit during the period of open circuit each lamp is provided with a film cutout that will puncture and short-circuit the lamp at a potential of approximately 100 volts. In addition to this, each transformer is provided with a short-circuiting device that will operate to short-circuit the secondary when the potential reaches 400 volts. This protection is designed to operate when for any reason the secondary circuit is interrupted at some point not protected by the lamp cutouts, as, for example, a post falling and breaking the conductor.

Induction.—Tests on the cable to be used for the 5000-volt circuit show that the steel armor forms such a good path for the magnetic flux that little or no benefit can be expected by placing the sides of a circuit in the same trench, while the armor in places makes impossible the transmission of electrostatic disturbances from one cable to another.

Charging Current.—When the original series tungsten circuits were placed in service a marked difference in the value of the current at the two ends of the circuit was observed. This difference was due tc a charging current combining with the line current and it was found necessary to correct the difference by inserting reactance at the point where the circuit connected to its return conductor.

A diagram of the various currents in the different parts of the proposed circuit combined in their vector relationship shows that while there is a difference in current value of 0.07 of an ampere between the two station ends of the circuit, the actual difference of current between the first and last transformers is only 0.033 of an ampere and is negligible.

Power Factor.—The transformers with their lamp load have a power-factor better than 98.5%; the cable has a power-factor of 95.8% as against 91.2 for that used in former installations. The regulator power-factor is very slow, making a combined power-factor of 81.3. The charging current combines to correct this to 89%. This is 1% better than that of straight series tungsten lighting and 1.5% better than 600-cp. series compensator circuits, and in addition has the advantage over straight series tungstens of localizing lamp outages when post failures occur.

Size of Conductors.—The wire sizes selected for the group lighting circuits were determined by equating the interest and depreciation on the cost of cable against the cost of losses when using such cable. These calculations resulted in sizes considerably smaller than the No. 8 selected, but the latter size was chosen rather than the small size for mechanical reasons.

PENETRATION OF MOISTURE IN INSULATING MATERIALS.

Many samples of standard insulating materials have been tested for penetrability of moisture. A large variation in penetration is shown. Untreated papers show immediate penetration, whereas paper impregnated with various insulating compounds, treated cloth or condensation products like bakelite micarta, show very small penetration. None of the standard insulating materials may be called moisture proof.

Where the penetration of moisture is slow, little difference is noticed whether the sheet is in contact with water or the saturated vapor. Several thicknesses of bakelite micarta were used, the penetration in this case being nearly independent of the thickness up to 1/64-in., which is 1.5×10^{-6} gms. H_2O cm.^{2} per hour. Plotting gms. H_2O against time a small rapid increase in water is first observed followed by a much longer period, with practically no increase in water (time of penetration and dependent upon thickness), and then a gradually increasing amount of water, the slope of the curve remaining almost constant, which value is representative of the rate of penetration.

Several qualitative methods were first tried: (1) Colormetrically, by placing anhyd. $CuSO_4$ or $CoCl_2$ on glass plate upon which is placed the insulating material. Wet blotting paper is weighted down upon the sample and change in color noted upon penetration. Certain dyes soluble in water may be also used with good results. (2) Electrically, by conductivity change with increase of moisture measured when insulating material is placed between Hg. surface and weak salt solution. (3) Quantitatively, by collection of moisture in P_2O_5 tube, or difference in pressure of penetration water vapor when released from liquid air trap by sensitive optical manometer method.

The method now in use may be briefly described as follows: Two 100-c.c. bulbs with stopcocks at necks and common connector for high vacuum system, each having flanged tube 1.5 cm. diameter leading from the side, are so arranged that the ground flanged surfaces fit together so that the apparatus is gas-tight. Through a ground joint in one bulb a weighed P_2O_5 tube is introduced. The opposite bulb contains a small amount of H_2O and the whole apparatus may be placed in a position so that the water will come in contact with the insulating material sheet which is held as a diaphragm between the bulb chambers. It is sometimes necessary to use rubber gaskets to make a tight joint between the sample and ground surfaces of the flanged side tubes.

The whole apparatus may be placed so that the water or water vapor in one bulb may come in contact with the diaphragm. Dry air is admitted each time a weighing is made.

Where rate of penetration of H_2O is small, and to eliminate the weighing errors, a pressure difference due to penetrated moisture is measured. In this case a trap attached to the lower end of the dry bulb is used to freeze out the penetrated water vapor. When freezing mixture is taken away the difference in pressure is measured by means of the Shrader optical manometer gage.

The above is gleaned from the September issue of the *Journal of the Franklin Institute*, in which appears at frequent intervals a number of notes from the research department of the Westinghouse Electric & Manufacturing Co.

CINCINNATI UNIVERSITY AFFILIATES WITH NATIONAL SAFETY COUNCIL.

The National Safety Council has effected an affiliation with the University of Cincinnati for the purpose of carrying out a new program of education in the field of accident prevention. It includes the establishment of an industrial medicine division at the University of Cincinnati where medical students and graduate physicians will be given special training not only in industrial medicine, but in industrial relations, including sanitation and all the fundamentals of safety work as well. The plan is being carried out jointly by the college of medicine of the University of Cincinnati and the Cincinnati local council of the National Safety Council and is said to represent the first attempt in America to train doctors for industrial work. The Cincinnati plan is an outgrowth of the call during recent years for industrial physicians.

Methods of Increasing Capacity of Existing Transmission Lines

Line Limitations—Determining Relative Costs of Increasing Capacity —Considerations Involved — Paper Before Pennsylvania Association

By E. C. STONE
Duquesne Light Co.

DURING the war the problem of increasing the capacity of existing transmission and distribution lines was one of getting the increased capacity in the shortest possible time—availability was often of more importance than cost. Now it may be assumed that the problem is one of getting the additional capacity at the least cost consistent with reliability of service. More time may be taken to get the increased capacity at a lower cost. The rapid growth of the load on central station lines has been primarily in power, so that the discussion which follows will deal particularly with three-phase power circuits.

Line Limitations.

In order to intelligently attack the problem of increased capacity of existing lines, the factors which limit this capacity must first be studied. The carrying capacity of a given line is limited by

(*a*) Maximum number of amperes it can carry as determined by heating, voltage regulation or economy of operation.

(*b*) Maximum voltage at which it can be operated as determined by insulation.

(*c*) Power factor of load carried.

Since the power delivered by a line depends entirely on these three factors, it is obvious that the capacity of a line can be increased only by increasing one or more of these factors.

Increase in current carrying capacity is accomplished by increasing the line copper—the physical limitation being the weight of copper which the poles can carry. Increase in line voltage is accomplished by increasing the size of the insulators and if a great increase in voltage is made, by providing greater spacing between line wires. The limitations encountered are usually the practical ones of insufficient clearances along rights of way, municipal regulations and the like. Increase in power factor will be discussed in a later paragraph.

In a given case the factors which are to be increased—current, voltage or power factor—will be largely determined by the total cost involved. The subject of voltage regulation, however, should be very carefully considered in this connection. Voltage regulation is a quality of electric power service and must be maintained good at all times. Motors and other apparatus utilizing electric power, especially control equipment, will not operate satisfactorily over too wide a range of voltage; in fact, the lack of good voltage regulation is one of the commonest faults of electric service and is particularly annoying to the power user, because it reduces the torque which his motor can develop at just the time when he needs the greatest torque. In some cases when the line voltage is too low for the loads and distances involved, voltage regulation even limits the carrying capacity of a line to a current below that which the legitimate limits of heating or economy of operation would allow it to carry.

In Fig. 1 are shown the approximate relations between line capacity, costs and voltage regulation when increased capacity is obtained by increasing the copper and by increasing the insulation. The enormous difference of the cost of securing increased capacity of the line only by these two methods is vividly brought out. It will be seen that improvement in regulation by increasing line copper is prohibitive because of the enormous cost, but improvement in line regulation by raising the voltage usually brings an actual reduction in cost, for ordinarily when the regulation is excessive, a raise in voltage will mean material reduction in total distribution cost. In a general way, voltage regulation is not only a criterion of service but is also a criterion of line cost, and when it becomes excessive, it is pretty safe to say that money

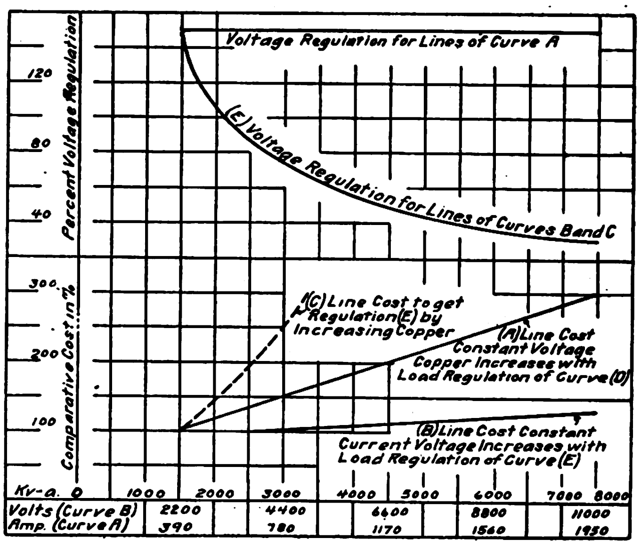


Fig. 1.—Approximate Relations Between Line Capacity, Costs, Voltage Regulation When Increased Capacity Is Obtained by Increasing Copper and Increasing Insulation.

can be saved both in investment and operating cost by increasing the line voltage.

In practice, the cost of consumers' installations connected to the line must be considered as well as the cost of the line itself. The cost per kv-a. of these installations decreases as their size increases, because of the smaller unit cost of transformers, fuses, lightning arresters, etc., for the larger capacities. Their cost also increases as the voltage at which they are to be operated increases, the increase in cost with increase in voltage being more rapid for small than for large installations. Usually, however, the insulation of equipment used on 2300-volt delta-connected transformer installations is sufficiently high to permit of operation on a line voltage of 4000, this being accomplished by changing the connections of the transformer primaries from 2300 volts delta to 4000 volts star. Under such circumstances no additional cost will be incurred in changing transformer installation

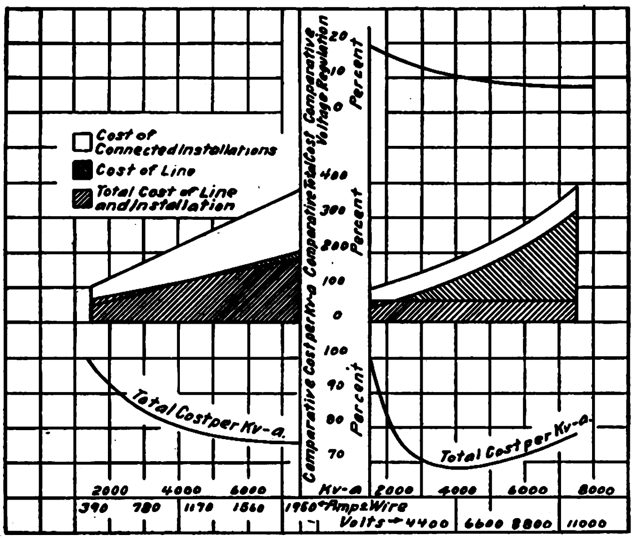

Fig. 2.—Relative Costs and Voltage Regulations for Increasing Capacity Including Lines, Connected Installations and Substations.

to 4000 volts. For a specific case, the extent to which copper or voltage will be increased depends on the cost of the line in relation to the cost of the connected installations. When the cost of the line is high compared to the cost of connected installations, increase in capacity will demand a considerable increase in voltage.

This condition exists when the connected installations are of large capacity and scattered, and the line copper already installed loads the poles heavily. When the cost of the line is low compared to the cost of connected installations, it will not be desirable to increase the voltage so much; it might prove more economical to increase the copper. This condition exists when the connected installations are small and close together and the poles are not already carrying much copper. In general, large connected installations, scattered load, long average transmission distance, make for more voltage and less copper; small connected installations, dense load, short average transmission distance make for less voltage and more copper.

In Fig. 2 the relative costs and voltage regulations are shown for increasing the capacity of a given 2200-volt distribution network by increasing the voltage and by increasing the copper, with lines, substation equipment and connected installations all taken into account. It will be seen that the least cost per kv-a. handled is obtained with voltages of between 4000 and 7000, while the regulation comes down, rapidly at first, from 20% at 2300 volts, to 8% at 11,000 volts. Going still farther, in Fig. 3, costs of line, sub-station and connected installations per kv-a. handled are shown for various capacities at each voltage. These curves indicate that for the case at hand, for any capacity up to about 4500 kv-a., 4000 volts gives the lowest cost, while for loads above 4500 kv-a., 6600 volts shows slightly lower cost than 4000 volts. In the matter of voltage regulation, 14% is obtained at 4000 volts, while 10% is gotten at 6600 volts as against 20% for 2300 volts. From the point of view only of cost, therefore, there is not much difference between 4000 and 6600 volts. If, however, the higher voltage were practicable, it would be desirable because of the better regulation.

Tabulated are shown the data required and method used for calculating the results on cost per kv-a. indicated in Figs. 2 and 3. By determining this data for a given distribution system whose capacity is to be increased, and calculating the cost per kv-a. of the greater capacity, as indicated in the table, the most economical voltage can be determined with a very fair degree of accuracy. Distribution losses are not taken account of in these figures, but it is a reasonable assumption that the increased losses of the higher voltage transformers will be more than offset by the decreased line losses at the higher voltage. In determining the voltage to be used, due weight should always be given to the better regulations obtainable at the higher voltages.

Influence of Power-Factor.

If the load carried by a line has a power-factor of less than unity, the capacity of the line can be increased by improving the power-factor, since the kilowatts of power which each ampere on the line will deliver is directly proportionate to the power-factor. If, for example, the power-factor of a given number of amperes on a given line is increased from 80% to 100%, the number of kilowatts will be increased in to 100%, the number of kilowatts will be increased in the ratio of 80 to 100, or 25%, without increasing the amperes on the line. The improvement of the

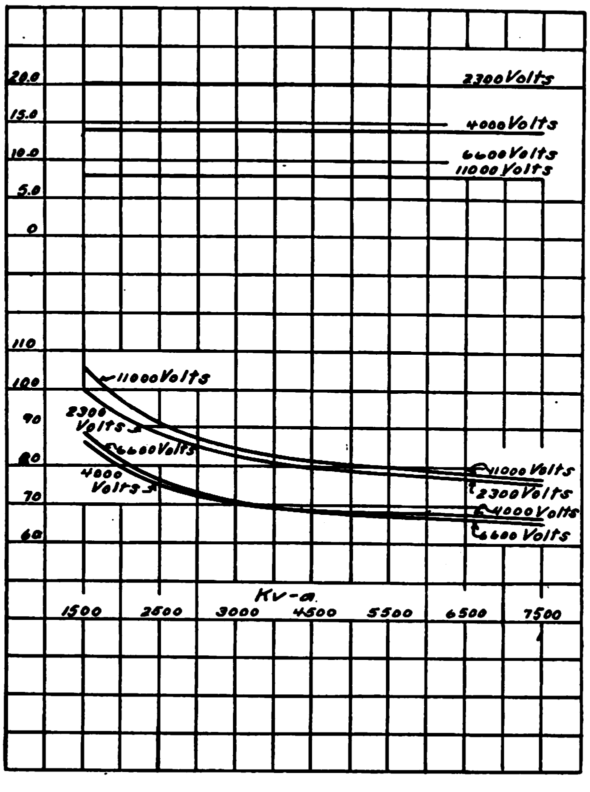

Fig. 3.—Costs of Line, Substation and Connected Installations Per Kv-a. for Various Capacities and Different Voltages.

power-factor not only decreases the cost of line per kilowatt by increasing the line capacity, but also decreases the cost of generating and transforming equipment. It, therefore, pays to spend money to improve power-factor as long as the total saving in line, transforming and generating equipment is greater than, or equal to, the cost of making the improvement.

DATA FOR DETERMINING VOLTAGE AND LINE COPPER TO SECURE INCREASE IN CAPACITY OF A DISTRIBUTION NETWORK AT MINIMUM COST.

	Existing system.	Required increase

Total cost per kw.	$33.33	$27.80	$23.00	$23.00	$27.70
Voltage regulation, per cent	20	20	14	10	8

More money can be spent in improving the power-factor when the line costs are high, *i. e.*, in general when the voltage is too low for the loads and transmission distances involved and cannot be increased to the proper amount on account of external limitations.

The power-factor of the load also affects the voltage regulation. This is shown in Fig. 4. Where the line wires are large—No. 1/0 or No. 4/0, for example—voltage regulation improves very rapidly as the power-factor is raised. As the wires become smaller, the effect of power-factor on regulation grows less, and for No. 3, or smaller wire, becomes so slight as to be unimportant. Looking at this effect from another viewpoint, for a constant power-factor and load proportional to conductor cross-section, the voltage

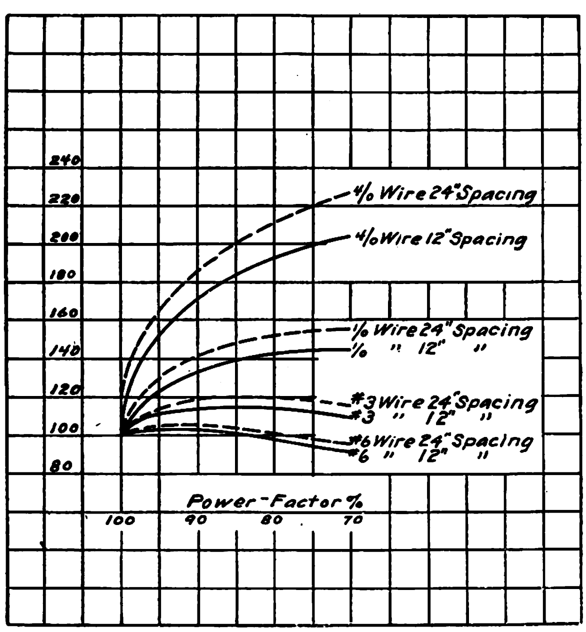

Fig. 4.—Effect of Power-Factor Upon Voltage Regulation.

regulation becomes rapidly poorer as the line wire becomes larger. This result must be watched when increasing the copper in a line by replacing a small line wire, such as No. 3, with a No. 1/0 or No. 4/0 wire.

Low power-factor on central-station systems is due chiefly to induction motors and can be improved by fitting the installed motor capacity more closely to the load, by replacing induction motors with synchronous motors where possible, or by installing corrective apparatus, such as synchronous or static condensers, phase advancers, etc. This apparatus should be installed as near as possible to the load which causes the low power-factor. Such corrective apparatus either may be installed by the customer or by the central station. If it is to be installed by customers, a power-

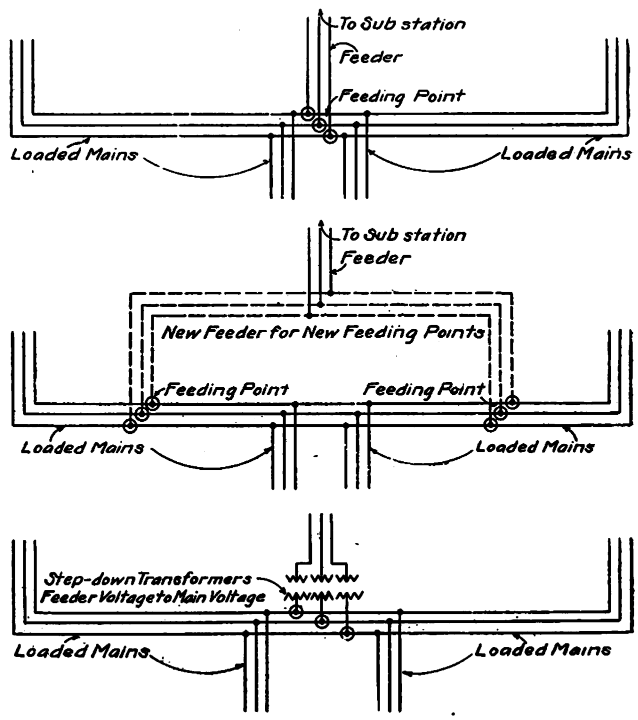

Fig. 5, A, B, C.

factor clause should be inserted in the rate schedule, by which the rate will be decreased as the power-factor is raised, in order that the customer may be compensated for the additional expense involved in improving his power factor.

Increasing Distribution Voltage.

In almost every actual power distribution network, where an existing 2300-volt system is sufficiently loaded to require an increase in capacity, it will be found desirable and economical to increase the line voltage from 2300 to 4000. Ordinarily, the insulation of line and connected installations on a 2300-volt system is heavy enough to stand 4000 volts, so that the only change necessary is to reconnect transformers from delta-delta to star-delta. In some cases it may be necessary to provide substation transformers with more insulation on the secondary windings or to modify somewhat the substation switchboard; if, for example, single-phase circuits are fed from the same substation transformers as the three-phase circuits, it will be necessary to install separate transformers for the two classes of circuits, or to run a fourth bus to the neutral of one star connected bank and connect the single-phase circuits between this neutral and the line busses. Or where single-phase installations are already connected between line wires, new transformers for 4000 volts primary may be required. These items are generally unimportant, so that by changing the voltage of a distribution network from 2300 to 4000, an additional 73% capacity and a materially better regulation can be obtained at practically no cost. On systems operated at more than 2300 volts, where the transformers are connected in delta-delta, a raise in voltage of 73% can be similarly accomplished by reconnecting the transformers for star primary, but transformer and line insulation will not be sufficient to stand the higher voltage, unless original conditions are retained by dead grounding the neutral of the substation transformers. When this is done, the potentials to ground with the star connections and higher voltage between line wires are held to the same values as existed with the lower line voltage and free neutral. There is, however, a serious objection to the dead grounding of the neutral, in that every time a line wire becomes grounded, a short circuit is produced and the circuit is interrupted. A distribution network with grounded neutral will always suffer more interruptions than will one with a free neutral.

If it becomes desirable to increase the line voltage by more than 73%, it will be necessary to reinsulate the lines and install new transformers throughout. To justify the latter requirement, some use must be found for the transformers discarded; on growing systems this is not difficult, for they will soon be used up in other localities where the load has not yet developed sufficiently to justify the higher voltage.

Where installations connected to a network are grouped in a system of mains supplied by a feeder connected in at a central point, increase in capacity can be obtained by increasing the number of feeding points and increasing the capacity of the feeder only by increasing its copper or raising its voltage. This scheme is shown diagrammatically in Figs. 5 b and d. The capacity of the mains will be in direct proportion to the number of feeding points, if these are properly placed. The proper placing is accomplished by dividing the network into as many parts as there are proposed feeding points, each part containing an equal load; the feeding point for each part will then be placed at the center of its load. Sometimes where a few large customers represent most of the load in a given network, but there are also connected a large number of small customers which constitute only a small part of the total load, it will pay to run two parallel mains from the same feeder—a high voltage main for the large installations and a low voltage main for the small ones. The feeder will be at the high voltage and will supply the low-voltage main through step-down transformers, see Fig. 5e.

In cases where voltage regulation is a limit to the

TABLE OF SCHEMES FOR INCREASING CAPACITY OF EXISTING LINES—SEE ALSO FIG. 5.

Scheme No.	Reference Fig. No.	Method of increasing capacity.	Changes required in line.	Changes required in substation and connected installations.	Line regulation reduced in ratio.	Capacity increased in ratio.	Availability.
1	5a	Original system.	....	....	......	......	....
2	5b	Increase cross section of line wires from C1 to C2	Increased copper.	None.	1	$\frac{C2}{C1}$	Very small and numerous connected installations. Short transmission distances. Not much copper on poles.
3	5a	Increase voltage from E1 to E2	New insulators throughout. Possibly more clearance between wires.	New transformers throughout.	$\frac{E1}{E2}$	$\frac{E2}{E1}$	Large connected installations. Long transmission distances, heavy copper on poles.
4	5a	Special case of No. 3—Increase voltage from E1 to $\sqrt{3}$ E1	None.	Connect all transformers star-delta. Ground neutral of substation transformer bank	$\frac{1}{\sqrt{3}}$	$\sqrt{3}$	See No. 3. Grounding of neutral may cause excessive interruptions to circuit.
5	5a	Special case of No. 4—Increase voltage from 2300 to 4000.	None.	Same as No. 4, except that neutral need not be grounded. Slight changes sometimes at substation.	$\frac{1}{\sqrt{3}}$	$\sqrt{3}$	Available in almost every case to obtain 73% increase in capacity. Very desirable.
6	5c	Increase cross section feeder and increase number of feeding points from K1 to K2.	Increase feeder copper in ratio $\frac{K2}{K1}$	None.	None	$\frac{K2}{K1}$	Short feeder lengths. Many connections. Average size small—grouped close together.
7	5d	Increase feeder voltage from E1 to E2 and feeding points in ratio $\frac{E2}{E1}$	New insulators on feeder only. Possibly additional clearance between wires. Step-down transformers between feeder and main at each feeding point.	New transformers at substation. No changes on connected installations.	$\frac{E1}{E2}$	$\frac{E2}{E1}$	Long feeders—heavy load. Many connections. Average size small—grouped close together.
8	5e	Increase feeder voltage from E1 to E2. Increase voltage on large connections to E2. Retain E1 on small connections.	New insulators on feeder and existing mains. Additional mains at existing voltage for small connections. Transformers between feeder and new mains.	New transformers at substation and on large connected installations. Small connections transferred to new mains.	......	$\frac{E1}{E2}$	May be used where greater part of load is on large connections, but remaining small part goes to very many small connections.
9	Any of above	Improve power factor of load.	None.	Install corrective apparatus at suitable locations as near as possible to origin of low p. f. May be done by customer of central station.	See Fig 5	$\frac{Pf2}{Pf1}$	Load largely induction motors or other low p. f. apparatus. Cost of line high, due to long transmission distance or too low voltage.
10	Any of above	Install voltage regulator at substation.	None.	None.	......	......	Desirable only when highest possible line voltage gives too poor regulation—regulator must be carefully adapted to load.

capacity of the line, even after line voltage and power-factor both have been raised as much as practicable, the capacity of the line may sometimes be brought up to the heating limit of the copper by the installation of voltage regulators at the sub-station. If this scheme is attempted, care must be taken that the regulators selected will operate satisfactorily on the particular load to which it is to be applied, for many types of regulators will be found impracticable when applied to loads having the rapid and wide fluctuations of the ordinary industrial power load.

In the foregoing discussion, it has been attempted to show how the need for increased capacity of power distribution lines and networks, brought about by the rapid growth of the central station power load, can best be met under different conditions. In general, power distribution systems are carrying at the original voltage for which they were designed, much greater loads than they were originally designed for, and their capacity can be best increased by increasing the voltage, both from the point of view of cost and quality of service as measured by voltage regulation. If the existing voltage is 2300, a raise to 4000 can generally be made very readily and in almost every case will be found desirable. By this means, an increase in capacity of 73% can be obtained with little

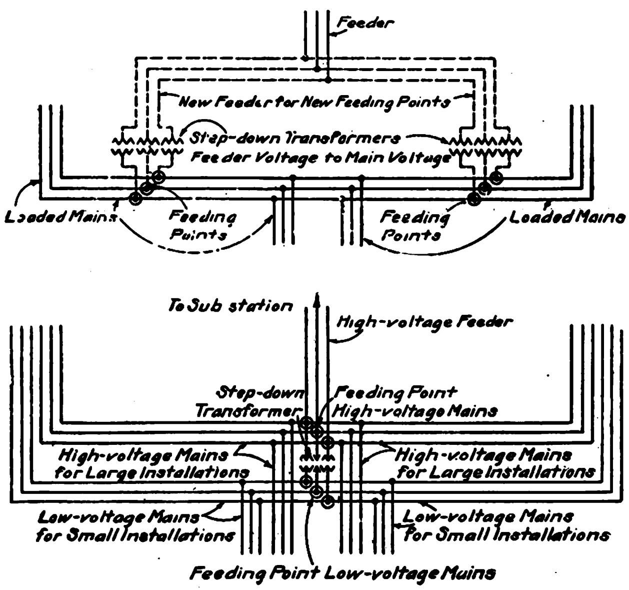

Fig. 5, D, E.

or no new equipment, and at very low cost. In some cases a greater increase in voltage will be desirable, in which case the reinsulation of lines and installation of new transformers will be required. Too high voltage, however, may prove as costly as too low voltage, because of the higher cost of connected installations, so that after the proper voltage is reached, further increase in capacity can best be obtained by increasing the copper. The highest voltage permissible is desirable, however, because of the better regulation which it gives. In some special cases, increased capacity of a distribution network may be obtained by increasing the feeder capacity only and providing additional feeding points for the mains, by raising the power-factor of the load carried, or by installing voltage regulators at the substation.

By way of conclusion, the accompanying tabulation is submitted, showing the various schemes which have been proposed above for increasing the capacity of existing lines.

PUBLIC UTILITIES LAW PROPOSED BY TEXAS MUNICIPALITIES.

League of Texas Municipalities Institutes Movement for Enactment of Law Governing Public Utilities in the State.

Many of the cities and towns of Texas, through their municipal officers, have joined in a movement to bring about the enactment of a public utilities law by the legislature at its next session. While a few of the members of the League of Texas Municipalities have voiced disapproval of the proposed law, the opposition from this source is not regarded as being of much moment.

It is announced that a business session of the League of Texas Municipalities will be held at Dallas on Oct. 18 for the purpose of receiving the report of a committee of its members which was appointed at a recent meeting held in Austin to draft a measure which would provide regulation of some nature of the public utility properties in Texas. At the Austin meeting the proposition was thoroughy discussed. Representatives of 52 cities were present and letters were received from many more who could not attend. At that time it was generally understood that a measure of some kind providing regulatory powers for the utilities was desirable, and the meeting finally agreed upon the appointment of a committee to draft tentative provisions. It was the plan to later call a meeting of the Texas mayors and submit the matter for their approval, after a copy of it has been sent to each for consideration and study.

In order to properly finance the league in its organization for the purpose of protection of the respective interests of the cities and towns, it was decided to levy an assessment upon each city on the basis of one cent per capita for each person, according to the 1910 census. The money to be collected will not be used for any purpose except the proper drafting of a bill to be presented to the legislature for the avowed curbing of the power of public utilities. It was specifically agreed that no paid lobby would be maintained to urge its passage. A number of state officials are reported favorable to such a regulatory measure.

LOSS FROM RUSTING OF STEEL.

It is now quite universally admitted that the rusting of iron and steel is one of the serious industrial problems. If we assume an average life of steel to be 33 years, the depreciation charge of 3% represents, according to the United States Bureau of Mines, a yearly loss of 1,000,000 tons of product in this country for the crude or semi-finished material alone, exclusive of correlated manufacturing costs. The inevitable rusting of steel may be justly claimed to be the mainstay of the zinc industry, as 60% of the metallic zinc used in the States is for galvanizing iron and steel articles, representing an annual outlay of $20,000,000 in an endeavor to protect metals from decay. Enormous amounts of paint are used in a like endeavor. About 5,000,000 tons of coal are needed in the production of steel to replace the annual waste, and 1,000,000 more for replacing the zinc that is annually lost. No estimate can be made of the value of the brass, bronze, copper, aluminum, nickel, tin and other metals and alloys used in machine parts, as sheathing, for plating, etc., to protect steel, or as a substitute for it in places where it would be used, but for its lack of resistance to atmospheric attack.

Editorial Comment

In the Cause of Safety

NO MORE important movement has taken place during recent years than the safety movement. It is one closely related to our industrial life, one interrelated to the well-being of every class, and one vitally affecting our economic and social welfare. During this week the largest convention ever held by the National Safety Council took place in Cleveland. The program presented was most extensive; every phase of industry was covered by papers on specialized subjects. The attendance was the largest in the short but successful history of the organization. It might be said that the rate at which the gospel of "safety" has spread has been phenomenal. The safety movement must be recognized as a factor in our industrial life.

The havoc wrought by death and suffering, the economic loss and the social and domestic problems created by accidents in the industries of this country are appalling. And this loss reacts throughout our national life in a thousand ways by creating widows and orphans, dependents and delinquents; causing poverty; breeding class bitterness and entailing economic loss. These are just a few of the phases of this vast problem of accident prevention that have been tackled so comparatively recently and that has progressed with such magnificent rapidity because of the justice of its cause and the urgency of its success.

If you have delayed so long, go over to the interests of the safety movement today. Affiliation with a recognized safety organization shows you realize your responsibilities; you have at least taken sides in this great issue of safety versus those tireless enemies—carelessness, thoughtlessness, recklessness and ignorance—that are taking an annual toll in this country exceeding that of the American army in the World War.

Each of us has done our part to make the world safe for democracy. Let each of us now do our best to make industry safe for humanity.

Increasing the Capacity of Existing Lines

VOLTAGE regulation is of paramount importance. It and continuity of service supply are the criteria of service. Upon voltage regulation depends revenue, since revenue from energy is based upon the product of current and potential.

However this is not all. Voltage regulation may also be said to be the criterion of line cost, and when voltage regulation becomes excessive it is a pretty safe statement to make that both operating costs and investment can be reduced by increasing line voltage and thereby improving voltage regulation. This matter of increasing the capacity of existing transmission and distributing lines by increasing the voltage is dealt with elsewhere in this issue in a very interesting and able manner by Mr. E. C. Stone.

In this article are pointed out the relative costs of increasing capacity of existing lines by increasing the cross-section of the copper on the one hand and increasing the pressure on the other. It is shown that when the cost of a line is high compared to the cost of the connected installations, increase in capacity will demand a considerable increase in voltage. This condition exists when the connected installations are of large capacity and are scattered, and the line copper already approaches the wise loading of the poles. When the cost of a line is low as compared to the cost of the connected installations, it is not desirable to increase voltage very much, but instead may be more economical to increase the cross-section of the conductors. When connected installations are of small unit capacity, when they are close together, and the conductors already strung are comparatively light, the above condition obtains, and increasing the conductivity rather than increasing the voltage is usually indicated.

As Mr. Stone ably points out, the current-carrying capacity of any line or circuit is limited by the maximum number of amperes it can carry as to heating, voltage regulation or economy of operation; by the maximum voltage at which it can be operated as determined by the properties of the insulation; and the power-factor of the load carried. Current, voltage or power-factor are therefore the three factors involved in determining the total cost involved. Power-factor affects current-carrying capacity of conductors; it affects voltage regulation, hence the importance of not allowing preventably low power-factors from occurring is obvious.

Voltage regulation, one of the criteria of service, and also the criterion of line cost may often be bettered, the capacity of a line increased, and service improved by installing voltage regulators in the feeders or lines. The use of voltage regulators in this way to increase the capacity of existing feeders is commonly resorted to, with all the other gains that accompany such an installation.

There is one phase of this matter of increasing the capacity of existing lines, touched upon by Mr. Stone, that deserves enlarging upon somewhat. In the article referred to it is pointed out that three-phase 2300-volt lines can advantageously be converted to 4000-volt three-phase lines by simply changing over from a delta to a star connection. In doing this the benefit of transmitting at 4000 volts and distributing at 2300 volts is obtained; such a method has been employed by several of the central stations operating large alternating-current distributing networks. The familiar three-phase four-wire system of distribution is the most flexible system possible, also probably the most economical from every aspect. There are many companies today who could advantageously change over from a delta 2300-volt system to a 4000-volt star.

Fire and Life Hazards and Electrical Codes

FIRE breaking out in any building is always a serious menace, not only to its property contents but also to the lives of its occupants. This fact is generally recognized by everyone, even by fire-insurance interests, although the latter have seldom any immediate business concern in the matter of life hazard. Early regulations of fire underwriters aiming to minimize the fire hazard seldom made any special mention of requirements to reduce the menace to life and this was usually left to the public authorities. The latter, however, seldom took definite steps until after some serious catastrophy that showed the necessity therefor.

In the first electrical code developed in this country (the National Electrical Code, now issued by the National Board of Fire Underwriters) the effort to minimize hazards to life was not strongly evident until the last few years. In the 1918 edition of this code this matter received greater attention than ever before.

In the National Electrical Safety Code, issued by the Bureau of Standards a few years ago and now in process of revision, the primary effort was to draft rules to minimize the life hazard as regards purely electrical causes since this had not yet been comprehensively covered in any previous set of rules of widely recognized standing. It is interesting to note that in the present revision much more extended rules covering the reduction of fire hazards is included, this being evidently due to the effort to minimize the danger to life that usually attends a fire. For instance, in the proposed revised rules of Part I, the principal changes in which are mentioned in another part of this issue, the matter of fire prevention in power houses and substations is given considerable attention. This is as it should be, especially in view of the fact that the rules covering this class of structures in the National Electrical Code are not comprehensive.

Mention is also made in this issue of the new electrical code just issued by the City of Chicago. In this provisions to safeguard against fire are also much more comprehensive than ever before, and special rules are introduced to cover assembly halls, exposition buildings and other places where people are likely to congregate in large numbers. These new rules, in addition to those already in force regarding theaters, make probably the most complete set of regulations aiming to minimize the life and fire hazards in places where they are most likely to cause the greatest danger on account of the large number of persons involved.

We are glad to see that the various electrical codes are gradually recognizing both of these serious hazards and we believe that after some years both the fire and the safety codes will necessarily approach each other in completeness in covering both these dangers. The ultimate outcome may be, in fact it is being hoped by many that it will be, a combination electrical code covering both fire and life hazards thoroughly.

Cost Data and Man-Hours

"HOW MUCH will it cost?" "What did it cost?" These are the questions the central-station manager, the contractor, the construction engineer and many more ask when inspecting a finished job of interest or when asked to sanction commencing a job.

Costs of work to be carried out may be determined either by piece by piece estimate, by calculation, or estimates may be based upon its similarity to previous jobs. Frequently both methods of determining what it will cost to do a job are employed—experience of others, of oneself and by estimate. Cost data are, therefore, of considerable value to the engineers, to contractors, structural engineers and executives, for they broaden one's experience, save time and are of general usefulness.

However, much of the cost data published is not of nearly the usefulness it might be were it presented in a form other than it is. Labor is often a large item, frequently the chief item, in the cost of a job. The cost of labor varies in different parts of the country; it varies from time to time. Obviously, therefore, it is desirable to reduce the item of labor to the least common denominator so that it may be applied anywhere. This can be done very simply by expressing labor in "man-hours" alone or in conjunction with the cost of labor. Both are most useful, and the latter more generally useful since more generally applicable than the former.

If it is known how many man-hours are required to erect a steel tower, to assemble a steam turbine, test the efficiency of a water turbine, or lay a run of conduit, it is an easy matter to charge off an expense equivalent to such a force divided into its constituent parts of supervision, inspection, etc.

One of the accusations brought against the unionization of labor and the closed shop is that production is lowered and the cost of production raised. Data on a basis of man-hours, distinguishing between union and non-union work of the same kind, would show immediately just to what extent unionism tends to curtail rate of work, hence cost of work, because, in man-hours, time and men are the factors, not money.

More Electrical Conventions Held—New York Show a Success—Ambitious Plans of N.E.L.A. Publicity Service Bureau

PRESIDENT BALLARD'S VIEWS ON RELATIONS WITH EMPLOYES.

Excerpts from an Address Before Recent New England Section Convention at New London, Conn.

In addressing the convention of the New England Section of the National Electric Light Association, at New London, Conn., on Sept. 24, President R. H. Ballard dwelt in some detail upon the great profit-sharing or employes' participation movement which had its inception with the big industrial organizations of the United States previous to the war and is now being adopted by the smaller business groups. The following excerpts from his remarks convey the trend of his argument:

"It is desirable that wage earners shall have opportunity to earn sufficient to maintain themselves and their families at a reasonable standard of comfort; to protect their dependents against poverty in case of death and to provide against want in old age."

"Our constructive problem seems to shape itself along these lines: Can the millions of workmen in the United States be gradually brought into partnership in the business in which they are employed without nullifying the result of partnership by placing the management of the industries in the control of those untrained in the administration of such affairs?"

"What our workers want is opportunity—opportunity to take part in the world's industries, and to weld their work, their earnings, and their intelligence."

"This striving after individual opportunities has brought the world out of barbarism and imperialism and is blazing the way to participating co-operation."

"Participation preserves the vital spark of individualism—that intangible factor of success which has written the story of progress on every page of the world's recorded history."

"Centralizing is the parent of participation because in eliminating ruinous competition, it automatically takes men out of destructive pursuits and sets them at harmonious production."

"The great element of success in our present-day profit-sharing movement is that it is being worked out by some of the best and most constructive minds of our generation—the minds that guide these great industries are simply expanding the methods that have made their own enterprises successful, and extend to those who are engaged with them the opportunities to become partners, preserving to them the stimulus of the personal quality of success—Individualism."

"If the business itself is a success, that is proof conclusive that its organization is sufficient for those who participate in its benefits."

"Mutual interest is the basis of every enduring human structure. The big central thought of the participation idea finds expression in the slogan of Dumas, 'Three Guardsmen, One for all, all for one.'"

"In hectic denunciation what do we achieve? In constructive thought, what may we not achieve?"

"Bolshevism is an idea; Socialism is an idea. They can best be corrected by presenting better ideas."

"Participation is the American antidote to Anarchy."

ACTIVITY MARKS CONVENING OF IRON AND STEEL ELECTRICAL ENGINEERS.

Interesting Program, Animated Discussion and Light Attendance Features.

The Association of Iron and Steel Electrical Engineers held its thirteenth annual convention at the Hotel Statler, St. Louis, during Sept. 22 to 26, inclusive. The report of this convention was held out of the last issue of the ELECTRICAL REVIEW due to the fact that there were so many other conventions occurring at the same time and space was limited. The convention was a very live one as regards papers and discussions but somewhat light in attendance, there being about 250 present.

In the annual presidential address President Petty outlined the work of the association during the past year, laying special emphasis upon the work of the various sections and committees of the association. Special reference was made to the work of the Standardization Committee's work. The association can now boast of five sections, namely, Birmingham, Chicago, Cleveland, Philadelphia and Pittsburgh, all of which are actively engaged upon the work for which they were organized. Reference was made to the very satisfactory growth of the association, which had 28 members in 1907 and in 1918 had 1020 members, with every prospect that before the close of the present year there would be 1200 members. There has already been an increase of 206 members during the first eight months of this year.

The first morning of the convention was devoted to the transaction of business, the reading of the various committee reports and the election of officers. In the afternoon A. B. Holcomb, chairman, Educational Committee, presented his report, as did also Walter Greenwood, chairman of the Safety Committee.

The morning session on Sept. 23 was given up to the presentation of joint papers on "Organization of the Electrical Department in the Iron and Steel Industry." The papers presented were "Inspection and Operation of Electrical Apparatus," by J. A. Morgan and J. J. Booth; "Educational Training for Electrical Employes," by B. A. Cornwall; "Electrical Repair Shop," by C. A. Menk; "Storeroom and Spares," by T. E. Tynes, and "Records and Tests," by R. B. Gerhardt. These papers being of a practical nature and on such subjects as concern every steel mill, almost everyone present took part in the discussion. The afternoon was devoted to excursions to places of local interest.

Wednesday morning and afternoon were devoted to the presentation of papers and their discussion. The annual banquet was held in the evening. W. S. Hall presented a paper in the morning on the subject of "A. C. Versus D. C. Motors for Rolling Mill Table Drives," in which the characteristic curves of the different types of motors were pointed out and their bearing upon motor performance and mill table drive explained. It was stated that there is no reason why the a-c. motor could not readily replace the d-c. motor, providing that the maximum torque of the former is sufficient for the job. The fact that the alternating-current motor cannot be readily abused is a great advantage, while the fact that table load conditions change from time to time over a wide range makes the constant-speed characteristic of the induction motor quite an advantage. A number of typical motor drives are taken and comparisons made of cost, time of performance and horsepower required. H. D. James, Westinghouse Electric & Mfg. Co., then presented his paper on "Recent Improvements in Industrial Control."

In the afternoon two papers were presented. R. D. Nye, chairman of the Electric Furnace Committee, presenting his report on the "Present Status of Electric Furnaces in the Steel Industry," and C. A. Winder, General Electric Co., read a paper on "Electric Heat Treatment."

Thursday morning, Paul M. Lincoln read a paper on "Overload Protection for Motors." In the afternoon A. G. Place presented a paper on "Overload Protection of Cranes," and T. E. Tynes, chairman, Standardization Committee, presented his report.

On Friday morning a joint paper upon "Present Status of Arc-Welding in the Iron and Steel Industry" was taken part in by A. Churchward, Wilson Welder & Metals Co.; H. L. Unland, General Electric Co.; A. M. Bennett, C. & C. Electric & Manufacturing Co.; R. A. Kinkead, Lincoln Electric Co.; C. J. Holslag, Electric Arc-Cutting & Welding Co.; R. M. Rush, The Arcwell Corp., and A. M. Candy, Westinghouse Electric & Manufacturing Co.

The following officers were elected for the ensuing year: President, B. W. Gilson, Youngstown, O.; first vice-president, H. C. Cronk, Cleveland, O.; second vice-president, F. A. Wiley, Chicago, Ill.; treasurer, James Farrington, Steubenville, O.; secretary, John F. Kelly, Pittsburgh, Pa.; directors, R. F. Gale, Philadelphia, Pa.; J. E. Fries, Birmingham, Ala.; W. S. Hall, Chicago, Ill.; C. E. Bedell, Wheeling, W. Va.

CONVENTION DISCUSSES RELATION OF FUSES TO KNIFE SWITCHES.

Municipal Electricians at Chicago Meeting Approve Resolution Recommending Switches Protect Fuses—R. J. Gaskill Elected President.

The concluding sessions of the twenty-fourth annual convention of the International Association of Municipal Electricians, held at Chicago last week, were largely devoted to a discussion of a paper on "Relation of Fuses to Knife Switches and Service Wires," presented by Fred B. Adam of the Frank Adam Electric Co., St. Louis, Mo.

This paper brought out the fact that differences in practice exist as to placing fuses on the service and on the line sides of switches and this results in confusion to the manufacturers of switches and panelboards. In eastern states it is common practice to put the fuses on the line side in order to afford protection when re-fusing is done, while in central and western states it is customary to place the fuses so they will protect the switches. As an illustration, Mr. Adam cited a case where an eastern architect had specified panelboards for a western installation with fuses on the service side of the switches; it was only by chance that the manufacturer changed the specifications so it was possible to obtain approval of the inspector. In an effort to standardize practice Mr. Adam suggested the association pass a resolution to the effect that fuses be connected to the hinged or dead end of all switches. Objections to the suggested resolution were made by Joseph Sachs of the

Post-War Convention of International Association of Municipal Electricians, Held at Chicago, Johns-Manville Co., and A. McLaughlan of the Square D Co., the former stating action on the matter should be delayed because standardization of inclosed switches is now being made, and the latter recommending adoption of inclosed type switches arranged so fuse clips are dead when renewals are being made.

Dr. M. G. Lloyd, Bureau of Standards, said the question was in a transition stage. Some years ago it was the practice to put fuses on the live side of switches, but now many exceptions were being made to this practice. The National Electrical Code rules that in inclosed switch devices it is permissible to place the switch ahead of the fuse, while the Electrical Safety Code makes this practice compulsory.

The matter was finally referred to the association's standardization committee, which offered a resolution to the effect that the fuses on all switches except service switches should be installed so that when the switch is opened the fuses will be disconnected from the source of supply. The convention approved this resolution.

William G. Keith, commissioner of gas and electricity, Chicago, read a paper on street lighting which gave a review of the progress made in street-lighting practice in Chicago and gave data on installation and operation of the series group system. This paper is published in full in another part of this issue of ELECTRICAL REVIEW.

At a business meeting held Friday, New Orleans was selected as the next meeting place and the following officers were elected for the year: Robert J. Gaskill, Fort Wayne, president; C. P. Steinmetz, Schenectady, N. Y., first vice-president; R. C. Turner, Atlanta, Ga., second vice-president; W. P. Briggs, New Bedford, Mass., third vice-president; F. A. Cambridge, Winnipeg, Can., fourth vice-president; C. R. George, Houston, Tex., secretary, and John Berry, Indianapolis, Ind., treasurer. Members of the new executive committee are W. L. Potts, Detroit, chairman; William Gaffney, Watertown, N. Y.; A. L. Duckett, Asheville, N. C.; Frank Williams, Elizabeth, N. J.; D. R. Snider, Augusta, Ga.; J. P. Allen, Jacksonville, Fla.; J. W. Bleidt, Little Rock, Ark.; W. G. Dey, Louisville, Ky.; Claude Converse, San Antonio, Tex., and Zack Morrison, Minneapolis, Minn.

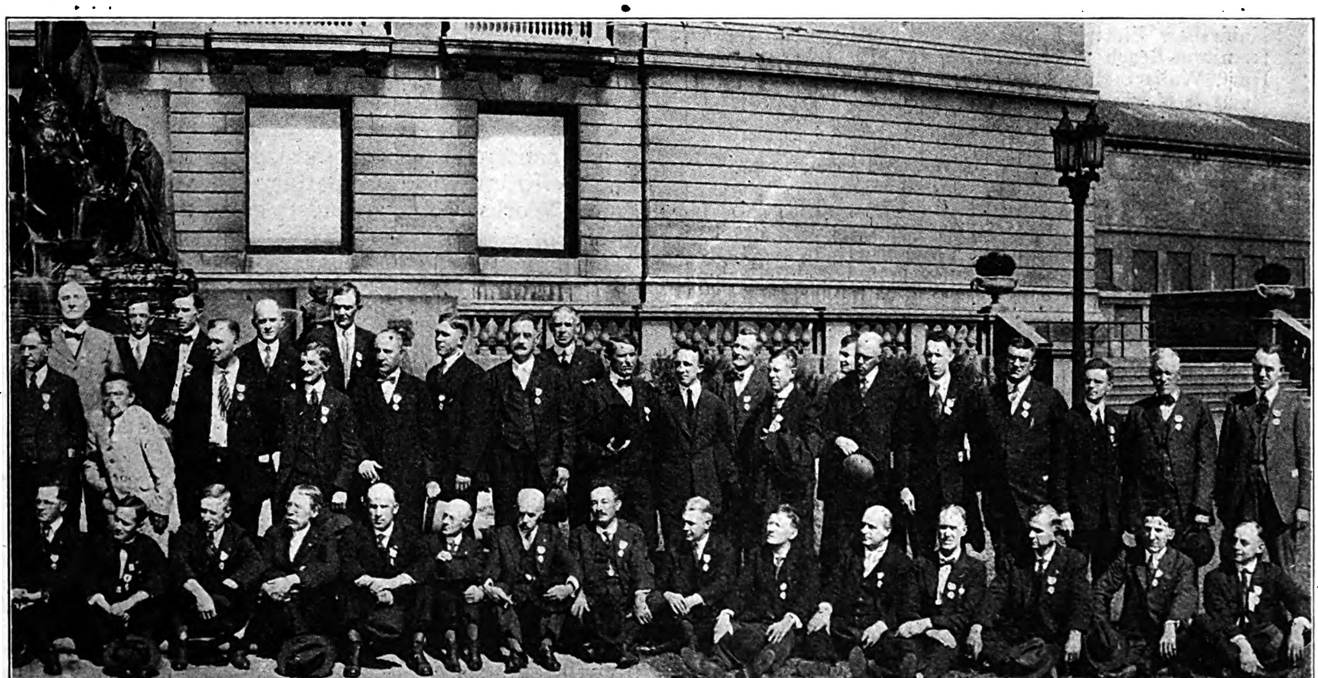
The feature of the entertainment program was the annual banquet, which was held in conjunction with the Bureau of Electrical Inspection, City of Chicago. The gathering marked the thirty-sixth anniversary of the latter organization, which took occasion to formally welcome home its returned soldiers.

NEW YORK ELECTRICAL EXPOSITION IS A BIG SUCCESS.

Unprecedented Attendance and Interest Rewards the Exhibitors—Many Buyers Among the Visitors.

The New York Electrical Show, of 1919, that began on Sept. 24 and will continue through Oct. 4, is one of the most successful shows ever held in our largest city. The excellent accommodations provided by the Grand Central Palace, the building in which the show is held, are ideal for exhibitions on a large scale, but they are none too large for the present show. All space on the first floor and most of that on the second floor is occupied by exhibits. Conversations with exhibitors reveals the fact that many of them underestimated their own needs for floor space and that they are making efforts to obtain additional space to accommodate the crowds of interested spectators that are visiting the exposition.

Exhibitors report that the interest shown by the crowds attending the exposition is larger this year than ever before. The audience is spoken of in fact as a buying audience. Nor is the interest confined to the male visitors only. The scarcity of domestic help in the home and the increasing number of labor-saving electrical devices has created an interest in the minds of the ladies that is revealed by the large numbers of them that are attending the exposition and are making inquiries about the devices exhibited. The ordinary comment of those having exhibits is that no



Ill., Sept. 23-26, Proves Noteworthy Because of Large Attendance and Interesting Program.

such interest on the part of women ever was discernible before, that the amount of floor space in the booths and the number of experienced demonstrators is inadequate, and that the visitors are essentially buying visitors. Most exhibitors report a larger number of sales than they ever made before in a similar interval of time.

The list of exhibitors is as follows:

Allen Sales Service, Inc., 347 Madison avenue
Alpha Electric Co., 149 West 30th street.
American Ironing Machine Co., 70 West 45th street.
American Bronze Products Co., 25 Third avenue.
Baker, R. & L., New York Corp., 17 Central Park West.
B & K Manufacturing Co., 200 Fifth avenue.
Bennage Co., New York Appliance Co., Times Building.
Bohn, C. C., Electric Co., 820 Sixth avenue.
Branden, Hedges, McLain, Inc., 80 Maiden Lane.
Brokaw, Eden Co., 50 East 42nd street.
Brooklyn Edison Co., Inc., 360 Pearl street, Brooklyn.
Buerkle, W. A., Sales Company, 212 Livingston street, Brooklyn.
Clements Manufacturing Co., 1472 Broadway.
Cockaday, L. M., & Co., 2674 Bailey avenue.
Commercial Electric Truck Co. of America, 405 Lexington avenue.
Comstock Household Service, 21 East 40th street.
Consolidated Telegraph & Electric Subway Co., 54 Lafayette street.
Contra-Pole Electric Co., 1227 Prospect place, Brooklyn.
Cooper-Hewitt Electrical Co., Hoboken, N. J.
Dayton Pump Manufacturing Co., 30 East 42nd street.
Delco Electric Laboratories Co., 18 West 62nd street.
Display Stage Lighting Co., 314 West 44th street.
Duntley Products Co., 295 Fifth avenue.
Duparquet, Huot & Moneuse Co., 110 West 22nd street.
Edison Electric Appliance Co., 147 Waverly place.
Electric Meter Corp., 55 Liberty street.
Electric Storage Battery Co., 19th and Alleghany streets, Philadelphia, Pa.
Electrical Testing Laboratories, East End avenue and 80th street.
Eureka Vacuum Cleaner Co., 12 East 42nd street.
Federal Sign System (Electric), 627 West 43rd street.
Federal Telephone & Telegraph Co., Buffalo, N. Y.
Fitzgerald Manufacturing Co., Torrington, Conn.
Fox Electrical Corporation, The, 119 West 42nd street.
General Electric Co., 120 Broadway.
Geyser Electric Co.
Goodwill Electric Co., 70 Fifth avenue.
Guarantee Electric Products Co., 110 West 40th street.
Habirshaw Electric Cable Co., Inc., 10 East 43rd street.
Hamilton-Beach Manufacturing Co., 114 Liberty street.
Hart, Wallace B., 46 East 41st street.
Hartt & Morison, 780 6th avenue.
Home Devices Corp., 11 East 42nd street.
Hooven Letter Service, Inc., 387 Fourth avenue.
Hoover Suction Sweeper Co., 47 West 34th street.
Hot-Flo Faucet Corp., 1400 Broadway.
Hurley Machine Co., 151 West 42nd street.
Illuminating Engineering Society, 29 West 39th street.
Jorgensen, John, 114 Liberty street.
Kimball Electrical Construction Co., 42 East 23rd street.
Landers, Frary & Clark, 200 Fifth avenue.
Lansden Co., Inc., Danbury, Conn.
Latham, E. B., & Co., 550 Pearl street.
Laun-dry-ette Sales Co., 34 West 37th street.
Lightoiler Co., 569 Broadway.
Livingston, J., & Co., 104 East 41st street.
Maimin, H., Co., Inc., 251 West 19th street.
Majestic Electric Development Co., 1705 Alleghany avenue, Philadelphia, Pa.
Manhattan Electrical Supply Co., 17 Park place.
Manning, Bowman & Co., 200 Fifth avenue.
Metropolitan Detroit Electric Auto Co., 20 Central Park West.
Metropolitan Engineering Co., 35 Vestry street.
National Lamp Works, Nela Park, Cleveland, Ohio.
New Home Sewing Machine Co., 45 East 17th street.
New York Appliance Co., Times Building, 42nd street.
New York Edison Co., Irving place and 15th street.
New York Electrical School, 39 West 17th street.
New York & Queens Electric Light & Power Co., Bridge Plaza, Long Island City.
Nicholas Power Co., 90 Gold street.
Ohio Electric Co., 145 West 45th street.
Pease, Behning Co., 22 East 40th street.
Pittsburgh Electric Specialty Co., 396 Broadway.
Pneuvac Co., Worcester, Mass.
Rawson Electrical Instrument Co., Cambridge, Mass.
Regina Co., 47 West 34th street.
Royal-Eastern Electric Supply Co., 114 West 27th street.
Shelton Electric Co., 16 East 42nd street.
Sibley-Pitman Electric Corp., 190 6th avenue.
Sloane, W. & J., Fifth avenue and 47th street.
Stodder, E. D., 6 Prospect street, New Rochelle, N. Y.
Strauss & Co., Inc., 302 West 52nd street.
Thompson, Albert, Jamaica, L. I.
Tri-City Electric Co., 18 Mechanic Street, Newark, N. J.
Truswell, Wm., & Sons, 16 Cedar street.
Tucker Electrical Construction Co., 114 West 30th street.
United Electric Light & Power Co., 130 East 15th street.
U. S. Cloth Cutting Machine Co., 414 West Broadway.
Viking Sign Co., 560 Seventh avenue.
Waite & Bartlett Manufacturing Co., 252 West 29th street.
Walker Vehicle Co., Grand Central Terminal.
Ward Vehicle Co., Mount Vernon, N. Y.
Western Electric Co., 195 Broadway.
Westinghouse Electric & Manufacturing Co., 165 Broadway.
Wireless Improvement Co., 47 West street.
Yonkers Electric Light & Power Co., Yonkers, N. Y.

Although the list of electrical equipment exhibited includes practically every device for converting electrical energy into useful work, the exposition is described as appealing largely to those interested in applying electricity to household uses. Perhaps those who are interested in the barn and barnyard should be included among those to whom the exposition has an urgent appeal, since some of the most popular exhibits are those of electric trucks, of milkers actually demonstrated by milking a herd of cows, of lighting and heating devices for outbuildings as well as for houses, and of many other labor-saving devices for all purposes.

A visit to the exhibition shows that three general classes of exhibits have been arranged. These classes are commercial, demonstrative, and educational. The classification into which an exhibit is grouped depends upon the apparatus shown. Several concerns, such as the Walker Electric Vehicle Co., the Commercial Truck Co. of America, the Ward Motor Vehicle Co., the Habirshaw Electric Cable Co., Inc., the Federal Electric Sign System (Electric), and many others have arranged demonstrational exhibits showing the operation of some peculiar feature of their apparatus. Other concerns, such as the Cooper Hewitt Electric Co., the Electric Storage Battery Co., and the National Lamp Works, have arranged exhibits that are historical or educational.

Although some exhibits are classified as commercial, they are also demonstrative or educational. The vacuum cleaner and electric washer exhibits, of which there are a large number, contain numerous demonstration machines showing their operating features and the work they will do. Naturally such booths are overcrowded. Many of the exhibitors that are not giving demonstrations have been compelled to close their booths. The Remmert Mfg. Co., maker of the Locomotive Washer, is endeavoring to secure larger floor space. Brokaw-Eden Co., manufacturers of electric washers reports business as wonderful, attendants and salesmen, of whom there are 25, working in four-hour shifts, and more help needed. The Home Devices Corp. reports business as excellent, many orders received, people satisfied and paying cash. Hurley Machine Co. reports great interest and good business. And so on from all booths prepared to take orders or sell their apparatus.

PLANS OF ADVERTISING AND PUBLICITY BUREAU, N. E. L. A.

Most Ambitious Publicity Work on Electric Service Ever Undertaken Will Be Conducted by Newly Enlarged Bureau.

Recently there has been organized the Advertising and Publicity Service Bureau of the Commercial Section, National Electric Light Association, which combines under one head work previously undertaken by the Publications Committee, the Committee on Coordinate Advertising and Sales Campaigns, and proposed work on many new lines.

The aim of the bureau will be to make electric service a household word, develop a conversational familiarity with its terms, and spread a knowledge of what it is and the part it plays in industrial, commercial and household life throughout our entire country. The work of this bureau if spread over only a few years will make electric service as much appreciated and as freely used as are any high-class commodities, like automobiles, pianos and talking machines. The bureau will endeavor to secure this result by both direct and indirect means.

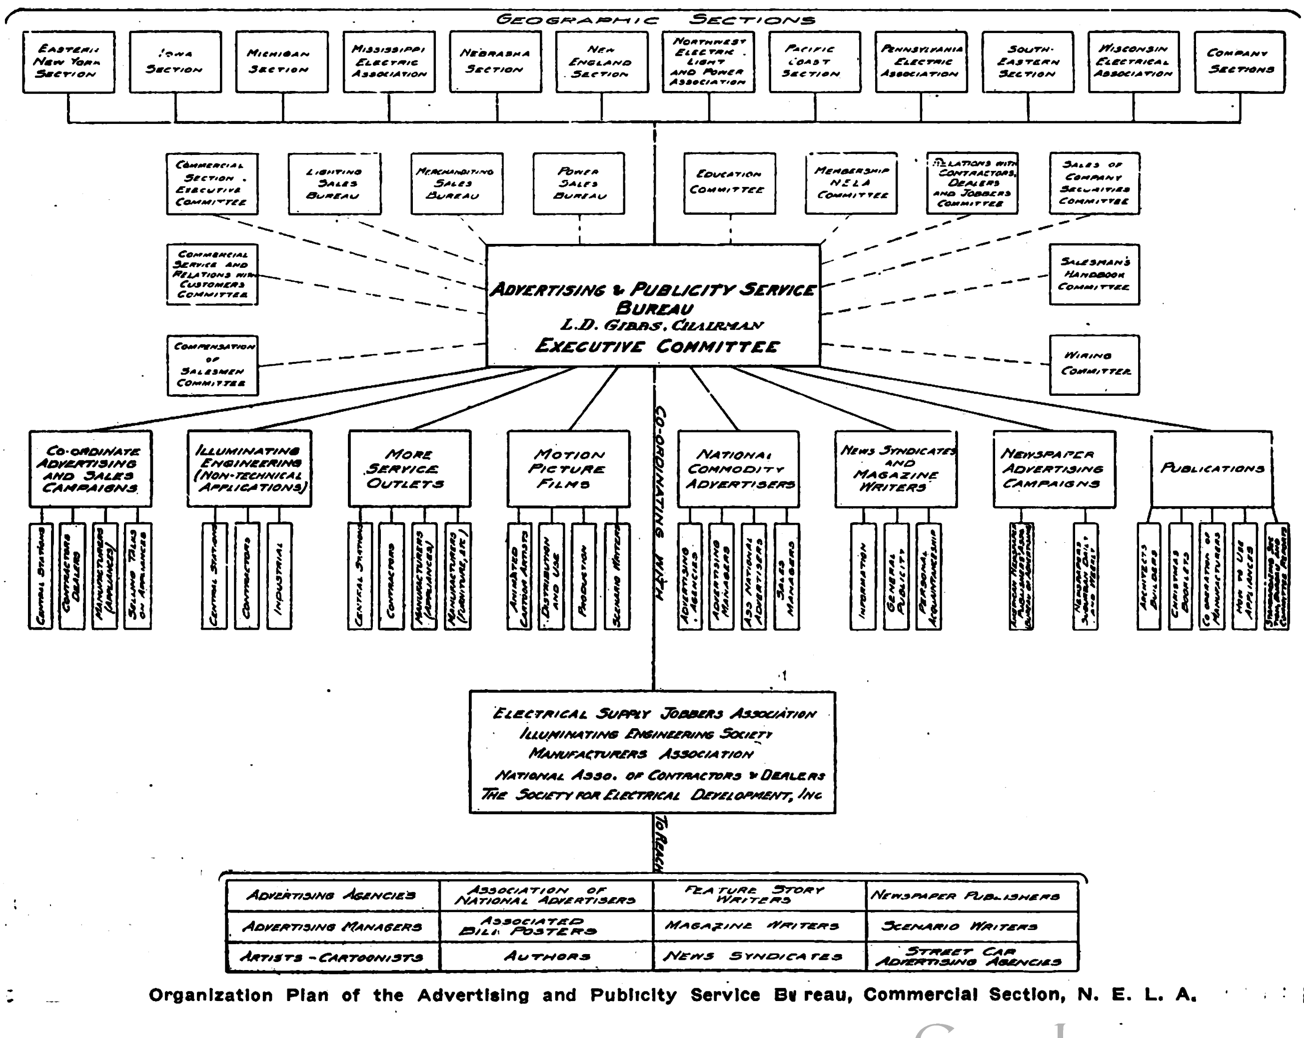
Following the lines already adopted by other bureaus, the membership in the Advertising and Publicity Service Bureau will be drawn from every state in the union, through the company and geographic sections, with cross-memberships in the other bureaus and independent committees of the Commercial Section, and through co-operation with co-ordinating associations.

These efforts will be directed toward reaching advertising agencies, advertising managers, artists, cartoonists, national advertisers, authors, feature-story and magazine writers, news-syndicate writers, newspaper publishers, scenario writers and street-car advertising agencies.

Appreciation of the plan and assurances of co-operation are already widespread. The presidents of the geographic sections are working enthusiastically along these lines; company sections are helping, and the managers of central stations are delegating their representative employes to serve in the bureau work.

The cross-membership idea will keep all other branches of Commercial Section activity informed on the bureau's work, members will keep in touch with all other activities, and duplication of effort and waste of time and money will be eliminated. Both the instinct and ability for promoting publicity will obviously dominate the activities of the bureau. For this reason, it ought to be possible to be of material assistance to other bureaus and committees in securing more general publicity for their work. Co-operation with other associations in related branches of the electrical industry will be made effective at every possible opportunity.

The Co-ordinate Advertising and Sales Campaigns Divisions will continue and extend the work already well begun. This work aims to systematize advertising campaigns and sales efforts to the end that: (1) Manufacturers may concentrate their advertising campaigns; (2) central stations, contractors and dealers may specialize in their selling efforts on the same appliances month by month throughout the year.



Organization Plan of the Advertising and Publicity Service Bureau, Commercial Section, N. E. L. A.

Definite co-operation in publicity work with the Illuminating Engineering Society is undertaken for the first time this year. The idea is to bring about a realization of the fact that the principles of good lighting can be applied nontechnically and so that, for instance, even an ordinary contractor can introduce these principles in his work and give his customers special service of lasting advantage.

The More Service Outlets Division will carry its educational work along far-reaching lines. For many years the importance of having installations fully provided with outlets has been realized and various committees have advanced the work. This new division will co-ordinate and stimulate these scattered efforts so as to bring the idea home to all branches of the industry as well as to the public in general.

An extension of activities into every branch of the field will be made by the Motion Picture Films Division, which will furnish advertising material to all connected with the motion-picture industry. The National Commodity Advertisers' Division will enter a new field for contact, this being the idea of illustration by means of electrical appliances or by showing applications where electric service plays the important part. Considerable work has already been done in making other industries realize that electrical appliances can be featured as part of their own advertising so as to show that the latter is thoroughly up-to-date.

The News-Syndicate and Magazine Writers' Division will reach into a new field. Here the development of appreciation for the timeliness of electricity and its service will result in more and better "copy." The aim will be to get in touch with the managements of news syndicates and their contributors such as furnish special articles to groups of Sunday magazines and Sunday newspapers; and also in touch with the writers of articles for magazines, such as the *Saturday Evening Post*, etc., with a view to having their names put on mailing lists so that they can receive up-to-date advertising material about electrical appliances and know where to write for information on electrical subjects which they may wish to use in articles they are preparing.

Newspaper campaigns are capable of great development. For a number of years efforts have been made to develop community of interest among central stations and electrical contractors and dealers so that so-called "electrical pages" could appear in the daily and weekly newspapers. If some plan can be devised that will be continuous and forcible in its action these pages can be maintained and the use of them extended. If pages cannot be developed, at least some plan for educating contractors and dealers to an appreciation of continuous advertising may be arranged which will result in ultimate good and greater increase of the business.

The Publications Division takes over the work that has been handled for many years under the Publications Committee. Through this division an effort will be made, first, through co-operation with manufacturers to get the most effective circulation of their advertising material. It is a foolish waste of money for the N. E. L. A. to prepare advertising literature that must be sold to the central stations, when the same field may be covered by manufacturers.

The organization plan of the bureau is shown herewith. L. D. Gibbs, 39 Boylston street, Boston, Mass., is chairman of the bureau; S. H. Gillerup, 130 East 15th street, New York City, is first vice-chairman, and I. W. Alexander, San Joaquin Light & Power Corp., Fresno, Calif., is second vice-chairman.

SPECIAL MEMBERSHIP CAMPAIGN FOR WESTERN SOCIETY OF ENGINEERS.

An intensive six-day membership drive is to be conducted by the Western Society of Engineers on Oct. 6 to 11, inclusive. This organization a few months ago celebrated its fiftieth anniversary and is one of the oldest engineering societies in the country. It is composed of engineers connected with the various branches of the engineering profession and has been since its modest beginnings in 1869 the engineering headquarters in Chicago. Its rooms and library on the seventeenth floor of the Monadnock block are the gathering place of a considerable number of engineering societies that hold either main or section meetings in Chicago.

The Western Society of Engineers has five sections devoted to electrical, mechanical, bridge and structural, sanitary, hydraulic and municipal, and gas engineering. Through the meetings of the main society and of its sections there are discussed a very wide range of technical problems at gatherings held practically every week, so that a member has the privilege of keeping in direct touch with the important developments in the principal lines of engineering and in personal contact with the leaders in the chief branches of the profession in the big district tributary to Chicago. At present the membership of the society is about 1200. It is believed that there are over 5000 engineers in and near Chicago that would derive great benefit from membership in this well established organization and from use of its facilites as the logical headquarters for the technical interests of the Chicago district. Many of these men are members of national engineering societies, but they also should have through membership in a strong local organization like the Western Society of Engineers means of keeping in contact with the engineering profession generally.

EIGHTH ANNUAL SAFETY CONGRESS OF NATIONAL SAFETY COUNCIL CONVENES IN CLEVELAND.

The Eighth Annual Safety Congress of the National Safety Council is meeting in Cleveland during October 1 to 4 inclusive. It is estimated that there are in the neighborhood of 4000 plant managers, safety engineers, employment supervisors, executives and others interested in accident prevention and the problems of industrial relations present. Nineteen different sectional meetings are being held, these being respectively automotive, cement, chemical, construction, electric railways, health service, local council officers, marine and navigation, metals, mining, packers, paper and pulp, public safety, public utilities, rubber, steam railroad, textile, women in industry and wood-working. In addition there are the general sessions and the round-tables where opinions can be voiced and general business transacted.

In the Public Utilities Sessions the following papers are being presented: "Preventing Accidents in Gas Plants" by J. F. Conner, "Inspection of Plants of Gas Companies" by Alvin E. Bliss, "Effective Means of Focusing the Responsibility for the Prevention of Accidents upon Foremen" by J. W. Easley, General Discussion, Questions and Answers, "Working Safely on Live High-Tension Lines" by H. J. Burton, "Practice of Operators and Tagging of Switches, Markings and Barriers" by Walter Wagner, "Spasmodic Safety Efforts and the Harmful Results" by H. M. Webber.

Turning Complaints Into an Asset—What One Utility Did Toward Closing Isolated Plants—Boston Flat Iron Sales

TURNING COMPLAINTS INTO AN ASSET—THE SMILING COMPLAINT MAN.

Excerpts from Paper Before Southeastern Section, N. E. L. A.

In a very able paper entitled "The Smiling Complaint Man" read before the Southeastern Section of the N. E. L. A. at their convention at Asheville, N. C., during the middle of last month, J. Prince Webster gave some good advice on how a utility may capitalize complaints, making them into an asset instead of a liability. To quote:

"Who, where and what represents your point of contact with the public? Is that point of contact sharp pointed—hard; or is it well oiled and greased and non-friction producing? The public, whose servant you are, forms its opinion as to the kind of servant you are from its point of contact with the company, with the employes of the company who it comes in contact with, and the public will let its complaints be known to and through such employes. Many small and trivial complaints, made by the public, are received with equally small and trivial attention, and the public goes on from day to day feeling that its complaints are not received with that degree of seriousness that attaches to the mind of the party making the complaint.

"Complaints, when made and received, should be received pleasantly, considerately and thankfully. The party to whom complaints are addressed should be courteous, conciliatory and helpful. Your average customer does not know the president of the company, the vice-president, the board of directors or other executive officials of the company, nor does he care who they are, but he does know the troubleman, your lineman, your cashier, your bookkeeper, your complaint man and such other of your employes as he comes in contact with; and it is by the conduct of these people that he does know the company, and it is by his contact with these people that the reputation of the company in the community is established—that is good or bad.

"Is your reputation in the community you serve good or bad? If it is not satisfactory to the public, not to you, then educate your points of contact with the public to the performance of their full duty to the public.

"The public is generally concerned only as to the character of service that you render, and embraced within the character of service rendered is, of course, the manner in which the public is handled and treated by your employes." Mr. Webster then went on to state that not more than 10% of the people who felt they had complaints to make made them, according to his experience with the U. S. Railroad Administration. It is important therefore that what complaints are made should be handled tactfully, that those making the complaints be shown courtesy and that their complaints be met and considered. He then went on to say that public relations could frequently be improved by more careful handling of complaints, thus bringing about a more satisfactory financial result to the company furnishing the service. A number of examples of different ways of handling complaints were presented, with their conclusions and morals.

"Which foot do you start out on in the handling of complaints? Is the company always right from the beginning, or is the customer sometimes right?" asks Mr. Webster.

"Satisfactory and friendly handling of complaints is one of the biggest assets a public servant has. The good will, aye, the good word spoken, as to the company's fairness in handling complaints means ever so much to the company; it increases the morale of its employes; it encourages growth in the community; it means sympathetic consideration in supplying increased revenue to meet increased costs of operation—all of which are vitally necessary in the successful operation of a public utility.

"Don't compromise just complaints and feel that you have served the company's interest; let the complainant himself suggest the solution and then gladly and freely and in a friendly way accept his decision; it means a friend in the community, a booster for the company's fairness; and additional money in the till at the end of the year.

"In conclusion: Make another study of your points of contact with the public; see if you have a friendly and smiley man or woman properly inoculated with the public point of view, handling your complaints; if you have not, make transfers until you do get one, and do it promptly.

"Receive complaints with a smile and with sympathetic consideration. Thank people for affording you an opportunity of making specific and special investigation as to matters affecting the operation of your organization. Assure them that their complaints will be handled promptly—then see that such handling is made.

"Don't compromise just complaints—go the whole route, and lastly lay all your cards on the table—face up—in explaining the result of your investigation; accept censure when due and promise to remedy the situation—then do so.

WHAT ONE UTILITY HAS DONE TOWARD SHUTTING DOWN ISOLATED PLANTS.

Experiences of Louisville Utility Make Interesting Reading.

Large electric light and power organizations continue year after year to increase their business at a rate far in advance of the growth of population and local industries. Just why this process should take place is not entirely clear to many observers and investors. The cause lies in the continuously multiplied uses to which electricity is being put as the result of its time, labor and money-saving abilities. There is no factory, industry, business house, municipality or residence in which a need for electric service does not exist.

A large part of the increased business still comes from the closing down of isolated, or individually operated power and lighting plants. What this means to the electric companies throughout the country, and how it comes about, is graphically illustrated by giving the facts over a period of years in an American city of about 250,000 population.

In 1913 the several electric companies which were operating uneconomically for themselves and the public in Louisville, Kentucky, were consolidated under Byllesby management. Louisville is a city of many small manufacturing enterprises and none of predominating size. Due to the activities of the Louisville Industrial Foundation 27 new industries were brought to the city during the last few years, and they are obviously, all users of electric service.

In the six years ended with June, 1919, the service of the Louisville Gas & Electric Co. was substituted for 91 previously established isolated and industrial steam-operated power plants. The amount of power business thus added to the central-station company was in round figures 18,000 hp., and the lighting business from these sources, 2000 hp., or an aggregate of 20,000 hp. transferred from 91 individually operated plants, to the large, modern power house of the company.

Of the 91 isolated plants closed down 11 were located in downtown office buildings and stores, the city hall, etc.; three were operated by railroads, four by tanneries, 18 by woodworking establishments, nine by tobacco companies, 8 in machine shops, four by flour and grain mills, two in brick and tile plants and 32 were in miscellaneous industries, including woolen and cotton mills, chemical and food products plants, soap factories, etc.

Reviewing the work of the commercial department of the Louisville Gas & Electric Co. in the conversion of steam plants to central station service, Walter D. Myers, sales engineer, states that many important questions have been settled once and for all time in favor of the centralized service. With reference to office buildings, municipal buildings and power plants serving a restricted district, Mr. Myers says they were all located in the heart of the city, with fairly well equipped direct-current plants, all supplying steam for building heating purposes. Three of the office buildings were equipped with hydraulic elevators. These obstacles had to be overcome:

(1) Changing equipment (fans and motor) to alternating current;

(2) Prove that the building could be heated and electric needs bought at a cost not to exceed the cost of operating power plant;

(3) Replace hydraulic elevators with electric elevators or install motor-driven pumps to replace steam-driven pumps. In either case the installation was expensive.

Mr. Myers says, "The second disadvantage was the most serious to handle, as to a building manager, the heating of an office building is an enigma, especially when he has been led to believe by his steam engineer that his plant is primarily a heating plant and that the electricity needed to light the building is merely a by-product and costs the management practically nothing.

"This was overcome to a great extent by obtaining the cost of heating similar buildings that were purchasing electric service from the outside, but in some instances this evidence was not sufficient, and on one of the largest plants the yearly expense for lighting and heating the building was estimated and a clause inserted in the contract that if the first year's bill exceeded a given amount the customers were to have the privilege of cancelling the contract. The result was that the building exceeded the estimate about $300.00 per year, but the management was so well satisfied with the superior service that they would not consider re-establishing the old service.

"Little trouble was experienced in changing over the plants of the three railroad companies, as their experience in operating plants, not only in Louisville, but at other points, brought them to the conclusion of purchasing electricity where it is available at reasonable rates.

"With few exceptions the Louisville tanneries are confined to the tanning of sole leather, and steam in large and consistent quantities is used for drying. From the standpoint of economy in plant operation compared with purchased service, the power company was at some disadvantage, but, with increased output and relief from power-plant troubles, the tannery customers are well satisfied with results.

"Wood-working is one of the principal Louisville industries, and is generally conceded, with its waste fuel and demand for steam for dry kilns, a problem for central stations but efforts were centered on two or three of the largest plants at first and the business secured on short-term contracts. Their experience and satisfaction permeated the whole industry, with the result that the power company is now operating 90% of the wood-working plants in Louisville."

BROOKLYN EDISON CONDUCTS MOST SUCCESSFUL IRON SALE.

Sells 2004 Irons in 26 Days of August, Breaking All Previous Monthly Records in This Line.

During the month of August of this year the Brooklyn Edison Co. conducted one of the most successful sales of electric irons ever put on in Brooklyn, N. Y.—2004 irons being sold in 26 working days, an average of over 77 orders a day.

The iron offered was of a well-known manufacture with the name-plate "Brooklyn Edison Special," and was sold at $4.98—$2.98 down and $1.00 a month to Brooklyn Edison customers.

Over 60,000 return postcards were sent out with the monthly bills to lighting customers and very satisfactory returns were received. In addition, each branch-office window was specially decorated where actual demonstrations were conducted throughout the entire month.

Two-column advertisements in preferred positions were carried periodically in all of the Brooklyn newspapers and local publications.

The lighting salesmen of the company were allowed a commission of 25 cents per order taken as an incentive. The illuminated billboards of the company were used as well as the billboards at the Brooklyn National Ball Park. All of the company's wagons carried a single sheet poster announcing the sale. These posters are most effective, inasmuch as they attract the attention of new customers. When a wagon drives up to the door to deliver material, such as meters, lamps, etc., the customer usually notices this advertisement on the wagon.

During September the Brooklyn Edison special is an electric washing machine on easy terms.

Operating Practice

Boiler-Room Instruments — Field Coil Troubles — Simple Location of Faults — Insulator Failure and Deterioration

BOILER INSTRUMENTS OF COUNTIES GAS & ELECTRIC CO.

Instruments Found Justified on Boilers of 520 B-Hp.

The Counties Gas & Electric Co., Norristown, Pa., applied to its boiler room its ability along efficiency lines to a greater extent than in other industries, but when the cost of coal soared during the war it concentrated its efforts toward greater efficiency. So when they built their new plant with an ultimate capacity of 53,000 kw. with an initial capacity of 17,250 kw. and containing 13 boilers of 5420 b-hp., they adopted the best modern methods in the way of equipment.

Some engineers maintain that it is only the largest plants that can install complete boiler-room instruments and find it financially worth while. But in a paper on "Economical Boiler Room Practice for Medium Size Plants" read before the Pennsylvania Electric Association, Henry B. Bryans, chief engineer of the Counties Gas & Electric Co., stated that the company aims to operate at about 200% rating at all times and 300% rating during peak loads. Each of his boilers has been equipped with the following equipment with good results:

1. Recording indicating steam flow meter.
2. Recording CO_2 meter.
3. Indicating gauge for determining pressure in wind box.
4. Indicating gauge for determining pressure over the fire.
5. Recording flue gas pyrometer at entrance to economizer.
6. Recording flue gas pyrometer at discharge from economizer.
7. Recording thermometer for feed water entering economizer.
8. Recording thermometer for feed water leaving economizer.
9. Automatic feed-water regulators.
10. Balanced draft control.

ACID FUMES CAUSE INSULATION DETERIORATION.

Storage Battery Ventilation, Defective Cause of Insulation Troubles.

By B. H. Smith.

A 1000-kw. synchronous motor driving a 1000-kw. three-phase generator was employed for changing the frequency of one system from 25 cycles to 60 cycles, thereby enabling the 25-cycle and the 60-cycle systems to interchange power between them.

The 1000-kw. motor operated at 9000 volts, and was called into service for about eight hours daily during the fall and spring, about four hours during the summer and about ten hours during the winter months. This synchronous motor had developed a sprung shaft thought to be due to previous step bearing trouble (the unit was of the vertical type). The entire unit vibrated considerably, especially with sudden load changes.

A certain amount of trouble was occasioned from time to time on account of the insulation on the field pieces breaking down and grounding the field circuit and short-circuiting the field turns as a result. Repairs had been made several times, but the trouble persisted in recurring. The reason for the insulation trouble in the field circuit was given as being due to the vibration resulting from the bent shaft.

However, it so happened that the writer visited the station containing this frequency-changer while it was down for repairs, some of the field poles having caused trouble again. An examination of the seat of trouble showed that the insulation showed none of the typical signs of abrasion or mechanical injury such as one would expect to find where the insulation trouble was due to the incessant shock or small knocks accompanying continual vibration. Instead, the insulation appeared to be somewhat discolored, the signs of moisture seemed to be present, although not in sufficient quantity to permit the statement to be made that the insulation was damp.

It now appeared that the previous diagnosis of vibration as being the cause of trouble might be wrong. Moisture was suggested as the cause. As no source of moisture could be found, oil was suggested, but the insulation had no appearance of being oil soaked. On holding some of the insulation close to the nose the writer discovered a slight odor of sulphuric acid, and that acid was present was later found to be correct by the use of litmus paper.

The cause of the failure of the insulation on the field of the synchronous motor was that sulphuric acid was able to collect on the insulation. The frequency-changer was a vertical machine. In the basement alongside the step bearing of the unit was a storage battery used for operating the switchboard, circuit breakers and emergency station lighting. This battery was housed, but the housing was not in good condition. The ventilating shaft had corroded to such an extent that instead of the acid fumes being carried off through the ventilating duct to the outside of the building, they had been sucked through the corroded holes in the shaft by the windage that occurred when the motor-generator was in operation.

The field of the motor, being the rotor and occupying the most exposed position for the fumes, was attacked most rapidly by the acid. It would doubtless have been only a matter of time before the insulation of the stator would have broken down also, although this would have taken longer, because of the heavier insulation and the more general application of insulating compound employed for 9000-volt windings than for 220-volt windings.

The battery room was repaired. A draft tube or ventilating duct of more generous proportions replaced the corroded and defective one, and all further trouble has apparently been prevented. It would seem that special care should be taken that storage battery rooms are located in places where the acid fumes can be readily carried off in a most direct manner, and that leakage of fumes and the presence of drafts that would tend to suck the fumes out of the battery room through cracks, leaks, etc., should be avoided. Where space does not permit choice of battery room location, suitable lagging can be employed to prevent the escape of acid fumes into the station.

LOCATING FAULTS IN UNDERGROUND CABLES.

Abstract of Article in Elektrotechnische Zeitschrift.

A method of fault location in underground cables that has been employed successfully in a large network in East Germany for the last two years permits one man locating trouble quickly and simply. By its means the location of the fault may be made as a check against calculations or to locate the exact position of the fault.

In one case a fault was found in a cable in which there was complete breakdown, and in another the case was that of a cable lying in 30 ft. of water. It was also used on other cables, and there was a notable success on two occasions on a direct-current cable which broke down twice at distances 150 ft. apart; in both cases the precise position of the fault was located. Many engineers still employ the plan of cutting the cable to find the defective part; others open some of the joints; all this is unnecessary.

When there is not a complete interruption in the cable, the method can be used in the following cases without interrupting the supply: (1) In polyphase systems without an earthed neutral if one phase is earthed; (2) in direct-current two-conductor systems, unless one of the conductors is uninsulated, and (3) with direct-current three-core cables, if the middle conductor is insulated and can be grounded if desired. Case (1) can be dealt with without any difficulty; in cases (2) and (3) the defective conductor will require to be earthed through a resistance for a short interval.

In the original article a diagram of connections is given. One pole of a direct-current generator is connected to the defective conductor, while the other can be connected to earth. If the circuit to earth is closed, then the current to earth passes through the armouring on both sides of the fault; a needle galvanometer is now connected in the circuit; it should have its sensitiveness properly adjusted, and should show deviations on both sides of the zero point. The direction of the throw and also its amount should be noted. If the positive pole is earthed, the negative pole of the instrument points towards the fault. When the position of the fault is entirely unknown, the observer proceeds by halving the defective length at each successive test. For instance, over a length of 1000 yards, it would probably be necessary to test at seven different points.

A special clamp consists essentially of a V-shaped grip which is passed beneath the cable. The grip is held at the end of a length of tube, through which a sharply-pointed rod can be fed forward by a screw device, which is clamped to the tube. As the pointed rod is fed forward through the grip, it penetrates the jute covering, and makes contact with the armouring of the cable. In this way a steady contact for the purpose of the test is obtained.

OBSERVATIONS AS TO INSULATOR FAILURE AND DETERIORATION.

Abstracts from Paper Before Pacific Coast Section, A. I. E. E.

As the result of the failure of insulators, much attention is now being given such matters as mechanical and electrical design, the investigation of ageing, the influence of mechanical and electrical stresses and climatic conditions upon different types of insulators and the same insulators under different sets of conditions. In a very able paper delivered before the A. I. E. E. in Los Angeles recently, L. M. Klauber discussed the theory of probabilities applied to failures of suspension insulators, pointing out the influence of factors of safety upon the probable reliability of a transmission line and its probable immunity from insulator troubles.

Mr. Klauber pointed out that although nearly every insulator failure is finally a flash-over there is little practical difficulty in differentiating between the two types of failure. The flash-over due to deteriorated line conditions shows a heavy foreign deposit on the insulator surface. In almost every case the bottom member of the string will be shattered; often the top member also, but rarely an intermediate member. Unbroken units will before cleaning give a zero reading with a megger and a very low flash-over with a high potential test. Subsequent to cleaning, however, unless badly burned by the power arc, they will give as high a megger and flash-over test as when new. Lines subject to difficulties of this kind cannot be tested with a megger in the field even on a clear, dry day, unless each unit is wiped off before test.

In the other type of failure occurs the fundamental condition that a number of units have failed by material depreciation (usually puncture) and the balance being unable to hold the line have subsequently flashed-over. The characteristic differentiating this class of failure from the former is the number of punctured units which occur at random throughout the string. Even if subsequently shattered by the power arc they may usually be readily distinguished from units shattered by the other type of failure.

In testing and renewing insulators on the line it is desirable that results be recorded in detail. The distribution of failures between strings, their location in different sections of the same line and the relative frequency of failure of units in corresponding positions in the string, all will be of interest in deducing the causes of failure. It is desirable to know whether bottom, top or intermediate units fail most frequently, and in what ratio; whether units in greater tension at dead-ends fail more frequently than those in suspension; whether units with bolts exposed to the direct rays of the sun fail more frequently than those on the same tower but with bolts toward the north and consequently protected from the sun by the porcelain shells. It is of interest to note whether failures follow hot spells, whether they are decreased by cleansing rains and other effects of the weather. If lines operating under similar conditions contain units differing in manufacture, it is of course important to determine separately the percentage of failures for each type. Also by noting the relative frequency of single and multiple failures, it is possible to determine whether failures follow the laws of probability for purely independent events, as above outlined, or whether successive unit failures are to a certain extent dependent events.

Contracting-Construction

Exit Sign and Emergency Lighting — Device for Signaling Stoppage of Motors—Changes in National Safety Code

RULES FOR WIRING EXIT SIGN AND EMERGENCY LIGHTING.

Revised Chicago Electrical Code Gives Complete List of Specifications for Wiring All Kinds of Buildings.

In connection with the rules governing the wiring of theaters, assembly halls, hotels and other buildings, the Department of Gas and Electricity of the city of Chicago has in the 1919 edition (just published) of its electrical code prepared a table specifying the kind of exit sign lights and emergency lighting systems required for different kinds of structures. It is probably the most complete specification for exit and emergency lighting that has ever appeared. Following is the table with explanation of the symbols:

Apartment buildings (three stories or more in height)		F
Asylums (more than ten persons and more than two stories high)	A-2	C
Assembly halls	A-1	E-1 and E-2
Banquet halls	A-1	E-1 and E-2
Billiard rooms and bowling alleys	A-1	E-1 and E-2
Churches	A-1	E-2
Clubhouses (less than 20 persons and more than four stories high)	A-2	B
Clubhouses (20 or more persons and more than two stories high)	A-1	C
Dance halls	A-1	E-1 and E-2
Department stores (more than two stories high)	A-2	B*
Dwellings	None	None
Expositions	A-2	E-1 and E-2
Factories (more than two stories high)	A-2	B
Garage (more than two stories high)	A-2	B**
Gymnasiums (if sleeping accommodations for 20 persons or more, and more than two stories high)	A-2	C
Gymnasiums (in buildings containing no assembly hall)	A-1	E-1 and E-2
Gymnasium (in buildings containing assembly halls)	None	None
Homes for aged or children (more than ten persons and more than two stories high)	A-2	C
Hospitals (more than ten persons and more than two stories high)	A-2	C
Hotels (20 or more persons and more than two stories high)	A-2	C
Infirmaries (more than ten persons and more than two stories high)	A-2	C
Jails (more than ten persons and more than two stories high)	A-2	C
Libraries (more than four stories high)	A-2	B
Lodge halls	A-1	E-1 and E-2
Lodging houses (20 or more persons and more than two stories high)	A-2	C
Moving picture theaters—(See Theaters)		
Office buildings (more than four stories high)	A-2	B
Parish halls	A-1	E-1 and E-2
Police stations (more than ten persons and more than two stories high)	A-2	B
Residences	None	None
Rooming houses (20 or more persons and more than two stories high)	A-2	C
Skating rinks		
Schools (more than 100 students)	A-2	C
School halls (in school building)	A-1	C
School halls (in separate building)	A-1	E-1 and E-2
Stables (more than two stories high)	A-2	B**
Stores (other than department stores, more than three stories high)	A-2	B
Theaters (regular theaters)	A-1	D
Theaters (not more than two sets of scenery and not more than 300 seats)	A-1	C
Theaters (not more than two sets of scenery and more than 300 seats)	A-1	D
Theaters (moving picture theaters with not more than 300 seats)	A-1	C
Theaters (moving picture theaters with more than 300 seats)	A-1	D
Warehouses	None	None

Note.—Any floor six inches below the surface level is considered as a basement.

(A-1) Emergency lighting system of gas or electricity in all halls, corridors, stairways or other means of exit, which shall be independent of all other lights. Separate meter and service switch and, on overhead services, separate service to outside of buildings. Lights to be controlled only in lobby. Lights shall be kept burning until audience has left building.

(A-2) Emergency lighting system of gas or electricity in all halls, corridors, stairways or other means of exit, which shall be independent of all other lights. Separate meters, and service switches, but service may be connected to mains inside of building. Lights must be controlled only at some point near the main entrance. Lights must be kept burning until the occupants have left the building.

Note.—Emergency lighting system must be electric where electricity is used for general illumination.

(B) Exit signs illuminated by gas or electric light.

(C) Exit signs illuminated by gas only. (Electric not permitted.)

(D) Exit signs illuminated by both gas and electricity. The electric lights must be connected to the emergency lighting system.

(E-1) Where auditorium is used for theatrical whether regularly or occasionally, and where the seating capacity is not more than 300, exit signs must be illuminated by gas; if more than 300, must be illuminated by both gas and electricity.

(E-2) Where not used for theatricals and where the seating capacity is not more than 400, exit signs must be illuminated by gas or electricity. Where the seating capacity is more than 400 exit signs must be illuminated by gas.

(F) Lights must be installed on each floor and in vestibule of public halls and must be so arranged as to thoroughly light the same. If the building is wired for electric light these lights should also be electric. They must be connected to separate circuits carried to cutout box and connected to owner's meter or to a separate meter. Lights must be kept burning from sunset to sunrise.

* Illuminated signs must be provided showing the number of the floor.

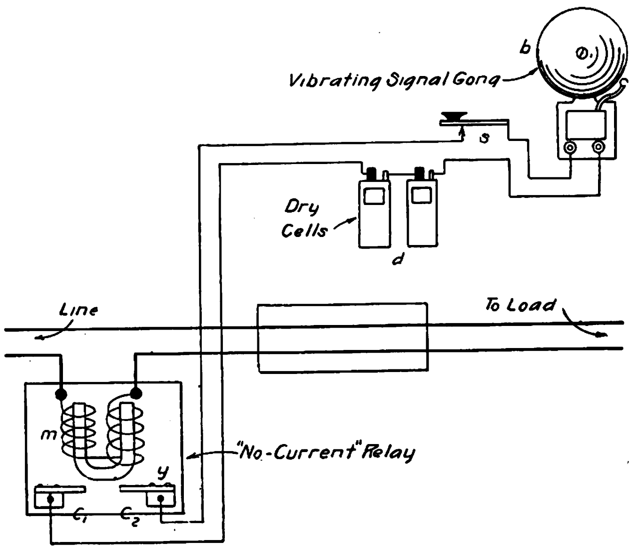
** Any building more than two stories high having a garage or stable on the first floor, exit signs must be illuminated by electricity; gas not permitted.

AUDIBLE SIGNAL TO INDICATE DISCONTINUANCE OF LOAD.

By Richard L. Dyke.

It is very often essential in industrial plants that certain motors or groups of motors be operated as continuously as possible. In such cases it is very desirable that the plant electrician or repair man be notified very quickly in the event of any trouble occurring that stops the motor. For this purpose the device shown in the accompanying sketch will prove very useful. By installing this device an audible signal will be sounded as soon as the current in the motor circuit drops off. It can also be used to indicate a shutdown on motors operating in places where nobody is working or watching.

In the sketch the signal is arranged so that a bell will ring when a group of motors in a distant building is stopped. Fig. 1 indicates the connections. A relay, M, was made and connected to the circuit which supplies the load. When the load is taking current through the line L, the magnet coils of M have current in them and pull up the U-shaped yoke Y. But when the load is discontinued, Y drops down and makes contact to cross C_1 and C_2. This closes the electric-bell circuit and causes B to ring. And it will continue to ring until switch S is opened. A large



Wiring Diagram for Audible Signal.

number of turns is not required on the magnet coils, M, as their function is merely to hold up the yoke Y. It is not, in most cases, necessary that the magnet coils be sufficiently strong to pull up Y, because it can be raised by hand. The wire used for the magnet coils, M, must be of sufficient size to carry the full-load current in the circuit.

PROPOSED CHANGES IN PART I, NATIONAL ELECTRICAL SAFETY CODE.

Revision Now Under Way Provides for Minor Changes in Safety Rules for Power Houses and Substations.

As previously announced, the National Electrical Safety Code is being revised by the Bureau of Standards, Washington, D. C., prior to publication of a new edition of this code. Part III, covering rules for installation of utilization equipment, has already been revised. A tentative revision of Part I—rules for the installation and maintenance of electrical supply stations and equipment—has been made, but has not been adopted; an opportunity is now offered to central-station engineers, contractors and others interested to submit constructive criticism of the revised rules prior to their adoption in the near future. A similar revision has been made of Section 9 of the Safety Code, including rules for methods of protective grounding of circuits, equipment and lightning arresters, and this is also open to such criticism. Copies of the tentatively revised Section 9 and Part I have been sent to all parties thought to be interested.

Most of the changes are not radical, but are intended to cover points which were previously omitted or which seemed to need clarification. Slight rearrangements to make a more logical grouping of the rules have also been made. The following are abstracts or the actual wordings of some of the more important new rules of Part 1; (matter in small type gives the actual wording of changes, while the larger type gives abstracts). It should be noted that these are not final, but only in tentative form.

Principle Proposed Changes in Part I.

Rule 104 (a)—Electrical apparatus and machinery rooms must be equipped for adequate artificial illumination available at all times.

106 (f) and (g)—Steel stairways and ladders must be suitably guarded.

108 (a)—Fire extinguishers shall not be installed in locations subject to high temperatures, unless specially designed for same.

108 (b)—Floors of galleries and rooms containing oil-filled switches and apparatus shall be drained and provided with oil gutters.

136. MOTORS—

(a) *Wiring Motors Below* 750—Motors operating at a voltage of 750 volts or less must be wired with the same precautions as required for industrial wiring carrying the same current.

(b) *Protection of Wiring Over* 750 *Volts*—All apparatus and wiring connected to circuits over 750 volts must be completely inclosed in substantial metal shields or casings and the conduit must enter and be properly secured to such casings or to suitable terminal boxes screwed or bolted to the casings. Shields, casing and conduit must be grounded as provided in Section 9.

The insulation of the several conductors for motors of over 750 volts where leaving the metal sheath of cables, must be thoroughly protected from moisture and mechanical injury. This may be accomplished by means of a pothead or some equivalent method. The conduit must be substantially bonded to the metal casings of all fittings and apparatus connected to the inside circuit. Except where exposed to moisture a metal sheath need not be provided over splices, but the ends of the sheaths must be belled out and sheaths must be bonded around splices by copper wire not smaller than No. 6 A. W. G. and suitable ground clamps.

(c) *Motors in Dusty Places*—Inclosed-type motors are recommended in dusty places, being preferable to wooden boxing.

(d) *Drip Pans*—Where practicable, motors permanently located on wooden floors must be provided with suitable drip pans.

144. *Apparatus with Oil*—Transformers, induction regulators and other electrical apparatus containing an appreciable amount of oil, when installed indoors shall be installed in fireproof inclosures, not having any doors or windows in such a position that burning oil could pass through them on to material or apparatus of a more or less inflammable nature. The inclosures themselves shall not contain any material or apparatus which could take fire from burning oil.

Where such apparatus is installed on a balcony or gallery above other apparatus a gutter or other means for draining off oil or preventing it from running down on to lower floors shall be provided.

Where such apparatus is installed outdoors, adjacent walls shall be of fireproof material and shall not have any doors or windows in such a position that burning oil could pass through them on to material or apparatus of a more or less inflammable nature. Material or apparatus outdoors which could take fire from burning oil shall not be placed within 25 ft. of the apparatus in question.

See Rule 108 (b) for requirement for oil gutters in connection with apparatus containing oil.

145. GROUND DETECTORS—

(a) *Where Required*—All circuits, except such as are permanently grounded as provided in Section 9, must be provided with reliable ground detectors. Detectors which indicate continuously and give an instant and permanent indication of a ground are preferable. Ground connection must be made as provided in Section 9.

(b) *Electrostatic Detectors*—Electrostatic ground-indicating devices shall be properly protected and be provided with a metallic shield if used on switchboards or near instruments.

150. (d) *Circuits Exposed to Higher Voltages*—If exposed through transformer windings, circuits below 750 volts shall be grounded unless everywhere in grounded conduit or other suitable duct or identified and guarded as required for conductors of the highest voltage to which they are exposed.

151. (d) *Lead Sheathing and Potheads*—Conductors between generators and outside lines shall be in plain sight and supported on approved noncombustible, nonabsorptive insulators or placed in approved metal conduit, tile or other fireproof ducts. Conductors installed in conduit or ducts where exposed to moisture shall be sheathed and the sheathing shall be grounded. Except for systems below 300 volts to ground the insulation of the several conductors where leaving the metal sheath of cables shall be thoroughly protected from moisture and mechanical injury by means of a pothead or some equivalent method.

(e) *Conductors Not in Conduit*—Conductors between generators and outside lines shall, where not in conduit, be kept so rigidly in place that they cannot come in contact. Where they pass through floors or fire walls they shall be carried through individual openings in fire-resisting insulating tubes or their equivalent and not through a common open space.

(f) *Protection Against Excessive Temperatures*—Wherever insulated conductors are exposed to excessive surrounding temperatures, a special protection shall be provided if the maximum temperature exceeds the maximum safe limiting temperatures adopted in the Standardization Rules of the American Institute of Electrical Engineers.

156—Wiring for illumination of the station or other utilization purposes should be installed as required for similar utilization equipment and conductors in Part III of the Safety Code.

157 (b)—During alterations or extensions to a station in service, equipment and apparatus exposed to weather, dirt, etc., shall be suitably shielded against same, and also made inaccessible to unauthorized persons or installed as per rules of Part III for equipment accessible to such persons.

161. LOCATION OF OIL SWITCHES. (See Rule 103 for hazardous locations.)—

(a) *Isolation*—Oil circuit-breakers and switches shall wherever practicable be isolated from other switches and electrical apparatus. On circuits of over 7500 volts they must be of remote-control type and be inclosed in separate fireproof cells or compartments.

(b) *Indoor Inclosures*—Oil switch or oil circuit-breakers when installed indoors shall be installed in fireproof inclosures, not having any doors or windows in such a position that burning oil could pass through them onto material or apparatus of a more or less inflammable nature. The inclosures themselves shall not contain any material or apparatus which could take fire from burning oil.

(c) *Drainage on Galleries*—Where oil switches or oil circuit-breakers are installed on a balcony or gallery above other apparatus, a gutter or other means for draining off oil or preventing it from running down onto lower floors shall be provided.

(d) *Outdoors*—Where oil switches or oil circuit-breakers are installed outdoors, adjacent walls shall be of fireproof material and shall not have any doors or windows in such a position that burning oil could pass through them onto material or apparatus of a more or less inflammable nature. Material or apparatus outdoors which could take fire from burning oil shall not be placed within 25 ft. of the switches or circuit-breakers.

164. (c) *Air-Break Disconnector*—An air-break switch or air-break disconnector shall be inserted in each conductor between electrical supply equipment or lines and sources of energy of over 5000 volts, if the equipment or lines may have to be worked on while the sources may be alive.

165. WHERE AUTOMATIC CUTOUTS ARE REQUIRED—

(a) Constant-potential generators, except alternating-current machines and their exciters, and transformers, or station auxiliaries shall be protected from excessive current by suitable automatic cutouts, except as noted below and in Rule 150.

For two-wire direct-current generators, single-pole protection will be considered as satisfying the above rule, provided the automatic cutout is so located or arranged as to be actuated by the entire generator current, and the action thereof will completely open the generator circuit.

(b) *Generators Not Electrically Driven*—For a generator not electrically driven supplying a two-wire grounded system, the automatic cutout shall be so placed as to disconnect the generator from all conductors of the circuit.

(c) *Generators Used with Balancer Sets.*—For two-wire direct-current generators used in conjunction with balancer sets to obtain a neutral for three-wire systems, an automatic cutout shall be installed, which in case of an excessive unbalancing of voltages will operate to disconnect the three-wire system.

(d) *Three-Wire Generators*—For three-wire direct-current compound or shunt-wound generators, an automatic cutout, other than a fuse shall be placed in each armature lead, and so connected as to receive the entire current from the armature. The automatic cutout shall consist of either: (1) a double-pole double-coil, over-load circuit-breaker, or (2) a four-pole circuit-breaker connected in the main and equalizer leads, and tripped by means of two overload devices, one in each armature lead.

These automatic cutouts shall be so interlocked that no one pole can be opened without simultaneously disconnecting both sides of the armature from the system.

(e) *Motors*—Motors shall be provided with cutouts and switches as required for motors in industrial installations by Part III.

170 (a) to (c)—Switchboards shall be so located as to reduce danger of communicating fire to adjacent combustible material. They shall not be built up to the ceiling, 3 ft. being left clear if possible. Spaces back of board must be kept clear and clean. If wired on the back, the board must be accessible on all sides.

180. LIGHTNING ARRESTERS—

(a) *Where Required*—Lightning arresters shall be attached to each wire of every overhead circuit connected with the station, except wires in cables with grounded lead sheath.

(b) *Indoors*—Lightning arresters, with auxiliaries, when installed inside of buildings shall be located well away from all other equipment, passageways and combustible parts of buildings. When of a type containing oil they shall be installed in fireproof inclosures not having any doors or windows in such a position that burning oil could pass through them onto material or apparatus of a more or less inflammable nature. The inclosures themselves shall not contain any apparatus or material which could take fire from burning oil.

(c) *On Galleries*—Where lightning arresters containing oil are installed on a balcony or gallery above other apparatus a gutter or other means for draining off oil or preventing it from running down onto lower floors shall be provided.

(d) *Outdoors*—Where lightning arresters containing oil are installed outdoors, adjacent walls shall be of fireproof material and shall not have any doors or windows in a position so that burning oil could pass through them onto material or apparatus of a more or less inflammable nature. Material or apparatus outdoors which could take fire from burning oil shall not be placed within 25 ft. of the arresters

184. (c) *Insulation of Attachments*—All choke coils or other attachments, inherent to the lightning-protective equipment, shall have an insulation from the ground or other conductors equal at least to the insulation demanded at other points of the circuit in the station.

ELECTRIFICATION OF RAILWAYS CONTEMPLATED IN FRANCE.

The French Ministry of Public Works is considering the question of adopting electric traction on French railways. A commission sent to this country to study railway electrification has recommended in a preliminary report the use of a 3000-volt direct-current system, such as that of the Chicago, Milwaukee & St. Paul railway.

BOOK REVIEWS

"Boiler Chemistry and Feed Water Supplies." By J. H. Paul. New York: Longmans, Green & Co. Cloth, 242 pages (8½ by 5½ ins.), with numerous illustrations. For sale by Electrical Review Publishing Co., for $4.50.

The properties of water used in boilers have always had an important bearing upon the safety and life of boilers; likewise upon their performance and efficiency. However, the chemistry of water has become of even more vital importance of recent years as higher steam pressures came to be employed, because of the higher temperatures involved and the greater opportunity offered to scale to become a hazard and to jeopardize efficiency. Boiler chemistry, by which is meant the chemistry that deals with the water entering the boiler, the deposits that collect in the mud drums and on the heating surfaces of the boiler, and the treatment of water before it enters the boiler that it may be made suitable, has not received the attention that it deserves. It will, therefore, be with gratification that engineers hail an intensely practical book upon this subject by J. H. Paul.

"Boiler Chemistry and Feed Water Supplies," as its name implies, deals with the properties of water supplied to boilers, what to guard against, and how to guard against these things; it tells of many and varied instances and experiences with boiler feed-water. The book is divided into seventeen chapters on the following subjects: Earth, Air and Water; Acids, Bases and Salts; Constituents of Natural Waters; Scales and Deposits; Softening; Soluble Salts; Iron; Carbonic Acid; Concentration of Waters Containing Carbonate of Soda; Action of Carbonic Acid on Iron; Corrosion; Condensed Waters; Superheater; Priming; External Deposits; Failure of Clean Tubes; Water Supplies; Appendix—carbonic acid in London waters; Index.

A book dealing with any phase of chemistry cannot be devoid of chemical terms and expressions. On the other hand, such terms and expressions need be only a means to an end, and they can be so explained and simplified that they expound and amplify a fact instead of masking it in the mind of the layman and those not specially conversant with chemistry. This is apparently exactly what the author of this book has done. He has employed chemical expressions as only a means to an end. The explanation, in simple and straightforward language, is the chief consideration; chemical technicalities are secondary and are used only as a means to an end. The result is that the book is very practical, hence should go a long way toward clearing up many difficulties and misapprehensions in the minds of those engineers who "do not know chemistry" and of those brought into close touch with conditions and who, while appreciating the dangers and objections of impure water, have little time or inclination to work things out for themselves. To such men this book on "Boiler Chemistry and Feed Water Supplies" should prove to be a very real boon.

As the author states, "chemistry has improved the physical character of industrial iron and steel and rendered possible the use of the high pressures now employed in steam boilers, and an acquaintance with the reactions which take place in a boiler under modern working conditions will enable steam users to preserve their boilers from those evils which are roughly summed up in the expression, "scale and corrosion" * * * "any chemical knowledge which will increase its (the boiler's) efficiency, preserve its life and save coal deserves thought and consideration."

The book handles a technical subject in a very practical manner. That space is devoted to economizers, to condenser tubes, mud drums and steam traps should make many engineers realize that chemistry and their work are related. The engineer possessing and reading this book will be a better engineer, and undoubtedly be worth more to himself and to his employer.

"Electrical Engineering Papers." By Benjamin G. Lamme. Pittsburgh: Westinghouse Electric & Manufacturing Co. Cloth, 773 pages (9 by 6 ins.), profusely illustrated. Price $2.50.

Benjamin G. Lamme, chief engineer, Westinghouse Electric & Manufacturing Co., has been connected with this company since 1889, during which time he has taken a prominent part in this company's work and has been largely responsible for the position this company holds in the engineering world today. As appreciation of Mr. Lamme's thirty years of continuous service, the Westinghouse Electric & Manufacturing Co. has recently published a book entitled "Electrical Engineering Papers," being a compilation of the most valuable papers on engineering subjects written by Mr. Lamme.

The book contains 773 pages, every one of which is of educational value. The papers have been gleaned from many different sources but all are typical of Lamme, the engineer, the mathematician, the student of humanity.

The book is not offered as a substitute for any textbook now in use, but, as the name implies, is a collection of engineering papers. Some of these are classic now—for instance, the one on "The Polyphase Motor," originally delivered in 1897 before the Niagara meeting of the National Electric Light Association. That this is still authoritative on the rotating field and induction motor principles is evident by the fact that the United States Navy copied it into their recent textbook for the young engineers of the Navy to study. Many other papers appeared originally in the Transactions of the American Institute of Electrical Engineers.

All the papers or articles are classics and are models of straightforward thinking and expression and analytical study. They can be read with equal advantage by he who seeks to learn the technicality of the subject or he who seeks to learn freedom of expression, consecutive thought and concise expression.

ELECTRIC FLASHER FORMS PART OF WINDOW DISPLAY.

An effective method of selling electric sign flashers is being used by the Electric Construction & Sales Co., Cleveland, Ohio. The company has a large electric sign of its own on the front of the building. This sign is operated by a flasher which forms a part of the window display. The flasher is placed in a neat glass case at the front of the window space.

The fact that the flasher is in actual operation serves to excite the curiosity of passersby, and it is no uncommon sight to see a dozen people standing in front of the window who alternately watch the flasher and the work that it is doing.

While the display may not be the cause of many direct sales, it is undoubtedly of great value because it sells the idea of electric signs and flashers.

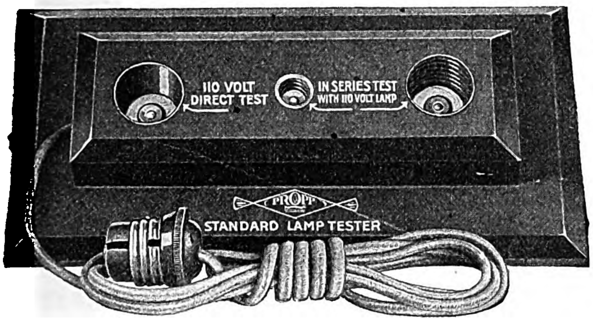
New Appliances

Portable Painting Outfit to Promote Economy in Paint and Painting—Handy Lamp Tester—Commutator Resurfacer

Propp Lamp Tester for Standard and Low-Voltage Lamps.

The dealer in lamps always likes to be sure that all lamps that go out of his establishment are intact, and the purchaser as a rule also appreciates, if he does not insist on, a test of each lamp as it is turned over to him. During the Christmas shopping rush there is always a big demand for Christmas-tree lighting outfits that in some dealers' stores almost overtaxes the capacity of the sales force. Consequently, every facility in selling is of special value at this time.

A special lamp-testing outfit has been developed for this purpose by the M. Propp Co., 108 Bowery, New York City. As illustrated herewith, it is of simple design, consisting of three lamp receptacles mounted on a board base and provided with cord and plug for conection with the 110-volt lighting circuit. The left receptacle is threadless for easy and quick direct testing of standard 110-volt lamps or of Christmas-tree series strings; in the latter case the plug of the set is merely inserted into the left receptacle. If the lamps do not all light, one or more of them are out of commission and each of the series lamps must be tested. This is done by putting them one by one into the middle receptacle, which is wired in series with the one at the right that is filled with a 110-volt lamp. In this way all lamp tests are very quickly and reliably made.



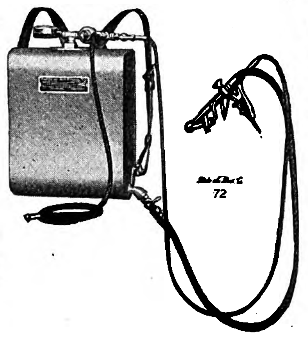
Device for Testing 110-Volt and Low-Voltage Lamps Quickly.

A Simple Commutator Resurfacer.

A very simple and inexpensive tool has been devised which is said to greatly reduce this continued expense and is daily proving its effectiveness in the plants of some of the largest industries. This appliance is known as the "Ideal" commutator resurfacer and consists merely of a manufactured block composed of special abrasive material and mounted on a metal backing provided with a handle.

When motors or generators show sparking at the brushes, the device is applied as a resurfacer while they are in service and under full load. By means of the handle it is held with a slight pressure against the revolving commutator or collector ring until the abrasive surface has cut down ridges and rough spots and entirely eliminated the sparking caused by the rough surface. Unless a commutator or ring is in extremely bad condition, a few minutes' work with this device will correct this trouble.

One of the features in the construction of the "Ideal" resurfacer is its uniform density. It being a manufactured article, the cutting surface is always uniform. The manufacturer, the Ideal Commutator Dresser Co., Chicago, has expressed its confidence in the device by a liberal ten-day free trial offer.

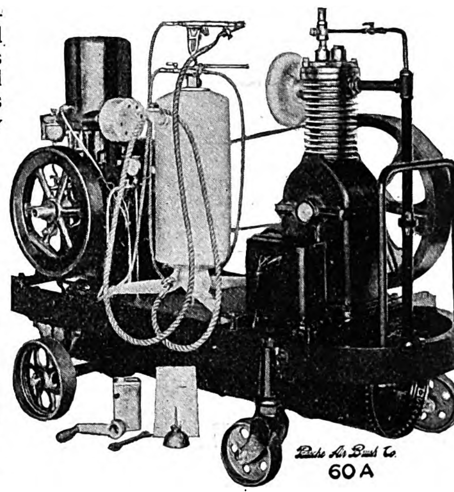


Paasche Napsack Painting Outfit.

Portable Painting Equipment Saves Time and Money.

With present high labor costs and the beginning of delayed building activity, special interest attaches to the Paasche air brush and portable painting equipment. The product of this company enables one man to do the painting ordinarily requiring the employment of four, six and even eight men using a hand brush; moreover, the work is done better and with less paint than when done by the old-fashioned method. Surfaces painted by the Paasche apparatus thus cost less to paint and require less frequent painting.

The Paasche outfit consists of an air brush, an air compressor, an air tank and engine or motor for driving the compressor (or hand pump as the case may be) and a length of flexible hose, and the various control mechanisms for manipulating the supply of paint, the pressure of air, etc. There are several different types of equipment, all embodying the same general principles, and depending upon whether one or two different colors of paint are used; the capacity of the unit, in gallons; and whether it is necessary that the entire outfit be moved or only part of it, which means according to the kind of work to be done. There is a type for every form of work and some of them are entirely enclosed against dirt and rain. In some of the types engine, compressor, air tank and paint drums are installed upon one portable truck. In others each of the fundamental units are mounted separately upon individual trucks. In yet other types the paint drum can be strung upon a man's back, like a knapsack, a convenient arrangement where the surfaces to be covered are difficult of approach, as smoke stacks and similar places; this outfit, complete with 6-ft. of hose, 3-gallon paint tank and fittings, weighs only 18 lbs. Still another outfit specially designed for painting smokestacks, tanks, and large surfaces elevated above ground, where scaffolding would be ordinarily required, is fitted with safety block and tackle and all necessary equipment for moving up and down safely. This is a very compact unit and consists of seat, 50-ft. of airline hose, tackle and tanks.



Paasche Portable Painting Outfit for Two Painters.

The Paasche painting equipments have been developed specially for painting efficiently such surfaces as walls, stucco houses, steel surfacees, brick buildings, structural work of all kinds, bridges, trucks, stacks, ships, etc. It can be used for finishing and general painting as well as for calcimining. It is being used by some of the largest steel manufacturers, including the Carnegie Steel Co., the Duquesne Steel Co., and others. Twelve Paasche equipments have recently been ordered by the Government for painting the forty large steel buildings that are now being erected at Savannah, Ill., for returned equipment.

Wherever and whatever is to be painted can be done quicker, better and cheaper when done the Paasche way than when done any other way, is the claim of the Paasche Air Brush Co., Chicago, who cite instances where men with only one arm have replaced several able-bodied men.

Lately Approved Appliances

Underwriters' Laboratories, established and maintained by the National Board of Fire Underwriters (for service—not profit), have examined, tested and listed these electrical appliances in accordance with the Laboratories' Code for Construction and Test of Electrical Appliances. Copies of complete lists of standard applances may be obtained from local inspection departments or from offices of the Laboratories in the principal cities.

Fixture for Use with Gas-Filled Lamps.—Duplex Lighting Works of General Electric Co., 6 West 48th street, New York, N. Y.
"Duplexalite." Catalog Nos. D-131, D-231, D-531, D-1031.
Listed May 16, 1919.

Fuses, Cartridge.—Atlantic Electric Goods Co., Inc., 1168 Broadway, New York, N. Y.
Cartridge enclosed fuses, 0-600 amperes, 250 volts.
Listed July 16, 1919.

Heaters, Curling-Iron. — American Electrical Heater Co., Woodward, Burroughs and Cass avenues, Detroit, Mich. Triangle Lektrik Sales Co., Detroit, Mich. (submittor).
"Triangle Lektrik," 100-125 volts, 85 watts, Catalog No. 601.
Listed May 15, 1919.

Heaters—Pressing Irons.—General Electric Co., Schenectady, N. Y.
Tailors' irons, 750-900 watts, 95-250 volts. Type Z-1053, 12-24 lb. sizes inclusive.
Listed Aug. 1, 1919.

Heating Appliances, Cooking and Liquid.—American Electrical Heater Co., Woodward, Burroughs and Cass avenues, Detroit, Mich.
"American Beauty." Electrically heated cooking appliances for voltages up to 250.
Glower stove, 500 watts, Catalog No. 33506.
Grill, 660 watts, Catalog No. 3375.
Hot plate, 8.9 amperes, Catalog No. 1100B.
Listed July 11, 1919.

Heating Appliances, Industrial and Laboratory.—General Electric Co., Schenectady, N. Y.
"G. E." Glue pots, 20-1100 watts, Types I-1, I-2, I-4, I-6, I-15 to I-18 incl.
Soldering irons, 75-275 watts, 95-250 volts, Types I-8 to I-12 incl.
Listed July 11, 1919.

Insulating Materials. — West Virginia Pulp & Paper Co., 200 Fifth avenue, New York, N. Y.
Fiber sheets having following properties: Absorptive to about same extent as ordinary fiber; readily combustible; moderate mechanical strength and readily worked with tools; not noticeably affected by temperature of 125° C.
While insulating material of this general type is not classed as either nonabsorptive or noncombustible and should, therefore, not in general be used as a substitute for materials so classed, this fiber is judged to be suitable for crossbars, washers, bushings and other small parts of electrical fittings where use of fiber has been recognized.
Manufacturers desiring to use this material should submit samples in commercial form for examination and test by Underwriters' Laboratories.
Listed July 12, 1919.

Internal-Combustion Engine Electric Plant.—Alamo Farm Light Co., 703 Tower building, Michigan boulevard and Madison street, Chicago, Ill.
Nonautomatic starting, internal-combustion engine (Standard Portable) for use with gasoline, and direct-connected electric generator, control apparatus and storage battery for small isolated stationary installations. Electric control automatically stops engine when batteries are fully charged. "Silent Alamo." Rating: Generator 1 kw., 32 volts. Gasoline capacity, 1¾ gal.
Listed Aug. 18, 1919.

Lamp Guards.—McGill Manufacturing Co., Valparaiso, Ind.
Portable steel guards with wooden handles with or without sockets. "Dreadnought," "National," "Crescent Reflecting," "Security," "Universal," "Mogul," "Tubular."
Wall lamp guards. Catalog No. 1436-40 incl., 1580-81 incl., 1583, 1585, 6000, 6005. "McGill."
Listed July 25, 1919.

Lamp Guards.—Racine Iron & Wire Works. Racine, Wis.
"Buck." Pendent or portable wire lamp guards. Catalog Nos. 1, 2.
Listed Aug. 21, 1919.

Outlet Bushings.—Adapti Manufacturing Co., 919-25 West street, Cleveland, Ohio.
Connector bushings of malleable iron or pressed steel, for connecting armored cable or flexible steel conduit to conduit boxes, Catalog Nos. 910, 931, 940, 941.
End outlet fittings for rigid conduit made for cast iron having porcelain covers with separate wire holes. Catalog Nos. 8900-02 incl., 8970-72 incl.
Listed Aug. 2, 1919.

Outlet Bushings.—James E. Gleason Co., 515 West Jackson boulevard, Chicago, Ill.
Connector bushings of pressed steel for connecting armored cable or flexible steel conduit to outlets.
Listed Aug. 8, 1919.

Outlet Bushings.—James C. Phelps, Springfield, Mass.
Brass and cast-iron fittings, "J. C. C." Caplets, Type AB.
For use only at an exposed end of conduit (but not under fixture canopies) and only where conduit wires pass out through fitting without splice, joint or tap within fitting.
Listed June 3, 1919.

Outlet Plates.—The B. & D. Electric Co., 183-185 Congress street, Boston, Mass.
Cast-iron outlet plates, Catalog No. 15.
Listed Aug. 5, 1919.

Outlet Plates.—The Pratt Chuck Co., Frankfort, N. Y.
Pressed-steel outlet plate ¾ in. for flexible tubing.
Listed July 19, 1919.

Outlet Plates.—The Toledo Metal Products Co., 956 Spitzer building, Toledo, Ohio.
"B.-G." Steel outlet plates, Catalog Nos. 904-R, 905-R.
Listed Aug. 9, 1919.

Panelboards.—Starrett Manufacturing Co., 523 South Green street, Chicago, Ill.
Consisting of double-pole toggle switch and plug-fuse cutout bases mounted in cutout box with auxiliary cover which encloses all live metal parts except flush receptacles for Edison plug fuses. Capacity not to exceed 30 amperes, 125 volts.
Listed July 31, 1919.

Raceway Fittings, Metal.—Appleton Electric Co., 218-30 North Jefferson street, Chicago, Ill.
Fittings for use with "Pagrip" metal raceways, Catalog Nos. 350, 355, 365, 370, 375, 380.
Listed June 27, 1919.

Receptacles for Attachment Plugs, and Plugs.—The Bryant Electric Co., Bridgeport, Conn.
"Bryant" or "Perkins." 12 amperes, 250 volts. For use in marine wiring when mounted in conduit boxes, receptacles, Catalog Nos. 583, 584; plugs 585-88 incl.
Listed July 2, 1919.

Receptacles for Attachment Plugs, and Plugs.—Central Electric Co., 320 South Wells street, Chicago, Ill.
Receptacles and plug attached to standard enclosed switch and so interlocked with switch mechanism that plug cannot be used to make or break circuit under load. "Ralco No. 42 Safety Receptacle." 60 amperes, 250 volts d. c. or 500 volts a. c., 3-pole.
"Ralco." 25 amperes, 220 volts. Catalog Nos. 1S.T. and 13S.T.
Listed Aug. 5, 1919.

Trade Activities

Ideal Electric Holds Sales Conference — New Roller-Smith Representatives—Electric Traveling Crane Exhibit

E. B. Badger & Sons Co., 63-75 Pitts street, Boston, Mass., announces the opening of a Chicago office, with Harry E. Wheeler as manager. Mr. Wheeler will be pleased to quote prospective customers on their requirements for air washers for turbo-generators, or spray ponds or cooling towers for cooling water for condensing plants.

Eureka Vacuum Cleaner Co., Detroit, Mich., is sending to dealers an attractive poster, 28 by 42 in. in size, an enlargement of the Eureka advertisement appearing in the October issues of *Ladies' Home Journal* and *Good Housekeeping,* and the Oct. 4 issue of the *Saturday Evening Post* and presents forceful arguments in favor of this labor-saving device. Another opportunity is thus afforded dealers of this cleaner to tie in with the extensive national advertising campaign now being conducted by the Eureka company. This campaign is one of the biggest things ever undertaken by the company and dealers can ill afford to pass by the opportunities presented by it to increase their sales for the Eureka vacuum cleaner.

Western Electric Co., 195 Broadway, New York City, has recently opened a new branch, consisting of a sales office and warehouse at 334 East Bay street, Jacksonville, Fla., in charge of A. H. Ashford. This new distributing house has been established for the purpose of enabling the company to give improved service to its customers in the extreme southeastern part of the United States. A complete line of electrical supplies and specialties will be carried at this house, this to include pole-line hardware, cross-arms and other pole-line construction material; all inside wiring material; portable sewing machines, vacuum cleaners, washing machines, heating apparatus and all other electrical household appliances.

Sprague Electric Works of General Electric Co., New York, N. Y., is sending out Bulletin No. 47942, introducing a new line of safety panel boards and cabinets, which are applicable wherever the live front type of panel board has heretofore been used. The branch circuit switches and main switches are distinctive features of these panel boards. They are simple in design, of strong construction, and positive in action, and are designed especially for safety panel board use and are claimed to outlast the type of switch generally used for this service. These panel boards meet the requirements of the National Board of Fire Underwriters. The bulletin contains considerable data on this new equipment and includes numerous illustrations.

Greaves-Etchells Furnace for Brazilian Plant.—Captain Teixeira, a member of the Brazilian Military Commission, who recently spent several months in this country investigating steel plants and electric furnaces particularly, has placed an order through Fenwick Freres & Co., New York City, for a Greaves-Etchells electric furnace, manufactured by the Electric Furnace Construction Co., Finance building, Philadelphia.

Electric Appliance Welcomes Home Soldier Employes.—On the evening of Sept. 26, the officers of the Electric Appliance Co., Chicago, tendered to its men returning from the service a reception and dance at the Masonic Temple. Various committees had charge of the affair, the Floor Committee taking upon itself to see that everyone became acquainted with the soldier employes. Several hundred couples danced into the early hours of Saturday morning, and all who were present pronounced the occasion a big success. The 40 soldier employes of the company who achieved distinction in many ways served in the Infantry, Medical Corps, Cavalry, Artillery, Ordnance, Quartermaster, and one in the Balloon Squadron. One of this number was gassed and another badly wounded, the latter still being in France.

The Bearings Co. of America, Lancaster, Pa., at a recent meeting of its board of directors decided to increase the facilities of the thrust bearing factory. A new building of the latest type of construction is to be erected in the immediate future, which will give approximately 10,000 sq. ft. additional space when the building is completed. This addition to the manufacturing facilities of the thrust bearing section of the company, with the new buildings which were completed last year for the increased production of its Universal joint plant in which is manufactured "Sterling" Universal joints for automobiles, trucks and tractors, is brought about by the material increase in the production of the automobile and allied industries. This will give the company four separate buildings, the first, for the first of complete thrust ball bearings; the second, for the manufacture of "Star" ball retainers of all types; third, for the manufacture of "Sterling" Universal joints, and fourth, for the manufacture of drop forgings. During the recent war, the company supplied large quantities of thrust bearings for use in Liberty airplanes, gun mount bearings for Navy Ordnance, thrust bearings for use in Class B motor truck steering gears, and for many other departments of war work that required ball thrust bearings.

The Roller-Smith Co., 233 Broadway, New York, N. Y., announce the appointment of the Alfred Collyer Co., 420 Power building, Montreal, Canada, as its agent for the entire Dominion of Canada and Newfoundland. The Collyer company will handle the Roller-Smith Co.'s products of instruments and circuit breakers. As the company has had an extensive experience in marketing electrical apparatus, it is particularly well fitted to handle the Roller-Smith Co.'s rather complex lines. The Alfred Collyer Co., which also represents the Wagner Electric Manufacturing Co., has a branch office at 183 George street, Toronto.

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., is distributing Bulletin 1537, presenting details of Allis-Chalmers oil engines, Diesel type, and instructions for ordering repairs and spare parts. This publication, comprising 31 pages, is devoted entirely to line drawings and half tone illustrations of Allis-Chalmers oil engines and the various parts entering into their construction. Another bulletin prepared by the company is No. 16320 dealing with centrifugal pumps and centrifugal pumping units. Both the centrifugal pump and driving agent have certain fixed characteristics which cannot readily be altered by adjustment. For this reason both the manufacturer and purchaser of centrifugal pumping units should give careful consideration to these points, and in order that no important point be overlooked, it is recommended that the complete unit be purchased from one manufacturer who designs and builds both the pump and driving member. Some 40 pages of this booklet are devoted to detailed descriptions of centrifugal pumping units which the Allis-Chalmers company builds for practically any pumping requirement. The advantages of this apparatus are clearly set forth, the fundamental points of efficiency, accessibility, durability and ruggedness of construction having received careful consideration in the design of Allis-Chalmers centrifugal pumps. Illustrations of the various types of pumping units, views of typical installations, efficiency charts, etc., are also included. The experience of the Allis-Chalmers company in the design of centrifugal pumping units extends for a period of many years, and its ability to select and furnish a complete unit of its own manufacture is almost unique in this respect of combined responsibility.

Roller-Smith Co., 233 Broadway, New York City, announces the appointment of the General Machinery Co., 744-5 Brown-Marx building, Birmingham, Ala., as its agent in the states of Florida, Georgia, Alabama and Tennessee. The General Machinery Co. will handle the Roller-Smith Co.'s line of instruments, circuit-breakers and meters in this territory, and as it had an extensive experience in handling apparatus lines, it is particularly well fitted to handle the Roller-Smith Co.'s rather complex lines. The personnel of the General Machinery Co. consists of: B. A. Schroder, president, W. H. Price, sales engineer. The company has been located in Birmingham for about ten years and has a wide acquaintance with the trade. In addition to representing the Roller-Smith Co., it also represents the following manufacturers: Crocker-Wheeler Co., Goodman Manufacturing Co., Cutler-Hammer Manufacturing Co., Pittsburgh Transformer Co., and Esterline Co.

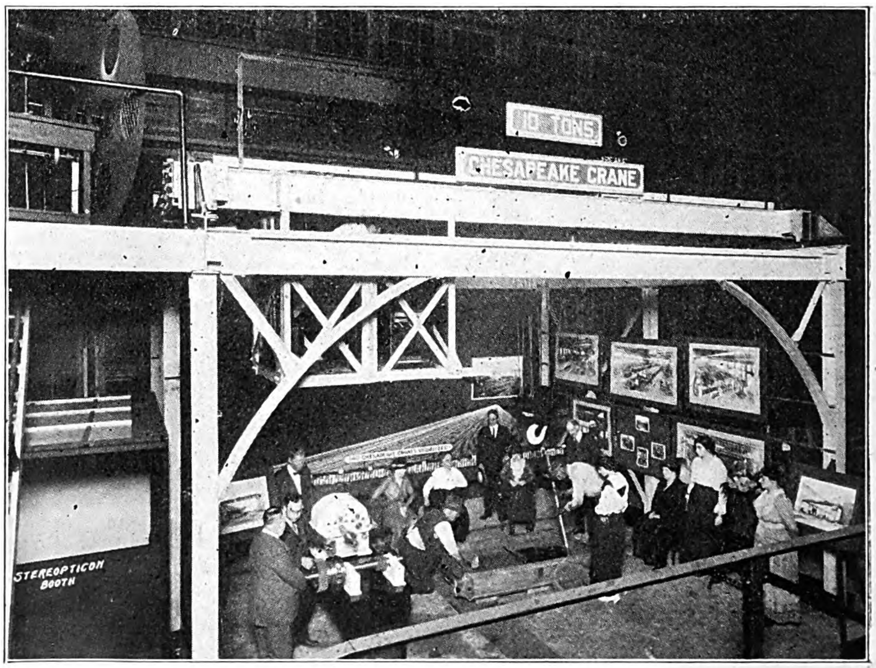
The Ideal Electric & Manufacturing Co., Mansfield, Ohio, held a sales conference at its Mansfield works during the week of Aug. 11. The following is a list of representatives who took part in the conference, S. Glen Vinson, secretary and general manager; L. S. Meeker, sales manager; T. Weiss of the Milwaukee office; C. A. Kuehn of the Cleveland office; James Kent of the Chicago office; R. F. Cooseka of the Minneapolis office and H. J. Brower of the New York office. Due to the business activities at the different agencies the district sales representatives from the following districts were unable to take part in the conference, J. M. Brugler of the Philadelphia office; A. L. Searles of the Grand Rapids office; and David Stead of the Denver office. In addition to the discussion of sales matters, the social side of the conference was a source of much pleasure to the "Ideal" men. Mr. Meeker took the various representatives through the plant explaining the details of the new types of motors under construction. From every point of view the conference afforded much benefit as well as pleasure and the Ideal Electric & Manufacturing Co. is already making plans for a more elaborate sales conference at some date in the future.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has prepared a new four-page two-color 8½x11 folder, the title of which is C-H Drum Controllers. It gives prominence to the outstanding features of C-H drum controllers which have won an enviable position in the drum controller field. Three of the features are: accessibility, interchangeability of parts and interchangeability of methods of manipulation. Any C-H standard stock drum can be equipped with either rope, radial or straight line drive and these are interchangeable. The folder plays up other points, such as, the ease with which the contact fingers and the cylinders may be removed; the absence of wood in construction; the square metal shafts, and the straight non-stubbing fingers. Dimensions, ratings and other engineering data are given. Three types having common dimensions comprise five bulletin numbers, capable of controlling and motors from 1 to 100 hp. The folder had been prepared especially for the St. Louis convention of the Association of Iron and Steel Electrical Engineers, at which it was distributed last week, but it is also being forwarded on request by those interested in drum controllers.

Mercury Manufacturing Co., 4118 South Halsted street, Chicago, is sending out an illustrated circular entitled "Mule-Hide and The Trackless Train." Mercury tractors have been applied to practically every transportation problem and have been productive of wonderful results. A typical installation of the "Trackless Train" is that in the plant of the Lehon Co., manufacturer of Mule-Hide roofing for buildings and cars, and waterproof paper and insulating paper for refrigerator cars. In this circular is contained the testimony of Tom Lehon, vice-president and general manager of the company, bearing evidence of the accomplishments of the Mercury tractor. Mr. Lehon states that since the installation of the tractors, the cost of handling raw and finished products has been reduced 25% and no mechanical trouble has been experienced with the machine. In conclusion he recommends the tractor as an excellent investment no matter how difficult the haulage problem may be and recognizes the true worth of the "Trackless Train."

The Independent Pneumatic Tool Co., Chicago, is reported to be doing a business that compares very favorably with that of last year. When the war closed there was a heavy slump in pneumatic tool orders, as a great part of the output was being taken for use in war material industries. During the war the company's energies were devoted chiefly to the manufacture of pneumatic tools, but since then the electrical tool department of the business has been pushed with such success that its sales are expected to bring the total earnings up to a level with last year's net. Agencies are now being established for the company's electrical tools in Europe and in the orient and South America, and foreign orders are reported to be growing rapidly in volume. At the company's offices it was stated that the electrical tool business of the company is expected to equal that of the pneumatic tools in the not distant future. The company has paid 15% in dividends this year and on Oct. 1 paid more than 5%.

Electric Traveling Crane Exhibited for Foundrymen.—One of the most interesting exhibits held in connection with the annual meeting of the American Foundrymen's Association at Philadelphia, on Monday to Friday of this week, was a full sized 10-ton electric Chesapeake traveling crane in actual operation. An experienced woman crane operator demonstrated the use of this labor-saving machine to the foundrymen and other visitors. This exhibit was made by the Chesapeake Iron Works, Baltimore, Md., and served incidentally to call attention to the war record of this company in this line. Within 1½ years the company built, shipped and put into continuous service over 140 large electric traveling cranes, ranging from 20 to 110 ft. in span, and aggregating nearly 6000 ft. in span. Over 40 of these cranes were shipped to France for use in United States base ordnance plants and over 45 of them did day and night service in some of the largest ordnance plans in this country. Views of some of these war cranes were shown in the exhibit booth. The accompanying illustration shows the 10-ton exhibit crane receiving its dress rehearsal at the Baltimore works just before it was dismantled and shipped to the foundrymen's exposition at Philadelphia. This exhibit was produced at the request of F. S. Chavannes, president of the Chesapeake Iron Works, under the general direction of Frank L. Perry, the company's publicity manager, who will be remembered as the old Western Electrician, which was merged with Electrical Review in 1908.



A 10-Ton Chesapeake Electric Traveling Crane Being "Tuned Up" at the Works for Exhibition Before the American Foundrymen's Association.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Fall River, Mass.—In connection with the construction of a new crude oil refinery to be located in the north end section of the city, by the New England Refining Co., estimated to cost $300,000, considerable new electrical and mechanical equipment will be required.

Greenfield, Mass.—Stanley Insulating Co. has had plans prepared for the erection of a new addition to its plant, to provide for increased operations. The structure will cost about $30,000.

New Bedford, Mass.—National Spun Silk Co. has awarded a contract to the J. G. White Engineering Corp., 43 Exchange place, New York, for the construction of a new one-story reinforced concrete power plant at its works, to cost about $100,000.

Springfield, Mass.—Westinghouse Electric & Manufacturing Co. is arranging plans for the erection of a large new addition to its plant at East Springfield.

Thorndike, Mass.—Leary & Walker, engineers, New Bedford, will soon award contract for the erection of a six-story, 75x163 ft., factory for the Thorndike Co., to cost about $175,000. A steam heating system and electric power will be installed.

Bridgeport, Conn.—Bryant Electric Co. has completed arrangements for the erection of a four-story addition to its plant on Hancock avenue, about 60x218 ft., to be used for increased capacity. The structure is estimated to cost $120,000.

Hartford, Conn.—Arrow Electric Co. has completed negotiations for the purchase of property adjoining its present plant, extending from Hawthorne street to the New Haven railroad, to be used for future expansion.

Stamford, Conn.—L. C. Terwilliger, Bridgeport, has completed arrangements for the purchase of the business of the Stamford Storage Battery Co., 22 Main street, Stamford. The new owner will continue operation of the business.

Buffalo, N. Y.—E. J. Wiggins Electrical Corp. has filed notice with the secretary of state of a change in its corporate name to the Allan Manufacturing & Welding Corp.

Dunkirk, N. Y.—Common Council is considering plans for the extension of the ornamental street lighting system from Fourth to Main streets.

New York, N. Y.—Display Stage Lighting Co., 314 West Forty-fourth street, has increased its capital from $10,000 to $50,000, for general business expansion. Notice of the increase has been filed with the secretary of state.

New York, N. Y.—Wilson-Maeulen Co., 781 East 142nd street, manufacturer of pyrometers and similar equipment, has awarded a contract to the Austin Co., 217 Broadway, for the construction of its proposed three-story plant to be located at St. Mary's street and Concord avenue, for increased capacity. Charles H. Wilson is president.

New York, N. Y.—Jandous Electric Equipment Co., 109 West Thirty-first street, has been awarded a contract for the electrical work in connection with the new public school building to be erected at Forest Hills, Long Island. The contract price was $13,456.

New York, N. Y.—Considerable new electrical and mechanical equipment will be required by the Aluminum Co. of America, 120 Broadway, in connection with the construction of its proposed three-story plant addition, about 125 by 300 ft., at Edgewater, N. J., contract for which was recently awarded to the Turner Construction Co., 244 Madison avenue.

Port Chester, N. Y.—P. R. Mallory, manufacturer of tungsten products, is having plans prepared for the construction of a new two-story and basement plant to provide for increased operations. The structure will be of reinforced concrete construction, about 40 by 112 ft., and is estimated to cost $60,000. Lockwood Greene & Co., 101 Park avenue, New York, are engineers.

Rochester, N. Y.—Plans have been filed by the Wheeler Green Electric Co., 29-33 St. Paul street, manufacturer of electric motors, etc., for the construction of a new addition to its plant, for increased capacity. The structure will be about 40 by 40 ft., and is estimated to cost $19,000.

Thorold, N. Y.—Plans are being arranged for the installation of a new street-lighting system throughout the municipality.

Elizabeth, N. J.—Considerable electrical and mechanical equipment will be required by the Warner Quinlan Asphalt Co., in connection with the construction of the proposed one-story filter plant, about 66 by 72 ft., to be located at Warner, N. J., estimated to cost $55,000.

Glassboro, N. J.—In connection with the construction of the proposed local normal school building by the State Board of Education, to be located in the vicinity of the railroad station, plans have been arranged for the erection of a power plant for general operation. The project is estimated to cost about $350,000. Calvin N. Kendall, State House, Trenton, is secretary of the board.

Hilton, N. J.—Following the acquisition of a tract of about four acres of land on Burnett avenue, Hilton, by H. Boker & Co., Inc., 101 Duane street, New York, manufacturer of steel and metal products, plans are being prepared for the construction of an initial group of buildings to form the first unit of a proposed plant by the company. Considerable electrical and mechanical equipment will also be required in connection with the new plant. Gilbert C. Higby, 207 Market street, Newark, N. J., is architect for the company.

Newark, N. J.—American Platinum Co., 231 New Jersey Railroad avenue, has had plans prepared for the construction of a new one-story brick boiler plant, about 25 by 42 ft.

Newark, N. J.—Public Service Electric Co. has filed plans for the erection of a new five-story brick and steel building and coal bunkers at its Point-No-Point electric station, about 48 by 92 ft., to facilitate operations. Estimated cost, $175,000.

Newark, N. J.—Eagle Electric Co. has filed notice of organization to operate at 158 Belmont avenue. Louis Maltz, 138 Prince street, and Morris Eklowstein, 230 West Kinney street, head the company.

Newark, N. J.—In connection with the establishment of the new plant of the Stanwood Rubber Co., located near the Newark-Elizabeth line, plans are being prepared for the erection of a new power plant, with capacity of about 1500 hp., to cost approximately $140,000. The site was formerly the property of the Diehl Manufacturing Co. and comprises a three-story reinforced concrete building with about 68,000 sq. ft. of manufacturing space. It is understood that the present power plant, a smaller structure, will be used for auxiliary operations at the works, while plans are also being prepared for a number of additions to the plant on adjoining property. It is proposed to have an initial output of about 500 cord tires a day, to be increased ultimately to 1000 tires and 2000 tubes per day. C. E. Barker is president.

Wilmington, Del.—Diamond Ice & Coal Co. is planning for the erection of a large addition to its plant, 11th street and Grant avenue, about 83 by 83 ft., estimated to cost about $50,000, and considerable electrical equipment will be required.

Bangor, Pa.—Plans are under consideration by the Bangor Central Quarry, operated by C. C. Wise and Peter Yetter, for immediate repairs in the boiler plant at the works, recently damaged by fire.

Carlisle, Pa.—C. H. Masland & Sons, Amber and Westmoreland streets, Philadelphia, Pa., have awarded a contract to the J. S. Rogers Co., Drexel building, Philadelphia, for the construction of a two-story power plant extension at its works on Carlisle Spring road, Carlisle. The structure with equipment is estimated to cost $150,000.

Catasauqua, Pa.—Town council has entered into a contract with the Lehigh Valley Light & Power Co., whereby the latter will furnish electric energy for street-lighting service to the municipality for a period of about ten years.

DuBois, Pa.—Northwest Mining & Exchange Co. is considering plans for the construction of an addition to its power plant. Seth H. Bloom is general manager.

Philadelphia, Pa.—Notaseme Hosiery Co., Mascher street, Germantown, will construct a power plant for works service in connection with its mill to be erected at Atlantic and I streets.

Philadelphia, Pa.—City has awarded a contract to the Dravo-Doyle Co., Commercial Trust building, for the installation of the proposed centrifugal pumping units at the Queen Lane pumping station. It is proposed to install four new units having a pumping capacity of 40,000,000 gal. every 24 hours. Estimated cost $404,600.

Philadelphia, Pa.—Penn Silk Hosiery Dye Works will build a new boiler plant and stack at its works.

Philadelphia, Pa.—In connection with the construction of a new five-story brick plant, about 80 by 250 ft., for the American Preserve Co., Third and Lehigh avenues, plans have been prepared for the erection of a new one-story brick boiler house, about 50 by 70 ft., to be used for general factory operation. Peuckert & Wunder, 310 Chestnut street, are architects for the company.

Pittsburgh, Pa.—Lutz & Schramm Co. has had plans prepared for the erection of a one-story boiler plant at 1412 River avenue.

Reading, Pa.—Metropolitan Edison Co. has been awarded a contract by the Textile Machine Co. for furnishing electric service for the complete operation of its plant.

Providence, R. I.—Electrical Products Manufacturing Co. has filed notice of organization to operate at 69 Sprague street for the manufacture of electrical goods. The company is an affiliated organization of the Commercial Radio Co. of America, Providence. H. A. McAvoy is secretary.

Baltimore, Md.—Maryland Color Printing Co. will install 600 hp. in motors.

Crownsville, Md.—Crownsville State Hospital has awarded a contract to the John Waters Building Co., 23 East Center street, for alterations and improvements in the power plant and heating system at the institution.

Monkton, Md.—In connection with the new plant of the Monkton Roller Mills, recently organized with a capital of $1,000,000, to comprise main manufacturing building, eight-story and basement, about 44 by 116 ft., with auxiliary structures, considerable electrical and mechanical equipment will be required. It is proposed to have a daily capacity of 2000 bbl. flour and 128,000 lb. mixed feed. Electric energy for operation will be furnished by the Consolidated Gas, Electric Light & Power Co., Baltimore. Otis E. McCoy is president, and Thomas B. Wolfe general manager.

DATES AHEAD.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Empire State Gas and Electric Association. Annual meeting, Buffalo, N. Y., Oct. 24. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

Norfolk, Va.—Norfolk Electric Manufacturing Co. plans to build a plant for the manufacture of induction motors of from 1 to 5 hp. Prices are desired on machine tools, ovens, bolts, etc. P. O. Sutton, 215 Cumberland street, is general manager.

Laurens, S. C.—Plans are under consideration by the city council for the issuance of bonds for $200,000, to cover the cost of extensions in the electric lighting and water systems, as well as other municipal work.

Plains, Ga.—Oct. 14 an election will be held to vote on the question of issuing $6500 in bonds to install an electric plant in connection with water plant. Address mayor.

NORTH CENTRAL STATES.

Akron, Ohio—Miller Rubber Co. is increasing its capital $800,000 to provide for factory expansion. This will bring its capital up to $9,832,700.

Genoa, Ohio—Nov. 4 the question of issuing $5,000 municipal light bonds will be submitted to vote. Address village clerk.

Mansfield, Ohio — Westinghouse Electric Products Co. will enlarge its plant by the erection of a six-story addition which will provide about 80.000 sq. ft. of floor space. The extension will be used for the manufacture of heating appliances, electric irons and similar products.

New Madison, Ohio—Madison Lighting Co. has increased capital from $3500 to $10,000.

Norwood, Ohio—Insurance adjusters inspected the ruins of the Norwood municipal electric light plant and water works and then requested the city officials to repair as far as possible the damage caused by fire. Address Harry J. Pierson, service director.

Oberlin, Ohio—A bond issue of $50,000 has been authorized for the construction of a municipal electric light plant.

Greencastle, Ind.—Standard Heating Sales Co. has changed its principal office from Terre Haute, Ind., to Greencastle, Ind.

Hammond, Ind.—American Steel Foundry Co. has purchased a tract of land in the Indiana Harbor factory district involving nearly $1,000,000. The tract comprises 100 acres, just south of the harbor ship canal and has a canal frontage of one-half mile. A program of expansion is being mapped out to begin as soon as the strike is over. This purchase quadruples the land holdings of the American Steel Foundry Co. and makes it one of the heaviest land owners in the Calumet factory district.

Indianapolis, Ind.—Haywood Tire & Equipment Co. will build a foundry to cost $75,000.

Indianapolis, Ind.—Cole Motor Car Co. will add two new buildings to its plant at Washington and Davidson streets. The expansion will involve an expenditure of $1,000,000. First building to be completed by Jan. 1, will be five stories, steel and brick construction, 180 by 228 ft. The second building, to be completed March 1, 1920, will be a duplicate of the first and will be 132 by 212 ft.

LaPorte, Ind.—Wanatah Electric Co. has changed its name to the Wanatah-LaCrosse Electric Co.

Muncie, Ind.—City council has authorized the erection of a new city building to cost $250,000.

Chicago, Ill.—American Car & Foundry Co. will build addition to its present plant on South Paulina street, south of Blue Island avenue, to cost, together with the rebuilding of the old plant, about $2,000,000. The present plant will eventually be torn down and a new one similar to the proposed addition will be built. The plant will have a capacity of 50 steel freight cars per day. It now turns out 30 daily. It will be one of the largest of the 16 freight car plants of the company.

Chicago, Ill.—Architect Z. E. Smith, 305 East 55th street, Chicago, has prepared plans and will let contracts for $200,000 shop and power house to be erected. Specifications include power station equipment, electrical equipment, boilers for steam heating.

Delavan, Ill.—Delavan, Green Valley and San Jose will be supplied with day and night current for light and power by the plant which is being rebuilt by F. B. Hullinger of San Jose, Ill. Mr. Hullinger has completed an addition, 40 by 60 ft., to his building and is installing two new boilers, 150 and 95 hp. respectively, and two new generators of 150 and 90 kv-a. respectively. A transmission line, 12 miles in length, will be built to connect Delavan and Green Valley with San Jose. The plant at Delavan will be closed. Green Valley has not been served with electric light and power before.

Elgin, Ill.—A bond issue of $200,000 is planned for a municipal lighting and electric power plant.

Elgin, Ill.—Elgin Sanitary Milk Co. will erect a $25,000 milk bottling plant. Address Oscar Ludwig, president.

Galesburg, Ill.—Farmers and Mechanics Bank will erect new bank and office building to cost $150,000.

Rankin, Ill.—Architects McCoy and Skaddin, Dale building, Rankin, have prepared plans for $30,000 water works and power house to be erected by city. The building will be one story in height, 30 by 86 ft. in dimensions. Address superintendent of water department.

Urbana, Ill.—University of Illinois will build new addition to power house to accommodate two 500-hp. boilers which are being added to the equipment.

Detroit, Mich.—Detroit Edison Co. will erect an $80,000 addition to its power plant. The specifications include generators, transformers, etc. Address Alex Dow, president, Whitman building, Detroit, Mich.

Detroit, Mich.—General Ice Delivery Co. is having plans prepared for the construction of a one-story 36 by 322 ft. ice storage plant on Warren avenue. An electric motor for power and an ice handling conveyor will be installed. Dalton R. Wells, 435 Woodward avenue, architect.

Escanaba, Mich.—If plans now under way materialize Escanaba is to have a great "white way." The plans now being worked out contemplate the erection of a large number of cluster lights on both sides of Ludington street from Oak street down to the post office block. Address Jacob Kratze.

Kalamazoo, Mich.—The city will hold an election Nov. 4 to vote on the issuance of $1,250,000 electric light bonds.

Reed City, Mich.—Osceola Light & Power Co. plans the installation of an auxiliary plant. It is reported that the company has placed orders for engines and boilers for the plant.

Ashland, Wis.—Northern National Bank will erect new bank building to cost, exclusively of interior work, $47,500.

Osseo, Wis.—The city council has under consideration the purchase of the local electric light plant and also the installation of a waterworks system.

Portage, Wis.—Contracts have been awarded for the Portage Madison, Janesville Interurban Railroad. After practically a standstill in construction for several years a contract has been awarded for completion of the line according to J. E. Jones, Portage, head of system.

Waupaca, Wis.—Waupaca county will receive bids for a hydroelectric power plant. Address E. H. Josslyn, Algoma block, Oshkosh, Wis.

Beverley, Kans.—Ordinance has passed granting a franchise to John S. Painter to furnish electricity to the city for a period of fifteen years. Waldo Hancock, city clerk.

Coldwater, Kans.—Election to vote $35,000 in bonds for the purchase of a new engine and to make other improvements to the water and power plant, carried.

Elk City, Kans.—C. R. Long, Elk City, has been granted a franchise to install a light plant that will give the city 24-hour service, starting with 50 street lights.

Garden Plain, Kans.—N. B. Rollins & Co., 209 Railroad Exchange building, Kansas City, Mo., engineers, have prepared plans for electric light plant to be erected by city. E. Behm, city clerk.

Hudson, Kans.—Engineers N. B. Rollins & Co., 209 Railway Exchange building, Kansas City, Mo., engineers, have prepared plans for a $15,000 electric transmission line to be built from Hudson to Stafford, Kans. Address Esther Arnold, city clerk, Hudson, Kans.

Junction City, Kans.—Riverside Power & Light Co. is making plans to extend its lines to White City and will form a circle of towns around this city. The company now furnishes power to more than forty towns in Kansas.

Richmond, Kans.—Plans are in progress for the construction of a transmission line from Ottawa, wiring the city of Richmond, purchasing meters, transformers, street lights and all other necessary equipment.

Seneca, Kans.—A new "white way" will be installed in the near future, which will extend four blocks.

Willis, Kans.—Engineers N. V. Rollins & Co., 209 Railway Exchange building, Kansas City, Mo., has prepared plans for a $9000 electric transmission line f rom Willis to Horton, Kans. Address E. Piner, city clerk, Willis, Kans.

Aurora, Mo.—Aurora contemplates purchasing one 15-hp. engine and 9-kw. dynamo for light plant.

Independence, Mo.—Election to vote $65,000 in bonds for the additions and extensions of municipal light and power plant, carried.

Marshall, Mo.—$46,000 in bonds have been voted for erection of electric light plant. Address mayor.

Richmond, Mo.—Plans are in progress for the installation of a "white way." Subscriptions are being solicited from business men.

Beatrice, Neb.—A new hotel to cost $500,000 will be erected by business men of the city.

Holmesville, Neb.—Plans are being prepared for erection of transmission line from Holmesville plant to supply current from lighting towns of Rockford, Filley, and Virginia. Address G. L. Humford, county auditor.

Kimball, Neb.—Election to vote $20,000 for electrical equipment carried.

Lexington, Neb.—The entire milling plant of the Platte Valley Milling Co. at Gothenburg, near here, burned, the loss being placed at $200,000, partly insured. The power plant, mill, elevator and office were destroyed.

Omaha, Neb.—City council has passed ordinance providing for the submission of $100,000 city jail bonds at the time of the regular election Nov. 4.

Plainview, Neb.—An election for a $24,000 bond issue for the installation of an electric light plant, carried.

Fargo, N. D.—$175,000 in bonds have been voted for erection of municipal light plant. John E. Hogan, commissioner.

Great Bend, N. D.—Business men and farmers have incorporated to build an electric light plant. The transmission line will extend from Hankinson to Wild Rice river. Work will be commenced soon. Address Joseph A. Renke, director.

Halton, N. D.—Bonds to the amount of $10,500 have been voted by the city for improvement to the electric light plant.

Madison, S. D.—The city commissioners have awarded to a Minneapolis concern the contract for erecting a power house, to replace that destroyed by fire some months ago.

SOUTH CENTRAL STATES.

Paducah, Ky.—An election will be held in November to vote on the question of issuing $100,000 municipal light bonds.

Clarksdale, Miss.—Johnson-Harlow Lumber Co. will improve its plant and install electric conveying equipment.

Jackson, Miss.—Jackson Light & Traction Co. will improve its electric generating plant. Address L. O. Gordon, manager.

Texarkana, Ark.—Southwestern Gas & Electric Co. is arranging plans for doubling the present capacity of its power plant. It is said that new generating equipment will be installed, the work being estimated to cost $75,000. W. L. Wood is general manager.

Wynn, Ark.—Plans are under consideration by the city for the construction of a new electric light plant, to be used for municipal service. The structure is estimated to cost $90,000.

Ponca City, Okla.—The city council has approved the proposed bond issue for $50,000 to cover the cost of extensions in the municipal electric light plant. W. H. McFadden is mayor.

Shattuck, Okla.—Plans are in progress for waterworks and electrical improvements to cost $75,000. Burns & McDonnell, Kansas City, Mo., engineers. O. W. Nichelson, city clerk. Bonds have been approved and will be sold in the near future.

Abilene, Tex.—American Public Service Corp. will erect plant here. The plans and specifications call for an expenditure of over half a million dollars and it will be one of the finest and best equipped electric ice and power plants in Texas. There will be large cold storage rooms in connection with the plant. High-power lines will be built from Abilene to Anson and other towns in this part of the state. The building will be fireproof throughout and the machinery all new and of the very latest design. A. Hardgrove, general manager.

Dalhart, Tex.—A modern lighting system is to be installed with the wiring under ground. Work will begin soon.

Marshall, Tex.—The installation of a "white way" is being considered.

Menard, Tex.—Menard Light & Power Co. is considering plans for improvements and alterations in its plant to facilitate operations. It is understood that new generating equipment will also be installed, the entire work being estimated to cost about $40,000.

WESTERN STATES.

Fort Sumner, N. M.—It is planned to install a large hydroelectric plant when the new dam is built, both for light and power purposes. The plant is estimated to cost between $35,000 and $40,000.

Nampa, Ida.—The Nampa Chamber of Commerce is considering the installation of a boulevard lighting system to replace the lights now in use.

Missoula, Mont.—The remodeling of the Missoula Light & Water Co.'s power dam in the Missoula river near Milltown, will cost about $85,000, according to H. L. Bickenbach, superintendent of the street railway here, who will have charge of the work.

St. George, Utah—Certificate of convenience and necessity was granted to the Dixie Power & Light Co. by the state public utilities commission authorizing the erection of a generating electric plant about 21 miles from St. George on the Santa Clara river. The company furnishes St. George and the surrounding territory with electricity and power now but desires to enlarge its plant in order to increase its capacity. Address T. L. Parker.

Seattle, Wash.—The city council has passed an ordinance appropriating $420,000 for expenditure in initiatory work on the city's Skaget river hydroelectric plant, 100 miles northeast of the city. The first work will consist of building a road, already located and surveyed, and the installation of a sawmill and power plant for construction purposes. The purpose is to engage a construction engineer to supervise the work of carrying out the plans to be furnished by the city engineer. It is proposed to pay the construction engineer an annual salary of $10,000 to $15,000.

Spokane, Wash.—F. E. Martin will erect a power house at the Edgecliff sanitarium at a cost of $21,110, contract having been awarded by the county commissioners.

Astoria, Ore.—Negotiations have been completed by the Pacific Power & Light Co. for the purchase of property located on Young's Bay, Astoria, comprising a total of about 15 acres, to be used as a site for the construction of a large new power, light and gas plant. In connection with the new plant, a distributing system will be constructed to furnish electric energy, etc., in the lower Columbia river district. The works are estimated to cost $75,000.

Bend, Ore.—The construction of a 1000-kw. steam plant is contemplated by the Bend Water, Light & Power Co. The new plant will double the present power outfit. Estimated cost, $100,000. J. H. Foley, Bend, manager.

Florence, Ore.—The Florence Electric plant owned by G. G. Bushman of Eugene was burned, causing a loss of $10,000. It will be rebuilt.

Grants Pass, Ore.—Plans are being arranged by the California-Oregon Power Co. for the construction of a new electric transmission line to extend from Medford to Roseburg.

Portland, Ore.—Northwestern Electric Co. has had plans prepared for extensions in its steam and electric mains, and active work has been inaugurated recently. The improvements are estimated to cost $100,000. G. C. Pierce is vice-president and general manager.

Chico, Cal.—Board of Trustees is understood to be arranging plans for the erection of a new local power plant and distributing system, to be used for municipal service.

Copperopolis, Cal.—Calaveras Copper Co. is understood to have completed plans for the erection of a new power plant and reservoir at its local plant, to be used for the furnishing of electric energy for general works operation.

Los Angeles, Cal.—Announcement has been made that plans are being prepared by the Goodyear Tire & Rubber Co., Akron, Ohio, for the erection of a large new plant on property recently acquired. The new factory will include a number of structures for various departments of operation, as well as the erection of an electric power station. Considerable electrical and mechanical equipment will be required in connection with the proposed project, which is estimated to cost in excess of $3,000-000.

Los Angeles, Cal.—In connection with the new packing plant to be constructed at Vernon by the California Provision Co., large quantities of electrical and mechanical equipment will be required. The works will comprise a number of structures, including boiler plant and refrigerating department. Estimated cost, $200,000.

Pasadena, Cal.—Warnerlite Co., Davenport, Iowa, manufacturer of electrical products for automobile service and kindred specialties, is planning for the construction of a large new local plant. The works will be erected on the unit system and it is understood that the initial structure is estimated to cost about $100,000.

Petaluma, Cal.—Petaluma - Santa Rosa electric railroad is planning to increase its present operations. Plans are being prepared for the extension of its electric system from Forrestville to extend to the Russian river at the Walls-Ford bridge.

Richmond, Cal.—Pacific Oil & Lead Co. has completed arrangements for the installation of 40-hp. additional in motors at its plant, to provide for increased operations. Electric energy will be furnished by the Western States Gas & Electric Co.

Richmond, Cal.—Plans are under consideration by the city council for the installation of a number of new electroliers for extensions in the street lighting system in the downtown district. It is understood that about 117 units will be installed.

Richvale, Cal.—Board of Supervisors has granted a franchise to J. W. Northedge providing for the operation of an electric light plant for the furnishing of electric service to Richvale. Power will be purchased from the Pacific Gas & Electric Co.

Whittier, Cal.—Southern California Edison Co. will build a new brick structure at Greenleaf and Penn streets, to facilitate operations. The building will be about 100 by 100 ft., and is estimated to cost $20,000.

PROPOSALS

Electric Light and Power Plant.—Bids are desired for the erection of a complete electric light, ice and power plant for the city of Wharton, Tex. Address C. M. Hughes, alderman ward No. 1, Wharton, Tex.

Power Plant Equipment.—Bids will be received at Youngstown, Ohio, until Oct. 13 for additions and alterations to electrical equipment of power plant in Mahoning county court house. Crippen & Funk, Ohio Hotel, engineers.

Lighting Fixtures.—Bids will be received Oct. 10 by the Board of Education of Independent School District, Virginia, Minn., for lighting fixtures for the vocational high school building, according to plans prepared by A. W. Kerr & Co., architects and engineers. Address C. R. Johnson, clerk.

Centrifugal Pumps.—Bids are desired by Clinton, S. C., for drilling one or two wells 10-in. or 12-in. in diameter at start, 8-in. or 10-in. finish, 500 to 700 ft. deep, and a centrifugal pump 750 to 1000-gal. capacity, to work against 550 lb. B. B. Mills, superintendent.

Hydroelectric Plant Equipment.—Until 10 a. m., Oct. 17, bids will be received by the Board of Public Works, Seattle, Wash., for furnishing hydroelectric machinery involved in the installation of an additional unit to the Cedar Falls hydroelectric station. C. B. Bagley, Room 234 County-City building, secretary.

Motor-Driven Pump.—Bids will be received by the board of trustees of the State Institute for Feeble-Minded of Western Pennsylvania at Polk, Pa., until Oct. 8 for furnishing a motor-driven low-service centrifugal pump and liquid chlorine machine with platform scales. Specifications may be obtained from Chester & Fleming, engineers, Union Bank building, Pittsburgh, upon deposit of $10. Marvin F. Scaife is secretary of the institution.

Personals

R. J. Gaskill Elected President International Municipal Electricians — J. J. Carrick Joins Paul W. Koch & Co.

CHARLES E. MERRILL, for the past ten years general purchasing agent for the Manhattan Electrical Supply Co., New York City, is now general manager of the Parr Electric Co., wholesale and export electrical supplies, New York City.

WILLIAM BURLEIGH has become chief engineer of the Machinery Sales & Electric Co., Detroit, in charge of designing, estimating and engineering of elevating and conveying equipment. For the past three years Mr. Burleigh has been connected with the Packard Motor Car Co., Detroit, in the capacity of assistant engineer.

JOHN J. CARRICK, who recently received his release from the Navy, has become identified with Paul W. Koch & Co., Chicago, in the capacity of sales engineer. After Mr. Carrick received his technical education he served three years in the electrical department of the Lincoln Park Board, Chicago, which period he spent in the construction of the power plant and underground cable system for park and boulevard lighting. Resigning this position he became connected with the Cutter Electrical & Manufacturing Co., Philadelphia, and for five years served as sales engineer in its Chicago office. At the outbreak of war Mr. Carrick entered the United States Navy with the Illinois Naval Militia, where he served for over two years, spending one year as electrical officer while with the Atlantic Fleet on the *U. S. S. Vermont.* He received the commission of lieutenant senior grade and was recently placed on the inactive list of the Navy.

F. M. WILKES has been appointed commercial agent and new business manager for the Arkansas Light & Power Co., Pine Bluff, Ark., succeeding W. F. Moody. Following his graduation from the Kentucky State University in 1908, Mr. Wilkes served in the power apparatus shops of the Western Electric Co., Hawthorne, Ill. After a year's service he became connected with the Public Service Co. of Northern Illinois as district superintendent in charge of inside and outside construction, continuing in this capacity for three years, when he was appointed consulting engineer associated with Henry C. Wood, Chicago, in 1913, in charge of power contract department, covering the operation of coal mines and the pumping plants in southern Kentucky. He later entered the service of the Missouri Public Utilities Co. as commercial manager with headquarters at Poplar Bluff, having charge of territory comprising the rice farming districts near Dudley and Fisk, Stoddard and Butler counties, Missouri, directing the electrically driven pumping stations for irrigation purposes. During the period of the war Mr. Wilkes served as a captain in the Signal Corps.

ROBERT J. GASKILL, who was elected president of the International Association of Municipal Electricians at its Chicago convention last week, is chief electrician of the city of Fort Wayne, Ind. Though a native of Pennsylvania, born in 1885, Mr. Gaskill was raised and received his early education in Indiana. His first electrical work was with the Bell Telephone Co. and the Western Union Telegraph Co., being employed in line construction work in northern Indiana and Ohio. In 1906 he entered the electrical department of the city of Fort Wayne, becoming chief

R. J. Gaskill.

electrician in the department of public safety the following year, which position he held until 1917, when he enlisted in the army and entered an officers' training camp. He was commissioned a lieutenant in the Artillery and later transferred to the Signal Corps and assigned to the 310th Field Signal Battalion, which went overseas in July, 1918, and served in the Toul sector in France and after the armistice with the Army of Occupation in Germany. He was discharged from the army in July, 1919, and returned to his former position with the city of Fort Wayne. Mr. Gaskill has always been greatly interested in the International Association of Municipal Electricians. He was vice-president for two years, a member of the executive committee for one year and was elected president at the Baltimore convention in 1916. His enlistment in 1917 prevented him from completing his term as president and as a tribute to his patriotism and ability the members again elected him president of the association.

H. C. HANCOCK, who has for several years represented the Trumbull Electric Manufacturing Co., Chicago branch, in the mid-western states, has severed his connection to accept the position of industrial engineer with the Great Lakes Electrical Co., Detroit, Mich., which is said to be the largest electrical supply jobber in the state of Michigan.

CLIFTON R. HAYES, who was elected president of the New England section of the National Electric Light Association at its annual convention last week, is manager of the Fitchburg Gas & Electric Light Co., Fitchburg, Mass., and is one of the best known central-station managers in the Northeast. He was born in Fitchburg, Mass., forty years ago and was graduated in electrical engineering from the Worcester Polytechnic Institute in 1901, and in 1909 received the degree of E. E. from that institution. Mr. Hayes has had a varied experience, including electrical engineering in both industrial and public utility organizations previous to becoming manager of the Fitchburg Gas & Electric Co. about eleven years ago. He was for two years assistant to the superintendent of motive power, Worcester Consolidated Street railway, and for five years electrical engineer for the Ludlow Manufacturing Associates. He is a past-president of the Fitchburg Y. M. C. A. and the Fitchburg Rotary Club, and last year was president of the Tenney Service Association, an organization of managers of public utilities, managed by Charles H. Tenney & Co., Boston.

Obituary.

C. H. HILL, chief electrical inspector of the Philadelphia Fire Underwriters' Association, middle department, and for many years associated with Washington Devereux on the staff of that organization, passed away on Sept. 23, and was buried from his late home in Palmyra, N. J., on Sept. 26.

CHARLES E. LORD, general patent attorney of the International Harvester Co., Chicago, died Sept. 25 from injuries sustained at the company's Deering harvester works when the automobile in which he was going through the plant was struck by a switch engine. Mr. Lord had been the head of the harvester patent department since 1912. He had previously been an examiner in the patent office at Washington, and later was in the service of the General Electric Co., Schenectady, N. Y., and still later with the Bullock Electric Co., Norwood, Ohio, and Allis-Chalmers Manufacturing Co., Milwaukee, Wis. He was a member of the American Society of Mechanical Engineers, Society of Automotive Engineers, Patent Lawyers' Association of Chicago, American Bar Association, American Institute of Electrical Engineers, and other organizations.

Financial News

Valuation at War-Time Prices Opposed.

A joint petition of the Southern Illinois Light & Power Co. and the Centralia Gas & Electric Co. for authority to purchase and sell electric and gas property of the Centralia company has been dismissed by the Illinois Public Utilities Commission. On the question of war-time prices, the decision says: "The commission cannot subscribe to a valuation which is based upon war-time prices in a case where substantially no investment has been made under war-time conditions. To do so would result in burdening a public already carrying a heavy load of war-time prices with increased costs of service received from plant and equipment which has experienced no added usefulness because of the war-time situation. Such a burden so placed could benefit only the interests selling the property, to the permanent disadvantage of the public which receives the service and the utility which would assume the responsibility of operating it upon a financially sound basis. We do not wish to be understood as condemning investment wisely and prudently made in the necessary development of utility property during war times. In many cases extensions and betterments have been made in the interests of the public good under these unusual and trying conditions. Capital so invested is entitled to consideration, but such does not appear to be the case to any marked extent in the present case."

Standard Gas Pays Dividend Debt.

All the back dividends on Standard Gas & Electric Co. preferred stock, amounting to 13%, were ordered paid by the directors, in common stock at par, and stock has been mailed to the preferred stockholders. A statement by President H. M. Byllesby accompanying the dividend announcement says that "in the first six months of 1919, without regard to any earnings accruing from its interest in the Shaffer Oil & Refining Co., your company has earned at the rate of over 7% per annum upon its common stock.

"In view of the now rapidly growing position of your company, it was deemed best to pay the accumulated dividends in this manner, rather than to deplete the company's cash resources at a time when it has large and increasingly profitable employment of its funds," the statement adds.

"From the earnings and general condition of your company and the rapidly expanding growth of its newly acquired oil and other interests there appears no reason why the earnings available for the common stock should not rapidly increase and place the value of the common stock of Standard Gas & Electric Co. substantially in excess of par."

Bell Telephone to Sell Notes.

To finance the continued growth of the Bell system, the American Telephone & Telegraph Co., it was announced recently, has arranged to sell $50,000,000 three-year 6% notes. It is expected that a public offering of the notes will be made shortly by a syndicate of bankers. An official of the company was quoted in New York as stating that action already taken by state commissions or consideration already given the present rate schedules of the company and its subsidiaries give assurance that nothing will be done by the rate regulation bodies to jeopardize the company's earnings, which are now, and for the last 13 years have been, sufficient for the payment of all charges and a dividend of 8% on the company's capital stock. The note issue has been underwritten by a syndicate headed by J. P. Morgan & Co.

The Allis-Chalmers Manufacturing Co., it is reported, for the nine months ending with September will have earned for the stock around $2,800,000 after all expenses and taxes. It is figured at this rate earnings on the common for the entire year would be about $8.50 a share after 10% on the preferred.

$4,989,000 Detroit Edison Bonds Offered.

The Harris Trust and Savings Bank (Chicago), Coffin & Burr, Spencer Trask & Co., First and Old Detroit National Bank, Detroit, and the Security Trust Co., Detroit, are offering $4,989,000 Detroit Edison Co. first and refunding mortgage 5% bonds. The bonds are due July 1, 1940, and are being offered at 89 and interest.

The company does the entire commercial electric lighting and industrial power business in Detroit and vicinity, serving a population estimated at over 1,000,000.

During the past seven years gross earnings have more than trebled, while net earnings are almost exactly two and three-quarters times the interest charges on all the mortgage bonds, including this issue. As officially reported for the year ended Aug. 31, 1919, gross earnings were $15,357,202 and net earnings $4,203,261.

Kentucky Utilities Bond Issue.

An offering of $3,500,000 first mortgage lien 6% gold bonds, series "A" of the Kentucky Utilities Co. is being made by Halsey, Stuart & Co., Chicago. The bonds are offered in denominations of $1000, $500 and $100 at 95.84 and interest, yielding 7%, and become due Sept. 29, 1924. They will be a direct obligation of the company and will be secured by a first mortgage upon all of the company's fixed property, rights and franchises now owned or which may hereafter be acquired with the proceeds of these bonds, and by a first lien upon the properties of the Electric Transmission Co. of Virginia through the pledge under the mortgage of all the first mortgage bonds and capital stock of that company now or hereafter outstanding.

The Kentucky Utilities Co., organized in 1912, owns and operates public utility properties. Not later than Oct. 1 the company will absorb the Tennessee Public Service Co., and will acquire all of the first mortgage bonds and capital stock (except qualifying directors' shares) of the Electric Transmission Co. of Virginia. These three companies have been operated practically as a unit for four years and are now serving, primarily with electric light and power, 38 communities with one or more public utility service, viz.: 38 with electric light and power, 8 with ice, 6 with water, 1 with gas, and 2 with street railway service. The company also owns all of the capital stock of the Kentucky Light & Power Co., which supplies light and power to five communities in western Kentucky.

Net earnings of the combined properties for the year ending Aug. 31, 1919, amounted to $448,862.07, or over twice the annual interest charges of $210,000 on all first mortgage lien bonds outstanding.

Progress Slight in Foreign Credit.

Bankers interested in plans for extending financial assistance to Europe, state that while the general situation is unchanged, some progress has been made in enlightening exporters, manufacturers and others on the necessity of their cooperation in extending credits to those countries in dire need.

Concerns who at first displayed little interest or enthusiasm in the bankers' plan now seem to be realizing the importance of bringing the suggestions to a head so that the matter of assisting Europe may be expedited.

War Finance Loans Repaid.

Advances of $220,885,523 have been repaid to the War Finance Corporation, according to announcement recently, leaving outstanding a balance of $105,797,989. The loans have been made to railroads, public utilities, industries and cattle growers. Although the corporation has authority to issue $1,000,000,000 in bonds for the financing of export trade it is not expected that any advances for this purpose will be made before the conclusion of peace.

Hurley Machine Plans Capital Increase.

Bonbright & Co., Inc., Chicago, and J. G. White & Co., New York City, are offering $1,500,000 three-year 7% gold notes of the Manila Electric Railroad & Lighting Corp. at 98½ and accrued interest. The notes are dated Sept. 1, 1919, and mature Sept. 1, 1922. The proceeds of this issue will be used for additions and improvements made necessary by the steady growth of the business. A sinking fund equal to 12½% per annum of the authorized amount of this issue must, during the life of these notes, be expended either for betterments and improvements to the property or used to retire notes by purchase in the market at not exceeding the redemption price or to redeem the same. These notes are a direct obligation of the company and are issued under a trust indenture by which the company covenants that while any of these notes are outstanding none of its subsidiaries shall create any new mortgage and that no new mortgage other than purchase money mortgages shall be created on any of the company's property without equally and ratably securing this issue. They are followed by $6,000,000 common stock which has paid dividends regularly since 1906 and since 1911 at the present rate of 6% or more per annum. The company during this period has also appropriated out of earnings $1,232,000 for replacements and renewals, and in addition has built up a surplus of $1,914,251, a total of $3,146,251. The corporation through its subsidiaries furnishes the entire electric light and power and railway service to the city of Manila and its environs in the Philippine Islands, having a total population of about 350,000. Average net earnings for the past ten years have been equal to over two and one-third times all interest charges including interest on these notes. For 1918 they were in excess of three and one-third times all interest charges. For 1918 65.5% net earnings were derived from the sale of electricity for light and power and 32.5% from the street railway service.

Railway & Light Reports Profits.

The reports for the year ended July 31, 1919, of the Railway & Light Securities Co. places the total profits at $256,095, profit from income $152,783, total income $178,760, and a surplus after dividends of $28,760.

The balance sheet as of July 31, 1919, shows cash on hand for redemption of collateral trust 5% bonds, $175,154; cash not including funds for redemption of collateral trust 5% bonds, $17,988; notes receivable, $165,348; surplus, $629,202, and total assets and liabilities, $3,657,241.

Western Power Placed on Six Per Cent Basis.

The Western Power Corp. has declared a dividend of 1½% on the preferred stock, placing the stock on a 6% annual basis, payable Oct. 15 to stock of record Sept. 30. Preferred dividends have been at the rate of 4% annually, with 2% a year being added to accrued dividends. There is now 12¾% in back dividends due on the stock.

Southern Traction of Illinois Sold.

Federal Judge English at Urbana, Ill., has approved the sale at public auction of the Southern Traction Co. of Illinois for $400,000. The purchaser, H. D. Mepham of New York, original promoter of the road, was instructed to pay the balance of the purchase price on or before Oct. 10.

Willys Corporation Expansion.

It has been announced that the new Willys Corp. will be in effect a combination to permit expansion of the Electric Auto-Lite Corp. of New York, the New Process Gear Corp. of New Jersey, and the Duesenberg Motors Corp. of New Jersey. The Willy Corp. will be capitalized

Outdoor Substations in Connection with Coal-Mining Installations

General Requirements and Station Design — High-Tension Current Control — Salient Considerations

By H. W. YOUNG

President, Delta-Star Electric Co.

DEVELOPMENT of high-tension outdoor substations during the past few years has been due primarily to economic reasons. The demand for power in small communities could not be met with the conventional and comparatively expensive indoor types unless the rate for service was materially increased. That the various problems incident to development have been solved successfully, it is only necessary to point to the wide adoption of outdoor substations by utility companies. Passing at once to the question as to whether outdoor substations are applicable to the power requirements of coal mines, it

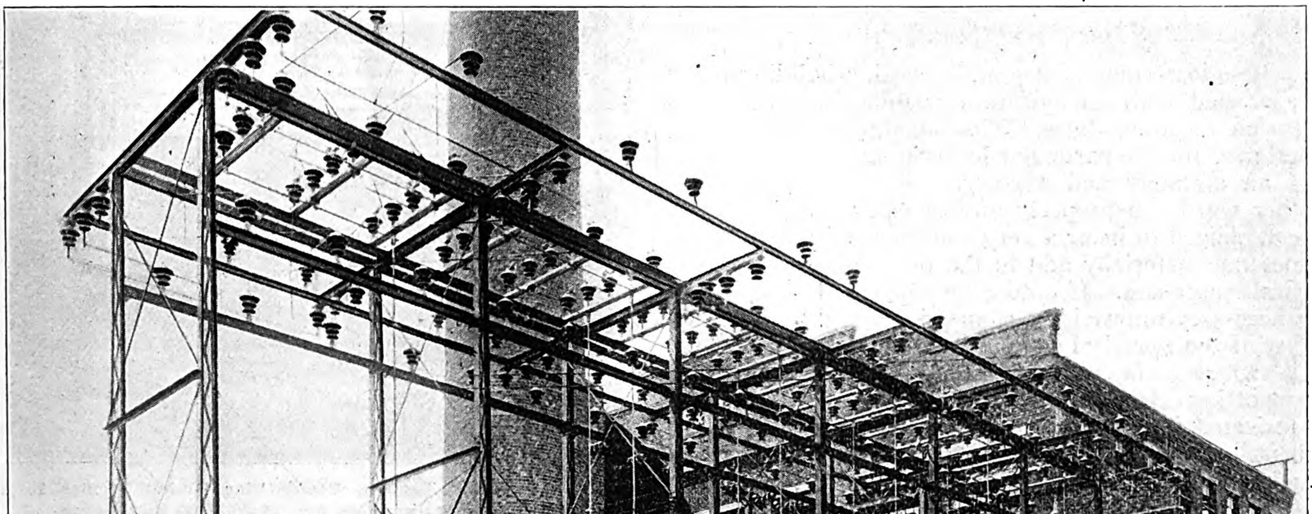

Fig. 1.—33,000-Volt Stepup Outdoor Substation Installation Outside a Power House Generating at 2300 Volts Stepping Up to 33,000. Twenty-one Coal Mines Are Supplied From Lines Leading From This Installation.

is well to consider first the elements entering into their construction.

Self-cooled outdoor transformers are no longer an experiment. The chief difference between an indoor and an outdoor transformer is in the type of bushings and cover. The outdoor type is commercially available in any desired capacity or voltage.

There are two distinct types of high-tension switches, the oil-break and the air-break forms. The oil-break switches are simply a development of the indoor types, the principal difference being in housings and terminals. They are thoroughly developed and in successful operation. Air-break switches are an accepted standard for transmission systems and are available in several forms. When provided with arcing horns or discharge horns, they can be used to open loaded circuits.

Lightning Arresters, Choke Coils, Fuses and Wiring Supports.

Outdoor types of electrolytic, oxide film and horn-gap arresters with or without limiting resistance are fully developed and have good service records. Outdoor choke coils are of the same general design as the indoor type with the exception of the insulating supports. The modern high-tension fuses can be used equally well indoors or outdoors, the only difference being that the outdoor mountings have petticoat instead of pillar-type insulators. High-tension wiring supports are standard commercial devices. Like the indoor types, they are made in many forms and assembled to meet the various wiring conditions.

Construction Requirements.

If indoor equipment is to be used, a building must be erected with wall or roof bushings for the high tension incoming lines. This building must first be designed for the particular location, hence the services of an architect and a contractor are required. In other words, to properly protect equipment, we have been obliged to incur a very considerable expense that does not materially add to the operation of the electrical equipment. If outdoor equipment is selected, it is necessary to provide a supporting structure for only part of the electrical equipment; the transformers and oil switches simply requiring a foundation slab. The supporting structure is composed of steel sections fabricated in a factory and shipped with the equipment, thus eliminating the expense of the architect and contractor, necessary with the indoor station.

The outdoor substation steel structures are of simple design and can be erected by common labor under the direction of a foreman connected with the electrical department of the mine. The steel-tower outdoor substation does not require much foundation preparation but can be erected on small concrete pillars on the side of a hill, on a piece of waste ground, or at points not suitable for other purposes.

General Design.

The general design of outdoor substations has been thoroughly standardized, the actual assembly of elements depending upon local conditions to be met. Where two sources of power, such as a double-circuit transmission line, are available, proper switching arrangements must be provided. A standard design for connecting transformers to either or both of two parallel and synchronous lines is shown in Fig. 3.

At the top of the tower are mounted two sets of three-pole, double-break-per-phase, air-break switches provided with separate interlocked operating mechanisms. Each switch has its own operating shaft and a handle so located that opening and closing the switch can be accomplished from ground level. In the high-tension side of the transformer wiring are located three single-pole combination choke coil and fuse units. On the opposite side of the tower are mounted three fused disconnecting switches connected to the separately mounted three-phase lightning arresters. From the one line diagram, the connections can be easily traced. The choke coils are so located that incoming high voltage surges or lightning disturbances are reflected to the arresters, where they will be discharged in the usual manner.

An important feature of this design is in the elimination of an expensive automatic oil circuit breaker on the high-tension side. That this saving can be made without jeopardizing the transformers is not generally understood by purchasers who often needlessly specify their use. It is essential that the expense be kept to the lowest possible value consistent with safety and good operation. As there is quite a difference in the cost of substations using automatic circuit breakers and air-break switches with fuses, the question immediately arises as to whether we can afford to use this lower cost equipment.

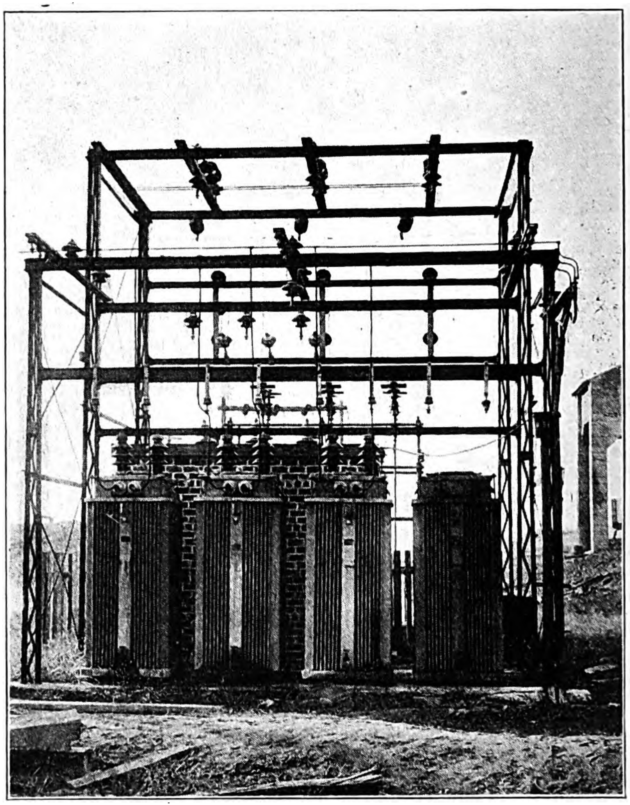

Fig. 2.—Substation Tapping Power Line Giving Service to a Coal Mine Containing 900-kw. 33,000/2300-Volt Three-Phase Transformer.

Damage Caused by Short Circuits.

It is conceded as a fact that the severity of damage done to transformers during short-circuit condition is in direct proportion to the amount of energy flowing into the circuit before the transformers are disconnected. Whether an automatic oil switch or fuse will clear the short circuit in the least time can be answered as follows: High-tension automatic oil switches of good design will open in approximately 0.16 sec. under short-circuit conditions. High-tension fuses of good design will clear short-circuits in approximately 0.013 sec. or from ten to twelve times as rapidly as the automatic oil switches.

High-tension fuses will, under short-circuit conditions, permit a current flow many times the full load rating. Assuming that the current flow with automatic oil switches will be no greater and by comparing the time elements of the fuses (0.013 sec.)

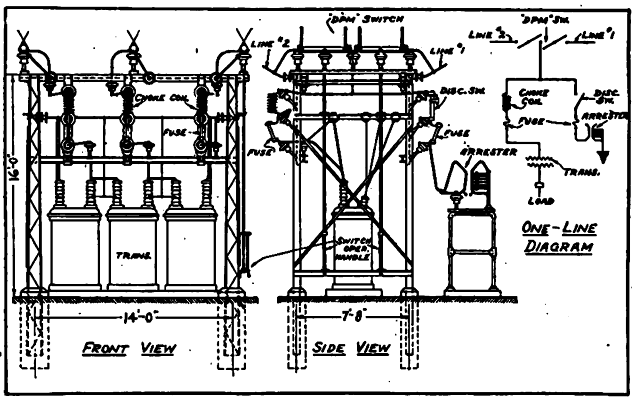

Fig. 3.—Steel Tower Substation with Transfer Type Switches for Connecting Transformers to Either or Both of Two Parallel and Synchronous Lines.

and the time element of the automatic oil switches (0.16 sec.), it follows that the slower operating switch will allow approximately twelve times more energy to flow into a short circuit than will flow with the faster operating high-tension fuse. In considering the above values, it should be borne in mind that the amount of reactance in the circuit including that of the transformers, will limit the actual flow with either device.

Over-fusing the Substation.

The exceptionally rapid action of fuses will therefore permit overfusing the transformers theoretically twelve times the normal current and still secure protection equal to that of an automatic oil switch. In actual practice overfusing from three to ten times normal is used depending upon local conditions. For power circuits subject to wide fluctuations, such as mining loads, high-tension circuit-opening devices should be so rated or adjusted that they will not operate except in case of actual trouble, such as transformer failure, and such cases are rare with modern transformer designs.

Such overload protection as is desired can be secured easily and cheaply by means of a low-tension automatic oil switch installed on the secondary side of the transformer bank. In substation practice, this combination of heavy high-tension fuses on the primary side, which will only open in case of transformer failure, and a properly adjusted oil circuit breaker on the secondary side of the transformer bank is an excellent protective system often taken advantage of.

The high-tension automatic oil switch has the advantage that it can be used for switching in addition to the overload feature. When fuses are used, it is necessary to install an air-break switch to disconnect the transformers from the line. In actual practice, however, it is often advisable and is considered good engineering practice to install disconnecting switches between the oil switch and the line. The reason for this is that the oil-switch contacts are necessarily concealed in the tanks and to be absolutely sure that a line is clear the disconnecting switches should be opened, thus giving the operator ocular evidence of disconnection.

Should the oil switch open frequently or under severe load conditions, it is advisable to inspect the contacts, oil levels, and condition of the mechanism. To enable inspection adjustments or repairs, it is often advisable to install auxiliary disconnecting switches so connected that the oil switches can be shunted and

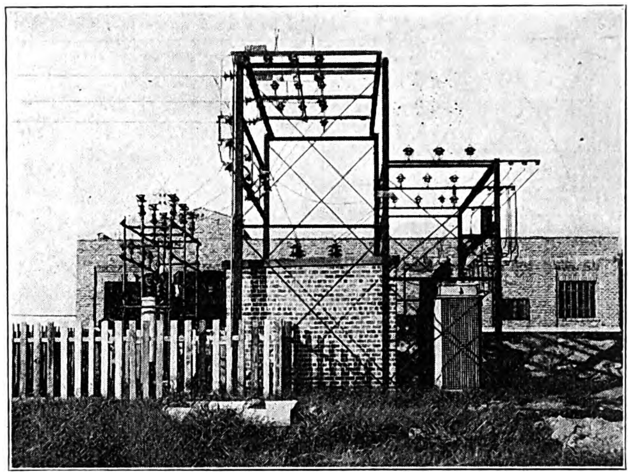

Fig. 4.—1200-kw. 33,000/2300-Volt Three-Phase Substation.

entirely disconnected from the circuit, power being temporarily delivered through the auxiliary switches.

Another point in favor of the oil switch is that after interruption it can, if in good condition, be immediately closed, thus reducing the time of service interruption. It will naturally require more time to open an air-break switch and replace fuses than it will to close the oil switch. The saving of a moment's time may in some instances warrant the additional expense of the oil switch. However, the average high-tension substation attendant, especially if not "hardened" by long experience, will after an interruption be inclined to go slow in closing the switch until he can actually view every possible part of the switch mechanism, assuring himself that it is in condition to resume service.

The fuse and air-break switch combination has, therefore, a certain advantage in that every part of the units, including contacts and condition of fuses, are in plain view of the attendant. The average man working on high-tension equipment has considerably more confidence if he can, without a shadow of a doubt, determine its condition at all times. The choice of equipment must finally rest with the purchaser but as a guide in determining in a general way the dividing line between the use of high-tension fuses and oil breakers, the following tabulation of substation capacities on which fuses can be advantageously used is given, when automatic oil breakers are installed on the low tension side.

Primary voltage.	Transformer capacity, kv-a.	Full load current per phase, amperes.	Rated capacity of fuses.
13,200	1000	43.7	200
22,000	1500	39.3	200
33,000	2000	35.0	175
44,000	2500	32.8	150
66,000	3000	26.2	100

When but a single source of power is used, the substation is simplified by omitting one of the three-pole air-break switches shown in Fig. 3. A typical design having but one source of power is shown in Fig. 6.

A recent coil mine installation made by Carl

Scholz, consulting engineer, for the Valier Coal Co., Chicago, and installed at Valier, Ill., shown in Fig. 6, is of interest in that it is a complete electrical installation using transmitted power furnished by the Central Illinois Public Service Co. which operates an extensive interconnected system. The incoming power

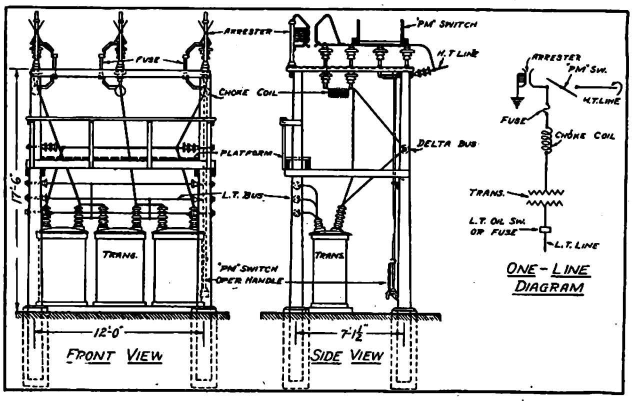

Fig. 5.—Typical Single Circuit Outdoor Substation with Large Capacity Transformers at Ground Level.

line is dead-ended to the steel tower, and by means of an overhead bus, taps are made to the arrester and load circuits. Three choke coils are so located that they offer a barrier to incoming lightning disturbances reflecting abnormal potentials to the arrester where they can be discharged. In the arrester circuit is a three-pole remote-control disconnecting switch operated by means of a handle at ground level. Below the choke coils is installed a three-pole disconnecting switch of the same type used in the lightning arrester circuit. Below this switch are three single-pole fuse mountings with fuses so rated that they will not blow except in case of transformer failure. The 33,000-volt primary metering equipment is located below the fuses, the current and potential transformers together with the watthour meter and demand indicator being a self-contained unit.

Just back of the main switching tower is located a second steel structure affording space for three 667-kv-a. 33,000/2300-volt, 60 cycle, single-phase transformers connected in closed delta. Above the transformers are the high-tension buses with their supports. The 2300-volt circuit is carried into the building by means of lead-covered cables and connected to a five-panel switchboard.

Panel 1 is equipped with a 2300-volt check meter and an automatic main oil circuit breaker. From this panel extends a 2300-volt bus located back of the other panels permitting connections to the various loads. Panel 2 controls the main underground feeder; panel 3 controls the 1350-hp. main hoist motor; panel 4 controls a 250-hp. air-shaft motor; and panel 5 controls the machine-shop and yard-lighting line. Each panel is equipped with automatic oil switches and the necessary instruments.

The underground cable from panel 2 terminates at a panel on which is mounted two automatic oil switches. The cable from one switch has a tap line to which is connected twenty underground substations, each station being equipped with three 25-kv-a. transformers and an oil switch. The feeder voltage of 2300 is transformed to 220 for use with alternating-current coal-cutting machines. On the same feeder cable is connected a 300-kw. 2300/220-volt motor-generator set supplying direct current for the main haulage trolley. This motor-generator set also supplies current to twelve stations for charging the storage battery locomotives. The other switch and cable supplies power to a 100-kw. 2300/220-volt motor-generator set for the main haulage direct-current trolley and also connects to twenty underground substations for supplying 220-volt alternating current to the coal-cutting machines.

The 75-kw. underground substations are at more or less temporary locations so that equipment can be moved as the work progresses, thus avoiding long secondary runs and giving full voltage to the motors. Control of the 1350 hp. hoist motor will be secured from the underground substation located near the base of the shaft. The operator, by means of switches and indicating devices, has positive control of and always knows the exact position of the hoist. During March, 25,000 tons of coal were mined at a power cost of approximately 6.5 cts. per ton, the load-factor on the station being 41.5%. During this month, power was also used for construction work in progress so that the total cost of power for coal mined was 8.1 cts. per ton. When the mine is in full operation and construction completed, the cost per ton will probably approximate 4 cts. or less.

66,000 Volt Substations.

The tendency toward higher transmission voltages has developed a need for 66,000-volt outdoor substations.

A feature of this type is in the use of three transformers in closed delta on one side of the station and a spare transformer at the opposite side. In case one transformer fails the spare can by means of disconnecting switches be immediately placed in service and in the correct electrical relation to the other transformers.

The high-tension side is controlled by means of a three-pole air-break switch operated from ground

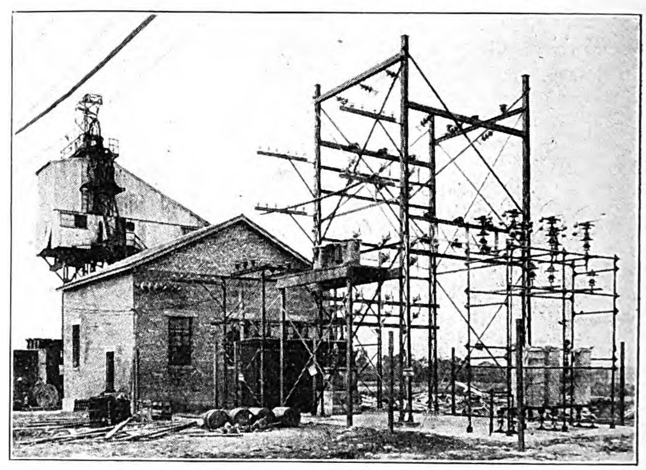

Fig. 6.—Scholz Substation at Valier, Ill. Supplied From Central Illinois Public Service Co.'s Lines.

level. On the switch bases are also mounted choke coils and fuses for the load circuit.

The lightning arresters are of the high speed sphere gap graded resistance type with auxiliary gaps shunted with limit fuses. In case of excessive flow of current to ground the limit fuses will operate in the usual manner. The arrester, however, is still connected to the line across the small auxiliary gap. This arrangement eliminates the possibility of entirely disconnecting the arresters after operation of the limit fuses.

Central-Station Rates in Theory and Practice

Fourteenth Article—Rate Systems and Reasons Therefor—Class Schedules Commonly Used—Minimum and Maximum Charges, Discounts and Related Features — Principal Types of Rates

By H. E. EISENMENGER

This is the fourteenth article of this series, which began in the issue of July 12. The first seven articles, constituting Part I, dealt with the cost of electric service. Part II consisted of six articles on the general policy governing selection of a rate system from the standpoint of profit contributed by the several classes of customers. Part III begins this week and will consist of six articles on rate systems. The remaining parts of this series will deal with rate analysis, accuracy of rates, utility regulation and other topics closely related to rates. These articles will continue weekly until the last issue of the volume, Dec. 27.

PART III—SYSTEMS OF CHARGING.

1. General Features.

A. Reasons for Making Different Rates for Different Classes of Consumers.

NOTE: The examples given in Part III for the various types of rates have been taken from the author's collection of rate schedules and from other sources of information. Pains have been taken to get reliable figures and the given figures are believed to be correct, although some of them may have become obsolete and others may be erroneous in other respects. The author assumes no responsibility for their absolute correctness. His object is to illustrate the type of rate to the reader more quickly and vividly by definite figures than is possible by mere abstract descriptions. It is of very little importance whether the figures are absolutely correct and up-to-date and whether they apply in this one or some other city. These articles discuss principles and are *not* intended as a book of reference for the actual rate schedules now used in the different cities.

103. It has been demonstrated in Parts I and II that not only the unit amount of the classified expenses (energy cost, demand cost and customer cost) varies between different classes of customers, but that also the percentage of the profit from different classes should vary between these classes. The rates—that means the prices—to different classes of consumers will therefore have to be different for these two reasons.[1]

Price is the cost plus profit. If the cost is figured according to the three items of energy cost, demand cost and customer cost, it seems logical that the price should be figured in the same way. But in the case of rates we have to deal with the general public and it is the opinion of most central-station managers that this method is too complicated for the public to understand, especially for the small consumer. The less the average consumer understands about the system of charging, the more prone he will be to assume that the whole rate schedule is nothing but a device made expressly to cheat him out of his money. In case of larger customers we may expect that the electric light company has to deal with somebody who has sufficient arithmetical training to understand a proper explanation of the rates, even if they embody the three-charge system.

The rates to different classes of customers will therefore vary not only in the amounts they charge, but also in the form. We will consequently have generally a number of different rate schedules, each one applying for a different class of service.

B. Classification of Consumers for Rate Purposes in Practice.

104. These classes of service are not standardized among the various central stations, but a selection from the following list is generally found in the rate schedules of most central stations:

1. *General Lighting* or sometimes *General Light and Power.*
2. *Residence Lighting.*
3. *Commercial Lighting,* which means lighting of business localities.
4. *Display Lighting* (signs, windows, decorative lighting).
5. *Street Lighting.*
6. *General Power.*
7. *Wholesale Power* (incidental lighting sometimes included).
8. *Retail Power.*
9. *Ice Making,* also called *Refrigerating Service.*
10. *Heating and Cooking.*
11. *Primary* or *High-Tension Service.* The current is delivered at the central station's primary voltage and transformed by the customer in his own transformers. This is practicable only for very large customers. This schedule may also be expressed by a deduction under the heading of transformer rentals, if the consumer does not use the company's stepdown transformers.[2]
12. *Off-Peak Service.* Under this schedule the customer agrees not to use his current during certain specified hours, generally the evening hours of the

[1] This refers to the unit charges (energy charge, demand charge and customer charge). If we reduce the customer's total payment to the kilowatt-hour consumed, as is frequently done, we get of course much wider fluctuations of the price (average price per kilowatt-hour) between different customers (see Section 13).

[2] Sioux City Gas & Electric Co.

winter months.[3] Sometimes the customer is allowed to use current under this schedule during the night hours only.[4]

13. *Auxiliary, Emergency* and *Breakdown Service.* For isolated plants in case of an increase of their demand over their capacity or in case of a breakdown of the isolated plant, in which case the installation is connected to the central-station service and its own generators through a double-throw switch.

14. *Battery Charging* for electric vehicles. Sometimes subdivided into "Wholesale" for public garages and "Retail" for private garages.

It is impossible to give a complete enumeration of all the varieties of schedules. Sometimes optional schedules appear under the same heading, so that the customer may choose which one of the two or more he considers preferable (see Section 106). The names of the schedules are, of course, not always the same as given above. Sometimes combinations of the above classes of schedules are found.[5]

105. A classification of the customers for rate purposes into these 14 classes, or into some of them, is carried out in every single large and medium-sized central station, and probably in every small one as well. Although these classes are by no means the only ones possible, other classes of rather isolated occurrence are found only in one or a few electric light companies.

C. Optional Rates.

106. Sometimes we find different types of rates, generally two in number, for the same class of customers in such a manner that the customer is allowed an option. One of the two rate schedules may, for instance, be of greater advantage to the customers with an energy consumption below a certain number of kilowatt-hours or with a demand below a certain amount or a combination of both. The other rate is then more favorable for the other customers (see first footnote of Section 108).

D. Minimum Charges and Guaranteed Minima.

107. Sometimes a rate schedule requires certain minimum guarantees from the customer, for instance a guarantee that his consumption during every month or every year will be large enough to bring his bill to a certain minimum amount either per month or per year.[6]

A minimum charge with the object of insuring a revenue of at least the "customer cost" from every customer is made in the vast majority of schedules which apply to residence lighting.[7] The minimum charge in that case ranges from 25 cents per month[8] to $1 net.[9]

The opinion of rate experts on the advisability of a minimum charge for residences seems to be strongly in favor of making such a charge, but it is not unanimous. A few of the large central stations in this country (among them New York, Chicago and Cleveland) prefer the gain in simplicity of the rate and the relatively slight risk that some of the customers now and then may pay less than a few dimes to the alternative risk of keeping prospective profitable customers away who are afraid to tie themselves down to a minimum.

These and similar questions in rate making are a matter of local conditions as well as of personal judgment and taste for which no hard and fast rules can be laid down. It is not easy to decide these questions and we have no means of saying, even afterwards, whether the decision was the best one or not. Rate making altogether is a matter of feeling and intuition as well as of exact research. Psychology, business instinct and experience have their place in the design of rates as well as engineering and mathematics. Many of the rate questions have to be decided temperamentally or artistically, if you please, rather than strictly scientifically.

108. An entirely different class from the minimum charges in residence schedules and other small-customer schedules is the minimum charge in schedules destined for large customers. The object here is to keep the small customers away from that schedule by requiring a rather large minimum payment per month or per year. In that case we have optional schedules, one with a high minimum charge and low unit rates per kilowatt-hour (or per kilowatt of demand or both) and the other schedule with a low minimum charge (or none at all) and a comparatively high unit rate per kilowatt-hour (or per kilowatt or both).[10]

Whereas the first kind of minimum charge is gen-

[3] In Allentown, Pa., for instance, current under the off-peak schedule is not available from 4 to 8 p. m. between Nov. 1 and Feb. 29. In St. Louis the peak hours assumed for the off-peak service are the following:

5:30 to 7:00 p. m. in October;
4:30 to 7:00 p. m. in November and December;
4:40 to 7:00 p. m. in January;
5:20 to 7:00 p. m. in February;
6:00 to 7:00 p. m. in March.

In Chicago an off-peak rate is available where the customer agrees during the peak period not to use more than 10% of the highest demand in the preceding year's peak period. The off-peak period in this case is counted between 4:00 and 8:30 p. m. from November to January and begins half an hour later in February.

Various methods are used to make the customer meet his obligations for the peak-loak period. A recording demand measuring instrument is installed as described in Insert XVI (for instance in Chicago) or a recording ammeter (Superior, Wis.). Where the off-peak schedule prohibits the customer from using any current at all during the peak period an automatic time switch in connection with a clock may be used (Spokane and St. Louis). Portland, Me., uses the expedient of stipulating that not more than 10% of the total power used annually shall be consumed between Nov. 1 and March 1 by consumers under the off-peak schedule. The "Ventilating Service" schedule at St. Louis, which is in effect an off-peak schedule, charges less for the service between April 15 and Oct. 15 than for the rest of the year. See also Section 111 about "Differential Rates."

[4] "Night Service" in St. Louis 10 p. m. to 7 a. m. and Spokane 7 to 7; "Night Power" in Hartford, Conn., 10 to 7, and Altoona, Pa., 11 to 6.

[5] Thus, for instance, in Topeka, Kans., under the "Battery-Charging Rate" customers must agree not to use current for that purpose between 4:30 and 8:30 p. m., so that the rate can be classed also as an off-peak rate. Another combination is, for instance, the "Primary Off-Peak Rate" in Detroit.

[6] This is not quite the same. For instance, a guarantee of $1200 per year is not entirely equivalent to one of $100 per month. The first guarantee would be fulfilled by a customer who is paying $150 during each one of the six winter months and $50 during each one of the six summer months, whereas under the second named plan that customer would be required to pay an additional $50 for every one of the summer months. The first plan requires a little more work on the part of the central station, since the bills of customers near the limit must be added up at the end of the year, whereas the other plan takes care of itself month by month. These considerations have led in a few cases to a stipulation of a monthly *and* a yearly minimum. The wholesale power schedule of Allentown, Pa., for instance, requires a minimum charge of 50 cents per horsepower connected and the twelve bills in a year must moreover amount to at least $15 per horsepower.

[7] This refers to central stations in cities of medium and large size. No information for statistical purposes is obtainable from the innumerable central stations in smaller towns, but we have no reason to assume that their rates should be essentially different from those in the larger cities.

[8] Duluth and New Orleans.

[9] The favorite amounts for the minimum charge in that case are 50 cents and $1; other values are of rare occurrence. In about a dozen cases we find yearly minimum charges in schedules which apply to residences. The most important of these cases are Baltimore, Boston, Brooklyn and Buffalo. In Pueblo, Colo., the residence lighting minimum charge is 3⅓ cents *per day*. St. Joseph, Mo., makes a higher minimum charge for residences in rural districts (75 instead of 50 cents), thus expressing the distance factor by the minimum charge. (A few central stations have entirely different rates for outlying districts.) Salem, Mass., increases the minimum charge from 50 cents to 75 cents for summer residences. The minimum charge of the Display Lighting schedule in Sacramento, Cal., varies with the season and is only about 57% in June of what it is in December. The General Lighting schedule of York, Pa., charges $1 minimum per month in winter and 50 cents in summer.

erally not more than $1 per month, the minimum charge or guarantee of the second type, that is, with the object of reserving a certain schedule for the large consumers, is naturally rather high and we find figures as high as $3000 per year (Primary Service, Indianapolis) or even $340 per month (Primary Large Lighting and Power, Chicago).

So far in this discussion the minimum charge has always been understood as a guarantee on the part of the customer to pay a certain amount in dollars and cents every month or year. This is the most frequent case. Not infrequently, however, we find a stipulation in a rate schedule requiring the customer to pay for a certain minimum number of kilowatt-hours or for a certain minimum of demand in kilowatts, watts, horsepower, or whatever the unit for the demand may be.

[10] For instance, in Toledo, Ohio, public garages can get battery-charging current at 5 cents per kw-hr. (net) with a minimum charge of $3 per month (this rate to be called Rate A hereinafter for short), but if they guarantee a minimum bill of $50 per month they get their current at 2 cents per kw-hr. (Rate B).

A graphical and analytical investigation of what this means may prove instructive. We step off as abscissae (horizontally) the energy consumption in kilowatt-hours (Fig. 4) and as ordinates (vertically) the amount of the bill in dollars per month. Beginning with Rate B we find that at 2 cents per kw-hr. the customer is to pay $20 for 1000 kw-hr. (point b_1), $40 for 2000 (point b_2), $60 for 3000, etc. The curve representing the bill as a function of the energy consumption will obviously be a straight line OB starting from the origin O. There is, however, a minimum of $50 for the bill. This minimum is denoted by the horizontal line NN'. The portion of the inclined line OB which is situated below horizontal NN' does not apply and NN' applies instead. Rate B is thus represented by the heavy dash-and-dot duct from N over P to B. On the other hand, we have the optional rate A of 5 cents per kw-hr. with a $3 minimum. We get the straight line OA and here again a minimum charge applies. This is now $3 and is represented by the horizontal line MM'. Rate A is represented by the heavy outlined duct from M over K to A. As the customer has the desire to get the lowest bill possible he will pick out that one of the two rates which shows the lower bill for his particular energy consumption; in other words, the rate represented by the duct which is lower for that respective energy consumption. The bill of the customers who choose their schedule wisely is then given by the ordinates of the shaded area. Small customers will be better off on Rate A, large ones under Rate B.

Where is the limit between those two sizes of customers, in other words, up to what energy consumption is it more advantageous for a customers to use Rate A? This limit is evidently given by the point L where the line duct ("curve") of Rate A intersects that of Rate B. The intersection means that the bill is the same for the respective energy consumption, whether the customer is being charged under Rate A or Rate B. This intersection is given by point L in Fig. 4 and the energy consumption belonging to that point will give the limiting value. We can

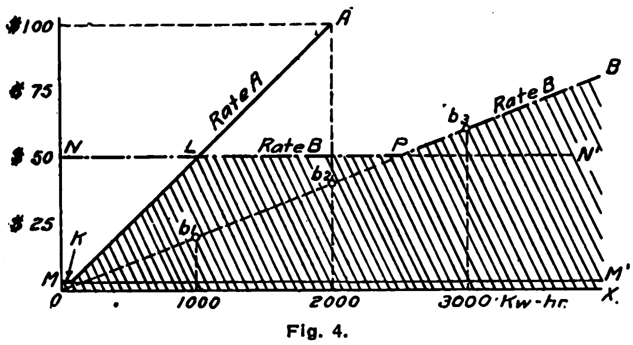

Fig. 4.

either find that value in kilowatt-hours by measuring it in the drawing with the kilowatt-hour scale or we can figure it in the following way:

The ordinate of L is $50 because L lies on the minimum-charge line NN'. On the other hand, the unknown amount of energy multiplied by 5 cents per kw-hr. must give $50. It is easy to figure out that 1000 kw-hr. are necessary to make up a charge of $50 at the rate of 5 cents per kw-hr. All customers with less than 1000 kw-hr. energy consumption should choose Rate A, the others Rate B.

The graph Fig. 4 also shows that all customers using Rate B between the points L and P are charged the identical amount of $50. Point P can easily be found as corresponding to

$$\frac{\$50}{2 \text{ cents per kw-hr.}} = \frac{5000 \text{ cents}}{2 \text{ cents per kw-hr.}} = 2500 \text{ kw-hr.}$$

Therefore, all customers using between 1000 and 2500 kw-hr. per month and choosing the schedule which is of best advantage for them will have to pay uniformly $50 no matter how large their energy consumption was within these limits.

We find further that the minimum charge of $3 (Rate A) affects the 5-cent-per-kw-hr. rate for such customers only as have a kilowatt-hour consumption of less than 300/5 = 60 kw-hr. per month (point K).

This is not quite the same as guaranteeing a minimum bill (except in case of the simplest rates), as will be shown later (Section 168), but the object is the same.

E. Maximum Unit Charges.

109. In some cases we find a clause in the rate schedules to the effect that where the average charge per kilowatt-hour figures out higher than a certain specified maximum the bill shall not be higher than what corresponds to that maximum average amount in cents per kilowatt-hour, regardless of what the schedule says elsewhere. This is in a certain measure the reverse of the minimum charge discussed in the preceding sections. Here, as well as with the minimum charges (see first footnote to Section 107) this restriction may apply either to the individual monthly bill or to the sum of the 12 monthly bills rendered during the year. For examples and further discussion of this principle of the maximum unit charge (which is not frequently applied) see Section 124, first and third footnotes.

F. Prompt-Payment Discounts and Delayed-Payment Penalties.

110. A prompt-payment discount, to induce the customers towards early settlement of their bills can be found in about three of every four rate schedules of the more important central-station companies in this country. The time within which this discount is allowed is 10 days in the great majority of cases, and the percentage taken off is usually either 10% or 5%. Sometimes the discount is expressed in terms of cents per kilowatt-hour, generally 1 cent or 0.5 cent per kw-hr. In a few cases the discount is limited, for instance the discount is given only on the first 200 kw-hr.[11] In some cases the gross unit charge is an odd figure which becomes a round figure after the deduction of the discount.[12]

Of course, most of the customers avail themselves of the prompt-payment discount and this makes the rate look higher on paper than what is actually being paid. If, for instance, we have a 10-cent-per-kw-hr. rate with a prompt-payment discount of 1 cent per kw-hr., the rate which almost everybody is actually paying will be 9 cents per kw-hr. and yet almost everybody will say: "We have a 10-cent rate." The company will get the blame for a higher rate than it actually charges. For this reason a few companies have reversed the statement by introducing a delayed-payment penalty. This would mean in the example quoted above: 9 cents per kw-hr. with a delayed payment penalty of 1 cent per kw-hr. It amounts to the same, only it sounds better and the impression given is more correct.[13] In one case[14] an aditional stipulation is made that the minimum amount of the delayed-payment penalty is 25 cents. The idea of this is evidently that as soon as a customer gets on the delinquent list he causes the company a certain amount of clerical work and other expenses, no matter how large or how small the amount of his bill is. We see here again the principle of the minimum charge.

[11] Lighting and Power schedule, Indianapolis, Ind.

[12] For instance, the cooking rate in Toledo, Ohio, is a straight-line meter rate of 5.56 cents per kw-hr. with 10% discount if the bill is paid within 10 days, thus making the net rate practically 5 cents per kw-hr.

[13] Delayed-payment penalties can be found in the rates of Philadelphia, Cincinnati, Washington, D. C., and a few other cities. In New Orleans, where two electric light companies are operating, one of the two charges a 7-cent rate with a 10-day delayed penalty of 1 cent for general lighting, whereas the other one charges an 8-cent rate with a 10-day prompt-payment discount of 1 cent.

[14] Topeka, Kans.

II. The Various Types of Rates.

A. Introduction.

111. The various types of rates base the amount of the bill of a certain consumer on his energy consumption or on his maximum demand or on both.

There are a very few exceptions to this rule, but under certain unconstrained assumptions we can bring even these under the above rule.

In the first place we find some isolated cases of rates which make the amount payable dependent also on the amount which the customer has been willing to guarantee in advance as a minimum payment per month.[1]

Evidently there will exist a certain guarantee for every customer which makes his bill smaller than any other guarantee would. If he guarantees less than that amount he will have to pay an unnecessarily high unit price and if he guarantees more his guarantee is higher than what he actually consumes. It is clear that, provided the consumer chooses his guarantee wisely, he will find his bill dependent only on the energy consumption and the demand, in other words, under that assumption there will be only one amount of the bill possible for every conceivable combination of kilowatt-hours consumption and kilowatts demand.

Another exception to the above rule, that the price charged to the customer under a certain schedule depends only on the amount of the kilowatts used and kilowatt-hours consumed by him, is the so-called time-differential rate which, however, though extensively in use in European countries, is hardly used in this country. Almost the only instance the author could find of this rate in this country is the "Time-Differential Service" rate in Detroit for auxiliary and emergency service for private plants. Ten cents per kw-hr. are charged for all energy consumed between 1:00 p. m. and 6:30 p. m. and 4 cents per kw-hr. at all other hours. This really is nothing but a combination with an off-peak schedule (cf. Section 104, footnote). If we consider the high-rate hours and the low-rate hours separately, we have again reduced the amount payable to the original elements of kilowatts and kilowatt-hours in each one of the two daily periods.

If, therefore, in this manner all rates can be assumed to be based upon the two elements of kilowatt-hour consumption and kilowatt demand only, we can distinguish the following three classes of rates:

(1) Rates based on the energy consumption only.
(2) Rates based on the maximum demand only.
(3) Rates based on both energy consumption and maximum demand.[2]

B. Rates Based on the Energy Consumption Only.

1. *The Straight Meter Rate.*

112. The straight meter rate is one of the simplest and one of the oldest systems of charging, but by no means one of the most satisfactory ones, at least not for general use. The customer's bill is proportional to the number of kilowatt-hours used, as measured by a watt-hour meter.[3] Frequently the straight meter rate is combined with a minimum charge[4] or sometimes with a customer charge.[5] The advantages of the straight meter rate are its simplicity and the readiness with which it is understood by the public.

113. A variety of the straight meter rate is the *prepayment-meter rate* for very small customers. A prepayment meter is a watt-hour meter constructed in combination with a vending machine ("penny-in-the-slot" machine). The customer inserts a coin of certain specified value, for instance a quarter, into the slot of the prepayment meter and then is furnished with current until he has consumed the amount of energy for which he has paid by that sum. After that time his circuit is automatically opened by the mechanism of the prepayment meter and his lights go out, usually after a warning of some kind has been given to him.

Opinions on the merits of the prepayment meter, as on so many other rate questions, are divided. The idea of paying in small amounts in preference to paying comparatively larger sums at the end of the month certainly appeals to some classes of the poorer population and is based on sound psychology. Meter readings are unnecessary and bad debts are avoided. On the other hand, the meter is more expensive and complicated than an ordinary watt-hour meter and gives more occasion for complaints. The extinguishing of the lamps at inopportune times is a great annoyance, especially if there is no coin of the required denomination at hand.[6]

(To be continued.)

ENGINEER TO BE SUGGESTED FOR INTERSTATE COMMERCE COMMISSION.

The American Association of Engineers, through its president, Dr. F. H. Newell, University of Illinois, is petitioning President Wilson to select as his next appointee to membership in the Interstate Commerce Commission, some qualified representative of the engineering profession. It is pointed out that the commission, in its railway valuation work, is the employer of a large number of the most skilled engineers in the United States, and that it would be only a fitting recognition of the engineers to appoint one of their number to a position on the commission itself.

---

[1] An example is the Retail Lighting and Power schedule of Pittsburgh, which charges the following average prices per kw-hr.:

Cents per kw-hr.	If maximum demand is	And guarantee is
10	1	$ 1.00
9	1	3.00
8	1	5.00
6.5	1	10.00
5.5	1	15.00
5	1	20.00
4.25	1	25.00
3.75	2	36.00
3.25	3	52.00
2.75	5	79.00
2.25	8	107.00

Add $1.00 to guarantee for each additional kw. of demand.

Another example is the Toledo Battery-Charging rate, which is quoted and discussed in footnote 10 of Section 108.

[2] We might add to this for the sake of completeness a fourth class, that is, rates which are independent of either energy consumption and maximum demand. This class has, however, only academic and slight historic interest. Every customer of the class, for instance every residence customer, would have to pay under that rate the same amount, no matter how large his installation and the size of the lamps in his sockets and no matter how long he is burning them. The rate is reduced to the customer charge and all other costs, but the customer cost, are averaged into the customer charge, the assumption being that the difference in cost between residence customers is not very large and that we can simply charge the average cost for every customer plus a percentage of profit. Such rates have been in use in a very few cases during the earliest days of central-station history. If the author's information is correct, one instance was in Monticello, N. Y. This type of rate has been abandoned long ago. (See later Part V—"Accuracy of Rates").

[3] An example of a straight meter rate is the Residence Lighting rate of the Bronx Gas & Electric Co., of New York, where the customer is simply charged 12 cents per kilowatt-hour.

[4] For instance, in the General Lighting and Power schedule of Boston, which charges 8.5 cents for every kilowatt-hour consumed, but with a minimum charge of $9 per year, payable monthly.

[5] Battery-Charging schedule of Springfield, Ohio, which makes a customer charge of $1.50 and an energy charge of 3 cents per kw-hr.

[6] About another rate especially adopted for the smallest customers, the limited flat demand rate, see Sections 128-130.

Tests to Determine Deterioration of Small Dry Cells with Age

Explanation of Terms—Outline of Test Methods—Results Obtained — Abstract of Paper Before American Electrochemical Society

By A. J. HELFRECHT

IT IS well known that small dry cells undergo a steady depreciation in capacity from the time they are made, and a knowledge of the rate at which such depreciation takes place has become of great technical importance due the extensive use to which dry cells are being put, and because of the new and exacting demands which are being placed upon this type of cell in its application to wireless telegraphy and telephony.

The term "shelf deterioration" is employed to designate the decrease in capacity which a dry cell undergoes when not in use. This factor has been touched upon in various papers presented to this society, and it is the purpose of this paper to present further data on this subject dealing specifically with the smaller sizes of cells.

The actual determination of the capacity of a dry cell involves its discharge and, therefore, its destruction; hence, to determine the rate of deterioration over a period of time by this method, tests must be made upon a sufficiently large number of cells of identical construction to give the required information. To avoid the complication and expense involved by such method, there is need of a deterioration test which can be made on a single cell without its destruction by the testing method. But no such test has been evolved which gives more than a crude approximation. It is a common but a decidedly misleading practice of numerous battery makers to guarantee their product not to deteriorate more than a specified percentage over a given period of time as judged by the decrease in voltage. The absurdity of this method is shown by the fact that the open circuit voltage of a cell has little relationship to its watt-hour capacity. A cell may decrease 50% in actual capacity, while its open circuit voltage may decrease not more than 10%. A more rational, but still unsatisfactory method which has had some use is to judge the deterioration of a cell by measuring its "flash" or its instantaneous short-circuit current at various intervals. It is known that as a cell deteriorates with age its internal resistance increases and consequently its flash decreases.

The main purpose of this paper is to present results showing how closely this method of judging cell deterioration approaches the method involving the actual measurement of capacity through discharging the cells.

Cells of four different sizes representing the range of the flash light cells on the market were employed in this test. Part of these were purchased on the open market of a standard well-known make, and to eliminate the factor of uncertainty as to the time which elapsed from the date of manufacture to the date of purchase, many other cells of these same sizes were made up in our laboratories by trained workmen, using standard materials, such as are used in the regular marketed product, special care being taken to avoid variations in construction between the different cells.

In the absence of uniform testing methods adopted by manufacturers, in the investigation covered by this paper the "flash" tests were made by short-circuiting each cell through a low-resistance Weston ammeter for as short a period as would indicate the steady maximum deflection of the needle. This test was repeated periodically over a year's time to indicate the deterioration. Since the initial flash differs greatly between individual cells of one make, the decrease of flash as time passes is expressed not in terms of decrease in amperes but in percentage of the initial flash when the cells are first put on test. This method places the readings as between different batteries on a more common basis.

Capacity tests were made by a method described in detail in "Characteristics of Small Dry Cells," by C. F. Burgess,* and designated here as the "4 ohm" test, in which each cell is connected to a 4-ohm coil and discharged 8 hours per day until the closed circuit voltage drops to 0.5 volt.

The corresponding test recommended by the Bureau of Standards consists in the use of a 2.75-ohm coil and discharging to a similar end point of 0.5 volt.

The "4 ohm" test used for the investigation set forth in this paper was adopted prior to the publica-

*Trans. Am. Electrochem. Soc. (1916), 30, 257.

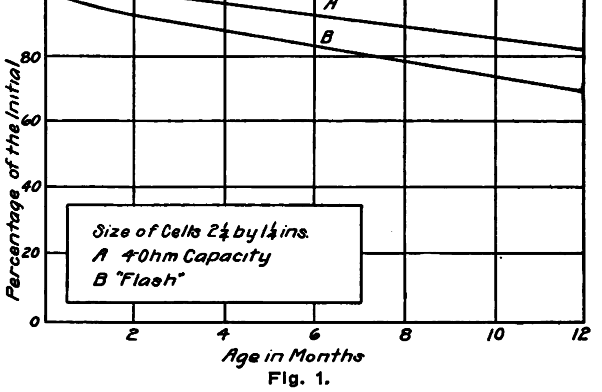

Fig. 1.

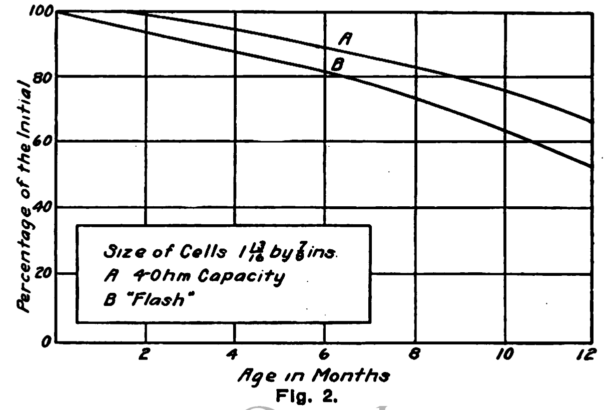

Fig. 2.

tion of the bulletin of the Bureau of Standards and to draw a comparison between these two tests a special lot of cells was made up and tested by the two methods.

Results.

In comparing the "4 ohm" test for capacity with the "2.75 ohm" test and expressed in time of service

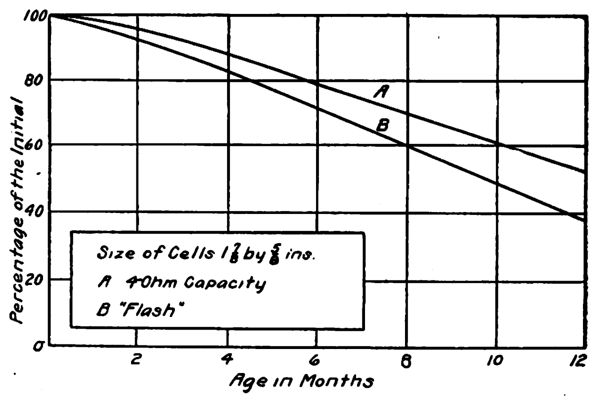

Fig. 3.

until the cells reached the 0.5 volts end point, the average of numerous measurements showed that the time of service on the latter test is 60% of that of the former with a range between 55% and 65%. In the accompanying curves, Fig. 1 shows the depreciation of the most largely used size of flashlight cell, such as is employed in tubular handlamps, 1½ ins. diameter and 2¼ ins. high. Graph *A* shows the percentage decrease in capacity during a period of one year as determined by the "4 ohm" test. There is no appreciable depreciation in capacity during the first two months, and during the remaining 10 months the depreciation of about 17% follows approximately a straight line. The corresponding graph *B*, derived by the "flash" test indicates an almost linear depreciation from the beginning of the test. The notable deduction from this curve sheet, as well as from the others which follow, is that the depreciation indicated by the "flash" test is decidedly greater than that measured by the actual capacity.

Curves Nos. 2, 3 and 4 represent in a similar way tests on smaller sizes of cells and indicate clearly the variations in performance as the cells decrease in size.

The curves as a whole show that the actual depreciation as measured by the capacity tests is less than the apparent depreciation determined by the flash tests and this departure becomes especially marked in the smallest size of cell. This difference is due to the fact that the "flash" test is influenced mainly by the internal resistance of the cell which slowly increases with age. Since this internal resistance is but small as compared with the resistance through which the cells deliver current when working normally or when placed on capacity test, the increased internal resistance does not necessarily influence to a large degree the ability of the cell to deliver current as measured in ampere hours. This must not be taken as an argument against the use of the "flash" test to indicate depreciation since the great simplicity and convenience of this test amply justifies its use. Where it is used, however, it should be borne in mind that it indicates a more rapid falling off in capacity than is actually the case, and the injustice which may thereby be done to the cell is especially great in the smallest sizes.

It is of interest to note that in Figs. 1, 2 and 3 the graphs *A* and *B* are divergent at their lower ends, while for the smallest size of cell (Fig. 4), the two lines converge. This is explainable by the fact that as the flash becomes zero the capacity must also approach zero, and in Figs. 1, 2 and 3 this convergence would be noted if the tests were carried further.

Previous discussions held before this have shown that any test on a dry cell will show the condition of a dry cell only at the time it is tested, without indicating what the condition of the cell will be at the same future date. While this is undoubtedly true, it is nevertheless true that shop and laboratory tests accompanying uniform methods of manufacture may furnish the means of foretelling with reasonable accuracy the future performance of a dry cell.

While the "4-ohm" test as used in this report cannot be considered as a standard method in view of the recommendations of the Bureau of Standards for a "2.75-ohm" test, nevertheless the curves here presented may be taken as representing fairly well the true relationship between the "flash" and the "capacity" tests. This statement is based upon a "2.75-ohm" test being made on a number of cells of various sizes and ages as a check against the "4-ohm" test.

It must also be borne in mind that either 2.75 ohms or 4 ohms per cell represents a much more rapid discharge than the small dry cells are frequently called upon to deliver in service. For example, in radio work, in which the cell shown in Fig. 3 is extensively employed, the actual current requirements are very low. A resistance of 333 ohms per cell has been adopted for testing batteries for such service. Extensive investigation has been made by one laboratory on batteries designed for this type of service, 15 cells being assembled in a battery delivering an initial voltage of 22.5 volts. In testing these batteries an end point of 17 volts is taken through a resistance of 5000 ohms. The results derived from such tests give curves of the same general shape as shown in curve No. 3. It may be noted, however, that on very slow discharges, the decrease in capacity is shown to be less during the early part of the life of the cell than is shown where the more rapid discharge method is employed.

While it is difficult to express numerically the depreciation which might be expected from dry cells as

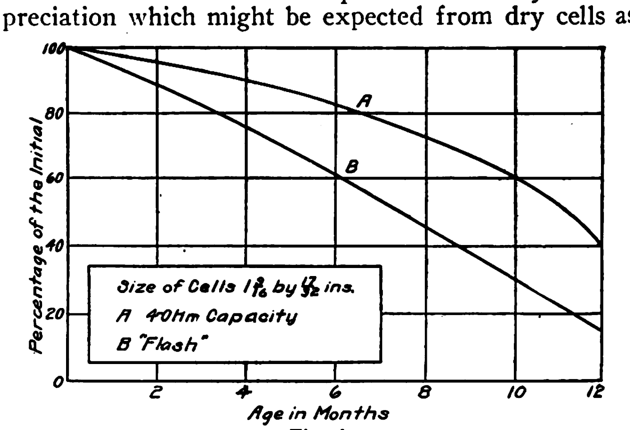

Fig. 4.

found on the market, nevertheless an approximation may be arrived at. From the data on which this paper is based, the following table has been compiled to indicate the reasonable depreciation of the four important sizes of small cells.

Size of Cells. Inches.	Centimeters.	Depreciation per Month, % First 2 Mo.	Last 10 Mo.
2¼ by 1¼	5.7 by 3.2	0.0	2.1
1 13/16 by ⅞	4.6 by 2.2	0.25	4.0
1⅞ by ⅝	4.8 by 1.6	2.0	5.5
1 9/16 by 17/32	4.0 by 1.4	2.0	6.5

Street Lighting and Traffic Accidents

Analysis of Year's Traffic Accidents in Cleveland as to Time of Day and Season Shows Large Percentage Due to Lack of Light — Value of Good Street Lighting Shown

By WARD HARRISON

Illuminating Engineer, National Lamp Works of General Electric Co.

An exhaustive survey has been published* showing that improper or inadequate lighting is at least a contributing cause of 24% of our industrial accidents. There are, however, no definite data available which show how many of the traffic accidents on city streets are due to this cause. The following survey of 3549 traffic accidents, shown on

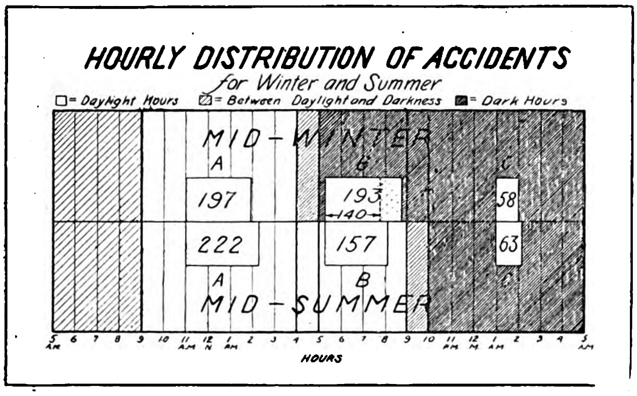

Fig. 1.—Graphic Study of Street Traffic Accidents in Cleveland as Compared to Hours of Daylight and Darkness in Summer and Winter.

the records of the Police Department of the city of Cleveland, for a period of one year will therefore be of some interest.

The purpose of this survey was to determine, if possible, how many of the 1059 accidents which occurred after dark would have been avoided had daylight or its equivalent been available. The simplest way of making such an estimate would be to compare the accidents which occur between, say, 5 and 9 p. m. in mid-summer when daylight is available with the number for the corresponding hours in mid-winter when it is dark. The records actually show that there were 157 accidents between these hours in June and July, while for December and January the total was 193, or about 22% more.

There are, however, several other variables beside the question of daylight and darkness which one must take into consideration when comparing accidents in winter with those in summer. For example, there are as a rule very many less vehicles on the streets in mid-winter, hence less liability of accident; on the other hand, this factor is counterbalanced to some extent by the effect of slippery pavements. It is necessary therefore to separate out these other variables before we can decide upon just how many of the 193 accidents on mid-winter evenings should be attributed to lack of light. Obviously, we can find the relative effect of all these other factors, except lighting, by comparing the number of accidents which occur during the middle of the day in winter months with those in the summer months or, for that matter, those that occur in the middle of the night at both seasons of the year. On this point the records show for December and January 12½% less accidents between 9 a. m. and 4 p. m. than occurred during the same hours for June and July, and they also show 8½% less accidents for the winter months during the hours that were dark at both seasons, viz., from 10 p. m. to 5 a. m. We are justified therefore in stating that, except for the question of light, there would really have been fewer accidents between 5 and 9 p. m. in the winter months than for the corresponding summer months. To be exact, instead of 193 accidents in the winter for every 157 accidents in the summer, we would have found 140 accidents in the winter had it not been for the lack of daylight. In other words, there were 53 accidents which can be attributed directly to lack of light. If we apply the same proportion, viz., the ratio between 53 and 193 to the total number of accidents occurring after dark in Cleveland during the whole year, we find that 292 of them are to be attributed to lack of light, and of these at least 14 must be classed as fatal accidents.

It of course seems out of the question today to provide street lighting which is as effective in pre-

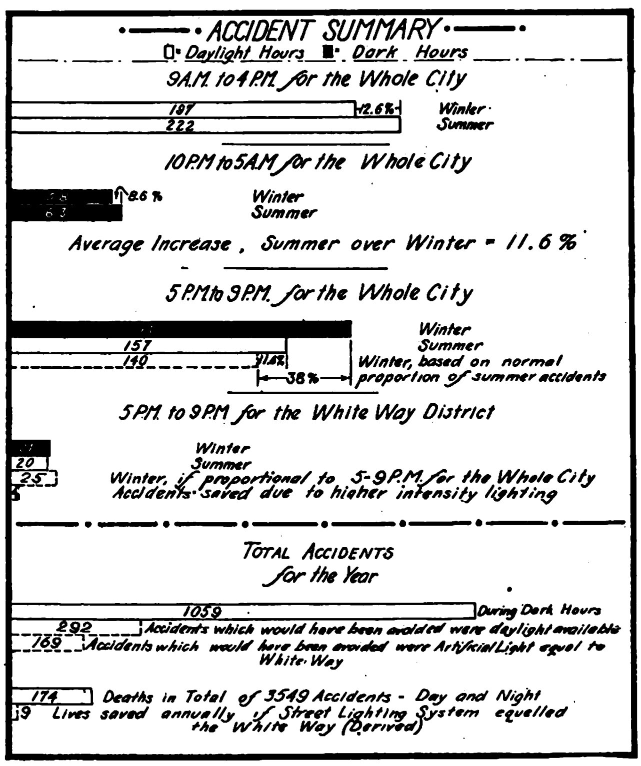

Fig. 2.—Comparison of Street Traffic Accidents at Corresponding Hours in Summer and Winter, Showing Influence of Darkness.

*"Illumination and One Year's Accidents," by R. E. Simpson, Travelers' Insurance Co. Transactions, Illuminating Engineering Society, Vol. X, No. 9 (1915).

venting accidents as daylight itself. It is nevertheless interesting to contrast the difference in accidents in the White Way district of the city with the number occurring in other portions. In this case, however, the total number of accidents involved is so small that the figures can only be taken as indicative. In the White Way district there were 20 accidents in summer between 5 and 9 p. m., and 21 in winter; whereas, the proportion for the city as a whole for these hours would indicate 25 accidents in the winter to every 20 occurring in the summer. We are safe in saying, therefore, that the higher intensity lighting in the White Way district has a marked tendency to reduce accidents.

The charts included, Figs. 1 and 2, summarize graphically the information given above.

HYDROELECTRIC POWER DEVELOPMENT IN BRITISH EMPIRE.

Further Report by British Water-Power Committee on Status and Plans for Development in Colonies, Etc.

We give below a summary of the present position of hydroelectric power development work in different parts of the British Empire and some European countries, as brought out in the second report issued by the Water Power Committee of the Conjoint Board of Scientific Societies.

The British Government has appointed a committee to investigate the water-power resources of Great Britain and Ireland. In India two eminent engineers have been appointed by the Indian Government to investigate the more promising sites. In Ceylon the water-power question is being considered by a committee appointed by the Ceylon Government. In British Guiana the discovery of large deposits of bauxite has suggested a possible and immediate use for the enormous water powers which the colony possesses. In Canada the government and community are fully awake to the necessity of such developments. In Australia a preliminary investigation ordered by the government of New South Wales has been commenced, and in Tasmania developments are progressing as fast as conditions permit. A great desire to promote hydroelectric schemes is manifesting itself in New Zealand, and the government is actively interesting itself in the investigation of promising schemes and in the East African Protectorate, government sanction has been obtained for the appointment of a special water engineer to organize a hydrometric survey of the protectorate.

The majority of the European states are showing intense interest in the matter, largely in consequence of the great demand for power for the manufacture of munitions, combined with the general world shortage of coal. In the countries at war, the normal development has been accelerated in a very large degree. Thus in France since the end of 1915, some 850,000 hp. has been actually put into commission or is in process of active development, and by the end of 1921 the country will have at least 1,600,000 hp. under control, as compared with 750,000 hp. before the war. In Italy concessions totaling over 250,000 hp. are already under way, and it is estimated that schemes totaling 2,000,000 hp. will be in operation in a few years. In Norway, Sweden and Switzerland large developments have been in train, while in Iceland a hydroelectric scheme contemplating the development of over 1,000,000 hp. from the River Fjorsaavasdraget is planned by an Icelandic company. In Spain various large projects are under consideration, including one on the Douro which is estimated to be capable of giving some 350,000 hp. In Bavaria a large project has been initiated to be financed in part by the state, in part by the various towns interested, and in part by existing stations; the total cost of the scheme is about 78,000,000 marks. In Wurtemburg, Saxony, and Prussia the state is to participate in the development and administration of electricity works. In Austria some 433 falls, with an aggregate average yield of 1,500,000 kw., have been surveyed; of these 17 have been secured outright, while seven additional concessions are pending. The aggregate of these 24 schemes totals 135,000 kw. Other large hydroelectric schemes have been planned and include an installation of some 25,000 kw. on the Talebor river, and one of some 120,000 kw. on the Wallsee.

Some information is given briefly respecting the use of hydroelectric power for railway electrification in the United States and a good deal of attention is naturally devoted to developments in Canada. In France much of the line of the Compagnie du Midi in the region of the Pyrenees has already been electrified by the aid of water power, and in many countries the electrification of trunk lines is under consideration.

In regard to British Guiana the principal available water powers lie on the Essiquibo river, with its tributary the Potaro, the Mazuruni river, and the Cuyuin river. On the Potaro river, the Kaieteur gorge has a total drop of over 1000 ft. The Kaieteur fall itself has a vertical drop of over 740 ft., the width of the head of the fall being about 400 ft. when the river is full. In times of exceptional drought, however, the width shrinks to 50 or 60 ft. No actual measurements have as yet been made by the government of the colony, but it is evident that the potential water power of British Guiana is extremely large. Thus the Kaieteur alone at the fall and gorge, assuming a mean depth of 10 ft. over the fall, offers possibilities of 2.5 million hp. The power developable in periods of drought, assuming a width of 60 ft. and a mean depth of 5 ft., would be about 125,000 hp. As very extensive deposits of bauxite have been proved in British Guiana, the country would appear to be exceptionally well situated for becoming an important producer of aluminum for the empire.

Turning to Australia, it is shown that the chief electrical engineer of New South Wales estimates that 300,000 hp. is continuously available from 18 schemes already investigated or partially investigated. The chief powers are on the Snowy river, 137,400 hp., the Clarence, 100,000 hp., and the Tumut, Shoalhaven and Nymboida, each about 10,000 hp.

In Victoria the large scheme for utilizing the available water powers between the Kiewa and Snowy rivers is still under consideration. It is estimated that the scheme will give more than 100,000 hp. at an estimated total outlay on a pre-war basis of $4,390,000.

The Tasmanian Government hydroelectric department is continuing its policy of surveying, as opportunity permits, the more promising sites. At present the principal purchasers of power from the hydroelectric department are the Hobart Corporation for tramways and general municipal requirements, the Electrolytic Zinc Co., and the Hydroelectric Power & Metallurgical Co., Ltd., which has installed works for the manufacture of calcium carbide. The present capacity of these works is 5000 tons per annum, but it is proposed to increase this. It is estimated that the electrolytic zinc plant may eventually absorb up to 26,000 hp. There appears to be every prospect of a ready demand for all the hydraulic power which can be developed by the department.

In Papua, or British New Guinea, taking all the rivers of any size, with their tributaries, in the central, northeastern, Kumusi, and Mambare divisions, it is estimated that the available horsepower would be somewhere in the vicinity of 6,000,000; and if the huge river systems in the gulf, delta and western divisions were included, 10,000,000 hp. would be well under the mark.

In addition, it is estimated that the occupied territory of German New Guinea affords possibilities of between 7,000,000 and 10,000,000 hp.

A great desire to promote hydroelectric schemes is manifesting itself in New Zealand. The success which has attended the hydroelectric works at Coleridge is apparently having considerable influence in favor of constructing other power schemes throughout the dominion. A scheme for the development of three important sites in the North Island has been prepared. From these it is proposed to develop 130,000 hp., requiring a plant capacity, in the main power stations, of 160,000 hp. The scheme is intended to render power available for every householder in the island and for any industry; also for main-line electrification, light railways and for coal and other mines. The sources mentioned are capable of supplying much more power than it is proposed to develop under the present scheme. Various new industries depending on the supply of electrical energy are either started or are proposed, and it seems clear that the government will be drawn into extensive hydroelectric development for the whole of the dominion.

In Rhodesia a gauging of the Zambesi at a point five miles above the Victoria Falls shows that the volume of water was 11,750 cu. ft. per second. It is estimated that the available fall is 315 ft., which would correspond to an output of about 350,000 hp.

In East Africa three projects, each of about 2000 hp., are being negotiated within 50 miles of Nairobi, and numerous smaller projects are being developed. In 1918 government sanction was accorded to the appointment of a special water engineer to organize and carry out, so far as funds may allow, a hydrographic survey of the protectorate.

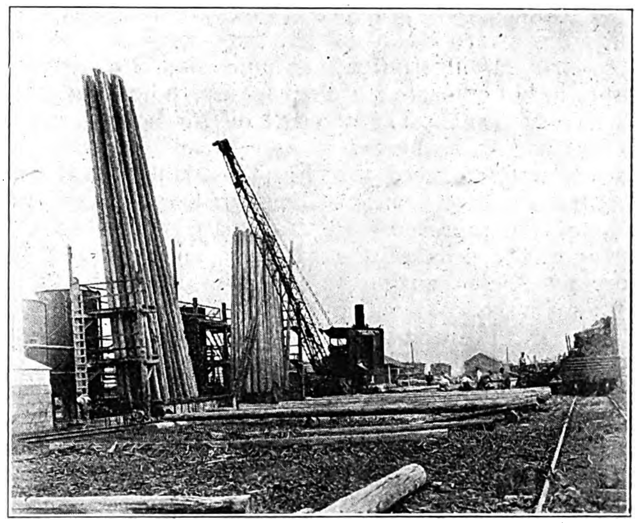
CONSERVATION ESSENTIAL IN CONSUMPTION OF WOODEN POLES.

Effective Preservative Treatment More Than Doubles Pole Life—Results in Conserving Supply and Reducing Maintenance Costs—Co-operative Treating Plant.

A preservative treatment for cedar and other classes of wooden poles used in carrying telephone, telegraph and electric power lines is fully recognized as essential in the conservation of our forest resources and of special importance in reducing maintenance charges in connection with such lines. The standing timber suitable for poles, existing in the northern, northwestern and southern states, is by no means limitless. In fact, it is estimated by competent authorities that the requirements for replacements and normal expansion will result in a practical exhaustion of such resources within 60 years, unless effective methods of conservation are extensively applied.

The erection of telephone and electric lines was very active in the central states and other sections 10 to 15 years ago, and on many of those lines practically very little consideration was given to any preservative treatment of the poles. As a result, the present demands for replacements due to decay are very heavy. Those replacements amount to hundreds of thousands of poles annually.

While the practice of treating the butts of poles is greatly increasing, it is estimated that at least 65 or 70% of the poles being required are erected without preservative treatment. The number of poles purchased in the United States in 1915 reached over 4,000,000, classified as follows: Western red cedar and northern white cedar, 2,314,980; southern white cedar, 89,244; chestnut, 651,643; cyprus, 67,644; pine, 546,233. Data supplied by the Forest Service show



Plant of Western Cedar Pole Preservers, Sand Point, Idaho, Showing Locomotive Crane in Service and Two Loads of Poles Receiving "B" Treatment.

that 95% of all poles are destroyed by decay, 4% by insects, and 1% by mechanical abrasion.

An estimate of the average life of poles of the several classes is as follows:

	Untreated, years.	Treated, "B" method, years.
Western red and northern white cedar	16	30
Chestnut	12	16
Cyprus	6	15
Pine	6½	20*
Southern white cedar (juniper)	8	18

*Pressure method.

This estimate is regarded as conservative, especially with regard to poles of the western red and northern white cedars, for which a longer average life is claimed.

The three standard methods of wood preservative treatment constitute the pressure process, in which the entire pole or log is treated; the open-tank method, usually adopted for treating the butts of poles; and the brush method, usually applied in the field and in the treatment of a comparatively small number of poles. These processes involve the use of both creosote and carbolineum as preservatives, and only the butt treatment is usually adopted for cedar poles required in transmission lines.

The three open-tank methods adopted by the Western Red Cedar Association are outlined in specifications prepared by that organization, designated as "A," "AA" and "B."

Treatment "A" requires a four-months' period of seasoning and the removal of fibrous inner bark preparatory to treatment. The poles are then placed vertically in an upright tank in which the butts are submerged in carbolineum, produced from pure coal tar, for a period of 15 minutes. The preservative is heated to a temperature of 215° F., at least once during every four hours' treatment, and it is required that it shall not fall below 180° nor exceed 230°.

Treatment "A" provides for the same preparation and methods of butt treatment as are required in "A," but requires the use of creosote instead of carbolineum. In this case, it is specified that the creosote shall be a coal-tar distillate and which must become completely liquid at 38° F. As in the use of carbolineum, the creosote is required to be used at 215° F.

Treatment "B" provides for placing the poles with butts downward in an upright tank, as shown in the accompanying illustration, for immersion first for four hours in hot creosote and then for two hours in a bath of cold creosote. The creosote oil for hot treatment is specified to be heated to 212° F. and for the cold bath at not to exceed 112° F. This double treatment secures deep penetration—about 50 to 75% penetration of the sapwood. In this treatment the hot oil expands the cells of the sapwood and the cold oil contracts them, causing an expansion and contraction of air in the cells which results in drawing the oil deeply into the wood.

It is considered impossible in the treatment of cedar-pole butts to secure a penetration deeper than the sapwood, as the oil penetration is resisted by a fibrous growth between the sapwood and the heartwood, and a penetration deeper than the sapwood is not necessary because decay at the ground line always starts at the outside and works inward. But the penetration of the sapwood must be to a depth sufficient to overcome volatilization of the preservative oil.

Many pole users have been content with the cheaper installations of untreated poles, with the resultant shorter life and the inevitable higher maintenance costs of the line.

Another wasteful practice has been to install poles of somewhat larger diameter than actual service requires, to allow for a certain amount of deterioration by decay before replacements become necessary. Thus, if a pole of 28-in. circumference is all that is required to support the line safely, a pole of 36-in. circumference is selected to allow for a 1¾-in. depth of decay, and still leave a pole of a size to sustain the load. The adoption of a pole of the smaller size and giving it an effective butt treatment, would be far more economical in the long run and much less wasteful of timber resources. That is, the longer life obtained by choosing a pole unnecessarily large could have been secured by selecting a pole of just sufficient size and giving it a preservative treatment.

The height of butt treatment is determined by the length of poles and the height of the ground line. Thus, a 20-ft. pole, sunk to a depth of 3½ ft., would require a 5-ft. height of treatment; a 30-ft. pole, set at a depth of 6 ft., would require a 7½-ft. height of treatment.

The illustration given herewith shows the treatment plant of the Western Cedar Pole Preservers, at Sand Point, Idaho. The stockholders in this concern are the members of the Western Red Cedar Association, of Spokane, Wash., and its operations are confined to the treatment of poles for those members. In this plant equipment is provided for pole-butt treatment by the "A," "AA" and "B" processes described above, of which the double treatment by hot and cold creosote is required in most cases. The plant has a capacity for treating four carloads of poles per day by the "B" method and is operating at about that capacity. The equipment comprises two 20,000-gal. steel working tanks, circular in form, for hot and cold creosote, rectangular treatment tanks and a round sump tank of concrete, and a 50,000-gal. storage tank for creosote and the necessary steam-boiler plant. In the illustration a locomotive crane is shown in service handling the poles.

RECENT IMPROVEMENTS IN AND FACTORS INFLUENCING INDUSTRIAL CONTROL EQUIPMENT.

Abstract of Paper Presented Before Association of Iron and Steel Electrical Engineers.

By H. D. James.

Westinghouse Electric & Manufacturing Co.

It is not probable that radical changes will be made in the general design of magnetic contactors, as experience has shown that the clapper type of magnet is more reliable than the coil and plunger type, and it is desirable to have all of the essential parts removable from the front of the board. An effort is being made to reduce the number of parts and to use as few different sizes as possible.

A careful study of the design of magnetic contactors and other control apparatus, together with our accumulated experience, enables improvements to be made which reduce the wear and maintenance and decrease the liability to freezing or failure of operation. A consideration of any contactor shows that the essential part of the device is the contact and arc rupturing means. Whether the contact is closed by hand, by magnet, or by an air cylinder, the important part of the problem is the ability of the contactor to handle the current and to stand up under repeated operation. The rolling contact is the most reliable type now in use, but an analysis of various designs indicates a considerable variation in the performance of this contact.

In the rolling contact the movable contact member is usually attached to the armature of the magnet and mounted on an auxiliary pivoted member which will be designated as the contact support. The pivot of this contact support approaches the stationary contact through the arc of a circle and the movable contact is tilted forward so that its tip comes in contact with the stationary contact tip. A further movement of the magnet armature causes the movable contact to roll against the stationary contact until the heels or bottom parts of the contacts are in engagement. The relation between the pin, around which the contact support rotates, and the position of the contacts is an important part of the design. The action of the contacts against each other cannot be a true rolling action, as the contact support hinge pin rotates through a circle and therefore its center moves up and down, due to this rotating action. The least amount of roll is obtained when the moving contact center is located so that it moves at an equal distance on either side of the line drawn from the heel of the contact to the armature hinge pin. Even with the above arrangement of centers there is always sufficient sliding action to keep the contacts clean. Any excessive sliding action causes additional mechanical wear on the contacts and in this way reduces their life.

An excessive sliding action is a disadvantage from another point of view. If the surfaces of the contacts become rough, they have a tendency to lock together and prevent the sliding action. While this locking together is not absolutely positive, it has been found sufficient in cases where the sliding action is excessive to prevent the armature of the magnet from sealing. This can be readily understood by considering two gear wheels in mesh with each other and an effort to move one gear relative to the other at the same time that they are rotating.

When a magnetic contactor is closed the contacts strike together with considerable force and there is a slight rebound. This is true of any two elastic bodies coming together; the motion is arrested and a slight rebound takes place. When the contact rebounds it draws a small arc which softens the surface of the contacts at the point where they touched. If these contacts are permitted to come together at the same point after the rebound, there will be a decided tendency to weld or freeze, due to the softened metal parts coming into contact. This re-establishment of contact at the same point is prevented by the closing movement of the magnet armature. During the period of rebound, the armature has travelled closer to the magnet core and the center carrying the contact support is in a new position, so that contact is re-established at another place.

The closer the contact support hinge is to the heel of the contact, the quicker the rolling action, and therefore the less liability to freeze. With a long slow roll, the opportunity to weld or freeze seems to be very materially increased. It is possible to obtain a welding of these contacts by energizing the closing magnet and then immediately de-energizing the magnet in such a way that the contacts will just touch and then drop away. With a slow-acting magnet and a long roll contact, it is easier to obtain this condition than where the center of contact support is close to the contact. This condition is the only one under which a well-designed contact will weld on normal overload current.

The closer the center of contact support is to the contact, the greater the lever action exerted by the closing means and therefore the greater ease with which a welded contact may be broken apart. This is of particular value in connection with manually actuated contactors, as these are more likely to be welded, due to improper operation. If the contact is closed by a cam, the operator can exert a very powerful force to break open any ordinary weld.

Importance of Magnetic Blowout.

The life of the contacts and arc box depends upon the efficiency of the magnetic blowout. The function of this blowout will be better understood by a brief description of the action which takes place in the arc box. The arc may be considered as consisting of a stream of positively and negatively charged gaseous particles or ions that travel rapidly from one contact to the other under the influence of the electrostatic field, which is established between the contacts by the line voltage. This stream of rapidly moving ions constitutes the arc current between the contacts; since it is a flexible conductor it can easily be stretched out lengthwise or readily deflected. If a transverse magnetic field is applied to this conductor, the reaction between the conductor and the field will be similar to the action which takes place in a motor where a conductor carrying current is placed in a magnetic field. The conductor moves in the same direction as it would in a motor. This movement increases its length, which cools the arc gases and increases the resistance to the flow of current. The increased length makes it more and more difficult for the voltage across the arc to maintain the flow or ions, until the arc becomes unstable and is finally ruptured. The length of the arc depends upon the amount of current flowing when the arc is established, upon the voltage between the contacts and upon the stored energy in the circuit. The length of this arc may readily be influenced by the design of the arc box and blow-out field.

In addition to the ions, which makes up the flexible conductor, some stray ions accumulate in the arc box. If the distance between the contacts is small, the voltage between the contacts may cause these stray ions to reestablish the arc by forming a new flexible conductor. Oscillograph records show that the arc is sometimes re-established two or three times before it is finally interrupted. The re-establishment of the arc depends upon the design of the arc box and the separation of the contacts. The higher the voltage, the greater the separation required. If two contactors are used in series, there is much less liability of the arc re-establishing itself. The two breaks in series also assist in rupturing the arc, as they require the maintenance in series of two flexible conductors made up of ions, they also distribute the heating effect between two or more arc boxes so that it is much easier to cool the arc.

To rupture an arc, it is necessary (1) To lengthen this arc, so as to increase the resistance, and therefore decrease current, and at the same time, to cool the arc. (2) The contacts should be separated far enough to prevent a re-establishment of the arc or two or more breaks should be used in series for this same purpose.

The cooling of the arc vapor and lengthening of the arc path is usually accomplished with a magnetic blow-out. This lengthening and cooling may be materially assisted by interposing barriers or arc splitters in the path of the arc. In this manner, the ions, which maintain this arc stream, are not only cooled and discharged by contact with the sides of the arc box and the surrounding air, but are also cooled by coming in contact with these arc splitters. The length of the arc is also materially increased while it is still under the influence of the blowout field, by stretching it across these arc splitters. The projection or throw of the arc beyond the edge of the arc box is therefore decreased and much more energy can be broken in the same size of arc box. If the arc extends a considerable distance beyond the edge of the arc shield, it ceases to be under the influence of the magnetic field and may continue to hang on for an appreciable length of time. The burning on the contacts and arc box for any given current depends directly upon the length of time the arc is maintained. The further the arc must travel in order to be ruptured, the greater the time for burning. By using these arc splitters, the arc is extinguished more quickly and therefore the amount of burning is decreased.

The material of which the arc shield is made bears an important relation to the duration of the arc. A good many asbestos compounds, now in the market, contain a binder, which is fused by the arc and forms a conducting skin on the side of the arc box. It is therefore very desirable to construct arc boxes of material which does not form a conducting skin. The more refractory the material, the greater the life of the arc box.

Editorial Comment

Street Lighting and Accidents

STREET lighting has long been recognized as having three main functions. It helps one who has to venture out on the streets after dark to find his way and locate his destination, to go without molestation by those maliciously inclined, and to avoid collisions, falls and other accidents. With the steady growth of automobile traffic in recent years there has been a tendency to increase of street traffic accidents, both by day and night. The far from satisfactory condition of the average automobile headlight has contributed to the latter increase, but it is generally realized that improved street lighting would materially decrease the number of traffic accidents at night. To focus attention upon the subject it was desirable to have definite data available on the effect of darkness upon street accidents and to what extent these might be reduced by modern street lighting.

Data on this matter have now been gathered as the result of an analysis of street traffic accidents in Cleveland, made by Mr. Ward Harrison of that city and reported in an article in this issue. He shows conclusively that there is a big increase in accidents during corresponding hours of summer and winter when daylight and darkness prevailed. In the well lighted part of the city this difference was very small, thus showing the accident-prevention value of modern street lighting. It would be desirable to confirm these findings by definite figures extended over a numzer of years, if possible, and including other cities.

While no one has seriously questioned the safety value of street lighting, data like these are of great intrinsic value when it comes to advocating proposed lighting betterments before city councils and other municipal authorities. Just as with industrial lighting, if one can show concrete benefits in lives saved or accident damages avoided, the arguments make much more impression than abstract statements and generalities.

Some Considerations in the Electrification of Coal Mines

WITH the agitation for higher rates of remuneration and shorter working hours—the bituminous coal miners are demanding a 60% increase in wages and a 5-day week of 6 hours each—to which must be added the fact that a very large number of foreign-born miners are going back to their native countries, coal-mine operators face today the very serious problem of combating increasing costs on the one hand and curtailed production on the other. There is but one solution to this problem, and that is to utilize to the full mechanical methods of mining and apply them most efficiently.

This means, of course, in nine cases out of ten, electrification. And electrification, efficiently carried out for most economical investment, the greatest reliability and minimum operating charges, means the purchase of central-station power, the employment of electricity as the working agent in almost every phase of getting the coal from the ground to the railroad car, and scientific secondary or underground distribution throughout the mine so that line losses and local trouble are minimized and shutdowns localized.

In going over to central-station service, installation costs must be kept to a minimum because there is sometimes small margin between central station and isolated plant costs, not capitalizing the other advantages of purchased service. However, the high value of coal, the value at which it might be marketed if not burned for power purposes, is making the margin wider and wider. In other instances, the lower the cost of supplying service, the greater the profit in the utility. In all cases, therefore, it is to the advantage of someone, frequently of everyone, that the cost of delivering "service" be a minimum. Elsewhere in this issue appears an article by Mr. H. W. Young on the "Outdoor Substations in Connection with Coal-Mining Installations," a solution to keeping the cost of delivery service down. There is little to be said further in this connection, for most of us know what Mr. Young has done toward making the outdoor substation what it is today. These columns have advocated the outdoor substation for so long and for so many applications that our readers must have learned our doctrine of "do not house what does not need housing."

An outdoor substation, *per se,* may with a little modification of detail but retaining the same salient features be used with equal success and effectiveness indoors—throughout the mine. In both instances reliability, economy of cost and flexibility are the predominating conditions to be met, to which portability must be added for the movable type. The place where service should be delivered is at the mine head. The place for the substation in the mine, or substations, as the case may be, is at the center of gravity of the load. As the center of gravity of the load changes the location of the portable or movable substation should change also, speaking generally. By so doing, the investment in conductors is kept down, energy losses are reduced and voltage regulation is maintained so that equipment and men are not handicapped. Only those that have worked in electrified coal mines appreciate the manner in which low pressure and poor voltage regulation are answerable for burnt-out motors, flashovers of direct-current apparatus and lost time in general.

The electrification of coal mines during the next ten years is prone to play an important part in combating the high cost and scarcity of labor and the demand for less work and more pay. Coal-mine electrification, unlike many other forms of electrification, calls for frequent adjustments to take care of changed locations of active workings, increase in depth of shaft and similar causes. The substation at the mine head may be expected to remain quite permanent except insofar as increased capacity and extensions may be required from time to time to care for the increased energy consumption taken by the mine. The initial choice of a flexible type of outdoor substation is therefore a fact to be borne in mind.

So, too, the distributing network in the mine will require periodic modification to meet new needs, and to this extent the portable substation is a factor in economical operation, in keeping down the kilowatt-hours per ton of coal mined, the investment in conductors and energy loss chargeable to distribution and voltage regulation.

Coal will play a vital part in our national life for many a day—perhaps forever, so far as we know now. Electrification of the coal mines is not only a matter of lowering the costs of mining and therefore in affecting the cost of coal to the consumer and to industry. Electrification means that coal can be better conserved, since coal can be mined less wastefully and less need be left behind in abandoned workings.

Records for Electrical Departments

IT IS obvious that the value of records depends on how much use is made of them and what results they bring. There are, no doubt, as many errors of omission as commission in this respect in factories, industrial plants, repair shops and the like. Neglecting to keep adequate records is as bad policy as to become involved in complicated record systems which may take more time to maintain than does actual production itself. Where to start and where to leave off is a matter of experience, observation and precaution.

Good practice in keeping records for electric repair shops and for industrial plants and other institutions having an electrical repair and maintenance department is indicated in an article by Mr. R. B. Gerhardt in this issue. While Mr. Gerhardt's suggestions are confined to the electrical departments of steel mills, it can be assumed that the points brought out regarding records of costs, production, inspection and tests will be well taken by any one in charge of an electrical department or repair shop.

The activities of such establishments being so varied, there can never be a great degree of standardization in the keeping of records. "Moderation in all things" seems to apply to records, and should be the rule to follow.

British Water-Power Utilization Progressing While American Waits

ONE of the many matters which the British prime minister is pledged to bring before Parliament when the legislators resume their sittings late in October is hydroelectric power development. Early in the year we particularized certain proposals which were advanced by the Water Power Resources Committee relating to nine potential schemes for Scotland which, if carried out, would upon the then average practice of coal-fired stations represent the equivalent of 1,850,000 tons of coal per annum. At that time it was urged that if some of the aforesaid schemes were to be quickly taken in hand so as to give useful employment to labor in 1919, speedy legislative action ought to be proceeded with giving the Board of Trade power to acquire the necessary rights and instruct engineers to complete their surveys, prepare plans and estimates. Doubtless it was owing to the heavy demands upon Parliament that the matter was delayed. The committee wanted the legislative part of the business to be put through quickly so that actual construction work could be begun in the summer now already past. If the bill now promised for the late months of the year is approved, that may happen next year instead of this, but the schemes or part of them, are now definitely accepted as part of the government intentions respecting the industrial development of the United Kingdom and, failing accidents, the way appears clear for something practical to proceed.

Interest in the matter is not limited to the United Kingdom for a second section has now been issued of the report of the Water Power Committee of the Conjoint Board of Scientific Societies on hydroelectric proposals and achievements throughout the whole British Empire. We publish some extracts from this important document elsewhere in this issue. It enters in detail into the greatness of the work and the opportunities and again lays emphasis on the need which has been recognized by careful British electrical observers for some time past of providing more adequate training facilities in British universities and technical institutes for young engineers wishing to take up this branch of the profession.

In the days of cheap coal hydroelectric work was not extensive in the United Kingdom. The colliery workers' wage and other demands, also coal transportation and other costs, have, by doubling the cost of the former commodity, altered the situation in favor of water power. This fact, coupled with the awakening of all parts of the British colonies to the folly of permitting prodigious waste of running water, has placed hydroelectric questions in the forefront of the engineering reconstruction problems of the entire empire, and indeed of practically the whole world. While our British cousins are actively planning, and actually carrying out water-power development, we are in the meantime still waiting on Congress to take some definite action on the matter.

Current Events

Electrical Christmas Campaign — Inductive Interference Survey—S. E. D. Activities—Northwest Association Meets

PRELIMINARY PLANS ANNOUNCED FOR "ALL-ELECTRICAL CHRISTMAS."

Society for Electrical Development Makes Survey of Electrical Trade Conditions and Prepares Plans for Holiday Selling.

Announcement has just been made that the Society for Electrical Development is completing plans to make this an "All-Electrical Christmas." In line with the plans carried out in 1915 for "Electrical Prosperity Week" and in 1916 for "America's Electrical Week," representatives of the society have completed a survey covering 16 states and the province of Ontario, Canada, during which electrical conditions in every branch of the industry were studied at close range.

In most cities the contractors, dealers, jobbers and manufacturers reported the greatest volume in their history. Manufacturers and distributors of electrical specialties are far behind on orders and dealers in these devices are finding ready sale. As one retailer expressed it: "For the first time in the history of electrical appliance selling in this city people are coming into the store to buy large and expensive specialties, which heretofore we had to go out and sell with the hardest kind of selling."

Based upon this information, the society has prepared complete and comprehensive sales and advertising material for holiday selling. This material will comprise posters, colored leaflets, envelope enclosures, cards for counters, cars and windows, form letters and various other advertising matter. It is planned to distribute this co-operative help to the trade at large, as in former campaigns. The society will supply details of the campaign and material upon request. Its headquarters are located at 29 West Thirty-ninth street, New York City.

RAILWAY AND UTILITY COMMISSIONERS TO CONVENE.

Meeting at Indianapolis Oct. 4 Will Be Concerned with Discussion of Transportation and Utility Problems of Readjustment.

The National Association of Railway and Utilities Commissioners will meet in Indianapolis, Ind., Oct. 14. John W. McCardle of the Indiana Public Service Commission will deliver the address of welcome. Governor Goodrich of Indiana, Mayor Jewett of Indianapolis, Clyde B. Aitchison, chairman of the Interstate Commerce Commission, and Max Thelan, director of service for the federal administration, will be among the leading speakers. Three hundred commissioners are expected to attend.

All sessions will be held in the Claypool Hotel and will continue five days. The meeting will largely be devoted to a consideration of reports of special and standing committees, which will cover all phases of railroad and utility regulation. Among the important subjects are public ownership and operation, safety of operation, service of railroads, service of utility companies, railroad rates, utility rates, demurrage, express companies, grade crossings, statistics and accounts, capitalization and state and federal legislation. It is expected that the various plans for the return of the railroads to private ownership, as well as the Plumb plan for nationalization of the systems, will be discussed.

The officers of the association are: President, Charles E. Elmquist, Minnesota; first vice-president, Charles M. Condler, Georgia; second vice-president, Joseph B. Eastman, Massachusetts; secretary, James B Walker, New York; assistant secretary, L. S. Boyd, Washington, D. C. The association comprises all of the railroad and public utility commissions in the United States, as well as those in Hawaii and the Philippine Islands. There are now 53 different commissions belonging to the association, representing every state in the Union with the exception of Delaware, which is the only state having no regulatory commission.

ELECTRICAL EXPORTS FOR JULY FAR BELOW RECORD.

Serious Slump From the Record Figures of June, but Substantial Increase Over July of Last Year.

Figures for the July electrical exports just made public through the monthly summary of the foreign commerce of the United States issued by the Bureau of Foreign and Domestic Commerce, Washington, D. C., show a very decided drop from the phenomenal total of last June, when there was reported an aggregate of $10,990,717. However, as compared with July of 1918 there was an increase of over 11%.

The detailed figures for last July and those for the corresponding month of last year are given in the following table:

Articles.	July, 1919.	July, 1918.
Batteries	$ 379,021	$ 240,640
Carbons	70,991	100,098
Dynamos or generators	475,271	283,407
Fans	142,103	105,823
Heating and cooking apparatus	156,745	64,822
Insulated wire and cables	659,893	477,448
Interior wiring supplies, including fixtures	160,099	135,221
Lamps—		
Arc	835	521
Carbon-filament	4,076	6,775
Metal-filament	240,719	309,919
Magnetos, spark plugs, etc.	203,809	151,821
Meters and measuring instruments	125,589	236,019
Motors	546,794	943,006
Rheostats and controllers	26,854	18,730
Switches and accessories	403,748	186,086
Telegraph apparatus, including wireless	44,892	30,710
Telephones	274,387	296,970
Transformers	285,496	287,459
All other	1,794,783	1,518,470
Total	$5,996,105	$5,393,949

These figures do not include electric locomotives, which are separately listed in the government reports.

INDUCTIVE INTERFERENCE COMMITTEE MEETS IN CHICAGO

Data to Be Collected by National Electric Light Association Sub-committees.

The first meeting of the newly formed Inductive Interference Committee of the National Electric Light Association was held in Chicago on Sept. 22 and 23. It is the purpose of the committee to study the inductive interference situation and its relation to practices of the power industry.

The discussions, with the deep interest which they evidenced, brought out clearly the increasing seriousness of this situation, due primarily to the rapid multiplying of the circuits of all parties concerned, to the ever-increasing susceptibility of telephone circuits attendant upon new advances in the telephone art, and to the lack of understanding of generally satisfactory methods of controlling the disturbing effects.

Plans were developed for organizing and inaugurating the committee's work in pursuance of which two sub-committees were appointed, one for the purpose of collecting general data pertinent to the subject and the other for studying the problems being encountered.

The efforts of the former sub-committee, of which S. G. Rhodes is chairman, will include the gathering and analyzing of all available data of actual cases of inductive interference, with descriptions in detail of the causes, nature and extent of disturbance, measures of relief applied, allocation of expense involved and other conditions. Any company that has experienced troubles of this character can lend effective support to the committee by contributing its information, mailed to W. C. Anderson, technical secretary, National Electric Light Association, 29 West 39th street, New York City.

The latter sub-committee, of which H. B. Gear is chairman, will work toward building up a centralized agency for assisting power and lighting companies to arrive at sound and proper solutions of their inductive interference problems, and for effecting a closer co-operation in matters of this nature.

The chairman of the Inductive Interference Committee is A. E. Silver, Electric Bond & Share Co., 71 Broadway, New York City.

ELECTRICAL MEN GIVE LUNCHEON TO EDWARD N. HURLEY.

Testimonial of Appreciation Presented by the Society for Electrical Development.

At a luncheon given on Sept. 19 at the Engineers' Club of New York in his honor by prominent men of the electrical fraternity, representing the Society for Electrical Development, Edward N. Hurley was presented an engrossed parchment testimonial expressing appreciation of his work while head of the United States Shipping Board.

The presentation was made by J. M. Wakeman, general manager of the society, who said, in part:

"When the United States entered the war it was already well recognized that ships were the all important weapon needed to keep the world safe from the hordes of barbarians who threatened it. Among the most notable achievements of this great country was the rapid construction of those vitally important ships.

"Representing the officers, directors and members of the Society for Electrical Development, I take the greatest pleasure in presenting you with this engrossed copy of the resolution passed by the directors and bearing their signatures, testifying their appreciation of the valuable and truly wonderful services you, as chairman of the United States Shipping Board and chief executive of the Emergency Fleet Corporation, rendered not only to this country, but to the entire world. Your work, Mr. Hurley, will be given a prominent place in history and we rejoice in the feeling that you are one of the oldest members and staunchest friends of the Society for Electrical Development. We feel honored that we are permitted to thus record our appreciation of your great achievements."

In acknowledging the presentation, Mr. Hurley said among other things: "I resigned my job with the Shipping Board to get back to the electrical business and I have spent some six weeks investigating what has been going on since I left it to take up governmental work. I am astounded at what has been done. In Washington, during the war, I was present when the question of doing something for the street railways of this country came up. I was asked to aid in the problem of bringing about some sort of an adjustment. Because I have always been interested in the success of the electrical industry, I complied.

"No industry has tried to help people more than the electrical, and that includes the street railways of this country, and no other industry can be of so much benefit to the people of this country. We are before the people more than any other industry and the country cannot afford to ignore the situation existing in the street railways, when they have difficulty in paying their fixed charges. They and everybody connected with the industry are doing one thing—trying to give service. And it is discouraging to feel that the public doesn't understand. They must be brought to understand, and that is one function of the Society for Electrical Development. It is to make people understand, to aid in helping all men of the electrical industry to get together, to hold hands and to stay together. Gentlemen, we must all hold hands, with each other and with the public, or I am frank to say some very important industries will be crucified.

"I think the whole electrical industry can well take to heart this message: Hold up your head and BE OF SERVICE. That is the thing the electrical industry exists for—to BE OF SERVICE."

The parchment is signed by the following directors of the Society for Electrical Development:

Henry L. Doherty, president, Cities Service Co.

James H. McGraw, president, McGraw-Hill Co.

Joseph E. Montague, vice-president, Niagara Electric Service Corp.

E. W. Rockafellow, Western Electric Co.

Fred B. Adam, president, Frank Adam Electric Co.

James R. Strong, president, Tucker Electric Construction Co.

L. P. Sawyer, National Lamp Works of General Electric Co.

Fred Bissell, president, F. Bissell Co.

Walter D. Steele, vice-president, Benjamin Electric Manufacturing Co.

Earnest McCleary, president, McCleary-Harmon Co.

Charles W. Price, chairman of board, Electrical Review.

J. Smieton, Jr., secretary and treasurer, Society For Electrical Development.

J. M. Wakeman, general manager, Society for Electrical Development.

CANADIAN GENERAL ELECTRIC JOINS SOCIETY FOR ELECTRICAL DEVELOPMENT.

Company Receiving Suggestions for Large Display Rooms and Greater Co-operation with Contractor-Dealers—Other Canadian Firms Joining.

The Canadian General Electric Co., with headquarters in Toronto, Ont., has become a member of the Society for Electrical Development, as have several other Toronto electrical firms, chiefly contractors and dealers. It is planned to extend the work of the society throughout the Dominion of Canada on an increased scale. The Honorable Frederic Nicholls, who for over 30 years has been prominent in Canadian electrical industrial activities, is president and general manager of the Canadian General Electric Co. A. S. Edgar, supply sales manager, together with Mr. Horton and Mr. Mallett, from the main office, have been spending considerable time in the New York offices of the society planning the co-operative work.

The Canadian General Electric Co. is building a new structure to house what will be the finest and most complete electrical showrooms in Canada. Many unique features will be incorporated in this department, which will be operated largely for the convenience of the contractors and dealers of Toronto and the surrounding cities. There will be rest rooms, consultation rooms, with stenographers in attendance, rooms for demonstrations of electrical appliances and specialties and provision made for carrying on a vast educational work within the trade.

CALL FOR ANNUAL CONVENTION OF JOVIAN ORDER ISSUED.

Meeting to Be Held in Chicago on Nov. 5 and 6 to Decide on Reconstruction or Disbanding of the Order.

The seventeenth annual convention of the Jovian Order will be held in Chicago, Nov. 5 and 6, at the Hotel Sherman, following a meeting of Jupiter's cabinet called for Nov. 4. The Jovian Order, like other similar bodies, because of retrenchment made necessary during the World War and changed conditions within the electrical industry, suffered during the past several years a material decrease in membership and income.

This impairment of finances and man power has reached a point so serious that some exceedingly resultful measures of reconstruction must be placed in effect or the order abandoned. This condition was defined in a resolution adopted by Jupiter's cabinet at a meeting held by that body on June 6, to the effect that this annual convention be petitioned by the cabinet to either disband the order or provide assured sources of revenue sufficient to cover a definite budget that will permit the order to realize the great potential good that rests within it.

The Jovian Order has been in existence 20 years. The fundamental principles upon which it was founded and for which it asked the support of the electrical industry were sound at the time of its inception, they are sound today, and will remain sound. The order has accomplished much within the industry.

It is believed by a considerable number of officers and members that the Jovian Order is far from a state of hopelessness; that it can be saved; that it can be guided and rejuvenated to high estate, to become an instrumentality of tremendous usefulness to our great industry, and to each of the mites and mighty that make that industry. Hence all interested in the revival of the organization and who treasure pleasant memories of its days of power and good are urged to attend the convention next month.

MEMBERSHIP CAMPAIGN OF WESTERN SOCIETY OF ENGINEERS.

Intensive Drive Is to More Than Double Membership in Six Days—Chicago and Neighboring Engineers Showing Interest.

Mention was made in these columns of an intensive membership campaign to be conducted by the Western Society of Engineers, Chicago. The time originally set was the week of Oct. 6-11, but preparations on a larger scale made it advisable to defer it to Oct. 11-17. A special campaign rally dinner was given on Oct. 9 at the Morrison Hotel to all interested in the drive, which is expected to bring in at least 2000 new members in six days. Fourteen teams are actively at work. On the evening of Oct. 10 a smoker was given to all participants, including prospective members. Six rally luncheons are to be held each noon on the active days of the drive. Engineers in and near Chicago are showing much interest in the campaign and recognizing the advantages of affiliation with this organization of engineers of all branches of the profession, which recently celebrated its 50th anniversary.

Detailed information can be obtained at the society's headquarters, 1735 Monadnock Block, Chicago.

INCREASED USE OF ELECTRIC VEHICLES IN ITALY.

Large Corporation Being Formed to Manufacture and Operate Electrics—Eagerness to Co-operate With Americans.

The shortage of gasoline during the war has brought about considerable use of electric vehicles in Milan, more particularly for heavy trucking. Although with normal conditions gasoline will not continue at its present price of a dollar a gallon, it will always be high in Italy and that of electricity low. The cities of the Po Valley are all level and the roads in the country are very good.

One electric garage in Milan operates electric busses for all of the hotels and also a regular express-truck service between Milan and Bergamo. It is organizing a 3,000,000 lire corporation to manufacture and operate electric vehicles. It is connected with the Soc. Generale Italiana Accumulatori Electtrici, which will make the batteries. This latter concern was a branch of the Tudor group, but has now been taken over entirely by Italians.

The company would like to form a combination with some American concern manufacturing electric trucks. It is possible that considerable business might be done in parts of trucks such as controllers, steel wheels, etc., and even entire trucks minus the batteries if the price was right. The address of this concern can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its numerous branch and co-operative offices in the leading cities of the country, by making reference to file No. 40723.

Northwest Electric Power Men Hold Important Convention

Central-Station Delegates from Four States and Many Visitors Meet at Seattle — Papers and Discussions Deal with Vital Problems — J. B. Fisken Elected President of Association

By W. A. SCOTT

THE electric public utility companies of Washington, Oregon, Idaho and Montana were well represented at the twelfth annual convention of the Northwest Electric Light and Power Association held at Seattle on Sept. 24 to 27, inclusive. This organization is a geographic section of the National Electric Light Association. Close to 150 delegates and guests were registered; included among the latter were 15 representatives of power companies and other electrical concerns of California. The convention was notable for its unanimity of action on important matters, for the ready grasp of problems before it, and for the ability manifested in papers and discussion.

All the sessions were presided over by H. J. Gille, of the Puget Sound Traction, Light & Power Co., president of the association. At the opening of the convention, Mayor C. B. Fitzgerald of Seattle gave a brief address of welcome. This was followed by President Gille's address, in which he first gave a review of the important part played during the war by those trained in the public-utility industries.

President Gille's Address.

Entering then into the affairs of the public utilities, Mr. Gille covered all phases of the subject, showing the problems and duties to be met. The following extracts cover some of the salient features of his address:

"The public, which had been taught that the combination of capital necessary to successfully and economically develop the large public utilities of this country was somewhat of a menace, was suddenly awakened to the fact that it was only by reason of the existence of such development that the tremendous construction necessary to successfully prosecute a great war was possible. Shipyards sprang up almost over night. Large machine shops and other war industries demanding large blocks of power came into existence, and yet this extraordinary demand for electric energy was everywhere promptly met. Nor is there a single record of any electric light and power company seeking in the slightest measure to take advantage of the country's abnormal needs to secure an abnormal profit. With the prices of every other commodity advancing by successive strides, the prices of electric energy remained practically stationary, despite the large increased cost in production and labor.

"Along with the other questions that have profited by the experiences of the past two or three years is that of standardization and equipment. Lamps and appliances have been brought up to a spirit level of quality that would have taken years to bring about had not necessity compelled. And at the same time much that has been worthless and unnecessary in the way of appliances and equipment has been scrapped and such machinery as was employed in the manufacture of our own necessities has turned out goods with the hall mark of quality, benefiting the electrical industry.

"One of the peace-time problems confronting us today is the development of business to employ the energy released from the needs of war production, and the development of the great industrial opportunities on the Pacific Coast, and particularly in the Pacific Northwest. Industrial research for developing industries employing electricity as a motive power should be vigorously prosecuted. I realize that few individual companies, except the large ones, can afford to engage competent investigators for this purpose, and it might be wise for the association to undertake this work along broad lines for the benefit of all member companies. Chambers of commerce, commercial clubs, associations of manufacturers, jobbers and dealers should co-operate with the central-station companies in working out such a plan and in encouraging new industries.

"In the Bureau of Labor statistics of the United States are records of wholesale prices of 240 commodities, grouped under nine heads. The average index number in 1913 was 100; in April, 1919, it was 203. In other words, the wholesale prices of 240 commodities have more than doubled since the date of the first record. For some reason the price of electricity for light and power is not included in this list of commodities, probably because it is included under the class of service. If, however, an index number showing the movement of light and power rates were available, and could be compared with the commodity-price movement, a very striking difference would be observed, as even in the few cases where rates have been increased it was only a fraction of the commodity-rate increase.

"If 100 represented the normal in 1913, the average light and power index number today for all member companies would probably not be more than 115. Our customers who produced these commodities which have increased tremendously in price have benefited by increased profits. In the meantime our own net earnings have not been increased. This statement is made in the face of greatly increased gross earnings, due to increased business, but the business extensions have compelled large additions to our plants and at very high construction costs.

"The furnishing of power for the operation of railroads is a problem that confronts all of the power companies on the Pacific Coast, as well as the inter-mountain companies. In a period of less than 15 years the manufacturers of electrical equipment have perfected motors for heavy duty, as well as for high speed, capable of handling the heaviest trains over railroad lines having the most difficult grades. The Chicago, Milwaukee & St. Paul railway has over 400 miles of electrified lines in operation in Montana, the power for which is being furnished by the Montana Power Co.; and the Milwaukee management will place in operation over 200 miles of electrified lines across the Cascade Mountains, in the western division, in the state of Washington, between Othello and Puget Sound, within a short time. The power for the western division will be supplied by the Washington Water Power Co., on its eastern end, and the Puget Sound Traction, Light & Power Co. on the western end. The success of the operation of the Rocky Mountain division in Montana is well known. At a recent hearing before the Interstate Commerce Commission in Portland, evidence was presented showing the economy of electrical operation. The testimony was based upon the authority of comparative records of steam and electrical power, and went into the question in detail, a summing up of which would tend to show that the proportions were 408 to 524 in favor of electricity. The figures were adduced upon a 1000-ton-mile basis.

"The success of railroad electrification is assured, and there is no small reason for doubt that in a short time many of the railroads in the United States will be operated with electric power. The character of the power load for operating a railroad is somewhat intermittent and can be furnished cheaper by a power company on account of a diversified load for light and power, than by a separate power plant. It is, therefore, of the greatest importance that we co-operate with the railroad officials in the working out of economical and reliable power supply.

"In the matter of co-operation between central-station companies, manufacturers, jobbers and dealers, we cheerfully acknowledge the success of the plan developed by our neighbor, the Pacific Coast Section, and I am convinced that a similar plan should be worked out in the Pacific Northwest. Much good has been accomplished in this direction through the efforts of W. L. Goodwin and S. A. Chase, and I would recommend that a committee of this association be appointed to work with the manufacturers and jobbers as well as with the contractors and dealers to bring about practical co-operation.

"Our industry, even outside of its engineering and technical branches, is highly specialized, and our greatest need is for men qualified and properly trained in its various branches. While it is theoretically true that merit and ambition must eventually rise to the top, it is also true that opportunity plays a large part in a man's development. The electrical industry has had a marvelous development by reason of the ability and breadth of vision of the men who have been connected with it. The accomplishments of these men were not accidental, and their opportunities were not a matter of chance, but resulted from their ambition to do one certain thing, in one certain branch of the industry, coupled with the ability of their superiors to seek out and recognize their qualifications. Along that line it is the duty of every manager, and head of department to ascertain what the particular ambition of every subordinate is; to then determine if he is qualified along that particular branch, and if so give him the opportunity of developing himself. It is only by these means that men with particular ability can be found, and when found properly trained to take the places of those who are now doing the work, and carry on."

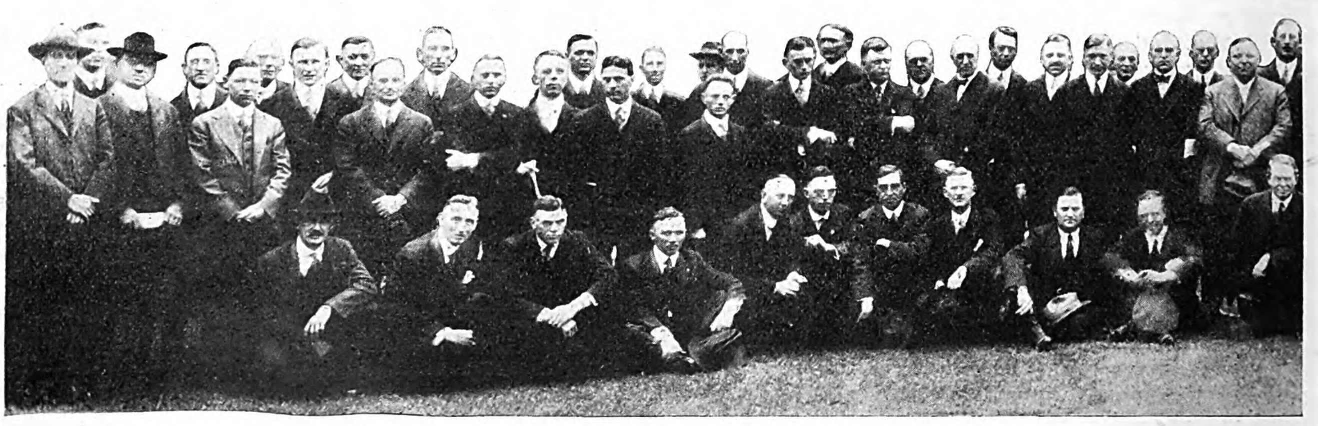
R. H. Ballard, of Los Angeles, president of the N. E. L. A., being unable to attend, sent a letter to the convention, which was read by the secretary. In this Mr. Ballard delegated A. Emory Wishon, of the San Joaquin Light & Power Co., Fresno, Calif., to represent him. His letter entered briefly into many important matters, giving emphasis to the necessity for greater water-power development; and urged co-operation among all branches of the industry, and the adoption of some method of participation by employes. The matter of good relations with the public and municipal ownership were discussed. Mr. Ballard thought the geographic section was the place in which all differences might be ironed out.

The report of W. E. Herring, secretary-treasurer of the association, was read; it showed a cash balance in the treasury of $5200.

O. B. Coldwell, of the Portland Railway, Light & Power Co., chairman of the Executive Committee, submitted a revision which his committee had made of the constitution for the association, which was subsequently adopted in lieu of the original provisions. It creates a stronger Public Policy Committee in each state, and under its provisions sufficient funds may be supplied for carrying out the plans of such committees.

On the recommendation of the Executive Committee, W. J. Grambs, of the Puget Sound Traction, Light & Power Co., was made an honorary member of the association.

E. Hofer of the *Manufacturer and Industrial News,* Salem, Ore., appeared before the convention, and, in a brief address, discussed matters pertaining



Group of Delegates and Guests from Washington, Oregon, California, Idaho, Utah and Montana in

to the rehabilitation of the public utilities, by securing the co-operation of the public. Concerning labor problems, he advocated voluntary mediation within each industry.

Report of Hydroelectric Committee.

G. E. Quinan, chief engineer of Puget Sound Traction, Light & Power Co., Seattle, chairman of the Hydroelectric and Technical Committee, read the committee's report. This valuable report dealt with revision of the National Electrical Safety Code, standards for transformers, rating of oil switches, turbogenerator fires, inductive interference with telephone lines and other related topics.

The reading of this report was followed by extended discussion, entered into by O. B. Coldwell and L. T. Merwin, of Portland; F. D. Nims, John Harisberger, and others, of Seattle. The convention tendered to Mr. Quinan a vote of thanks for his research and service in preparing the report.

Accounting Methods.

Proper methods of accounting, adaptable to city and suburban electrical business, were treated in a paper presented and read by J. S. Simpson, of the Washington Water Power Co., Spokane. His initial statement was that the object of a set of books was to have it show at any time the actual financial condition of a corporation or firm, and also to meet the requirements in rendering federal and state government reports applicable to public utilities.

In the discussion that followed, the subject of billing customers and making collections received much attention. The plan of maintaining district offices in a city for the convenience of customers and to secure closer personal contact with them received the endorsement of a number of delegates. Under such a plan it was considered important that district managers have complete information at all times as to each customer's account. The method of keeping down billing costs by listing charges for services and goods on one bill had been adopted by some companies. It developed that in some lines of business it is essential that bills be rendered weekly; that the cost of billing and collecting was running too high; that the various companies should compare methods and costs and get away from methods which are cumbersome and expensive. In discussing meter reading, the fact was brought out that continuous meter reading had been found advantageous; and that the plan of allowing the customer in outlying districts to do the meter reading had proved satisfactory. This phase of the discussion was entered into by H. J. Gille, F. D. Nims, L. R. Grant, G. E. Quinan, R. W. Clark, of Seattle; H. L. Walther, Medford, Ore.; O. B. Coldwell, J. D. Scott, of Portland; W. M. Hamilton, Salem; Geo. D. Brown, Wenatchee; L. R. Lewis, Spokane; and E. E. Walker, Vancouver, B. C.

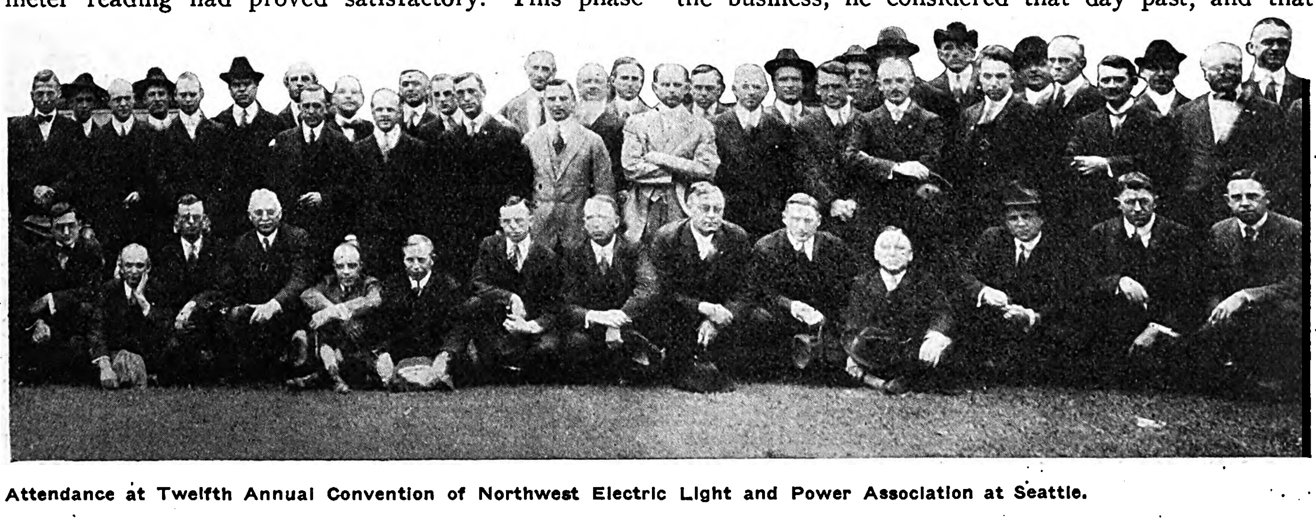
In answer to the question of H. H. Schoolfield, Portland, as to the computing of interest on construction and heavy maintenance, Mr. Simpson, author of the paper on accounting, stated that interest on construction should begin as soon as the money is raised, and cease when the plant was turned over to the operating department; and that no interest should be allowed on maintenance. The subject of depreciation was then discussed. In practice it was declared much of this can be standardized.

The evening of Sept. 24 was given to a lecture on "Electricity Today," by Wm. H. Easton, of the Westinghouse Electric & Manufacturing Co. The lecture attracted a large audience, which included a good many persons outside of the electrical industry. After giving an outline of the rapid development of electrical applications within the last 20 years, Dr. Easton predicted that in the future the adaptation of electrical energy to industries and utilities would be 20 times as great as at present. Numerous lantern slides were used in exhibiting the many applications of electricity in the industries and in domestic and farm life.

Electrical Merchandising.

The second day's sessions were devoted to round-table conferences on electrical merchandising, electric ranges and water heaters. They attracted a full attendance and brought out animated discussion and undivided attention. The round-table discussion in the forenoon, on Improving Electrical Merchandising, was conducted under the chairmanship of L. A. Lewis, Washington Water Power Co., Spokane. Mr. Lewis presented a paper dealing with the relations between manufacturers, central stations, jobbers, contractors and dealers, clearly showing the need of a policy of co-operation. He then called for 5 and 10-minute discussions, in which many took part.

E. E. Walker, British Columbia Electric Co., Vancouver, B. C., took up the attitude of central-station companies toward the merchandising branch, as to whether the tendency was to conduct the merchandising feature as a separate unit, or to run it as an adjunct to power and light production. While in former days, as a means of creating a demand for electrical appliances, it was necessary to mix the two phases of the business, he considered that day past, and that



Attendance at Twelfth Annual Convention of Northwest Electric Light and Power Association at Seattle.

now the merchandising of appliances should be on a profit-producing basis. He realized, however, that in some smaller centers it is still difficult to separate the two classes of the business. He predicted that in most cases central stations will continue in the merchandising business, but that their co-operation with the regular dealers will be such as to be advantageous to the latter, thus resulting in increasing the number of distributors.

John V. Strange, of the Pacific Power & Light Co., read an interesting paper on "Relations with Dealers and Contractors," taking up the subjects of prices, merchandise handled by central stations, and selling campaigns. In most of the larger cities he thought the appliance trade may be well and sufficiently served by local dealers; but in localities in which the central station is a factor in merchandising its competition should be such as to allow the contractor-dealer to live and prosper. He gave the manufacturer credit for accomplishing much in educating the public to the extent of creating a demand for appliances. Pioneering days are over and central stations will serve themselves by encouraging the local dealer.

D. E. Harris, sales manager of Pacific States Electric Co., San Francisco, spoke of the co-ordination of electrical interests in California, and showed how the local contractor-dealer in towns and the smaller cities is able to succeed when he receives the co-operation of central stations and jobbers.

W. S. Berry, sales manager Western Electric Co., San Francisco, referred to the work accomplished in California by an advisory committee of nine members, representing all branches of the industry, and expressed the hope that a similar plan may be adopted in the Northwest. He gave a brief account of the work of the field men working under the direction of that committee.

Robert Sibley, editor of *Journal of Electricity*, San Francisco, in further explanation of the California plan, said it was a method of co-ordinating the interests and services of the four branches of the electrical industry by means of the advisory committee's field men, and the help of the jobbers' salesmen.

Lewis A. McArthur, Pacific Power & Light Co., Portland, in speaking of merchandise accounting, outlined methods of cost keeping, including overhead and profits. The stock, he insisted, should be kept in salable condition and should be regarded the same as cash; and in the possible turnover of two and three times a year he considered the gross profit should not be less than 21%, and an additional 5% should be added if the goods are sold on installments extending over six months. In the sale of appliances to employes, he said the practice had been to make a price of cost plus 10%.

D. E. Harris and others discussed the subject of discounting the customers' paper, and in connection with this the Morris Bank plan was referred to. W. A. Marsden, of Electrical Appliance Co., Seattle, had found it possible to sell washing machines and other appliances in competition with central station and department stores.

Geo. A. Boring, Portland manager for Pacific States Electric Co., spoke of the good services of jobbers' salesmen in advising dealers in sales methods and displaying goods.

A. C. McMicken, sales manager Portland Railway, Light & Power Co., advised against the practice of carrying heavy stocks, but suggested the buying from jobbers in monthly requirements and let the latter absorb the carload discounts. Buying in heavy quantity, he considered, was not justifiable. Let the jobber do it.

Lewis A. McArthur said it was inadvisable for dealers to handle more than one make of each appliance, and W. O. C. Sawyer, of Yakima, supported the same contention. He said that, for instance, after the experience of carrying 4 or 5 kinds of vacuum cleaners, the store of the Pacific Power & Light Co. at Yakima got down to only one kind. The salesman's loyalty is thus not divided by efforts to sell several kinds.

H. C. Schade, of Portland Railway, Light & Power Co., read a brief paper on the experience of selling appliances through employes other than salesmen. It was considered a good method of extending sales and also a means of interesting many employes in the success of the company and in becoming users of appliances themselves. C. M. Brewer, of Mountain States Power Co., Albany, Ore., spoke of his success in selling electric ranges through special salesmen and other employes, and the sale of other appliances by co-operating with dealers. Under this head, A. C. McMicken told of paying bonuses to regular salesmen in the electrical appliance store, and said the plan had resulted in increasing sales materially. The effect had been better than that of a direct increase in salary.

S. M. Kennedy, Southern California Edison Co., Los Angeles, by invitation of President Gille, delivered an interesting address. After speaking of the dual responsibility of central stations—to stockholders and to the public—he turned to the subject of the selling of merchandise by central-station companies. He cut to the core of the question when he stated that the central station's chief interest in the merchandising branch rested in the matter of developing and building up the energy load. Securing and maintaining a satisfactory load for the generating plants in southern California had been accomplished by a system of genuine co-operation among all concerned. As the dealers become strong and effective in caring for the appliance trade, the central stations there gradually relinquish that branch of the business. His company, he said, keeps appliances on sale, but is not an aggressive competitor.

Sale of appliances through employes, other than regular salesmen, was explained and discussed by L. R. Grant, of Puget Sound Traction, Light & Power Co., Seattle, and the discussion was continued by others.

The National Convention of the N. E. L. A. in Southern California Next Year.

The afternoon session of Sept. 25 was crowded with matters of great interest. The first hour was given over to the California visitors. They were invited to speak on the 1920 convention plans for the N. E. L. A., on their California Electrical Development League, and other subjects. The first speaker was A. Emory Wishon, of the San Joaquin Light & Power Co., Fresno, who represented President R. H. Ballard of the N. E. L. A. He spoke of the co-operation of the leading electrical men of California to promote the success of the 1920 convention of the N. E. L. A., and he asked the co-operation of the Northwest. The great idea, by means of that convention, is to bring the East to the West, to bring them into closer contact. The national body was essential, but interest in the geographic sections should also be maintained.

Robert Sibley, referring to the problems of readjustment before the country, said the electrical industry would be a potent factor in working them out. He said the use of electrical energy per capita west of the Rocky Mountains was four times as great as that east of those mountains. The co-operative movement was harmonizing all interests and the ideals of the West were being carried to the nation.

S. M. Kennedy spoke of Mr. Ballard of the N. E. L. A. as a constructive president, and he predicted the convention of the national body, in southern California next May, would be one of the greatest in the history of the association. He asked assurances that the members of the Northwest association would be there in force. On motion of H. L. Walther, of Medford, Ore., the convention went on record in favor of attending the national convention as a body, and O. B. Coldwell, of Portland, was appointed committee to arrange for doing so.

Electric Ranges and Water Heaters.

The round-table conference on this subject was under the guidance of A. C. McMicken, of Portland. The matter was treated under separate heads, including advertising and merchandising. John V. Strange, of Pacific Power & Light Co., read a paper on "Advertising Service," which had been prepared by Mr. Gilham, advertising manager for Utah Power & Light Co., Salt Lake City. A paper on "Merchandising the Electric Range," by J. F. Durge, of Utah Power & Light Co., was read by R. W. Clark, of Seattle. Both papers brought forth interesting discussion. A few of the points made clear were that the first essential is to sell the idea; that service is the basis of success in selling ranges so they will stay sold; the confidence of all employes is an asset, and this can be built up by having them use ranges and understand them; much of the success of electric ranges is due to the wise policy and methods of manufacturers; we should get away from the idea that electric cooking is a seasonal proposition, as it is one of all-year utility; demonstrations in stores and influence of cooking schools are of special benefit; every range should be set up, inspected and tested before it is delivered to the customer.

F. N. Cooley, of Western Electric Co., Seattle, read a paper on "Electric Bake Ovens," by E. E. Rowley. It was shown how this class of ovens for restaurants and hotels and for commercial bakeries had greatly developed. Their great advantages were in perfect distribution of heat, their safety, economy, speed in baking and sanitary features. It was stated that there are 38 electric bake ovens on the lines of Utah Power & Light Co.

D. F. Henderson, of Washington Water Power Co., Spokane, said that company had 1131 electric ranges on its lines, and he gave some account of the new line construction necessary to handle this service, saying the revenue from this source justified the expenditure. He gave some interesting figures on the costs of electric range maintenance. It was explained that ranges were now being sold only in connection with the sale of water heaters.

H. J. Gille called into question the actual profit of electric range sales in small towns and in the country; and R. W. Clark, Seattle, said the prices of ranges had increased, the cost of wiring had also advanced, and he intimated that possibly development of the electric range business had in some cases been at the expense of the central station.

J. C. Henkle, of Portland Railway, Light & Power Co., submitted a valuable paper on "Range Maintenance Methods and Costs," as shown in the operation of that company's service department. He was followed by L. R. Grant, of the Puget Sound Traction, Light & Power Co., Seattle, on rates for ranges, water heaters and similar service.

The features of the last day were the presentation of two important papers and the discussion they brought out. The first was by W. H. McGrath, of Puget Sound Traction, Light & Power Co., Seattle, on "Value of Public Utility War Experiences and Their Effect on the Future." In Mr. McGrath's absence his paper was read by R. W. Clark. The paper referred to the various experiences of the electrical utilities and especially commented on the inflexibility of the present system of rate regulation. Mr. McGrath advocated a national campaign of education to bring the public to realize the economic fundamentals of the public utility business and appreciate the need of more speed in rate adjustments or more flexible rate schedules in order to meet emergency conditions more promptly.

David L. Huntington, president Washington Water Power Co., in discussing Mr. McGrath's paper, considered the position and conclusions of the latter axiomatic and not open to argument. He then took up such matters as taxation, replacements, construction, flexible rates and methods of educating and informing the general public on the problems faced by public utility companies. These he treated in a most lucid manner. S. M. Kennedy advocated the use of newspapers in disseminating information to patrons and the public. A. E. Wishon presented the advisability of interesting local people in becoming stockholders in the concern. The West, he said, could not advance ahead of its hydroelectric development.

The second paper was on "Industrial Heating," by C. A. Winder, of the General Electric Co. Mr. Winder's paper was read by O. L. Coward. The author covered a wide range of subjects dealing with the electric furnace, heat treating, enameling, core baking, welding, fruit and vegetable drying, bake ovens and vulcanizing.

In the discussion, the commercial point of view was given by B. S. Manuel, of Westinghouse Electric & Manufacturing Co.; H. J. Gille spoke on rates for heating loads; G. E. Quinan took up its application to steel furnaces and discussed the matter of load-factor; A. C. McMicken, speaking of rates for such loads, said continuity of service and adaptability were of far greater moment. He spoke of the installation in Portland of the first electric brass furnaces in the Northwest in which a 300-kw. load will be required. Among others who discussed different phases of electric heating were D. L. Huntington, J. King, R. W. Clark, A. A. Miller and F. D. Nims.

The nominating committee presented a list of nominees for officers of the association for the ensuing year. These were unanimously elected by the convention, as follows:

President, J. B. Fisken, chief engineer of Washington Water Power Co., Spokane.

Vice-presidents: F. D. Nims, of North Coast Utilities, Seattle, for Washington; G. L. Myers, of Pacific Power & Light Co., Portland, for Oregon; F. M. Kerr, general manager of Montana Power Co., Butte, for Montana; W. D. Putnam, of Idaho Power Co., Boise, for Idaho.

The convention closed with a banquet at the Army and Navy Club on the evening of Sept. 26, attended by about 150 members and guests.

Commercial Practice

Electric Heating in Typewriter Factory — Progressive Municipality's Electric Range Campaign—Rate Referendum

ELECTRIC HEAT IN THE TYPEWRITER INDUSTRY.

Paper Presented Before American Electrochemical Society's Meeting in Chicago Describes Plant of Royal Typewriter Co.

By A. M. Clark.

Industrial Heating Dept., General Electric Co.

The Royal Typewriter Co., of Hartford, Conn., is one of two companies manufacturing typewriters who bake the finish on typewriter parts in electrically heated ovens in preference to other methods now in use, such as in gas or oil heated ovens.

The installation consists of a battery of six ovens. Four of these ovens are 7 ft. 5 in. high, 7 ft. 1 in. deep, and 6 ft. 2 in. wide, while the other two are slightly smaller. Each oven has a connected load of 27 kw. The heating units which rest on the floor take up very little space and run at a relatively low temperature. This low temperature, combined with the ventilation which is provided, practically eliminates the danger from explosions and fires. The ovens run almost without attention, as automatic control and a time clock insure the desired temperature and the throwing off of the current at a predetermined time.

Oven No. 1 is used for baking japan on the spacer bar of typewriters. These spacer bars are made of soft wood, and are given five coats of a rubber japan, which gives a hard-rubber-like surface which cannot be easily dented. It was found advisable to use a temperature of 250° F. for 3 hours for the first four bakes. The last bake is run at a temperature of 275° F. for the same period of time.

The other five ovens are used for baking japan on the frames, ribbon spools, base plates, top dust plates, back dust plates, front plates, and paper tables. The finish on these parts requires a more complicated system of baking and finishing. In the first of these ovens the parts to be baked, having first been dipped in a metal japan are baked for five hours at 350° F., after which they are rubbed down by hand and again put through the same process in the second oven. Before being placed in the third oven they are sprayed with a black-baking japan and baked for five hours at 400° F. After this bake the parts are all sanded and rubbed clean and the same operation is repeated using the fourth oven. They are then rubbed down by hand with a hard piece of felt and powdered pumice, giving them a very smooth dull finish, sprayed with the same black-baking rubbing japan and baked for five hours at 400° F., when they are ready for the final assembly of the typewriter.

These ovens have been in operation for more than four years and have proven very satisfactory.

The following tables show the comparative capacity and cost of operation of two of the ovens, one equipped with gas and the other with electric heating equipment. The second table shows the comparative cost of gas and electricity per day, per month, and per year, and a saving per year of more than 20%, or $360.36 for each oven.

Summary of Fuel Costs per Bake in Japan Ovens.

	Electricity.	Gas.
Capacity	300 frames	180 frames
Capacity	3,288 lb.	2,055 lb.
Fuel used per bake	123 kw-hrs.	1,100 cu. ft.
Rate	$0.015 less 40%	$0.85—12% = $0.75
Cost per bake.	$1.10	$0.825
Cost per frame	$0.00366	$0.00458
Cost per pound	$0.000334	$0.000401
Fuel Cost—Full Time.		
Cost per day..	$ 4.62	$ 5.78
Cost per month	120.12	150.15
Cost per year..	1441.44	1801.80
Saving per year	360.36	

or 20% of present costs, without allowance for savings in defective bakes.

From the above it is evident that the Royal Typewriter Co. under the conditions existing in Hartford, Conn., is able to effect a considerable saving in dollars and cents by using electrically heated ovens. A superior finish without any increase in the cost of labor is also an item which makes the electrically heated ovens desirable.

In addition to the above, the Royal Typewriter Co. has found that electric heat proved advantageous in other ways as well. With gas-heated ovens their experience showed that owing to burning, underbaking, dust and variations in the heat, a certain percentage of bakes was lost. It was also found that with electric heat they get a superior and uniform finish, which is durable and does not easily chip off.

There are a number of companies manufacturing typewriters who are undoubtedly contemplating the installation of electrically heated ovens to bake the finish on typewriter parts. As this method is economical and insures a very good and uniform finish, it should not be long before the typewriter industry is using electrically heated ovens exclusively.

PROGRESSIVE MUNICIPAL ELECTRICAL PLANT MAKES GOOD HEADWAY WITH ELECTRIC COOKING.

Beloit Light and Water Department, City of Beloit, Kans., Finds Publicity and Propaganda Get Results.

By F. A. Darst,

Superintendent, Beloit Light and Water Department, Beloit, Kansas.

The Light and Water Department of the City of Beloit, Kans., has been carrying on a "Cook with Electricity" campaign during the past summer with results that are very gratifying. As the system is quite small, as are also the number of customers, relatively speaking, it may be of interest to tell what has been the effect of this electric cooking campaign upon the station output; and the manner in which this form of load is supplied.

Beloit is a town of 3750 population, and operates a municipal electric light and water plant, the total generating capacity of the electric light plant being 270 kw. The city does not sell electrical appliances or supplies but leaves this business to the merchants. This department does, however, help to interest prospective consumers in the use of electricity for various purposes, and as soon as a customer or prospective customer is found, the dealers are apprised of the fact at once. One of the dealers handles Hughes ranges, another one handles Westinghouse ranges and a third dealer handles General Electric ranges.

Last spring when a range campaign was commenced the Beloit Light and Water Department had 36 electric ranges connected to its transmission lines and today it has 73 electric ranges in service. I believe, when we began our campaign, every one of the 36 electric range consumers were absolutely satisfied with electric cooking and we used them as living advertisements, referring to them very frequently when talking to prospective range patrons. Next year we will double our present number of electric ranges in use without any trouble, as we find the demand is still very good. One of our dealers sold three ranges in one week and another one of the dealers sold two, and I have been informed that they have several more prospects for ranges this season.

Our range rates are as follows: Twelve cents per kw-hr. for the first three kw-hrs. consumed, per room per month, and 4 cts. per kw-hr. for the remainder. Minimum rate, $1.50 per month.

With this rate the municipality is able to obtain a very large appliance load which it would not otherwise be able to obtain.

The output of the municipal plant for the months of May, June and July was 146,174 kw-hrs., divided as follows:

Sold to consumers,

Lights	46,314	54.3%
Power	16,847	19.8%
Ranges and lights	22,140	25.9%
Total sold	85,301	100. %

	kw-hrs.
Total sold consumers	85,301
Used pumping water	19,763
Used street lighting	10,031
Used at plant	6,203
Unaccounted for	24,876
	146,174

From these figures it will be noted that the range business has added materially to the current sold. The output increased during these months from a total of 46,267 kw-hrs. generated during the month of May to 58,125 kw-hrs. generated in August, which is a gain of 20.4%.

It has been the experience of the municipality that the diversity-factor of the range load is such that in practically every instance where the transformers were previously large enough to carry the lighting load that they will also carry our added range load. No trouble has been experienced in carrying four ranges on one 5-kv-a. transformer and there are as many as eight ranges on one 10-kv-a. transformer.

The Beloit Light and Water Department has used the reverse side of the light and water receipts for advertising electric cooking and also the local daily paper.

Service connections for range consumers are made with No. 8 weatherproof wire and 25-ampere three-wire meters are used on this class of services, connecting lights and range on the same meter. At first separate services were used and separate meters for light and range services but the one meter method has proven much more satisfactory.

The municipality's electric ranges are competing with coal which sells at $9.50 to $11.00 per ton, and it is due to the high fuel cost that we are unable to give a better than a 4-cent rate on this class of service.

ELECTRIC CONSUMERS ASKED IF RATE INCREASE IS JUSTIFIED.

Central-Station Company Gives Customers Opportunity to Express Their Opinion as to Rates to Public Utility Commissioners.

The Commonwealth Electric Co., Summit, N. J., has adopted rather novel means to win the support of its consumers in connection with a proposed rate increase of 1 cent per kw-hr. for light and power, and ½ cent per kw-hr. for cooking service. The company recently made application to the Board of Public Utility Commissioners for permission to make this advance in its rate schedule and immediately following mailed a circular letter to its customers enclosing a blank form to be returned signed with an expression of views. This letter read in part as follows:

> If you do not feel that the company is reasonably entitled to make this increase (10%) in the rates you should tear off this slip, sign it with your name and address and mail it to the company at once. It is the desire of the company that every one of its consumers should have an opportunity to express their views to the Public Utility Commissioners, who, as you know, are the judges and jury in such matters, and this company will present to the commission all slips which are returned properly signed.

In explanation of this action the company sets forth that it believes that its patrons desire it to maintain a first-class quality of electric service and that they are willing to pay for such service whatever may be a just and reasonable charge. The company has endeavored to maintain adequate service during the war, irrespective of the cost, and believes that the service has been of the best quality and thoroughly satisfactory to customers.

COMMERCIAL ACTIVITIES OF BOSTON EDISON ELECTRIC ILLUMINATING CO.

Commencing September 2, the Edison Electric Illuminating Co. of Boston started to finance its own lease sales on such electric appliances as washing machines, vacuum cleaners, dish washers, etc. During the war, when financial conditions were "tight," and public utilities had to retrench in outlay of men, materials and money and when the Government asked that expenditures be curtailed to an absolute minimum, the company arranged that their customers make purchases of current-consuming devices through payments made through the Morris Plan Co. when buying on installments.

The company, in going back to its pre-war method of selling the higher priced devices, states it is very glad to once again come into the closer contact that always occurs when direct payments are made by their customers. The company in financing sales is charging 8% on deferred payments.

Transmission Structures of Steel and Wood—Cooling Coils—Portable Blower for Cooling Underground Cables

COMPOSITE TRANSMISSION STRUCTURES OF STEEL AND WOOD.

Abstracts from O-B Bulletin Tell War Practice of Alabama Power Co. to Reduce Line Costs and Increase Life of Supports.

By F. C. Weiss.
Superintendent, Line Construction, Alabama Power Co.

During the period of extreme high prices of transmission line materials the construction of priamry lines was limited to those serving essential war industries. Where conditions gave an opportunity for utilizing such construction so that it could be operrated in post-war times for commercial purposes, the installations were designed along lines of a more permanent character.

In 1918 the Alabama Power Co. was confronted with just such a problem on a 27-mile transmission line from its Bessemer substation to Gorgas, Ala. A 110-kv. connection for these two points was necessary. The high cost of right-of-way necessitated the construction of a double-circuit structure. This developed the problem into a matter of high price of steel and the necessary approval of the War Industries Board.

A composite structure of wood and steel was found to be the most economical under the conditions outlined above. Accordingly, test towers were constructed and various loads applied; finally the towers were tested for destruction.

The tests developed the weak points in exact accordance with the engineers' figures. The design of the wood-steel joint was perfected and steel work adapted to more economical erection costs, and the Alabama Power Co. then proceeded with the construction of this new type of tower which showed an over-all saving of more than 10% on the entire line over standard steel towers figured on a basis of market prices of July, 1918.

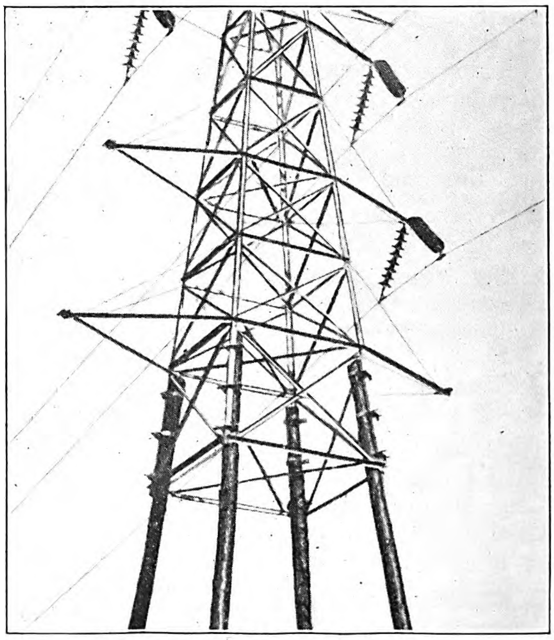
Two types of towers were used, one with four legs and one with two legs. The basis of the line was a two-legged structure with four-legged structure at points of special stress and at intervals of not more than one mile. The result is a line of semi-flexible type with more than ordinary stiffness.

The two-legged structure consisted of two creosoted long leaf yellow pine poles supporting 1750 lb. of galvanized steel super-structure. The four-legged towers consist of four creosoted long leaf yellow pine poles supporting 2750 lb. of galvanized steel superstructure. The normal spacing at the base is 15 ft. using 50-ft. poles with 8-in. tops. The steel superstructure is 32 ft. in height, clamped by steel bands to five feet of timber, making a mechanically strong and also a neat appearing wood-steel joint. Wood filler blocks perfected the fit from pole to channel section on two-legged structure and to angle section on four-legged structures.

The structures are designed to carry two galvanized steel 3/8-in. ground wires and two No. 2/0 copper three-phase circuits, insulated by 7 units Sanitary O-B suspension disks. The standard span is 700 ft. with maximum span of 2100 ft. The country traversed by the line is very hilly and to take care of side hill construction as well as special crossing clearances some 60-ft. poles are used in conjunction with the standard 50-ft. poles. A grounding wire is used on each pole and pole steps provided for workmen.

The poles were set as it is customary in pole construction. The depth of pole hole is 7½ ft. in normal instances and back-filling was done with dry mixture of cement with earth as found. This back-fill gives reasonable protection against side strain.

The steel structures are designed so that the lower 8 ft., including the wood-steel joint make a separate section. This section is used as a template, in squaring and aligning the structures after the poles are placed and properly back-filled. The additional steel work is handled by means of a small gin-pole mounted



Composite Wood and Steel Tower.

on the tempate section. This class of construction is very difficult to handle without especially trained workmen.

An analysis of costs indicated that the labor charges on this line were the same as for the standard 5000-lb. steel double-circuit tower line. The cost of excavating was less, the cost of hauling more, and erection or assembly less.

The relative cost can be better understood by a transmission engineer by stating that the character of the country necessitated the assembly of the structure "in the air." Also, 40% of the excavation was in rock.

The service that can be expected from this type of construction in first analysis is limited to the life of the wood-steel joints. This can be safely set as 10 years with reasonable attention from operators. Further, as wood section fails it can be replaced by wood or steel without excessive construction costs or interruptions to service.

STOPPAGE AND LEAKS IN TRANSFORMER COOLING COILS.

From Paper on "Symposium of Operating Difficulties," Before Pacific Coast Section, A. I. E. E.

By Julian Adams,

Assistant Electrical Supt., Pacific Electric Railway Co.

In the substations of the Pacific Electric Railway system the transformers vary in size from 100-kv-a. to 1000-kv-a. and a large percentage of them are water cooled. With these substations scattered over a wide area, all sorts of water conditions are encountered. In localities where a large amount of solid matter is held in solution considerable trouble has been experienced with the transformer water coils becoming clogged with the solids deposited by the water on the interior of the coils. The presence of the deposit is indicated by a gradual decrease in the amount of water which will flow through the coils and as the amount of water is decreased the temperature is raised and the deposit of the solid matter becomes more rapid.

Our experience in cleaning these coils has indicated that the best method is to pump in a dilute solution of muriatic acid through them. For this purpose we make use of a 1½-in. all brass centrifugal pump. We start by pumping water through the coils and slowly add muriatic acid until a maximum strength of about 2 pints of acid to 10 gallons of water is used. It is often necessary to pump the acid through for several days before the coils are clean. If acid of the final strength mentioned is used to start with it is likely to result in stopping up the coils completely, and when this occurs it is sometimes impossible to clear the coils even with the use of high pressure. We had one case of this kind, and when the coils were cut open they were found to be solidly plugged with very dense iron oxide. In this case the water came from a deep well pump and examination showed that the pump casing in the well had been eaten away by electrolysis and the iron transferred to the interior of the transformer coils in the form of iron oxide. This of course was an unusual case.

Some of the older transformer coils were made of very thin brass tubing and after some years of service these coils gave a great deal of trouble due to leaks produced by local galvanic action set up through impure water by the dissimilar metals composing the brass. In a few cases leaks developed in these coils which allowed sufficient water to get into the transformer, before it was detected, to short the transformer windings. In more recent years copper has replaced brass for transformer coils and heavier tubing used, making more durable coils. While iron coils seem to be meeting with some favor, they are open to the objection that iron has much lower heat conductivity than copper, thus requiring greater coil area and weight for equal cooling effect, also a greater labor cost.

It is of course apparent that much of the trouble that developed with transformer water coils, both as to their becoming clogged and as to their leaking, could be avoided by the use of an effective purifying system for the water, but where a large number of substations are involved, as well as a large number of different kinds of water, the cost of an effective purifying system of water is considerable.

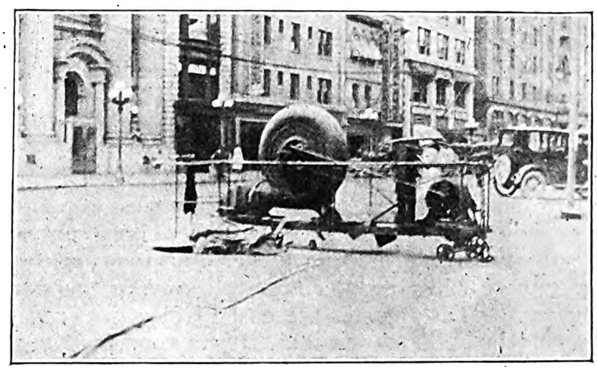
In the case of new installations the simplest and cheapest means of avoiding trouble with transformer water coils is not to use them. In sizes up to 1000-kv-a. self-cooled transformers now cost little if any more than water cooled transformers and when the cost of installing and maintaining a cooling water circulating system in connection with water cooled transformers is considered, together with the other costs incident thereto, it is my opinion that the use of water-cooled transformers is undesirable even in sizes much larger than 1000-kv-a.

PORTABLE BLOWER FOR COOLING OF OVER-HEATED DUCT SECTIONS.

Practice of Detroit Edison Co. for Overcoming "Hot Spots" in Underground Cables.

When a periodical temperature survey of an underground distributing system brings to light a particularly hot duct section of, say, 150° F. or more, some means must be adopted to dissipate the heat if trouble is to be avoided. This is accomplished in Detroit according to G. B. McCabe, in the *N. E. L. A. Bulletin* by the use of locally applied forced ventilation from a portable blower. The outfit consists of a blower of the upper right-hand horizontal-discharge type equipped with a 28-in. fan and directly connected to a 7.5-hp., 220-volt direct-current motor. The entire equipment is mounted on a steel truck.

When a particular hot duct run is discovered the blower outfit is hauled to the vicinity and mounted over the manhole at one end of the run. The discharge pipe from the blower is inserted in a circular sheet-iron plate of the same diameter as that of the manhole cover. The iron plate and the discharge pipe are then cemented in place with asbestos cement in order to make an air-tight joint. At the other end of the hot run a ventilating cover is placed which covers the manhole.



Portable Blower Outfit Employed by Dayton Power & Light Co. Answers Same Purpose as That of Detroit Edison Co.

This cover consists of a number of 1-in. by 0.5-in. iron bars placed 0.75 in. apart and bound together by a circular band. Direct-current service at 250 volts is furnished to the blower motor from some nearby pole or wall box. The current of air is forced through the underground ducts until the temperature of the duct section affected has been reduced to the desired degree.

Contracting-Construction

Suggestions for Obtaining and Keeping Records of an Electrical Department—Effect of Lightning on Circuit Unexplained

RECORDS FOR AN ELECTRICAL REPAIR AND MAINTENANCE DEPARTMENT.

Methods for Gathering Records Advocated in Paper Presented Before Association of Iron and Steel Electrical Engineers.

By R. B. Gerhardt.

Inasmuch as the direct benefits derived from an accurate method of securing and keeping records and data in an electrical department are hard to capitalize, such systems should be elaborated with great caution else the benefits will not be commensurate with the expense involved. In a well organized and well regulated department the records of most value are:

(1) Cost records.
(2) Force reports.
(3) Foremen's and motor inspector's reports.
(4) Station and power distribution reports.
(5) Electrical repair shop production reports.
(6) Storehouse and material reports.
(7) Employes' records and accident reports.
(8) Generator, motor and transformer data.

Cost Records.

The electrical department may be considered a business in itself, and, as in any other business, the most vital records to the successful conductance of same are the cost records. In most plants it is the usual practice for the accounting department to take care of all cost accounting entering into the cost of electrical energy to be billed to the various operating departments and also of cost of electrical repairs to these various departments. There have been innumerable treatises published on power-house cost accounting, and we will not enter here into any further study of same, but, as regards the cost of electrical repairs, it would be well to consider satisfactory methods of arriving at a cost price. The electric repair shop can usually be operated as any other standard shop account and all work going through same should bear a definite order number and proper accounting done to give the cost on this order when the work is completed. However, in the smaller plants this would involve considerable expense, and it is often the practice to distribute the cost of the electric repair shop operations on a basis of the labor distribution in this shop, this labor being accounted for daily according to the number of hours worked on repairs for any of the plant departments.

The shop costs will consist of labor, material and overhead. The overhead is approximate at best, but should be determined monthly as a percentage on the labor by dividing the cost of all items, such as foreman, clerk, telephone, light, heat, power, etc., by the total cost of all producing labor. This figure can be determined readily by the accounting department.

Every shop, no matter how small, should have a job ticket system. This would consist of a number of serially numbered tags, either in duplicate, or single tags with corresponding numbers in a record book. This tag can be an ordinary small shipping tag and should take a form similar to that shown in Fig. 1. If difficulty is encountered in some places in establishing the material charge, such odds and ends as tape, solder, etc., which nearly every worker carries on his bench, can be carried in the overhead without destroying the value of the record. This card should be turned into the shop office after the work has been accepted as complete. It should then be routed to the person maintaining the apparatus record, who will take off the total repair charge on the record card for this particular piece of apparatus. This gives a fair value to the job, enables the shop production to be recorded and gives the superintendent immediate data on the maintenance cost of the apparatus.

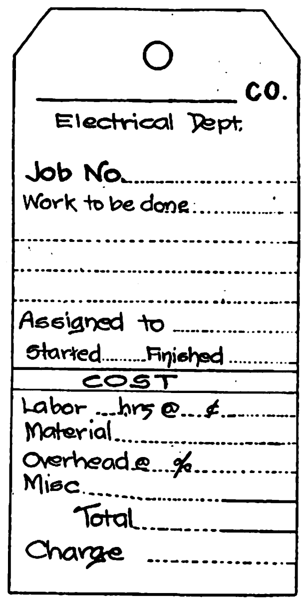


Fig. 1.

It is often desirable to secure an accurate cost figure on a particular armature or motor or controller to be repaired, and in such cases a good practice is to have the accounting department assign a special charge, such as a repair and renewal order, for this job, in which case when the work is completed they can furnish an itemized cost of same.

Force Reports.

An accurate daily report of the electrical department force distribution is essential to the proper handling of the department, and usually a copy of this report is requested by the management, principally as a guide to determine whether the department is being handled efficiently or not. The force report should be divided up according to departments in the plant, showing under each department the number of foremen, assistants, motor inspectors, electricians, repairmen, helpers and any others. To obtain the force report an efficient and inexpensive method usually employed is to have each foreman or motor inspector

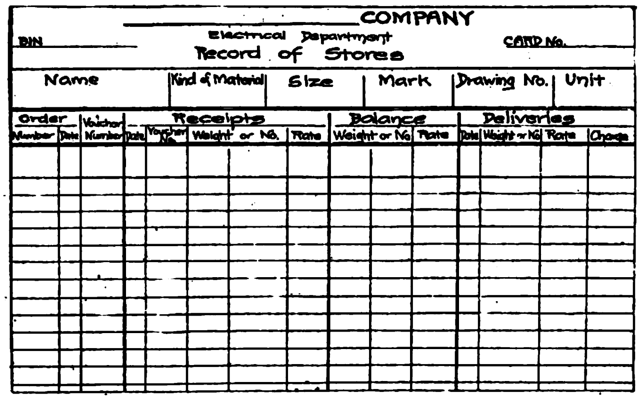

Fig. 2.

in charge of a shift in each department make out a time distribution sheet for his men, to be collected by the department timekeeper on his daily round of the plant, said timekeeper compiling the figures for the final report when he returns to the office each morning.

Foremen's and Motor Inspectors' Reports.

Along with the force report made out each shift by the foremen and motor inspectors should go a condensed written report of the important work taken care of during the shift, this report to indicate any delays due to electrical failures, results of inspections, explanation of remedies for delays and principal work done other than this. Such reports, together with cost records and force reports, give complete data on the electrical repairs in any department.

From the practice of having foremen and motor inspectors turn in daily reports there sometimes results a tendency on the part of these men to elaborate too much in these reports and give too much detail, or the reverse, be too brief and not give sufficient information. One fundamental point, however, should always be insisted upon, i. e., a statement of the plant delays chargeable to the electrical department, with an explanation of these delays and remedies for same, the foremen's or motor inspectors' signature to be written below this statement. When this is insisted upon and the man given to understand by the department superintendent his full responsibilities for an accurate check between this report and the plant delay sheet, the desired end is usually accomplished, viz., that proper co-operation is secured in keeping down such delays.

Station and Power Distribution Reports.

It is becoming more and more the practice in industrial plants to secure, as far as possible, an accurate distribution of electrical energy to the various departments, and, therefore, the electrical department station records are invaluable for this purpose. A station report is usually a printed form giving space to record all energy distribution data, according to the outgoing feeders. When such a station has an operator in continual attendance it is a wise policy to have all distribution meters read hourly, as this keeps the operator's attention more closely applied to his work and prevents his falling asleep at night.

In many of the departments in which energy-metering instruments are lacking it becomes necessary, in order to secure proper distribution of power, to make tests under normal conditions of load for the purpose of securing a basis for making a charge for this energy, and at the end of each month the energy consumption is figured out on the basis of such tests. Likewise at the end of the month the final power distribution report is made up in the department office, which gives an accurate statement of the energy furnished to all accounts properly chargeable, and this statement is the accounting department's basis of distributing the cost of producing this energy.

Electric Repair Shop Production Reports.

Under cost records we have considered electric repair shop production costs, but there is still further information from the shop which is essential to the good management of same, and this is production data. In other words, how many armatures of a certain type are rewound in a given period; the average number of man-hours for rewinding these armatures; an accurate record of the armature serial numbers; a short condensed statement of the work involved in the repairs, and similar information for motors, controllers, transformers, etc.

On these records a great deal or a very small amount of effort may be expended. One very good method of keeping data on armature repairs is to have each armature winder make out in duplicate, one copy to be kept by himself, and the original turned in to the office, a record which will serve more as a diary, and which gives the information referred to above. It is very desirable and satisfactory for the department superintendent to know when an armature goes out on a breakdown job and fails without apparent reason, and by referring to the armature winder's daily diary the responsibility for poor workmanship in the case of such failure is easily determined.

Storehouse and Material Reports.

There is probably more miscellaneous material carried in the storehouse for the use of the electrical

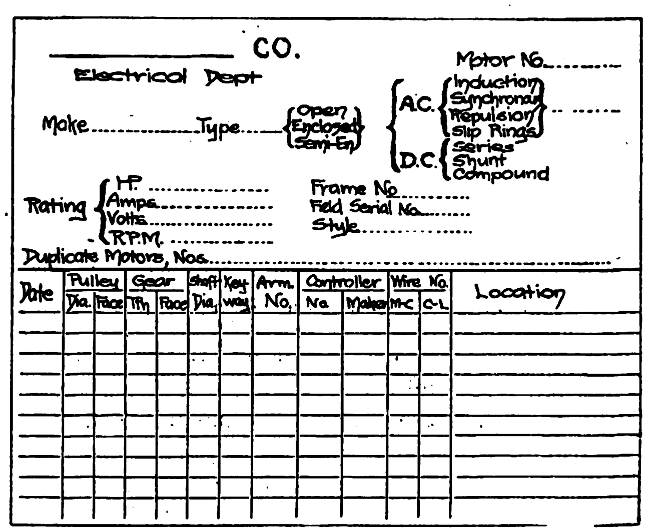

Fig. 3.

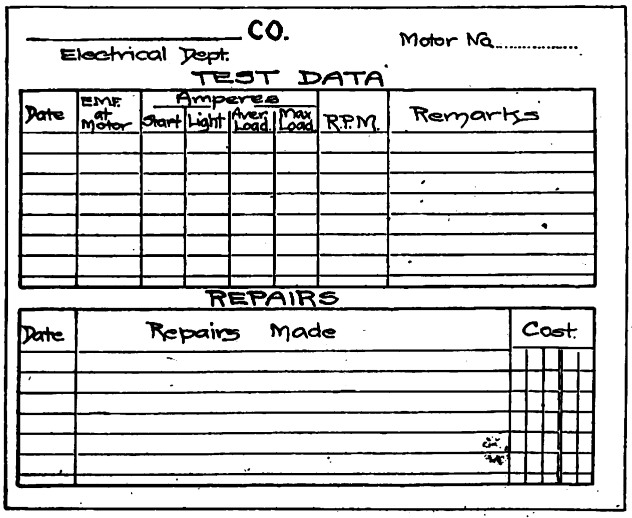
department than any other department in an industrial plant, and an accurate and reliable storehouse record on this material is absolutely essential. Any material used in the department is first obtained by placing a requisition to cover an order for the purchase of same. For keeping a proper record of this material a card index scheme is usually used. Each item of material is carried on a card as shown in Fig. 2, and properly indexed, each card bearing a number. This card should contain the following information: Requisition and order numbers for each receipt of this material, date of receipt in warehouse, voucher number, unit cost, weight and kind of material. The card should also contain a column for balance and deliveries. By working this scheme in connection with a bin system in the storehouse, the material records can easily be kept and a satisfactory check made at any time with very little expense. It is usually the custom to set a minimum amount or number of each piece of material to be carried in stock, and whenever the storekeeper sends to the bin to take out material it can be easily noted whether the minimum amount still remains, and if not a note made and requisition placed for additional amounts in order to replenish the stock.

Employes' Records and Accident Reports.

A record of department employes showing the date of employment, check number, work or job to which assigned, any further changes of assignment, rate, change of rate, and termination is very essential to the proper management thereof. This record, however, should be kept confidential and where it is not available for everyone's use.

Department accident reports are so closely connected with employes' records that it has been found desirable to keep these two forms of records together. A copy, however, of the accident reports is also maintained for the use of the department safety committee in its work. Each plant usually has its special form



______ CO. Motor No. ....
Electrical Dept.

TEST DATA

Date	E.M.F. at Motor	Amperes Start	Light	Aver. Load	Max. Load	R.P.M.	Remarks

REPAIRS

Date	Repairs Made	Cost

Fig. 4. Back Side of Form Shown in Fig. 3.

of accident report so it is not necessary to discuss the form this should take.

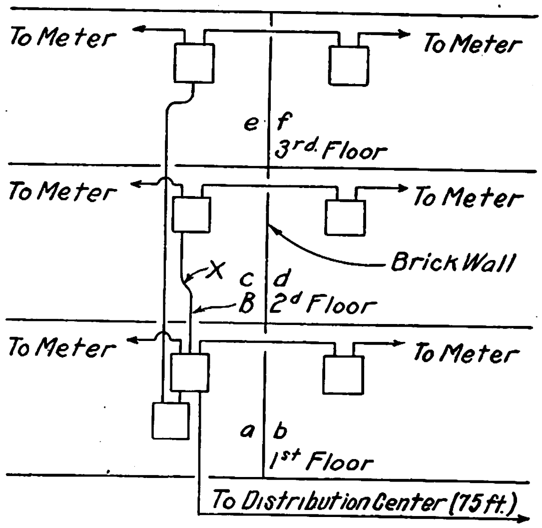
General Motor and Transformer Data.

This data is most easily compiled and maintained on a card index where an individual card is made out for each of these units, and thereon is given all data pertaining to each, which covers serial number, nameplate data, principal dimensions, including, in the case of generators and motors, size of shaft, keyway, pulley or gearing data, all particulars regarding windings, brush size, etc. A sample motor card is shown in Figs. 3 and 4. The motor data cards should be indexed according to departments and a cross index kept showing the motors by size and type, and in this way a complete record of the total number of motors of each size and type is readily available.

PECULIAR EFFECT OF LIGHTNING ON A DISTRIBUTION CIRCUIT.

By W. F. Perry.

During a violent thunderstorm recently the lighting circuits in several of the suites of a Boston apartment house were put out of commission. The building contained 36 suites and was of brick and concrete construction. The wiring was installed in conduit and was so arranged that the suites were fed in groups of six from a two-wire main. There were two of these suites on each floor. In a small closet in



Wiring Diagram Showing Location of Circuits and Fault.

each suite were placed the service cutouts and the meter. There were no other cutouts, the number of outlets being small, the service cutouts protected the wiring system as well as the meter. The feeder which supplied current to these suites was No. 12 rubber-covered duplex wire. The service supplying the building was of the three-wire type and entered the building underground.

While the storm was in progress the fuses which protected the feeder blew out, as did the service fuses in the two lower suites. A trouble man from the central-station company was called and replaced the blown fuses, but he could get no current in the four upper suites. An electrician was called and he spent several days in search of the trouble without finding the cause. Later, the writer was called upon to solve the problem.

Several hours were spent in getting "the lay of the land" and in working out various tests upon the defective lighting circuits. A sketch was made, showing how the runs of conduit were made and how the several lines of wire were connected at the junction boxes. The accompanying illustration gives an idea how the conduit was run between boxes.

The trouble was found in the riser *B* at the point marked *X*. About ¾ in. of the outer braid of the No. 12 duplex was blown off and a piece ⅜ in. long of one side of the circuit, including wire, rubber and braid, was missing, the remaining ends looking as if the piece had been cut out with a knife. There was nothing to indicate the presence of fire, as the rubber and braid were not charred.

[Editor's Note.—The peculiar effect of lightning in this case seems unexplainable. If some of our readers have had similar experiences their comments would be welcomed.]

QUESTIONS AND ANSWERS

All readers are invited to submit questions and answers to this department. Anonymous communications will not be considered. Questions should relate to electrical matters of any kind. Answers contributed by readers should be submitted preferably within eight days of the date of publication of the question and should be limited, if possible, to 300 words. Payment will be made for all answers published.

Questions.

No. 467.—Operating Cost of Electric Household Refrigerators.—I would like to know from some reliable source what is the operating cost of the electrically operated refrigerators that are being recommended for household use. What is the experience as to their dependability?—R. H. T., New York, N. Y.

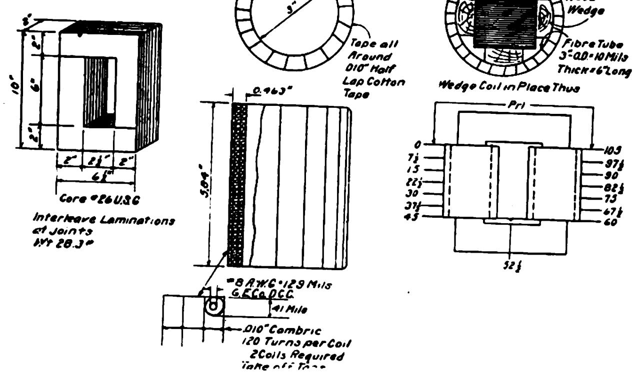
No. 473.—Changing Motor Frequency.—I would like information regarding changing of a ⅛-hp. Holtzer-Cabot single-phase motor of 1130 r. p. m. and 12 poles now operating on 133 cycles to make it possible to operate on 60 cycles at a speed of 1200 to 1300 r. p. m.—M. B., Dekalb, Ill.

No. 474.—Inferior Wire for Fixtures.—In my experience I have often run across fixtures wired with old Code wire and with No. 20 and even No. 22 low-voltage wire. I understand that considerable quantities of these wires are being used. What can be done by a contractor who wants to live up to Rule 30*c* of the National Electrical Code to meet the competition of those who ignore this rule?—B. T. F., Morgan Park, Ill.

Answers.

No. 464.—Transformer Design.—I am trying to build a transformer with 110-volt primary and 14 steps on the secondary varying by 7½ volts up to 105 volts, thus, 7½, 15, 22½, 30, etc. Each step must be capable of carrying 10 amperes. What size and amount of wire is necessary on the primary and secondary windings?—W. A. S., Augusta, Kans.

Answer A.—The attached sketches illustrate an autotransformer capable of doing what W. A. S. wishes without being as expensive as a transformer with isolated primary and secondary would be. This transformer will operate on 100 to 120 volts, 60-cycle alternating current. As many taps as desired may be brought out. The case may be 6 by 10 ins. by 12 ins. high. A cover must be provided. Place the terminal



No. 464.—Design of Autotransformer with Numerous Taps.

board on top. For method of clamping laminations, see "Gray's Electrical Machine Design" or similar work.—H. E. W., Chicago, Ill.

Answer B.—Owing to the fact that no data are given concerning the operating characteristics of the transformer in question it is difficult to supply figures which will exactly suit the builder's purpose. The following data may be of some value:

Core area, square inches	9
Number of turns on primary	412
Size of primary conductor, B. & S.	14
Number of turns per layer—primary (approximate)	69
Number of layers—primary	6
Volts per turn	0.26
Length of primary conductor, ft.	370
Number of turns on secondary	395
Size of secondary conductor, B. & S.	14
Number of turns per layer—secondary	69
Number of layers—secondary	6
Length of secondary conductor, ft.	362

Secondary taps brought out as follows:

7.5 v.	= 28 turns	45 v.	= 168 turns	82.5 v.	= 308 turns
15	= 56 turns	52.5	= 196 turns	90	= 336 turns
22.5	= 84 turns	60	= 224 turns	97.5	= 364 turns
30	= 112 turns	67.5	= 252 turns	105	= 392 turns
37.5	= 140 turns	75	= 280 turns		

—W. F. P., Atlantic, Mass.

No. 471.—Ringlemann Charts for Determining Smoke Density.—The use of Ringlemann charts is frequently mentioned in connection with the determination of the density of smoke emitted from smokestacks. I would much appreciate an explanation of what the Ringlemann chart actually is and how the density of smoke may be determined from its use.—M. A. P., Spokane, Wash.

Answer A.—Ringlemann charts, named after their originator, are used for determining readily the density of smoke. The density of smoke is at best somewhat elusive and hardly permits of a definite basis for comparison. However, there are a number of "standards" employed, one of the best known and simplest of which is by the use of the Ringlemann charts. These charts are quite generally accepted as the standard today.

There are six Ringlemann charts, numbered respectively from No. 0 to No. 5. Chart No. 0 is white and is rated as being 100% white or zero black. No. 1 chart is rated as 80% white or 20% black; No. 2 as 60% white or 40% black; No. 3 as 40% white and 60% black; No. 4 as 20% white or 80% black, and chart No. 5 as 0% white and therefore 100% black. The Ringlemann charts or cards are made by ruling lines at regular intervals; the higher the number of the card the thicker and closer are the lines, consequently the card looks more or less gray at a distance.

In using the Ringlemann charts, they should be placed vertically at such a distance from the person that is to determine the smoke density that any of the charts appear to be of a uniform shade of coloring. That is to say, the checks must not be visible, but instead the cards should appear of different shades from the absolute black to the slightly dark, according to the card placed in position. The person observing the smoke should stand not less than 100 ft. nor more than one-quarter of a mile away from the stack. The observer's position should be such that the direction of his observation is at right angles to the direction of travel of the smoke. He should avoid looking in the direction of bright sunshine, and the background against which the smoke is to be studied should be free from trees, buildings and similar objects that tend to harmonize with the smoke.

Compare the smoke emitted from the stack with the Ringlemann charts, and determine which of the cards corresponds to the color of the smoke. The period for deciding the chart corresponding to the smoke is usually taken as 15 seconds. The color of the smoke may change frequently, and the observer should write down on paper at every 15-second interval the chart number corresponding to the color of the smoke.

How long a stack should be watched, depends upon how much time can be devoted to the matter, to what extent the stack is given to emitting smoke, and whether the effluent from the stack changes very radically in color from time to time. For example, a hand-fired plant may emit dense clouds of smoke periodically corresponding to the act of throwing coal on the fire, whereas a plant using mechanical stokers will give a very much more uniform density of smoke, because in the one case firing is erratic and in the other case continuous. Half an hour should probably suffice under most conditions.

A few definitions of terms, and a simple example in the use of the Ringlemann charts will suffice to make their use understood.

(1) A stack-minute corresponds to watching the stack under scrutiny for one minute.

(2) In any set of observations the stack-minutes are obtained by multiplying the number of stacks observed by the number of minutes during which the observations are performed.

(3) A smoke unit is understood to be that value during which one minute of No. 1 smoke or its equivalent occurs. For example, one minute of No. 2 smoke (which means a smoke density corresponding to chart No. 2) is equivalent to two smoke units. Likewise, two minutes during which the smoke has a density corresponding to No. 3 chart would give a smoke unit of six, or six smoke units. Three minutes of No. 4 chart would correspond to 12 smoke units.

The percentage of smoke density is percentage of light that is prevented from passing over the stack because of the smoke. The smoke density is calculated as follows:

$$\text{Percentage smoke density} = \frac{\text{Smoke units} \times 0.20 \times 100}{\text{Stack-minutes.}}$$

$$\text{This when simplified gives} \frac{\text{Smoke units} \times 20}{\text{Stack-minutes.}}$$

Understanding what the Ringlemann charts are, what they represent and how a smoke unit is determined, an example in the use of these charts for an actual smoke inspection should clear up any misunderstandings and place the matter upon a proper basis for future application.

During one hour a stack was watched and its smoke compared with Ringlemann charts with the following results recorded:

Smoke density according to Ringlemann chart.	Duration of smoking minutes.
No. 4	2
No. 5	1½
No. 3	3⅓
No. 2	10
No. 1	9
Clear	34

Smoke units are the product of chart number and duration corresponding to this number. Hence,

$$4 \times 2 = 8$$
$$5 \times 1\tfrac{1}{2} = 7\tfrac{1}{2}$$
$$3 \times 3\tfrac{1}{2} = 10\tfrac{1}{2}$$
$$2 \times 10 = 20$$
$$1 \times 9 = 9$$

55 total smoke units.

Therefore, according to formula previously given,

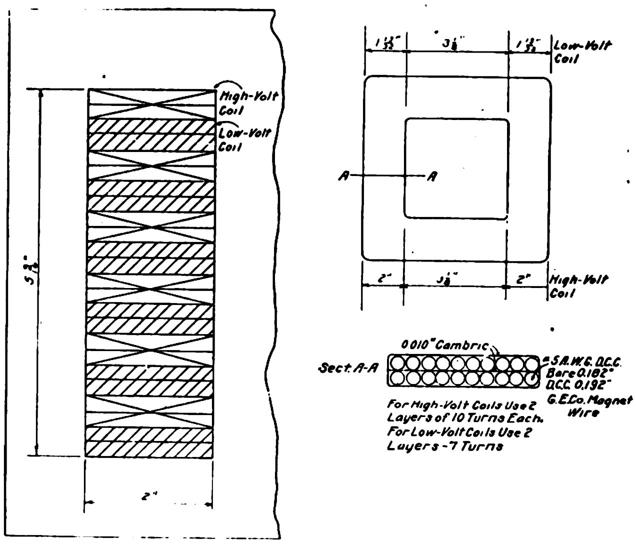
$$\text{Percentage smoke density} = \frac{55 \times 20}{60} = 18\% \text{ (approx.).}$$

In observing smoke densities, it is a good thing to use cross-section paper in a notebook. Each entry is made as shown above and each step toward the result should be kept when observations are made for civic purposes. When observations are being made merely for personal reasons, it is well for the firemen to keep a close and accurate log of boiler-room operations, as in this way much may be learned in the way of smoke abatement.—W. H. D. M., Chicago, Ill.

[Another answer to this question has been submittded by another reader. It will appear in an early issue.]

No. 472.—Rewinding a Transformer.—I have the complete core and case of a 2½-kw., type H, 60-cycle G. E. transformer which I would like to rewind for the ratio of 88-176-volt primary and 115-230-volt secondary of about 2 kw. capacity. The inner core is 3 by 3 ins., extending over the outside of the coil in four equal sections of 2½ by 1¼ ins. cross-section, leaving a winding space around the core of 2 by 5¾ ins. The original voltage ratio was 1200-2400 primary and 120-240 secondary. The use of this transformer is to be for intermittent service only of about 2 to 3 hours' duration, for demonstration of fractional-horsepower alternating-current motors. Please advise what size of wire and number of turns to use on primary and secondary windings. Would it have to be oil-cooled like the original? Would a 3-hp. direct-current motor, old style G. E., wound with two No. 14 B. & S. wires in parallel, wave-connected, running as converter on 115-volt direct-current line, be sufficient for this purpose or would it be necessary to decrease the capacity of the transformer to suit the converter? The present alternating-current voltage obtainable at the converter averages 88 volts, 60 cycles, single phase.—V. S., Portland, Ore.

The sketch herewith shows one of the many possible methods for solving the problem. The view at the left shows the layout of the coils and the view to



No. 472.—Rewinding of a Transformer.

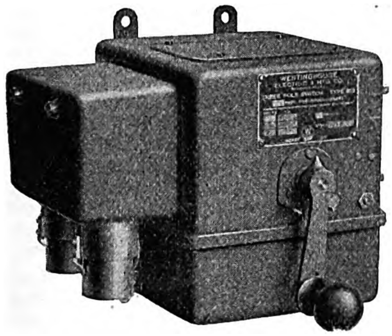
the right the dimension of the coils and method for their insulation. These coils can best be wound on a form and then slipped out. The quantity of material can be easily taken off by calculation from the sketch. With this arrangement a single size of wire is used and no oil is needed to load up the transformer for 2-kv-a. intermittent use. Sufficient data are not given for an intelligent answer to the second question, but I believe the converter can be made to carry a 2-kv-a. load under the conditions stated. I would suggest keeping a thermometer on the machine for the trial run.—H. E. W., Chicago, Ill.

New Appliances

Safety Inclosed Starting Switch—Hubbell Devices—Series-Parallel Controller—Light Plant—New Turbine Governor

Westinghouse Safety Inclosed Motor-Starting Switch.

Safety for the operator, safety for the motor and equipment, and safety for itself are the three features embodied in a new type of starting switch for small induction motors that is being put

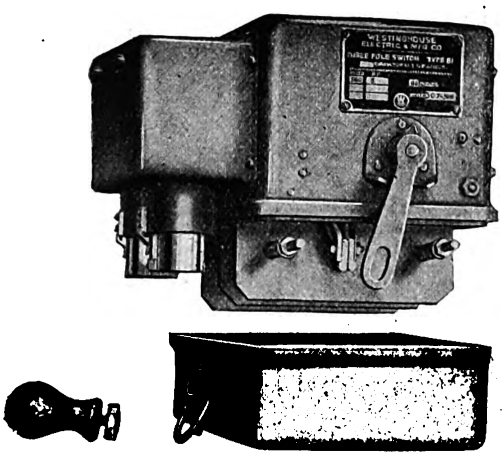


Type 815 10-hp. Quick-Make-and-Break Starting Switch.

on the market by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. The switch is said to be absolutely accidentproof and well nigh foolproof as well.

The action of the switch is automatic and involves use of strong springs attached to the contact parts and controlled by a trigger. This trigger is released by overload, failure of power or by hand. When the switch passes the neutral point, the spring snaps it the rest of the way.

Safety to the operator from injury due to contact with live parts is assured by the entirely inclosed, dust-and-dirt-proof case. It is impossible to touch the live parts by accident for this reason. Safety to the operator and equipment from restarting after the machine has shut down is assured thus. When power leaves the equipment a low-voltage protective relay releases the trigger and throws the switch. Upon the return of power it is necessary for the operator to move the handle first to the reset position and then to the running position before the motor can again be started.



Type 815 Quick-Make-and-Break Starting Switch with Tank and Arc Barrier Removed to Show Position of Contacts.

Any undue overload causes the overload relay to release a trigger which opens the switch the same as on failure of voltage. Overload throws off the switch just the same as power and the switch must be reset before the motor can again be started. This overload relay prevents burnout of the motor. Motor burnouts may arise from two causes—an overloaded machine or the opening of one wire, due to the blowing of a fuse or other cause and subjecting the remaining phases to an extra burden. The overload relay may be set to open the switch at any desired point, such as 100-110-150% of full load. Fuse protection is not sufficient to guard motors against burnout. A fuse that, without blowing, will carry the starting current, which is several times the operating current, will also carry without blowing sufficient overload to burn out the motor. The overload relay is provided with oil dashpots which afford a time-element protection, permitting the carrying of small peak loads and the starting current without interruption of service. However, they will allow the operation of the overload relay if the overload is heavy or is sustained long enough to threaten the motor. This insures the motor against burnout and at the same time permits maximum production.

Replacing burned-out fuses with copper wire when new fuses are not available results in a burned-out motor the next time an overload occurs. This danger is eliminated because the new switch uses no fuses and automatically resets itself when the overload is removed. Besides this, the danger of shocks and burns in replacing fuses is eliminated.

When the handle of the switch, moving toward the "on" position, passes the neutral point, the spring whips the contacts together. The same action takes place with the opening of the switch. This rapid opening and closing of the contacts practically eliminates the injurious effects of arcing and preserves the life of the switch.

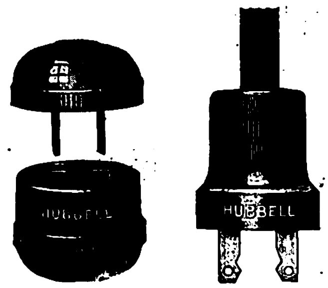
Asbestos barriers between the sets of adjacent contacts have permitted the omission of switch oil with all its accompanying fire hazards and other objectionable features. But when explosive gases are present and the danger of explosion is greater than the fire hazard, the contacts may be immersed in oil. Emergency-stop push buttons may be connected in the low-voltage relay circuit and located at any convenient point near the machine.

This switch has been approved by the National Board of Fire Underwriters. Two sizes are made, each for use on two and three-phase motors, on voltages up to 600. Type No. 815 starts motors of 10 hp. or less while Type No. 816 starts motors up to and including 25 hp.

New Hubbell Cord Connector and Cap.

Harvey Hubbell, Inc., Bridgeport, Conn., has recently added two new devices to its extensive line of electrical specialties, namely, the No. 6180 cord connector and No. 6337 elongated cap. The former measures only $1\frac{5}{8}$ ins. over all and is of exceptionally neat design. Although so small it is sturdy enough for use with any appliance where a cord connector of 660-watt, 250-volt capacity is desired.

The elongated cap is made of composition throughout. While similar in appearance to this firm's No. 6336 cap,



Compact Cord Connector and Composition Elongated Cap.

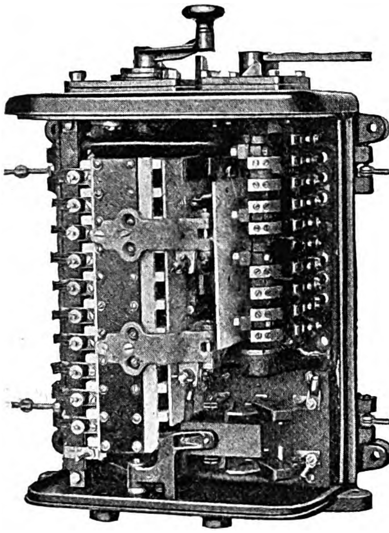
this new one has a half-inch cord hole for No. 14 and 16 reinforced cord.

Drum Controller for Series-Parallel Operation of Locomotive Motors.

A drum type controller for series-parallel control of two series motors is one of the new products of the Cutler-Hammer Manufacturing Co., of Milwaukee, Wis. This controller, which is provided with both a main cylinder and a reverse cylinder, is for use on storage-battery locomotives or on trolley locomotives using 250 volts or less.

The motors are accelerated by the main cylinder, which has seven points of control. A star wheel provides an interrupted motion to the lever, so the operator readily feels the speed points. The fourth point is the full series or low-speed running point and the seventh the full parallel or high-speed running point. All intermediate points are resistance points. The Wheatstone bridge method is used for transition from motors in series to motors in parallel between the fourth and fifth points of control, and as the circuit is not opened, continuous torque is obtained during the transition. Arc barriers are provided between each contact finger, and strong magnetic blowouts prevent excessive arcing.

The reverse cylinder is positively interlocked with the main cylinder so it cannot be operated when the latter is in any but the "off" position. The fingers of the reverse cylinder are therefore not used for making or breaking



New Two-Motor Storage Battery Locomotive Controller—Cover Removed to Show the Two-Cylinders.

the current; hence the contact parts will last indefinitely and magnetic blowouts are unnecessary.

Two cutout switches allow either motor to be by-passed, if it becomes damaged in any way, and the locomotive operated by the other motor until repairs are made. When one cutout switch is thrown to by-pass its corresponding motor, mechanical interlocks prevent closing the other cutout switch or operating the main cylinder beyond its full series position, thus eliminating the possibility of a short-circuit.

A dust-tight and weatherproof construction is obtained by fitting the sheet-metal cover under a ledge in the top and providing a rubber gasket between the edges of the cover and the cast-iron frame.

This new controller has the following features of construction common to other C-H drum controllers: Cast-iron sections of cylinder clamped on square insulated shaft, using no keys or taper pins, thus making removal easy; cylinders readily removed from case by merely taking off top plates; steel contact fingers of main cylinder mounted on square insulated metal shaft, which can be removed by taking out two cap screws; all fingers provided with drop-forged copper tips of the nonstubbing type.

The contact fingers and segments may be adjusted or renewed without removing the cylinders from the drum case. Those on the reverse cylinder are exposed by merely loosening two thumb nuts and throwing back the blowout plate and arc barriers.

Most mine-duty apparatus is employed where the service conditions are severe and delays in operation costly, consequently this new controller has its parts very liberally proportioned to prevent wear and breakage, and those parts which do wear are made accessible and easily renewable.

Buda-Ross Steam-Turbine Electric Light Plants for Construction Projects, Etc.

There are many cases of construction projects where the contractor has a steam boiler for supplying hoisting engines, pumps, compressor sets, etc., and where light is also needed. A steam-driven lighting plant could be of special service in such cases. In many cases small isolated sawmills, oil-well-drilling outfits, cotton gins, steam shovels, small steamboats, etc., could use a similar outfit.

The Buda Co., Chicago, Ill., began manufacturing small steam turbogenerators for locomotive headlight service about six years ago. The use of the small steam turbogenerator has grown in many industries and the demand for this kind of a lighting plant has grown to such an extent that the manufacturers have made some recent improvements in it, enlarged the facilities for production, and will market it generally through dealers as one of the main line of Buda products.

This practically new plant is known as the Buda-Ross electric light plant. It is an unusually small one for a steam turbogenerator plant, the smaller size having a capacity of ½ kw. and the larger size 1 kw., making it adaptable for lighting small plants and portable outfits.

The steam turbine and the electric generator are built compactly into one direct-connected unit. The field coils of the generator have a compound winding which keeps the voltage uniform on any lamp load ranging from zero to the full capacity of the plant. This makes the operation of the lighting plant entirely automatic, requiring no other attention than turning on the steam when the lights are needed and turning off the steam when lights are no longer needed. The generator is of the bipolar type and wound either for 32 volts or 110 volts direct current as desired.

As with the headlight plants, the turbine for the new plant is of the mulistage, radial-flow, impulse type. Its speed is kept uniform, regardless of fluctuations in steam pressure within the range of 85 to 200 lbs., and regardless of the electrical load within the range of from zero to full capacity, by a centrifugal, throttling type of governor which admits only enough steam at the primary nozzle to run the turbine at the speed required.

Westinghouse Marine Turbine Governors Keep Speed of Vessel Uniform.

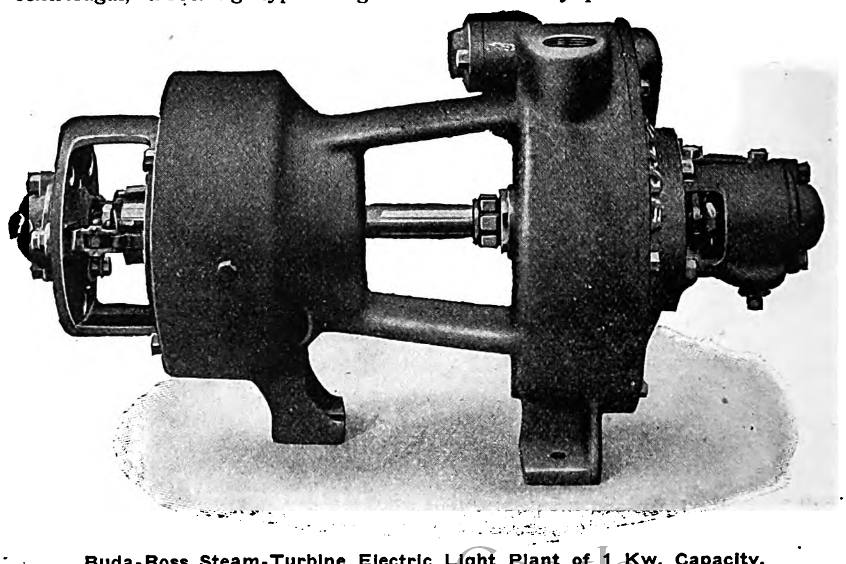
To guard against racing the majority of marine-turbine builders install on their machines an automatic tripping device, which is set to shut off all steam to the turbine when the speed reaches a limiting point of, say, 10% or 15% above normal. This stops the turbine entirely and in order to start up again the trip must be reset and the steam valve opened.

All marine turbines made by the Westinghouse Electric & Manufacturing Co. are fitted with governors which under no circumstances will shut the turbines down completely, but which will regulate the flow of steam to the nozzles in such a manner that the speed is kept practically constant under all conditions of fair and rolling seas.

The arrangement consists of a vertical spindle mounted on the forward end of the turbine, driven by a worm wheel from the main shaft at a speed of about one-quarter of that of the main shaft. At the top of this spindle is mounted a fly-ball governor of the familiar type, the motion of which is transmitted through a system of levers to a small steam relay piston valve, which in turn regulates the flow of steam to the operating cylinder of the main governor valve.

As the speed of the turbine increases above normal, the governor weights are thrown farther away from their center of rotation by centrifugal force and the steam relay valve is moved a corresponding amount. This opens up the steam ports which exhaust the steam from the bottom of the governor valve-operating cylinder, producing an unbalanced condition, and the governor valve starts to close, slowing down the turbine. But as soon as the speed is reduced to normal the governor weights return to their former position, moving back the relay and reopening the governor valve.

While no attempt is made to obtain extremely close regulation, such as is needed on electric generator drives, it has been found that the marine governors are very positive in their action.



Buda-Ross Steam-Turbine Electric Light Plant of 1 Kw. Capacity.

Trade Activities

Organization of Booth Electric Furnace Company—Domestic Engineering Taken Over by General Motors—Catalogs

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., is sending out a new price list on electric ranges and bayonet immersion type liquid heaters, effective Sept. 10.

Remmert Manufacturing Co., St. Louis, Mo., of which William Remmert is the organizer, was recently awarded a basic patent on its Locomotive washer. Mr. Remmert is a well known designer and an expert in washing machine construction, and his experience covers practically every make of washer. About three years ago he conceived the idea of a machine which would eliminate the mechanical appliances and rubbing devices which come in contact with the clothes while they are being washed. This he claims is accomplished in the Locomotive washer in which the clothes receptacle contains no moving parts, the possibility of tearing clothes thus being eliminated. To provide the necessary water agitation the entire receptacle or tub is moved horizontally over a runway by means of reducing gears and an eccentric. In this way the water is forced through the fabric, cleansing it thoroughly and quickly. The machine is very compact and substantially built with all moving parts inclosed.

Domestic Engineering Co., Dayton, Ohio, manufacturer of the Delco light and power plant for use on farms, and in isolated public buildings, will be taken over by the General Motors Co. It is reported that the acquisition of the Domestic company involves millions of dollars, and through the deal Dayton will benefit immensely as expansion plans will be prosecuted on a gigantic scale. Though the Domestic company was incorporated only three years ago with a capital of $800,000, the development of its business was so rapid that the capitalization was increased to $1,500,000. During the three years of its existence the company has manufactured 100,000 lighting plants, and the product has been shipped to Australia, England, France, South America, China, Japan and other foreign countries. An enlargement of the foreign trade will be one of the earliest developments under the new consolidation plans. The Domestic Engineering Co. now employs a force of 2000 persons in office and factory and 3500 salesmen whose territory embraces all sections of the United States and the world. It has been reported also that accessories manufactured by the company assure a volume of business reaching $3,000,000 annually. The plant now occupies 340,000 sq. ft. of space and new buildings are under course of construction.

Eureka Vacuum Cleaner Co., Detroit, Mich., is distributing a new folder to the trade, containing various sales helps for the dealer of the Eureka vacuum cleaner. There is a particularly fruitful field for this labor-saving device, and dealers should avail themselves of the opportunities afforded to promote the sale of this product by linking their sales efforts with the national advertising campaign which is being conducted by the company. The folder contains full-page reproductions of forceful advertisements appearing in the *Saturday Evening Post, Good Housekeeping, Ladies' Home Journal* and other mediums. In addition, it includes a series of newspaper advertisements, providing space for the name and address of the dealer. These have been prepared especially for the dealer for use in local papers, and electrotypes of the "ads" are furnished by the company. As a part of its sales and promotion and advertising campaign, a great variety of attractive window cards, hangers, folders and booklets are also offered by the Eureka company.

Important Change in Booth-Hall Management. — Announcement is made of the organization in Chicago of a new corporation under the laws of the state of Illinois known as the Booth Electric Furnace Co., with paid up capital of $1,000,000. Of this amount one-half is preferred stock, and one-half common. The new company has acquired all the patents, assets, and good-will of the Booth-Hall Co., well known as a manufacturer of electric steel and brass melting furnaces, and has taken over the business formerly carried on by that company. It will greatly enlarge the scope of operations, and develop the electric furnace business along standard manufacturing lines rather than on a special engineering contracting basis. The Booth rotating furnace which has been in successful operation during the last six months, and which is especially designed for the melting of non-ferrous metals, has been thoroughly developed and standardized, and the company is prepared to deliver this type of furnace in four sizes, viz., 250-lb., 500-lb., 1000-lb., and 2000-lb. equipments. The well-known 2-phase, 2-electrode Booth-Hall furnace for the melting of iron and steel will also be made in five sizes, namely, ¾-ton, 1½-ton, 3-ton, 6-ton, and 12-ton. An improved type of furnace, oval in shape, has been designed, and prompt shipment can be made of any one of these five sizes.

The new company will have exceptional manufacturing facilities for turning out furnaces in quantities. Not only have all parts been standardized, but each furnace will be assembled complete before shipment, and thoroughly tested out to absolutely insure mechanical and operating perfection. Associated in the management of the company will be a number of the best known engineering and operating executives in the public service field. L. E. Myers, of Chicago, president of the L. E. Myers Co., has been elected president of the new corporation; C. H. Booth, formerly president of the Booth-Hall Co., vice-president; W. K. Booth, formerly chief engineer of Booth-Hall Co., secretary; and L. J. Clark, of the L. E. Myers Co., treasurer. In addition to the president, vice-president and secretary, the board of directors will include Martin J. Insull, vice-president of the Middle West Utilities Co., and E. W. Lloyd, of the Commonwealth Edison Co., both of Chicago. The new company is prepared to carry on an aggressive campaign for business, and will open sales offices in different parts of the country to properly handle its business. An adequate engineering staff will be maintained to co-operate with customers in connection with their electrometallurgical problems, especially those relating to the melting of metals.

Edison Electric Appliance Co., 5660 West Taylor street, Chicago, is distributing a new catalog of lamp socket appliances and heavy duty equipment. It comprises some 25 pages and contains brief and comprehensive descriptions at Hotpoint appliances accompanied by illustrations. In this publication is introduced a new line of beautiful silverware which is doubtless one of the highest developments of the art of electric hollow-ware. This ware is the celebrated 1847 Rogers Brothers, Adam Period design, and is so constructed that lifetime service is insured.

The new coffee percolators of this line, as well as other coffee percolators manufactured by the company, are equipped with a safety switch, which is a feature worthy of consideration. Increases in voltage and the fact that electric percolators were allowed to "go dry" while current was still on, resulted in burnouts of heating and damage to percolators. To solve this difficulty the engineering department of the Edison Electric Appliance Co. has brought forth a safety switch, which may be put into service again after an accidental overheating has caused the circuit to be opened, and is claimed to prevent burnouts and damage to appliance. It operates equally well on either direct or alternating current and is placed in the bottom of the percolator, being covered with the base plate.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Westminster, Vt.—Abenaquet Machine Works will erect a one-story shop, 150x500 ft., to cost $200,000.

Cambridge, Mass.—New England Telephone Co., 50 Oliver street, Boston, has commenced the construction of a new two-story addition to its local telephone building. The structure will be about 35x35 ft., and is estimated to cost $70,000.

Cambridge, Mass. — Cambridge Electric Light Co., Western avenue, has awarded a contract to Walsh Brothers, 150 Hampshire street, for the construction of its proposed transformer building on Western avenue. The structure is estimated to cost $10,000. French & Hubbard, 88 Pearl street, Boston, are engineers for the company.

Lynn, Mass.—Davis Lynn Storage Battery Co., Commercial street, has recently broken ground for the construction of a new one-story addition to its plant, about 50x200 ft. The structure is estimated to cost $35,000. Edward D. Dearborn, 24 Elm street, Lynn, is the building contractor.

Worcester, Mass.—Worcester Brass & Electro Plating Co. has purchased the factory of Oliver M. Dean & Sons, 316 Shrewsbury street, for $27,000 and will move there.

Providence, R. I.—H. H. Electric Storage Battery Co. has filed notice of organization to operate at 506 Broad street. Edward Hacking, 954 Lonsdale avenue, Central Falls, heads the company.

Woonsocket, R. I.—Arthur Dauray, Jr., 186 Harrison avenue, has filed notice of the organization of the Electric Maintenance & Engineering Works, to operate a general electrical contracting and repair establishment at 143-45 Railroad street.

Albany, N. Y.—Hunt, Helm & Ferris are having plans prepared for a factory and storage building.

Auburn, N. Y.—Auburn Button Works, 48 Canoga street, has filed plans for the construction of a new one-story boiler plant and engine house at its works. Contract for the structure, which is estimated to cost about $10,000, has been awarded to William Ludke, 33 Hockeborne ave., the building will be about 56x71 ft.

Canandaigua, N. Y.—Plans are under consideration by the Department of Public Works for the installation of a new electric street lighting system throughout the municipality. Power for operation is furnished by the Rochester Railway & Light Co. The system would include new concrete lighting standards placed about 100 ft. apart.

Greenwich, N. Y.—Consolidated Electric Co., Greenwich, Washington county, has filed notice with the secretary of state of an increase in its capitalization from $150,000 to $210,000, to provide for general expansion.

Lockport, N. Y.—The lamps and gas committee in its report to the aldermen recommended that the three-year proposal of the Lockport Light & Heat Power Co. to light the streets of the city at the rate of $57.50 per lamp per year be accepted and suggested that the council take up the matter of a municipal lighting plant for the city.

Oneida, N. Y.—Fire recently damaged a portion of the local power plant of the Morrisville Electric Light & Power Co., with loss estimated at about $5000. It is understood that immediate repairs will be made.

Rochester, N. Y.—Common Council has recently passed an ordinance providing for the installation of additional electric lighting units on Oxford and Dartmouth streets, to facilitate the present service.

Troy, N. Y.—Common Council has approved an appropriation of $145,000, to provide for the installation of a new and modern police-fire alarm signalling system throughout the municipality. Of this sum, $125,000 will be utilized for the installation of the system, while the remaining $20,000 is to provide for the erection of a new central station at Seventh and State streets.

Port Henry, N. Y.—In the near future the Port Henry Light & Power Co. will erect a new power plant and dam, two miles west from this village at a cost of $250,000.

Belleville, N. J.—In connection with the construction of the proposed local plant of the Overland Tire Co., 15 River street, for the manufacture of rubber tires, estimated to cost $90,000, considerable electrical and mechanical equipment will be required for operation.

Cape May, N. J.—United States government has had plans prepared for the installation of a new central heating plant with equipment at the local Government station. Commander J. D. Robnet, Senior Member, Board of Survey, Appraisal and Sale, Navy Yard, Philadelphia, Pa., is in charge of the work.

Irvington, N. J.—Final contracts have been awarded by the Atlantic Chemical Co. for the construction of the proposed group of factory buildings at 1190 Grove street. The plans include the construction of a large boiler plant department, to be used for general works operation. Hughes & Horton, Essex building, Newark, are architects for the company in charge of construction.

Newark, N. J.—Radel Leather Manufacturing Co., Wilson avenue, has awarded a contract to the Reynolds Construction Co., 308 South Ninth street, for the erection of a new boiler plant at its works. The structure will cost about $6000.

Newark, N. J.—A four-story plant, 60 x 80 ft. will be erected by the General Electric Co. at a cost of $66,000.

Newark, N. J.—In connection with the construction of the new plant of the New Jersey Pull Clean Towel Co., to be located in Halleck street, plans have been prepared for the erection of a boiler plant for factory operation.

Newark, N. J.—American Platinum Works, 231 New Jersey Railroad ave., has completed foundation work for the construction of the proposed factory and boiler plant to be located at Oliver and New Jersey Railroad avenues. The new works will provide for increased operations. Frederick Kilgus, 13 South Sixth street, Newark, is the building contractor.

Paterson, N. J.—Large quantities of electrical and mechanical equipment will be utilized in connection with the construction of the new municipal garbage incinerating plant, plans for which are now under consideration by the Board of Public Works.

Phillipsburg, N. J.—In connection with the construction of the new local sewage disposal plant by the city estimated to cost $137,980, contract for which has just been awarded, considerable new electrical and mechanical equipment will be required.

Pompton, N. J.—New York Telephone Co. has commenced the removal of its pole line to its new lines on the Newark-Pompton turnpike, now in course of construction by the state highway department.

Trenton, N. J.—The new power plant now in course of construction at the plant of the Trenton Malleable Iron Co., New York avenue, is rapidly nearing completion, and it is expected that operations will be inaugurated at an early date. S. W. Mather & Sons, Trenton, are the building contractors. The structure is estimated to cost $20,800.

Trenton, N. J.—Application has been filed with the Board of Public Utility Commissioners by the Bell telephone interests for approval of the increased telephone rates fixed by Postmaster General Burleson while the telephone lines were under federal control. The company is planning to increase the rates of the Delaware & Atlantic Telegraph & Telephone Co. by approximately 25% after Dec. 1.

Frankford, Del.—Prominent local business interests are taking active steps for the organization of a new company to engage in the generation and distribution of electric energy. It is proposed to construct a new local power plant, as well as install a new electric street-lighting system.

Millsboro, Del.—Plans are under consideration for the installation of a new electric street-lighting system.

Allentown, Pa.—International Motors Co. will erect an addition to its plant, two stories, 300 x 600 ft. Estimated cost $1,000,000.

Allentown, Pa.—City council has passed an ordinance creating a division of electric lighting in the water department, as well as adopted a resolution directing the preparation of the necessary legislation whereby the water department will be enabled to raise the sum of $62,000, to be used for the construction of an electric light and power plant for municipal service.

Carlisle, Pa.—General construction for erecting a $150,000 power plant for C. H. Nasland & Sons, America and N. Moreland street, Philadelphia, has been let to J. S. Rogers, Co. Drexel building, Philadelphia, Pa. Complete electric installation to be made of dynamos, transformers, switchboard, etc.

Columbia, Pa.—Borough council has recently awarded a contract to the Edison Electric Co., Lancaster, for furnishing electric service for the operation of the municipal electric street lighting system for a period of five years.

Greensburg, Pa.—Penn Aluminum Co., Pittsburgh, will erect a plant here.

Philadelphia, Pa.—Electric Storage Battery Co., Nineteenth and Allegheny streets, has broken ground for the construction of the proposed one-story building, to be located at 19th and Willard streets. The structure will be about 32x97 ft., and is estimated to cost $14,000. William Steele & Sons Co., 1600 Arch street, is the contractor.

Pitman, Pa.—The sum of $75,000 will be expended for improving the municipal light plant.

Baltimore, Md.—Chesapeake & Potomac Telephone Co. has announced the opening of a new telephone central office, located in the building at 5 Light street, to be known as "Calvert" exchange. The cost of the installation of the new switchboard, with accessory equipment, is placed in excess of $150,000.

Baltimore, Md.—In connection with the construction of the proposed packing plant of the William Schluderberg & Son Co., to be erected at Baltimore and Fifth streets, 339x414 ft., estimated to cost approximately $300,000, considerable new electrical and mechanical equipment will be required.

Cumberland, Md.—Application has been filed with the Public Service Commission by the Potomac Edison Co., for permission to take over and consolidate the electric and gas utilities of this city, including the street railway system and the Edison plant which furnishes light, heat and power with the company's plant at Grafton, W. Va. Included in the proposed consolidation is the plant of the Hartland Co., Hartland, W. Va., and the operations of the natural gas companies which supply this territory from the Central West Virginia field.

DATES AHEAD.

National Association of Electrical Inspectors. Annual meeting, Springfield, Mass., Oct. 13 and 14. Secretary, W. L. Smith, Concord, Mass.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Empire State Gas and Electric Association. Annual meeting, Buffalo, N. Y., Oct. 24. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

Jovian Order. Annual convention, Chicago, Nov. 5 and 6. Headquarters, Hotel Sherman. Acting Mercury, Eli C. Bennett, St. Louis, Mo.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

Danville, Va.—W. V. Young and Thomas S. Jones, Chatham, Va., are understood to have completed negotiations for the purchase of the plant of the Chatham Light & Power Co. for a consideration of about $17,000. It is said that the new owners are planning for operations on an increased scale.

Norfolk, Va.—A plant will be erected by the Norfolk Electric Manufacturing Co. P. O. Sutton, 215 Cumberland street, is general manager.

Laurens, S. C.—$200,000 bonds have been voted for extending the lighting and water systems. Address mayor.

Jacksonville, Fla.—W. L. Griffs and associates will establish an electric light plant at Atlantic Beach to furnish lights to cottagers.

Millville, Fla.—W. L. Wilson, Panama City, and associates, are planning for the construction of a new local electric plant with a five-mile transmission system extending to Panama City, the entire work being estimated to cost about $100,000. Thomas L. Johnston, Panama City, is engineer for the project.

Mount Dora, Fla.—Issuance of $27,000 municipal electric light and water bonds was voted. O. W. Sadler, mayor.

St. Petersburg, Fla.—The Ford Service Station is in the market for five 7½ and 10 hp. electric motors.

Pelham, Ga.—The council has contracted for power with the Gwyer-Alabama Power Co., the corporation which recently bought the Albany Power & Manufacturing Co., and is now building a much larger plant across the Flint river whereby that company will furnish electric power for Pelham's business houses, homes, streets and industries.

NORTH CENTRAL STATES.

Cleveland, Ohio—Architect R. Thompson, 6110 Euclid avenue, has prepared plans and will let contract for $50,000 concentrator station. Specifications include electrical machinery, electric power generating machinery, etc., to be erected by Cleveland Railroad Co., 700 Leader News building.

North Canton, Ohio—Hoover Suction Sweeper Co. is having plans prepared for an addition to its plant. The structure will be four stories, 80 x 170 ft., and will cost $125,000.

Port Clinton, Ohio—Ohio State Rubber Co. will erect a 100 x 300 ft. power plant. The specifications include electric power plant equipment and machine shop equipment, $15,000 to be expended. N. A. Bruess, president. Architect M. C. Millock, Sandusky, Ohio, has prepared plans.

Evansville, Ind.—Bucyrus Steam Shovel Co. will double its working capacity and will also build a hospital for the workmen, the total cost of the improvements to be $500,000. The company employes 400 workmen and is arranging to employ night shifts.

Fort Wayne, Ind.—Fort Wayne Engineering & Manufacturing Co. has increased its capital stock $200,000, the total capitalization now being $500,000 instead of $300,000. H. C. Paul is the president of the company.

Terre Haute, Ind.—The machine shop of the American Car & Foundry Co. burned with loss estimated at $100,000. Rebuilding will be begun as soon as the insurance is adjusted.

Terre Haute, Ind.—Bowen Motors Railway Corp. has completed plans for the erection of a plant to produce its gasoline propelled passenger car for use on steam roads for short runs.

Valparaiso, Ind.—McGill Manufacturing Co., manufacturer of electrical supplies, has under consideration the erection of a three-story plant, 65 x 260 ft., to cost $150,000.

Chicago, Ill.—Gulbransen-Dickinson Co. will shortly erect a six-story and basement addition to its present factory. The building will be of reinforced concrete and brick, with a frontage of 250 ft. and will embody the latest ideas in modern factory arrangement and equipment.

Chicago, Ill.—H. Channon Co., manufacturer of machinery supplies, will erect a seven-story building at North Market and West Randolph streets, to cost $450,000.

Chicago, Ill.—Gloria Light Co. will build a four-story factory building on property, 84x125 ft., in Sangamon street, which will cost about $75,000.

Deer Creek, Ill.—Deer Creek Power & Light Co. will construct and operate an electric light plant.

Fairbury, Ill.—A committee has been appointed to secure funds for ornamental lighting for streets. W.

A. Roth, president of commissioners.

Freeport, Ill.—H. W. Horst Co., Rock Island, Ill., is building a five-story and basement building for the Furst McNess Co., manufacturing chemists.

Galesburg, Ill.—Rowe Manufacturing Co. will build new reinforced steel and brick factory building. Company will also install a bolt factory for making all the bolts used in its manufacturing. The company will also extend the saw tooth building and when completed it will be 114 by 400 ft. Other improvements include the extension of the loading track. Six acres of land haye been acquired for the extension of the plant.

Minier, Ill.—A new electric light company will incorporate for the purpose of installing an electric light plant and bringing current from the traction system. Address G. E. Peine.

Springfield, Ill.—At the November election the question of issuing $400,000 in bonds in aid of the municipal plant will be submitted to vote.

St. Charles, Ill.—The council has passed an ordinance authorizing an issue of bonds for improving electric light plant. The work will be done at once. Address city clerk.

Vandalia, Ill.—Consulting Engineers Fuller & Beard, 721 Olive street, St. Louis, have prepared estimates for improvements to light and water systems. $140,000 will be expended. Address city clerk.

Waukegan, Ill.—Allied Masonic orders will erect a $100,000 Masonic Temple.

Chilton, Wis.—Aluminum Specialty Co. has awarded contracts for a factory and power house, two story, 60 by 200 ft., to cost $40,000.

Fond du Lac., Wis.—Northern Casket Co. will build a new power plant for its factory at Fond du Lac. E. E. Dillon, Madison, Wis., has been retained as consulting engineer and is drawing the plans and specifications for the plant.

Stoughton, Wis.—M. A. Kimball has a contract and will erect a power plant for the city. Power equipment will be purchased. L. C. Currier, clerk.

Kalamazoo, Mich. — Engineers Woodmansee & Davidson have prepared estimates for improving electric light plant. The question of issuing $1,200,000 bonds will be submitted to vote at the November election. A. Sonderenk, city clerk.

Three Rivers, Mich.—Nillingham & Cobt, Press building, Kalamazoo, Mich., have prepared plans for a 5-story, 380 x 175 ft., power plant and paper mill to be erected by Eddy Paper Co. Specifications include paper machinery, equipped with generators, transformers, etc. Address C. E. Nelson, manager, Three Rivers, Mich.

Dubuque, Iowa—A physical appraisement of the property of the Dubuque Electric Co. will be made by the Stiver Auditing Co., Des Moines, Iowa. This work is in addition to an audit of the books of the company. The entire task of appraisement and auditing is being done in order to arrive at a correct idea of what increased rates should be allowed the company. The company will pay one-half of this expense and the city one-half.

Elkhart, Kans.—Excavation has been begun for a settling basin, and for the foundation of a new power house for the city water and electric light plant. The city recently voted $60,000 bonds for the extension of the plant.

Kansas City, Kans.—$150,000 electric light bonds will be offered for sale. The bonds will be issued for improvements at the electric light plant, which will practically double its capacity. Of the $500,000 voted, $250,000 already have been sold.

Kansas City, Mo.—Kansas City Bolt & Nut Co. will expend in excess of $1,000,000 for additions to its plant, increasing its monthly capacity to 65,000 tons by next March. Five open-hearth steel furnaces, each of 50-ton capacity, 22-in. rolling mill, with traveling tilting tables and overhead cranes and electric power will be installed.

St. Louis, Mo.—Wagner Electric Manufacturing Co., 6400 Plymouth avenue, is arranging for the construction of a new five-story addition to its plant, about 160x400 ft., to provide for increased capacity.

SOUTH CENTRAL STATES.

Benton, Ky.—City council is understood to be arranging plans for the immediate installation of a new electric light plant, to be used for municipal service.

Greenfield, Tenn.—The city has voted $70,000 bonds for water and electric light plants. Address Clyde Ezzell, mayor.

Knoxville, Tenn.—Tennessee Mills will expend from $75,000 to $100,000 for building a two-story, 70x30-ft. addition to its plant and install new underwear knitting machinery.

Lebanon, Tenn.—Tennessee Power Co., Nashville, will erect a transmission line from Lebanon to Murfreesboro.

Irondale, Ala.—City has approved a bond issue of $5000 to cover the cost of the construction of a new transmission line to Birmingham. J. W. Richards is mayor; F. O. Floyd is engineer.

Lexington, Miss.—Issuance of $20,000 of municipal bonds for electric light purposes was voted. W. J. Jordan, city clerk.

Natchitoches, La.—City commissioners are having plans prepared by Xavier A. Kramer, consulting engineer, Magnolia, Miss., for alterations and improvements in the municipal light and water plant. It is proposed to install new alternators, engine and pumping equipment, and arrange for the construction of a new power station building. F. W. Johnson is mayor.

Horatio, Ark.—The city contemplates the installation of electric light and water plants. Address the mayor.

Ponca City, Okla.—$50,000 in bonds have been voted for electric light extension. Address W. H. McFadden, mayor.

Kyle, Tex.—Kyle Power & Light Co., recently incorporated, is arranging plans for the construction of a power plant for local service. C. F. Heidenreich is manager.

Waco, Tex.—Central Texas Electric Railway Co., recently incorporated with a capital of $500,000, is arranging plans for the construction of an electric railway system from Waco to Temple for passenger and freight service. It is said that the plans will include the ultimate construction of an extension to Austin, and thence to San Antonio. The board of directors is as follows: J. L. Davidson, O. A. Rifle, and S. M. Clark, all of Waco; P. A. Clark, Rosenthal, Tex.; Henry Meisner, G. E. McSelver, and H. L. Dailey, Temple, Tex.

Sadler, Tex.—H. L. Kinney, Grayson county, advises that a chamber of commerce has been organized and a franchise granted to a Denison firm for the immediate erection of an electric light plant at Sadler.

Wichita Falls, Tex.—In order to provide electric power and lights for a wide scope of territory in northwest Texas the Wichita Falls Electric Co. will greatly enlarge its central power station here and extend its transmission line to a number of cities and towns. It is stated that the proposed improvements will cost about $1,000,000. The company is already furnishing electric power for oil well pumping plants in the Burkburnett district and for other industries of this city and adjacent section.

WESTERN STATES.

Missoula, Mont.—Missoula Light & Water Co. will expend about $85,000 in remodeling its power dam in the Missoula river near Milltown. H. L. Bickenbach will have charge of the work.

Nampa, Idaho—The installation of a boulevard lighting system to replace the lights in use is being considered by the Nampa Chamber of Commerce.

Ogden, Utah—Application has been made by the Uintah Power & Light Co. for a preliminary permit for the construction of an electric generating station on the Uintah river, to furnish 4000 hp. The plant would be situated on the Uintah river in the Ashley forest and distribute power to all of the towns in the Uintah basin. If the permanent permit is granted the right of occupation for 50 years is granted.

Roseburg, Ore.—Roseburg will have a municipal lighting and power plant, according to plans of the city council. Mayor Hamilton with Claude Frear, city engineer, located a fine power site on the North Umpqua river, east of the mouth of Rock creek, 25 miles east of the city.

Rio Vista, Cal.—Plans are being completed for the construction of a 22,000-volt power line from Hood to Franklin by the Great Western Power Co., this work to cost about $20,000. Most of the power will be used for pumping water, which is needed for the big agricultural development in the Franklin district.

CANADA.

Hamilton, Ont.—International Plow Works has under consideration the erection of a manufacturing plant. B. H. Prack, Lumsden building, Toronto, engineer.

New Toronto, Ont.—Goodyear Tire & Rubber Co. of Canada, Ltd., will erect a $200,000 addition to its factory. Plumbing, heating and electrical contracts will be let.

Coquitlam, B. C.—Gregary Tire & Rubber Co., Vancouver, plans the erection of a factory to cost $175,000. Gardiner & Mercer, 827 Birke building, Vancouver, architects.

PROPOSALS

Light and Water Plant.—Bids will be received Oct. 13 for the construction of a water and light plant at Ansonia, Ohio. G. L. McKibben, of Van Wert, has prepared plans. Address city clerk.

Water-Tube Boiler.—Bids will be opened in the Treasury Department, supervising architect's office, at 3 p. m., Oct. 28 for an additional 200-hp. water-tube boiler at the Bureau of Engraving and Printing, Washington, D. C., in accordance with drawings and specifications, copies of which may be had at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Pneumatic-Tube System.—Bids will be opened at 3 p. m., Oct. 27, in the office of the supervising architect, Treasury Department, Washington, D. C., for a pneumatic-tube system in United States assay office at New York, N. Y. Drawings and specifications may be obtained from the supervising chief engineer, Room 731, United States Customhouse, New York, N. Y., or at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Electric Work.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Nov. 28, for furnishing materials for the construction of the United States post office at Gilmer, Tex., including materials for concrete, reinforced concrete, stone, granite, brick, structural terra cotta, structural steel, miscellaneous iron and steel work, composition roofing, slate roofing, sheet-metal work, plastering, interior marble, sanitary slate, lumber, millwork, painting, glazing, hardware, plumbing, heating, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto. Copies may be obtained after Oct. 23 from the custodian of the site at Gilmer, Tex., or at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Electric Conduit.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Nov. 10 for furnishing the labor required in the construction complete (including heating, plumbing, electric conduits, and wiring) with material that will be furnished by the Government, for kitchen and mess hall, officer's quarters, attendants' quarters and garage and approaches, for the United State marine hospital at San Francisco, Cal. Drawings and specifications may be obtained from the superintendent of construction, room 403, post office and courthouse, San Francisco, Cal., or at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Hydroelectric Machinery.—Board of Public Works, Seattle, Wash., is asking for sealed bids up to 10 a. m., Oct. 17, for hydroelectric machinery required for an additional unit at the city's Cedar Falls hydroelectric station. The requirements are for a 10,000-kw. generator, alternating current, revolving field, 3 phase, 60 cycles, 6600 volts. Generator is to be direct-connected to water wheel, and to withstand for one hour runaway speed of water wheel, without injury to machine. Water wheel may be of impulse or reaction type, with horizontal or vertical shaft, and may have more than one runner. It is to be driven from a 78-in. penstock, 7500 ft long. Capacity of wheel shall be not less than 16,000 hp., with a speed not to exceed 515 r. p. m.; other requirements include a 200-kw. exciter unit, consisting of a direct-current generator, direct-connected to a water wheel, the latter to be driven from a steel penstock, supplied with water from the main penstock through a connecting tap. All necessary accessories are to be included in bids submitted.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Engines (30,761).—An American exporting company desires to purchase suitable engines and boilers of a type necessary for running a rice-milling plant. Its requirements are a small, compact steam-power plant consisting of horizontal tubular (preferably portable) fire-box boiler with engine mounted on same and connected to boiler, in two sizes, 30 and 50 hp. References.

Motors, Dynamos, Wire, Electrical Appliances (30,646).—A Spanish merchant established in the United States, having representatives in Spain, is about to visit that country and desires to secure agencies for the sale of tools, hardware, lathes, electrolytic copper wire, iron plates, motors, dynamos, electrical appliances, paints, chemicals, drugs, and crome-tanned upper leathers. References.

Electric Lamps (30,729). — An agency is desired by a man in Italy for the sale of electric lamps, hardware, oilcloths, linoleum, toys and drawing instruments. Quotations should be given c. i. f. Italian port. Correspondence should be in Italian or French. References.

Engines (30,736).—A manufacturing firm in France desires to secure exclusive agencies for France and her colonies of agricultural implements, including tractors and internal combustion engines. Correspondence may be in English.

INCORPORATIONS

Queens, N. Y.—McPhilben Lighting Fixture Co. Capital, $43,000. To manufacture electric and gas fixtures, etc. Incorporators: H. Schneider, M. Malk, and B. Schaefer, Queens.

New York, N. Y.—New York Power, Steam & Engineering Co. Active capital, $52,500. To engage in a general electrical and mechanical engineering capacity, etc. Incorporators: S. E. Trumbull, T. W. Barnes, and A. V. Clements, Albany.

Schroon Lake, N. Y.—Schroon Lake Lighting Corp. Capital, $30,000. To operate a local electric light plant. Incorporators: B. F. Stetson, M. C. Stanton, and R. B. Dudley, Elizabethtown.

Phoenix, N. Y.—Northern Cayuga Light & Power Corp. Capital, $50,000. To operate an electric light and power plant and distributing system in the Phoenix district. Incorporators: Frank Longley, C. E. Dudley, and James D. Bloomfield, Meridian, N. Y.

Wilmington, Del.—Glascox Electric Co. Capital, $10,000. To operate a local electrical engineering establishment. Incorporators: George G. Steigler, W. F. O'Keefe, and J. H. Dowdell.

Beckley, W. Va.—Beckley Machine & Electric Co. Capital, $25,000. To manufacture machinery, electrical specialties, etc. Incorporators: A. J. Truman, W. E. Griffiths, J. T. Evans, J. L. Smith, and J. S. Lilly, Beckley.

Paducah, Ky.—Suburban Electric Supply Co. Capital, $30,000. To manufacture electrical supplies. C. B. Smiley is the principal incorporator.

Gilbert, Iowa—Gilbert Electric Co. has filed articles of incorporation at the office of county recorder to be $15,000 divided into shares of $100 each, to be paid up in full. Address John Hill, president. The object of the incorporation is to erect, operate and maintain poles, wires and other equipment for the purpose of transmitting electrical energy for light, heat, power and other legitimate purposes, to sell and distribute such electrical current in and adjacent to the town of Gilbert.

Minier, Ill.—Minier Electric Light & Power Co. has been incorporated with capital of $15,000. Address George Peine.

Pine Village, Ind.—Pine Village Light & Power Co. has been incorporated with capital of $10,000 to supply light and power for the village of Pine Village. Address Melvin Akers, Pine Village, Ind.

Personals

Major Jackson Cited—P. S. Klees Becomes Vice-President of Pierce Fuse—Warner Jones Joins Dayton Fan & Motor

FRANK O'RYAN has been appointed district manager of the Allis-Chalmers Manufacturing Co. at Denver, Colo.

C. S. ANDERSON, formerly superintendent of the Clark Electric Power Co., Tooele, Utah, is now superintendent of the Butler district of the Western Pennsylvania Power Co.

MALACHI G. BRENNAN, advertising manager of the Sanford Riley Stoker Co., Ltd., Worcester, Mass., has been transferred to the sales department of the Chicago office of the company. He will be succeeded by Otis C. Sheldon.

LEWIS A. BELDING, who for the past two years has been assistant professor of mechanical engineering at Stevens Institute of Technology, Hoboken, N. J., is now associated with the Thomas A. Edison interests at Orange, N. J., in the power service division, as service engineer.

MAJ. JOHN B. JACKSON, an engineer with the Commonwealth Edison Co., Chicago, is the recipient of a citation signed by General John J. Pershing dated April 19, 1919, "for exceptionally meritorious and conspicuous service." Major Jackson was in the Corps of Engineers and was assigned to the office of Chief of Engineers, A. E. F. In the Division of Construction and Forestry he had direct administrative charge of electrical projects in France; that is, in all territory except the immediate fighting zone.

R. L. FRISBY, testing engineer of the Commonwealth Edison Co., Chicago, has resigned to become chief electrician for the Kansas City Light & Power Co. Mr. Frisby has been connected with the Commonwealth Edison Co. for about 16 years, during which time he has been connected with operation. For many years he has had charge of testing at the Fisk, Quarry and Northwest stations of the company. It has been through his efforts that numerous operating economies and safety methods have been adopted at these power houses of the company. In addition to testing and maintenance at the Fisk street generating station, Mr. Frisby has carried on a considerable amount of research work at the company's laboratories in connection with balance relays for generator protection, the use of noncombustible generator coils, the use of exploring coils versus thermocouples for determining "hot spots" and similar work relating to large turbogenerator stations. In Kansas City he will have charge of operating and maintenance of the entire system, where it is expected that his extensive experience with Chicago's large system will prove, alike, of service to himself and the Kansas City Light & Power Co.

WARNER JONES, formerly special representative of the National Carbon Co., Inc., and whose duties have called him to all parts of the country, is now sales manager of the Dayton Fan & Motor Co., Dayton, Ohio. He will have charge of the sales and advertising departments of the company and will be responsible for the advertising and sales of the Dayton fans and small motors. Mr. Jones has had 20 years' experience in selling various kinds of electrical merchandise, and the experience and acquaintanceship that he brings with him will undoubtedly be of great value to the Dayton Fan & Motor Co. He has many new ideas on the merchandising of electrical equipment that will doubtless be of great interest to electrical supply jobbers and dealers throughout the country as well as manufacturers of electrical apparatus who use small motors.

PETER S. KLEES has tendered his resignation as manager of the Franklin Incandescent Lamp Works of Westinghouse Lamp Co., New York City, to become associated with the Pierce Fuse Corp., Buffalo, as vice-president and sales manager. Mr. Klees has been prominent in the lamp industry for many years, having joined the organization of the American Incandescent Lamp Co. in 1899. In 1905 he went to Hartford as a member of the sales department of the Franklin Electric Manufacturing Co., later becoming sales manager and then also vice-president. He continued in this capacity until the sale of this company in 1918 to the Westinghouse Lamp Co., at which time he became manager of the Franklin Works and removed to New York City. Mr. Klees has a very wide acquaintance among electrical men throughout the country, who will be glad to hear that his new interest in the fuse field will still keep him in the industry.

COL. EDWARD A. DEEDS, president of the Domestic Engineering Co., Dayton, Ohio, was the principal speaker and guest at a dinner given in his honor by the Indiana section of the Society of Automotive Engineers at the Claypool Hotel in Indianapolis, Ind., Oct. 10. At the age of 26 Colonel Deeds joined the staff of the Thresher Electric Co. as assistant draftsman, becoming chief engineer and superintendent within a year. Shortly afterwards he went to the National Cash Register Co., where, as maintenance engineer, he built the power house and electrified the plant. Leaving that position he went to Niagara Falls where he built and put into operation the shredded wheat plant. On the completion of this work he returned to the National Cash Register Co. as vice-president in charge of engineering, remaining there until 1914. In April, 1917, he was called to Washington as a civilian member of the munitions standards board. Later he became a member of the aircraft production board and was placed in charge of the production division of the board's activities. In August, 1917, he was commissioned a colonel.

COL. T. H. DILLON of the Engineers Corps of the United States Army, has resigned from the army and his appointment to a professorship of Electrical Engineering at the Massachusetts Institute of Technology is announced, thereby adding his name to the already notable electrical engineering staff of that institution. Colonel Dillon graduated from the military academy at West Point in 1904, and was appointed to the Engineers Corps of the army. After some military duties he was assigned to the Engineer School of Application of the United States Army, from which he graduated in 1907. Since then he has had a wide, varied and notable engineering experience. He was in Cuba during the American occupation as assistant to the director of public works. He was occupied in the Philippines on the military survey of the Island of Luzon, part of the time being in charge of the work. Later he was located at Portland, Ore., in charge of the construction of the Dalles-Celilo canal around the Dalles of the Columbia river, and the roads in the Crater Lake National Park. He then was assigned to Panama and made electrical engineer of the Panama Canal and superintendent of the Gatun Locks. Here he was also in charge of engineering in the locks division and the hydrographic division. He had the unique experience of locking the first great ships through the Gatun Locks.

In 1918 he went to France as colonel in command of the 37th Engineers, which was the notable electrical and mechanical regiment whose reputation is widely known. In France he was deputy chief engineer of the First Army of the American Expeditionary Forces during the St. Mihiel, the Aisne-Marne and Argonne-Meuse campaigns, in charge of the mechanical and electrical work, water supply, general construction, army shops and engineers' supplies for the army throughout these notable campaigns. After the armistice, Colonel Dillon was made deputy to General McKinstry, who was the chief of the board of damages in allied countries, and as such he had charge of the plans for making the estimates for the American peace commissioners of personal and property damages suffered by the allies on account of the aggressions of the enemies in the war. Colonel Dillon brings a large fund of scientific training and engineering experience to his duties at the Massachusetts Institute of Technology, where he will make a specialty of instruction in the problems of electric railroads, including tramways and electrification of steam railroads and in the problems of power transmission.

For the Readjustment Period—What?

LIV.

Financing Foreign Trade

Commercial interests of the United States will be asked to unite and determine on a definite plan of action regarding trade with other countries at a conference of business men of the country, to be held in New York Oct. 16 and 17.

The conference, which will be held under the auspices of the American Manufacturers' Export Association, will discuss the export situation and also, it is expected, will devote considerable time to considering the lengths to which manufacturers are prepared to go in utilizing facilities for financing foreign trade provided by the Edge bill.

Among those interested in calling the conference are James A. Farrell of the United States Steel Corp., W. W. Nichols of Allis-Chalmers Mfg. Co., A. C. Bedford of the Standard Oil Co., E. M. Herr of the Westinghouse Electric Export Co., W. C. Durant of the General Motors Co., W. L. Saunders of the Ingersoll-Rand Co., F. A. Seiberling of the Goodyear Tire & Rubber Co., William H. Ingersoll of Robert H. Ingersoll & Brother, and Robert A. Shaw of the National Aniline & Chemical Co., Inc.

The widespread interest being taken in this effort to crystallize the views of business on foreign trade problems is regarded as a sign that American manufacturers and shippers, who have only recently entered the export field, are determined to make this international trade a permanent part of their business.

Factories which increased production during the war to meet abnormal demands are continuing to maintain their enlarged output because of orders from overseas. Not a few of the manufacturers who are operating on this basis declare that any great decline in the volume of the nation's foreign business is certain to bring depression and unemployment in its wake.

The accompanying reproduction of an announcement in the daily press calls attention to a matter of importance to manufacturers of electrical equipment. I hope it will have the consideration which it deserves.

C. A. TUPPER *President*
INTERNATIONAL TRADE PRESS, INC., CHICAGO

Financial News

$10,000,000 Power Deal Authorized.

Hydroelectric development in California was given a decided impetus by the Railroad Commission recently when it approved the purchase of the properties of the Northern California Power Co. by the Pacific Gas & Electric Co. Approval of this transaction by the Railroad Commission, in addition to making possible a merger of power properties that will prove of great benefit to the state, will prevent threatened litigation that promised to block for years needed hydroelectric development. Its immediate effect will be to make possible the development of the Pit river project, a gigantic power scheme, held in abeyance by the Pacific Gas & Electric Co. because of threatened trouble with the Northern California Co. over water rights.

The order by the Commission makes possible a transaction involving an amount approximating $10,000,000, the approval covering the purchase by the Pacific Gas & Electric Co. of 10,000 shares of the Northern California Power Co. stock at $34 a share and the assumption by the gas company of the power company's obligations totaling $6,213,526.74. The Pacific Gas & Electric Co. is willing to pay for the stock forthwith and has agreed to pay for the properties on or before Dec. 1, 1948, the sum of $3,400,000, in addition to assuming the Northern company's obligations.

Northern California Power Co. generates and distributes electric energy in portions of the counties of Shasta, Trinity, Tehama, Colusa, Glenn and Butte. It sells water in Redding and Willows, and manufactures and distributes gas in Redding, Red Bluff and Willows. The company's engineer estimates that to reproduce the properties at present day prices would cost $13,300,000. Its listed assets total $18,471,668.36.

As further evidence that the transaction is for the best interests of the Northern company's stockholders, the commission points out that from 1913 to 1918 the company paid no dividends but levied assessments totaling $1,400,000. Up to May 31, 1919, it was in arrears $225,029.80 in sinking fund payments, owned notes amounting to $249,250 and would have to meet, in February, 1920, maturing debentures aggregating $370,000. Taking into consideration the Pit river project, and the required expenditure of $6,000,000 for the first unit of this development, the commission says:

"An expenditure of from $6,500,000 to $7,000,000 must be made to keep Northern California Power Co. a solvent up-to-date public utility corporation and able to discharge its obligation to the public. There is no doubt that an entirely new financial program would have to be devised by the company to install even the first unit of the Pit river development."

Rochester Railway Issues Stock.

Rochester Railway & Light Co. has completed arrangements for the issuance of 6% cumulative preferred stock for $500,000, a portion of the proceeds to be used to increase the present service facilities of the company. The company has recently commenced the changing of the system used at the present time from direct to alternating current, it being held that the latter system is preferable for long distance transmission, with greater efficiency at a lower cost of production.

Hurley Machine Votes Capital Change

Stockholders of the Hurley Machine Co. at a special meeting held last week voted to change the capitalization of the company from 15,000 common shares of $100 par value to 200,000 shares of no par value. No change was made in the preferred stock issue, which is 5000 shares of $100 par value.

It also was voted to increase the directorate from five to nine members, the new directors elected being Edward F. Carey, president of the Haskell-Barker Car Co.; Joseph E. Otis, vice-president of the Central Trust Co. of Illinois; Silas Strawn of Winston, Strawn & Shaw, and Edward N. Hurley, Jr., president of the Hurley Supply Co.

The directors have also directed that the present outstanding 11,650 common shares be called for cancellation and exchange for the new common stock on the basis of seven shares of new stock for one share of old common. The exchange will be made with stockholders of record Oct. 15, who also will be offered the right to subscribe to 10,000 shares of new stock at $35 a share. The proceeds from the sale of stock will be used for plant extensions.

Brazilian Traction Note Issue.

An issue of $7,500,000 Brazilian Traction, Light & Power Co. three-year 6% secured gold notes is being offered at 92½ and interest to net about 7% by the Continental and Commercial Trust and Savings Bank and William A. Read & Co., Chicago. The notes are dated Nov. 1, 1919, and mature Nov. 1, 1922. The total authorized issue is $10,000,000. The company agreed to pay the United States normal income tax up to 2% if exemption is not claimed by the noteholder.

Public Service Notes Offer.

Halsey, Stuart & Co. are offering $2,500,000 Public Service Co. of Northern Illinois three-year 6% collateral notes, series C. due Sept. 1, 1922, at 98 and interest, yielding 6¾%. A part of the proceeds of this issue will be used to pay off the $1,500,000 two-year 6% notes of the company. The balance of the proceeds will reimburse the company for expenditures made, or to be made, for improvements and extensions. The notes were all sold within an hour after the books were opened. The syndicate underwriting was very largely oversubscribed.

Dividends.

Carolina Power & Light Co. has declared a quarterly dividend of 1½%, payable Nov. 1 to stockholders of record Cct. 15.

A quarterly dividend of 1¾% on preferred stock has been declared by the Fort Worth Power & Light Co., payable Nov. 1 to stockholders of record Oct. 21.

Babcock & Wilcox Co. has declared a quarterly dividend of 2%, payable Jan. 1 to stock of record Dec. 20.

Southern New England Telephone Co. has declared a quarterly dividend of 1¾%, payable Oct. 15 to stock of record Sept. 30.

A cash dividend of 75 cts. per share on preferred stock has been declared by the Puget Sound Traction, Light & Power Co., payable Oct. 15 to stock of record Oct. 2.

A dividend of 1¾% has been declared by the Public Service Co. of Northern Illinois, also a dividend of 1½% on preferred stock, both payable Nov. 1 to stock of record Oct. 15.

Chicago Pneumatic Tool Co. has declared a quarterly dividend of 1½%, payable Oct. 25 to stock of record Oct. 15.

Illinois Northern Utilities Co. has declared a dividend of $1.50 a share on preferred stock, payable Nov. 1 to stock of record Oct. 20.

Sullivan Machinery Co. has declared a quarterly dividend of 1½% with the usual extra dividend of 1%, both payable Oct. 15 to stockholders of record Oct. 1.

A quarterly dividend of 2% has been declared by the Kaministiquia Power Co., payable Nov. 15 to stock of record Oct. 3.

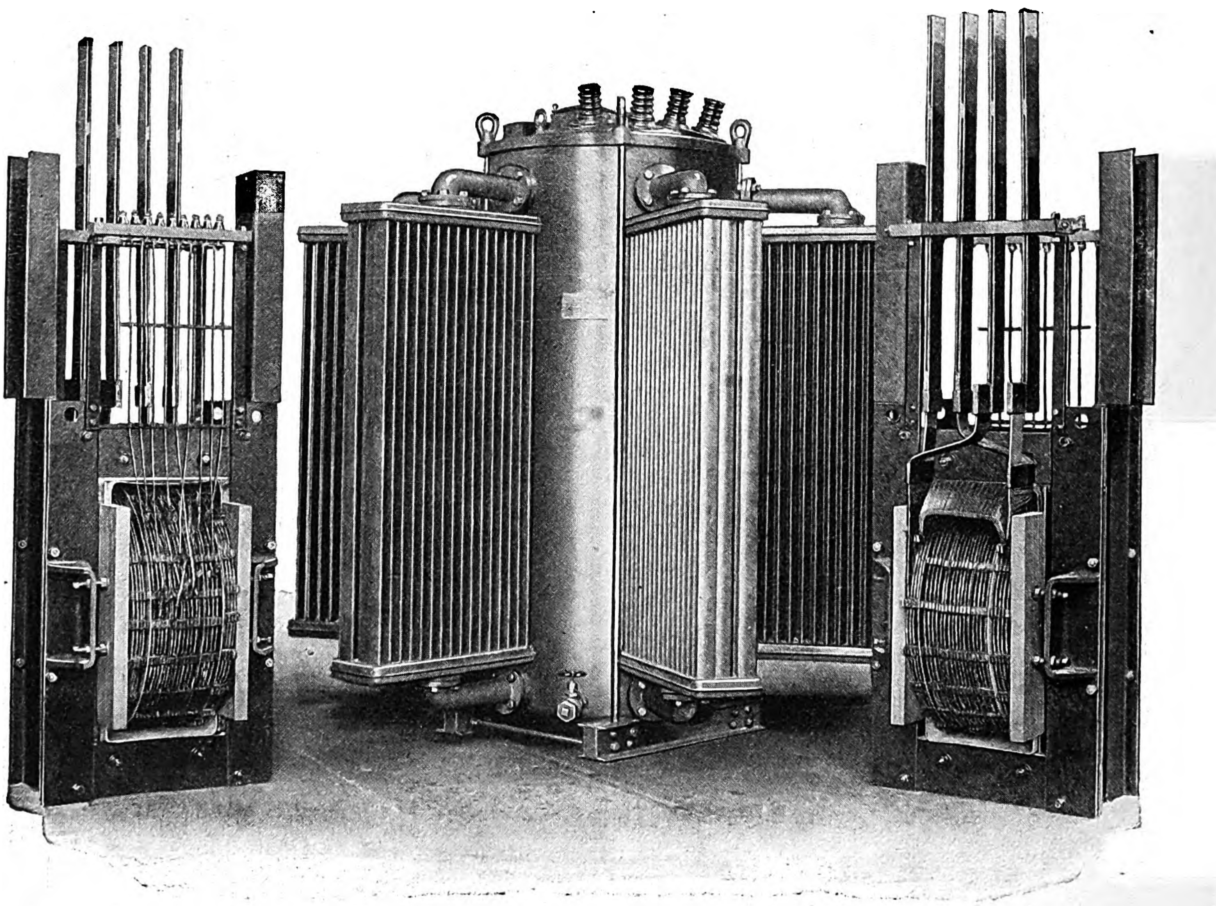
Electrical Review

. 75. No. 16. CHICAGO, OCTOBER 18, 1919 Three Dollars a Year



Electrical Review

WITH WHICH IS CONSOLIDATED WESTERN ELECTRICIAN AND ELECTROCRAFT

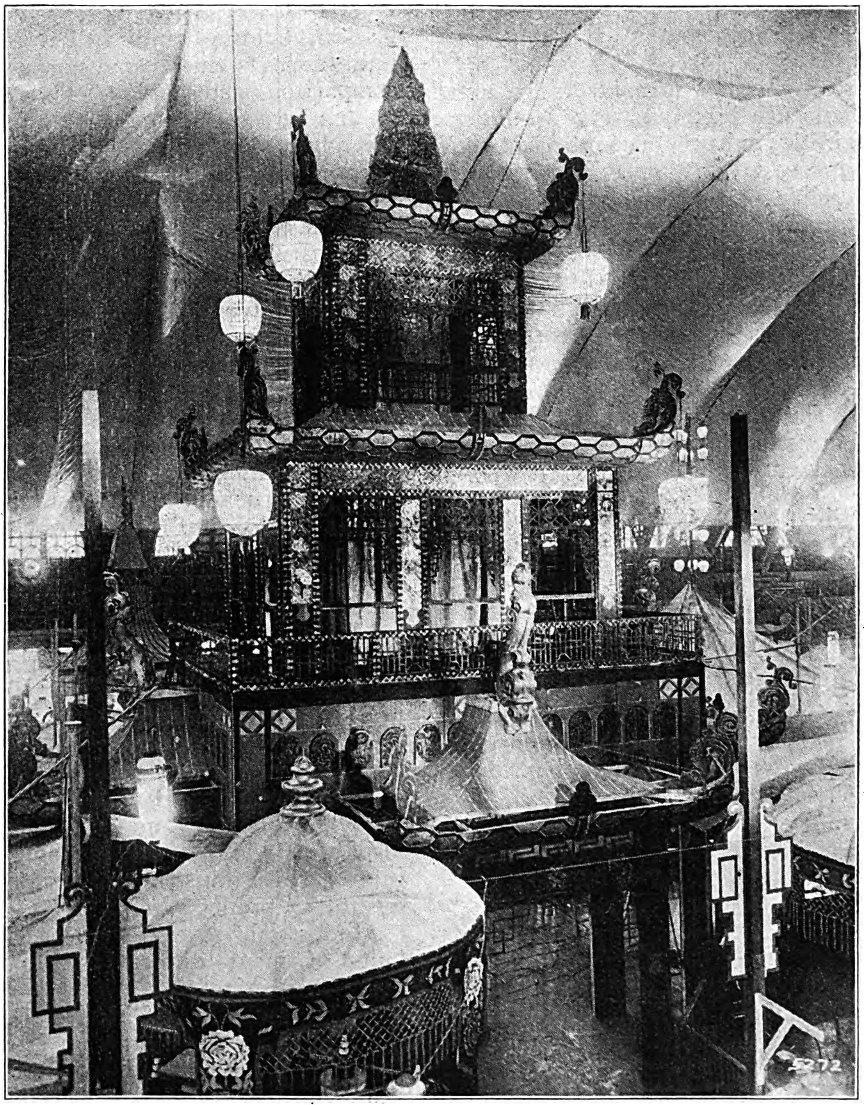
VOL. 75—No. 16. CHICAGO, SATURDAY, OCTOBER 18, 1919. PAGE 639.

Chicago Electrical Show Proves a Noteworthy Success

Elaborate Decorative and Lighting Effects Are Features of Show—All Branches of Industry Make Representative Exhibit of Electrical Products

AFTER being without an electrical show for eight years Chicago came back into its own again with a show that eclipses by far all its former attempts at making a display of electrical products.

The most striking features of the show, which opened at the Coliseum Oct. 11 and which will continue until Oct. 25, are the lighting and decorative effects. They are conceded to be the most elaborate that have ever been used in connection with any electrical show. The whole scheme of decoration is typically Chinese in effect and centers about a pagoda, 60 feet high, which graces the exhibition. This pagoda is ornamented with 18,000 "Novagem" jewels which were originally a part of the famous "Tower of Jewels" at the Panama-Pacific Exposition at San Francisco, Calif., in 1915. The pagoda is brilliantly illuminated with searchlights and forms a beautiful centerpiece around which the exposition booths are grouped. The decorative effects of the latter are secured by means of smaller Chinese pagodas, bamboo-thatched roofs, lanterns, sunshades, paintings and the like. Gold and dull red are the predominating colors in the scheme of decorations.



Chinese Pagoda Which Forms Centerpiece at Chicago Electrical Show.

The lighting effects are secured by means of searchlights and floodlights together with numberless Chinese lanterns, the latter serving to subdue the high intensity of the units and in combination with the dull colorings make the exhibition very pleasing to the eye. The lighting effects and decorative scheme were designed by W. D'A. Ryan, director of the Illuminating Engineering Laboratory of the General Electric Co., who also designed those at the Panama-Pacific Exposition.

The immensity and completeness of the exhibition can perhaps be better realized when it is stated that the Coliseum, in reality

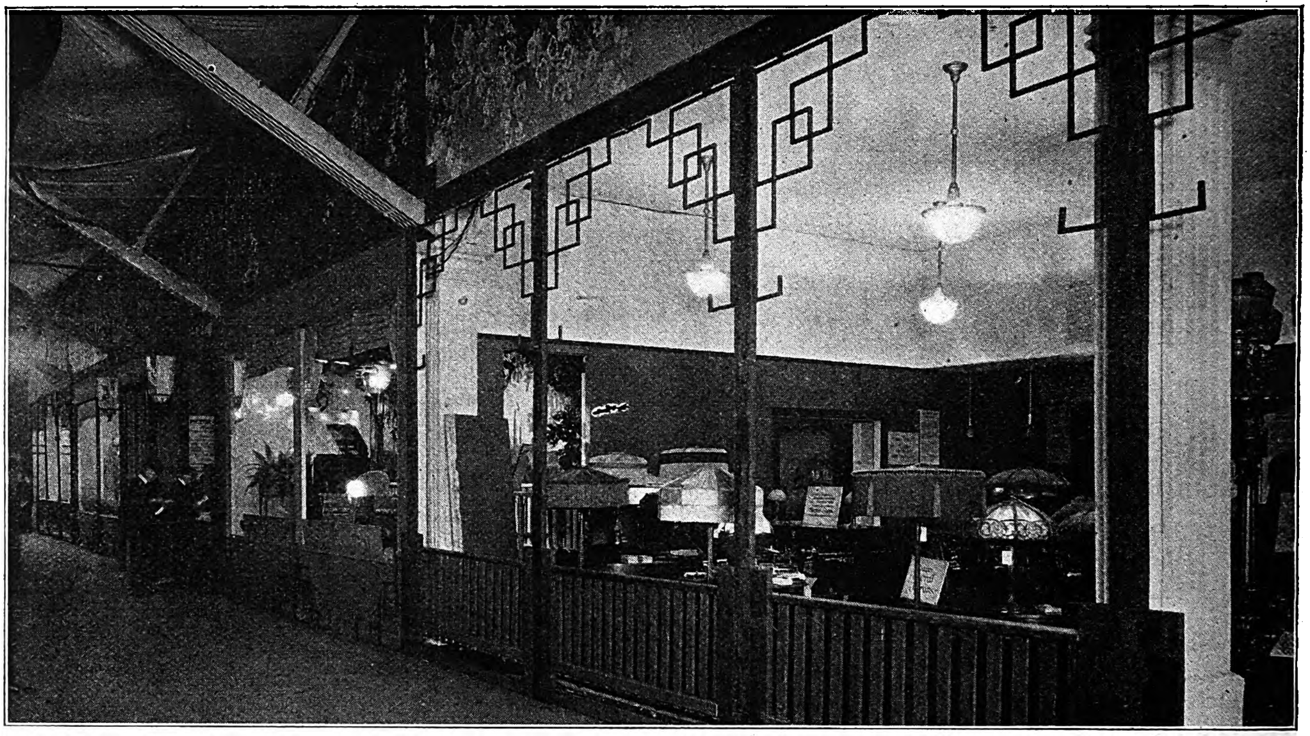


Exhibit of Residential Lighting Units and Show Window Lighting at Chicago Electrical Show.

a very large exposition building, appears rather small to the casual observer.

Over 100 electrical manufacturers are represented at the show, and their varied exhibits serve to indicate the progress made in the industry since the last show was held in Chicago eight years ago. This progress is particularly noticeable when one stops to consider that at that time Mazda C lamps, multiplex telegraphy and wireless telephony were unknown, and such devices as enclosed switches, electric furnaces and heating apparatus, industrial reflectors, electrotherapeutic apparatus and electric cooking utensils were in the early stages of development.

To do full justice to all the exhibits is not possible with limited space. The following notes are the result of disinterested observation of what seemed to be the most striking developments exhibited.

Wireless Telephony and Multiplex Telegraphy.

The most recent development of the electrical art to be exhibited at the show is that of wireless telephony. The U. S. Signal Corps has installed a station and conversations are carried on with a station in one of the downtown office buildings. Phonograph music is transmitted by wireless telephony from the latter station to the Coliseum and there amplified so those in attendance at the show may hear. Conversation is also transmitted to stations at Ludington, Mich., and Milwaukee, Wis.

Multiplex telegraphy, by means of which four messages may be sent in each direction over a single wire at the same time, is shown by two interconnected machines exhibited by the Western Electric Co.

Lighting Equipment.

The many exhibits of manufacturers of lighting equipment augment the lighting effects of the show proper. Prominent among these is an exhibit showing a comparison between modern and antiquated method of industrial lighting. Two shops identical as to machinery, benches, etc., have been equipped, one with modern lighting units and the other with old-style units, such as cluster and unshaded drop lights. The comparison is so striking, as one walks from one room to another, that it effectively convinces any one of the advantages of good industrial lighting. In connection with this display, which is made by Commonwealth Edison Co., is a clever scheme for showing the illuminating value of a dozen or so different makes of industrial lighting units. Large plats showing the light distribution curves for all of the units are placed directly under the corresponding units themselves. When one of the latter is in operation, one can tell not only from the unit in question but from its distribution curve what the characteristics of the particular reflector or lighting unit are. Good show-window lighting is illustrated by an actual window display alternately illuminated with old-style equipment and with modern reflectors; also the use of daylight Mazda lamps for bringing out color values is illustrated by a display alternately illuminated by Mazda "C" units and by daylight Mazda lamps.

The evolution of the modern lamp is shown in an exhibit of the National Lamp Works of General Electric Co., types of lamps from prehistoric times up to the new "White Mazda" being displayed. In connection with this exhibit moving pictures showed the steps in the manufacture of "White Mazda" lamps and souvenirs made of "White Mazda" glass are manufactured and given away.

Westinghouse Lamp Co. showed the method of inspection and packing of lamps and by means of colored slides illustrated other steps in the manufacture of its products.

Industrial, store, office and residential lighting units of many different designs are exhibited by various manufacturers.

A large number of householders are attending the show and they find attraction in the many exhibits of electrical washing and ironing machines, vacuum cleaners, ranges and other electrical heating and cooking utensils. Among the electric baking ovens being

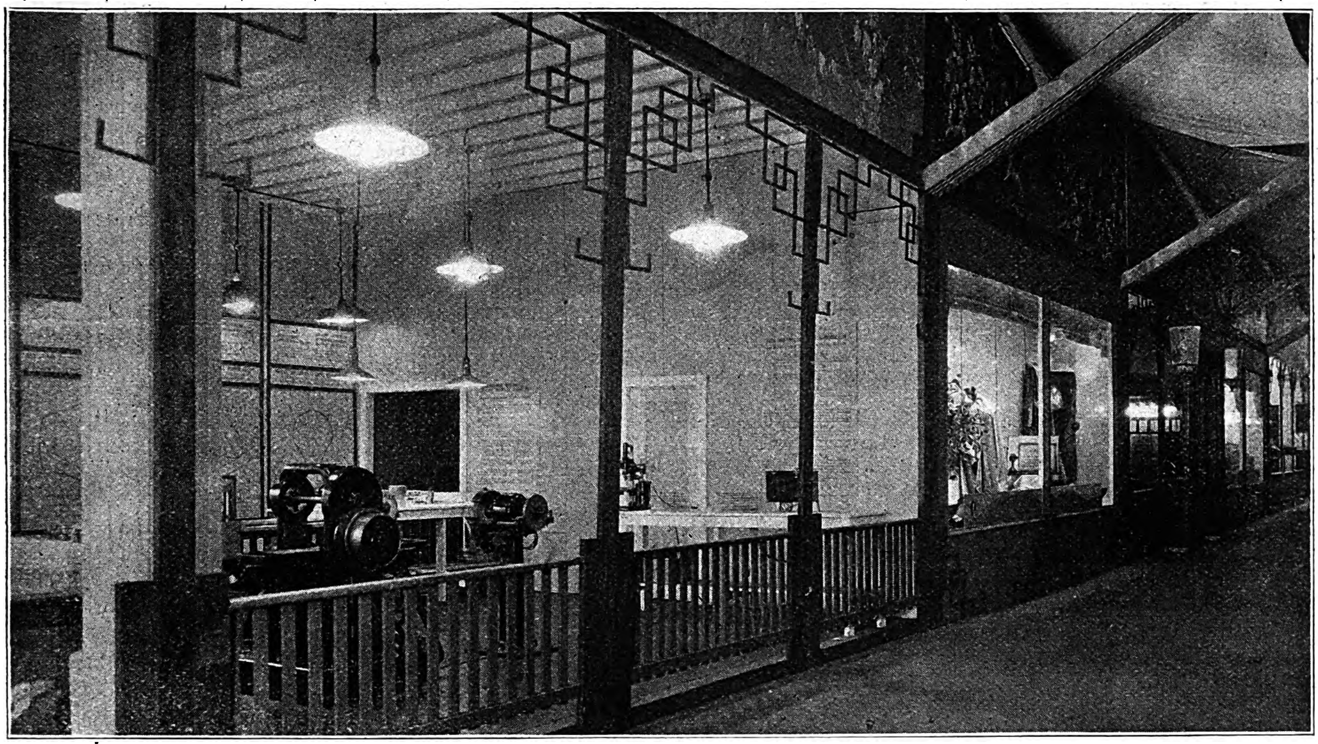

Exhibit of Modern Industrial Lighting Units and Show Window Lighting at Chicago Electrical Show.

shown is an automatically operated oven made by the Westinghouse Electric & Manufacturing Co. A combination kitchen sink and electric dishwasher is exhibited by the Dunn Manufacturing Co., and the Edison Electric Appliance Co. is showing its new automatic electric range.

A constant-current welding machine with 200 amperes capacity forms part of the General Electric Co. exhibit, which also includes industrial heating devices, an acid-resisting insulated motor, wiring devices, etc.

Electric furnaces and samples of their products are exhibited by the Booth-Hall Co. and the Detroit Electric Furnace Co. One type of furnace is built upon the rocker principle while the other is of the revolving type.

The part that asbestos plays in the electrical industry is shown by the H. W. Johns-Manville Co. exhibit, which also includes enclosed switches, fuses, cutout bases, etc.

An exhibit by the Chicago Telephone Co. contains equipment to illustrate the procedure and operation of completing a telephone call. Sections of "A" and "B" boards are used to demonstrate the method of putting through a call in the exchanges.

The electrical contractors of Chicago are represented at the show with an exhibit conducted by the Electrical Contractors' Association of Chicago. Pictures of various installations form the background of the booth, and two electrically lighted miniature houses make an interesting exhibit that draws many prospective house-wiring customers.

Attendance at the show was stimulated by the Commonwealth Edison Co., which gave coupons with its electric light bills, entitling the holders to half-rate admission. The first week the attendance was larger than was expected and demonstrators are kept busy afternoon and evening showing the many time and labor-saving electrical devices at the show.

List of Exhibitors and Their Exhibits

Altofer Bros. Co., Peoria, Ill.—Electric washing machines.

Ackerman-Johnson Co., Chicago—Screw expansion bolts.

C. F. Adams Co., Chicago—Electric washing machines.

Apex Appliance Co., Chicago—Electric washing machines.

American Ironing Machine Co., Chicago—Electric ironing machines.

American Steel & Wire Co., Chicago—Steel and wire.

Americolite Co., New York, N. Y.—Electric lighting fixtures.

American Enameled Magnet Wire Co., Muskegon, Mich.—Magnet wire.

Anderson Electric Specialty Co., Chicago—Portable automobile headlights and specialties.

Amalgamated Machinery Corporation, Chicago—Automatic heaters.

M. B. Austin & Co., Chicago—Electrical jobbing specialties.

Art Metal Manufacturing Co., Chicago—Industrial and residential lighting fixtures.

Bake-Rite Corp., Chicago—Electric baking ovens.

Benjamin Electric Manufacturing Co., Chicago—Industrial reflectors and wiring specialties.

Bennage Co.—Electric glue pots, soldering irons, etc.

Bleadon-Dunn Co., Chicago—Electric therapeutic apparatus.

Blue Bird Appliance Co., St. Louis, Mo.—Electric washing machines.

Booth-Hall Co., Chicago—Electric furnaces.

Frank S. Betz Co., Hammond, Ind.—Electric therapeutic devices.

Central Electric Co., Chicago—Industrial reflectors, electrical supplies and auto accessories.

Central Station Institute, Chicago—Students' electrical courses.

Chicago Reedware Manufacturing Co., Chicago—Electric lamps.

Chicago Telephone Co., Chicago—General exhibit showing operation of telephone service.

Chicago Washing Machine Co., Chicago—Electric washing machines.

Clements Manufacturing Co., Chicago—"Cadillac" electric vacuum cleaners.

Commonwealth Edison Co., Chicago—General exhibit of central-station service; industrial, store, office and residential lighting, household appliances, etc.

Coyne Trade and Engineering Schools—Electrical engineering schools.

Commercial Lighting Co., Chicago—Electric lighting fixtures.

Contra-Pole Electric Co., Brooklyn, N. Y.—Electrotherapeutic apparatus.

Crane Co., Chicago—Electric power-plant supplies.

Crouse-Hinds Co., Syracuse, N. Y.—Electric switches and safety devices.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis.—Electric switches, lifting magnets, wiring and heating devices.

George Cutter Co., South Bend, Ind.—Industrial and street-lighting specialties, switches and panelboards.

Frank B. Cook Co., Chicago—Electric soldering irons and specialties.

A. J. Deer Manufacturing Co.—Electric grinders and choppers.

Detroit Electric Furnace Co., Detroit, Mich.—Electric furnaces.

Delta-Star Electric Co., Chicago—High-tension electric distribution specialties.

De Mooy Electric Co.—Electrotherapeutic apparatus.

Dunn Manufacturing Co., Chicago—Electric dishwashing machines.

Duparquet-Huot & Moneusse Co., Chicago—Electric ranges and hotel equipment.

Eden Appliance Co., Chicago—Electric laundry machines and vacuum cleaners.

Edison Electric Appliance Co., Chicago—Electric heating appliances.

Edison Storage Battery Co., Orange, N. J.—Storage batteries and accessories.

Electric Appliance Co., Chicago—Electric jobbing supplies.

Electrical Record, New York, N. Y.—Electrical publications.

Electrical Journal, Pittsburgh, Pa.—Electrical publications.

Electrical Review, Chicago—Electrical publications.

Endless-graph Manufacturing Co., Chicago—Combination electric lamp and phonograph.

Eureka Vacuum Cleaner Co., Detroit, Mich.—Electric vacuum cleaners.

Estate Stove Co., Hamilton, Ohio—Electric ranges.

Electric Club of Chicago—General exhibit.

Electro-Magnetic Tool Co., Chicago—Electric hammers and drills.

Electric Storage Battery Co., Philadelphia, Pa.—Storage batteries and accessories.

Electro Steam Radiator Co., Chicago—Electric steam radiators.

Edison Lamp Works of General Electric Co., Harrison, N. J.—Mazda lamps.

Electric Service Construction Co., Chicago—Jobbers and contractors.

Electric Vacuum Cleaner Co., Cleveland, Ohio—Electric vacuum cleaners.

Electrical Contractors Association, Chicago—General exhibit of installations.

Electrical Testing Laboratories, New York, N. Y.—Exhibit of tested materials.

Elwell-Parker Electric Co., Cleveland, Ohio—Electric industrial trucks.

French Battery & Carbon Co., Madison, Wis.—Dry battery specialties, flashlights, etc.

Federal Sign System (Electric), Chicago—Electric signs, washing machines, vacuum cleaners, fuses, etc.

General Electric Co., Schenectady, N. Y.—Industrial heating devices, motors, street-lighting equipment, wiring devices, etc.

Grether Fire Equipment Co., Dayton, Ohio—Reflectors and flood-lighting equipment.

Habirshaw Electric Cable Co., New York—Electric wires and cables.

Hamilton-Beach Manufacturing Co., Racine, Wis.—Sewing machine motors, vibrators, vacuum cleaners, etc.

Handel Co., Chicago—Electric Lamps.

Hoover Suction Sweeper Co., North Canton, Ohio—Electric suction sweepers.

Hurley Machine Co., Chicago—Electric washing machines, ironing machines and vacuum cleaners.

Hot-Flo Faucet Corp., New York, N. Y.—Electric water-heating devices.

Hotwat Distributing Co., Chicago—Electric water-heating devices.

Ilg Electric Ventilating Co., Chicago—Electric ventilators.

Illinois Electric Co., Chicago—Electric jobbing supplies.

Inland Electric Co., Chicago—Electric jobbing supplies.

Judd Laundry Machinery Co., Chicago—Electric washing and ironing machines.

H. W. Johns-Manville Co., New York—Fuses, asbestos products, fire extinguishers, molded insulation, fibre conduit, etc.

Kellrohe Co., Chicago—Electric ironing machines.

Keeps-Fresh Electric Bakeries, Chicago—Electric ovens.

K. W. Battery Co., Chicago—Electrical storage batteries.

King Manufacturing Co., St. Joseph, Mo.—Electric street-lighting equipment.

Landers, Frary & Clark, New Britain, Conn.—Heating and cooking appliances.

Lindstrom, Smith Co., Chicago—Electric vibrators, heating devices, etc.

Lu-mi-nus Sign Letters Co., Chicago—Electric signs.

Manhattan Electric Supply Co., Chicago—Electric jobbing supplies.

Manufacturers Distributing Co., St. Louis.—Electric washing machines.

Majestic Electric Development Co., Philadelphia—Electric heating devices.

McClellan Refrigerating Co., Chicago—Electric refrigerating machinery.

Meyer, W. F.—Electric tools.

McGraw-Hill Co., New York—Electrical publications.

Edward Miller & Co., Meriden, Conn.—Electric lamps.

National Lamp Works of General Electric Co., Cleveland, Ohio—Incandescent lamps.

National X-Ray Reflector Co., Chicago—Reflectors, floodlights, etc.

New Home Sewing Machines Co.—Electric sewing machines.

Irwin Manufacturing Co.—Electric washing machines for metal parts.

Henry Newgard Co., Chicago—Electric contractor.

1900 Washer Co., Binghamton, N. Y.—Electric washing machines.

Oneida Truck Co.—Electric trucks.

Pathe Freres Phonograph Co.—Electric phonographs.

Pittsburgh Reflector & Illuminating Co., Pittsburgh, Pa.—Industrial lighting specialties.

Pneuvac Co., Worcester, Mass.—Electric vacuum cleaners.

Public Service Co. of Northern Illinois—Central-station service.

Regina Co., New York—Electric vacuum cleaners.

Reynolds Electric Co., Chicago—Electric sign flashers.

Roth Bros., Chicago—Electric motors.

Rutenber Electric Co., Marion, Ind.—Electric ranges and heating devices.

Remmert Co., Belleville, Ill.—Electric washing machines.

Shelton Electric Co., Philadelphia—Electric vibrators and specialties.

Simplex Electric Heating Co., Cambridge, Mass.—Electric heating and cooking devices.

Signal Corps, U. S. Army—Electric wireless signalling.

Standard Stamping Co., Huntington, W. Va.—Electric washing machines.

Surf Manufacturing Co., Milwaukee, Wis.—Electric washing machines.

Thomson Electric Welding Co., Lynn, Mass.—Electric welding machinery.

Thordarson Electric Manufacturing Co., Chicago—Electric X-ray apparatus, transformers, etc.

Torrington Co., Torrington, Conn.—Electric vacuum cleaners.

United Electric Co., Canton, Ohio—Electric vacuum cleaners.

Universal Electric Washer Co.—Electric washing machines.

Universal Products Co.—Farm-lighting plant.

J. W. Vaughn—Electric meat cutters.

Walker Vehicle Co., Chicago—Electric trucks.

Weeks Manufacturing Co.—Electric sterilizers.

Western Electric Co., Chicago—Electric cooking, heating and cleaning devices, sewing machines, etc.; printing telegraph, wireless telephone.

Wadsworth Electric Manufacturing Co., Covington, Ky.—Switches and wiring devices.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.—Electric heaters, motors, household appliances, etc.

Yankee System of Baking, Chicago—Electric ovens.

Central-Station Rates in Theory and Practice

Fifteenth Article—Defects of the Straight Meter Rate—Why Large Consumers Deserve Lower Rates — Various Forms of Step Meter Rates — Detailed Study of the Step Meter Rate

By H. E. EISENMENGER

This is the fifteenth article of this series, which began in the issue of July 12. The first seven articles, forming Part I, treated of the cost of electric service. Part II included six articles on the policy to be followed in selecting a rate system. Part III begun last week will consist of six articles on the various rate systems in use. Parts IV to VI will discuss rate analysis, accuracy of rates and rate regulation by commissions. The articles will continue weekly until the close of this volume, Dec. 27.

PART III—SYSTEMS OF CHARGING—Continued.

II. The Various Types of Rates—(Continued).

B. Rates Based on Energy Consumption Only.

2. *Application of Lower Average Kilowatt-Hour Charges to Larger Energy Consumers.*

a. Reasons for the Desirability of a Graduation of the Kilowatt-Hour Charges.

SECTION 114. The defect of the straight meter rate—apart from the defects which it shares with all other rates based on the energy consumption only—is that it makes the large consumer pay the same unit price as the small one. The adequate prices per kilowatt-hour under a pure meter rate are far from being the same for all consumers. They become steadily lower as the energy consumption of the customer becomes larger and larger. There are a number of reasons for this which will be explained in the following.[1]

115. Wherever business transactions are made, it is an established principle that the wholesale buyer gets lower prices than the small consumer. Very few exceptions can be found from this sound business principle. As far as the electricity supply business is concerned, it is clear (from what has been said in Part I about the cost of electric service) that large consumers cause smaller unit cost and inasmuch as the cost is at least one of the factors that make up the price, we are justified in expecting to find lower unit prices for larger consumers in the electricity supply business.

The "customer cost" which is the same for all customers, as we have seen, makes the average cost per kilowatt-hour higher if a small consumer is being served than if the consumer is a large one. These differences in cost can be very considerable. Let us assume, for instance, that the customer cost to the central station be 60 cents per customer per month and that all the rest of the total cost to the central station (demand cost and energy cost together) be 3 cents per kilowatt-hour.[2] These values are in no way extremes and they can be said to be near average conditions. (The figures of the different central stations vary within wide limits.)

Now with these assumptions we can figure out the following table for the total average cost of customers with various energy consumptions:

Monthly Energy Consumption in kw-hr.	Average Cost to the Central Station in cents per kw-hr.
5	$\frac{60 + (3 \times 5)}{5} = 15$ cents per kw-hr.
10	$\frac{60 + (3 \times 10)}{10} = 9$ cents per kw-hr.
20	$\frac{60 + (3 \times 20)}{20} = 6$ cents per kw-hr.
100	$\frac{60 + (3 \times 100)}{100} = 3.6$ cents per kw-hr
1000	$\frac{60 + (3 \times 1000)}{1000} = 3.06$ cents per kw-hr.
10000	$\frac{60 + (3 \times 10000)}{10000} = 3.006$ cents per kw-hr.

We see from this that the average cost per kilowatt-hour falls, first rapidly, with increasing energy consumption, and then more slowly, until for very large energy consumptions it becomes practically constant and converges towards the limit of 3 cents per kilowatt-hour.

Another reason why the average cost of the kilowatt-hour becomes lower as the energy consumption of the consumer increases is that the large consumer generally has a better load-factor, or a better diversity-factor, or both. A consumer, for instance, who is using only 10 to 20 kw-hr. per month is generally a residential customer or a small store owner, and this

[1] Graphical methods convey the best and most accurate conception of these several reasons and their effects. Drawings have been termed "the engineer's language" and it has been the author's experience that many commercial men get shy when it comes to representation of facts by curves. According to the leading principle of these articles to make their contents accessible as far as this can be done, to those who do not take kindly to mathematics and graphical representation, an attempt will be made in the following to explain purely by words the question why and how the unit price varies with the amount of the energy consumed, but the same question is treated graphically and much more thoroughly in Insert X. Readers who entertain no objections against curves are strongly advised to substitute Insert X for Sections 115-117. Later in the articles graphical and elementary mathematical methods will be found indispensable.

[2] From what has been explained before (Part I) it is not quite logical to divide the demand cost by the number of kilowatt-hours. The result of the operation is an average value which applies only under the given load-factor conditions. But as long as we deal with rates which do not take any cognizance of the maximum demand of the customer, we must of necessity be satisfied with this rough average, inaccurate as it may be. This is a disadvantage intrinsic to all rates which are based on the energy consumption only.

type of user is, as a rule, a short-hour user. If the kilowatt-hour consumption is a little larger, that is if it approaches the first 50 or 100 kw-hr. per month, we will in some cases still have a residential customer or a store owner, but a larger one. People living in larger residences are more liable to use current-consuming appliances other than lamps, such as flatirons, toasters, heating and cooking apparatus, and the like. Now these appliances generally have a much greater capacity than the ordinary lamp; a flatiron, for instance, is using 300 to 500 watts, or roughly as much as ten lamps. These appliances are largely used during the daylight hours and consequently they bring about an improvement of the customer's load-factor and with that of the central station's load-factor. Medium-sized stores are liable to use all-day lights in the back part of the establishment, also ceiling fans, desk fans, etc., which has a tendency to improve the customer's load-factor. If we now proceed to customers using several hundreds or thousands of kilowatt-hours per month, this increase in energy consumption is due generally not only to an increase in the size of the installation but also to the increase in the number of hours of daily use. If we go into a hotel, or a restaurant, or a large store, a theater, an office building, etc., we will always find a number of lamps burning in daytime, not a few of them may be even burning 24 hours a day; for instance, in the lobby and other portions of a hotel. Such large establishments will frequently also have some motors connected to the lines, for elevators, ventilators, refrigerators, and the like. All this means that large lighting consumers will have a better effect on the central-station load-factor than small ones. The same applies to power consumers, only for different reasons. A little workshop with not more than one or two machines consuming electric power will at some times during the day run at full load and at others at no load. The variation between the maximum and the minimum load will be 100%. If we have 100 motor-driven machines there will be a certain diversity between their power demands, just as we have seen a diversity between the power demands of different consumers. Every single one of the hundred machines may vary between full load and no load, but the more machines we have, the larger is the probability that at the time when one machine is running at full load another will have very little or no load so that the peaks and valleys of the various machine's load compensate each other and the load curve of the total establishment will be flattened out and become the smoother the larger the number of the power-consuming machines is; that is, in general the larger the energy consumption of the consumer is.

116. The above refers to the cost. If we were to add the same percentage for profit in every case (cost-of-service principle, see Part II) obviously the same relations would subsist between the prices charged to various customers as have been found between the cost of these customers. The value-of-service principle requires, however (see Part II), different percentages of profit for different customers and we shall now investigate in what manner the relations between prices for various sizes of customers will differ from the relations between costs of the same customers.

It has been shown in the discussion of the value-of-service principle (Sections 97-99) that the percentage of profit from the largest and from the smallest customers should be smaller than that from the medium-sized ones. This furnishes another reason why the consumers with a large energy consumption should receive lower unit prices per kilowatt-hour. But at the same time the value-of-service principle seems to point towards giving lower prices to the small consumers also and this in opposition to what we have found so far about what the cost of the small customer is. The tendency of the value-of-service principle to lower the price per kilowatt-hour to the smallest consumers doubtless exists, but in case of the straight meter rate it is more than offset by the influence of the fixed customer cost which has just been explained. We see, for instance, in the table of Section 115 that the change of the average cost per kilowatt-hour which is due to the influence of the customer cost is much more marked in the region of the smallest consumers than in that of the medium and large consumers. It vanishes the more the larger the consumers become. If we assume, for the sake of an example, the typical small consumer to be one of 20 kw-hr. and the typical medium-sized consumer to be one of 200 kw-hr. monthly consumption, the average cost per kilowatt-hour of the small customer would be 6 cents per kw-hr. and that of the medium one 3.3 cents per kw-hr. The cost to the central station of the typical small consumer is then nearly twice as high, if referred to the kilowatt-hour, as that of the medium-sized one and even if we add a very much lower percentage of profit for the small consumer in obedience to the value-of-service principle, the price charged to him per kilowatt-hour will still be higher than for the medium-sized consumer.

117. Summarizing, we can say: Where the customers are classified by their kilowatt-hour consumption only, the unit kilowatt-hour prices should decrease with the size of the consumer for the following three reasons:

1. The fixed customer cost is distributed over a larger number of kilowatt-hours.
2. The load-factor is liable to be better for large energy consumers than for small ones.
3. The percentage of profit is to be reduced for both the largest and the smallest consumers according to the value-of-service principle. This works towards further lowering of the prices of very large consumers. As regards the smallest consumers this effect is more than offset by item 1.

Several attempts have been made to follow this principle in the meter rates, that is to correct the straight meter rate in such a manner that the larger energy consumer gets lower average prices per kilowatt-hour. These methods consist either of a restriction of a given straight meter rate to certain classes or sizes of customers or of a modification of the meter rate which results in the so-called *sliding-scale rate* or of the addition of an explicit customer charge. The term "sliding-scale rate" means meter rates which specify decreasing charges per kilowatt-hour as the energy consumption of the customer increases.

These methods will be discussed hereinafter.

b. The Methods for Applying Lower Average Kilowatt-hour Prices for Larger Energy Consumers.

1. Limited Application of the Straight Meter Rate.

118. Those central stations as are using a straight meter rate at all restrict it to certain classes of consumers, at least certainly all the large and medium-sized central stations. Some central stations have restricted the straight meter rate to small customers only, chiefly residential customers or "general lighting" customers. Others have several straight meter rate schedules, those with higher charges applying to such classes as are liable to consist of small energy users only, such as residence lighting, whereas the lower charges apply to such uses where the amount of energy consumed is greater or the load-factor is better, or both.[3]

2. The Step Meter Rate.

119. Another one of these methods is given by the step meter rate. The range of kilowatt-hours, beginning from zero, is divided into a certain number of "steps" and the unit price charged per kilowatt-hour depends upon the "step" which the customer's energy consumption has reached in that respective month. The higher the step which has been reached, the lower is the charge made per kilowatt-hour. In contradistinction to the "block rate" to be discussed hereafter, all kilowatt-hours consumed by a certain customer in a certain month are charged at the same price.[4]

A step meter rate can also be expressed in the form of a straight meter rate with "quantity discounts," that is, discounts which increase as the quantity consumed increases.[5]. The quantity discounts need not be given according to the number of kilowatt-hours. They can also depend on the amount of the bill.[6] In case of pure meter rates this is only another form of stating the same thing, but we will later see some of the rates where it does make a difference whether we apply the quantity discounts according to the number of kilowatt-hours or to the amount of the bill (see Section 168).

120. The plain step meter rate has a serious drawback and that is the possibility of a reduction of the bill by an increase of the consumption.[7] The man who is careful about his bill and understands the rate may under certain circumstances reduce his bill by wisely wasting energy shortly before the meter reader comes around. He can thus not only make the company furnish gratuitously the wasted energy, but he can reduce the company's revenue from him besides.[8]

This sudden reduction in the income of the company from the consumer is smaller and less important if the difference of the prices per kilowatt-hour between neighboring steps is smaller. If, therefore, we wish to design a schedule with a given unit price in the first step (maximum price) and another given unit price in the last step (minimum price) it follows that the difference between these two prices should be split up and divided between a large number of intermediate steps if the effect of the above-mentioned undesirable feature shall be kept in narrow limits. We find for this reason that step rates in practice frequently have a large number of steps.[9]

Another method for getting around the drawback mentioned is to make a statement in the step-rate schedule to the effect that the total charge is never to be greater than what would be due (at the next lower rate, that is at the next higher step) for a greater consumption.[10]

This may also change the form in which the step rate is expressed, inasmuch as the upper end of a step must no longer coincide with the beginning of the next higher step (or remain within 1 kw-hr. below it). The whole range of energy consumption within which the charge is constant is then exempted from the steps, or counted as separate steps.[11]

121. A step meter rate with this stipulation can to a certain degree also be expressed as a system of optional straight meter rates, each one involving a

[3] For example, Reading, Pa., charges 10 cents per kw-hr. for residence lighting and 3 cents per kw-hr. for cooking and heating. This is also based on the "value of service" principle (see Part II.) The Toledo rate discussed before (Section 99) that is, a straight meter rate varying with the guaranteed minimum in such a manner that the higher the guarantee the lower the kilowatt-hour charge, belongs also in this class.

[4] The example of the General Lighting schedule at Allentown, Pa., will illustrate this rate. Under this schedule the charge per kilowatt-hour is as follows:
10 cents, if the customer's monthly energy consumption is 100 kw-hr. or less.
9 cents, if the customer's monthly energy consumption is between 101 and 200 kw-hr.
8 cents, if the customer's monthly energy consumption is between 201 and 400 kw-hr.
7 cents, if the customer's monthly energy consumption is between 401 and 800 kw-hr.
6 cents, if the customer's monthly energy consumption is 801 kw-hr. and over.

[5] For instance, the Retail Power rate in Birmingham, Ala., is a straight-line meter rate of 7 cents per kw-hr. with the following quantity discounts applying on the total bill:
10% if the energy consumption is 450 kw-hr. or less.
15% if the energy consumption is more than 450 kw-hr.
This means that the rate is 6.3 cents per kw-hr. if 450 kw-hr. or less are consumed and 5.95 cents per kw-hr. if more than 450 kw-hr. are consumed.

In the General Lighting rate of Mobile, Ala., which is a step meter rate, the prompt-payment discount is stepped off according to the energy consumption. The gross rates are:
10 cents per kw-hr. up to 50 kw-hr.
9 cents per kw-hr. from 51 to 150 kw-hr.
8 cents per kw-hr. from 151 to 300 kw-hr.
7 cents per kw-hr. from 301 to 500 kw-hr.
6.5 cents per kw-hr. over 500 kw-hr.
The prompt-payment discount is 3 cents per kw-hr. if the consumption is 1 to 50 kw-hr. and 2 cents per kw-hr. if the consumption is over 50 kw-hr.

The net amount per kilowatt-hour for the first step is therefore $10 - 3 = 7$ cents, and for the second step $9 - 2 = 7$ cents. The prompt-payment discount is therefore in this case graded in such a way as to entirely wipe out the difference between the first and the second step.

[6] General Lighting rate of Jacksonville, Fla. The following discounts are given on a straight meter rate of 7 cents per kw-hr.:

10% if the monthly bill is at least \$50, 15% if the monthly bill is at least \$100, 20% if the monthly bill is at least \$150; 25% if the monthly bill is at least \$200; 40% if the monthly bill is at least \$300.

This is, of course, the same as if we were to say: The rate is a step rate charging (net)
7 cents per kw-hr. for 1 to 5000/7 or 1 to 714 kw-hr.
6.3 cents per kw-hr. for 715 to 10 000/7 or 715 to 1428 kw-hr.
5.95 cents per kw-hr. for 1429 to 15,000/7 or 1429 to 2142 kw-hr.
etc.

[7] A customer, for instance with a consumption of 200 kw-hr., in the above Allentown schedule, will have to pay $200 \times 9 = 1800$ cents or \$18. If now he increases his energy consumption by one kilowatt-hour, that is to 201 kw-hr., he will have to pay $201 \times 8 = 1608$ cents or \$16.08.

[8] This is clearly shown in a graphic representation of the step rate. We again step off the energy consumption horizontally in kw-hr. as abscissae and plot the amount of the corresponding monthly bills vertically as ordinates (Fig. 5). The line representing the 10-cent-per-kw-hr. rate (for the above Allentown schedule, footnote 4, Section 119) is found by joining the origin O with a point given, for instance, by the abscissa 500 kw-hr. and the corresponding ordinate $500 \times 10 = 5000$ cents or \$50 (point A_{10}). This inclined straight line represents a straight

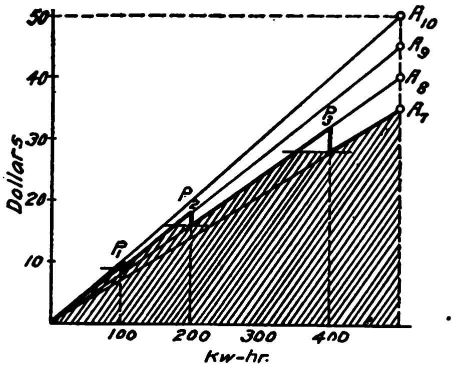

Fig. 5.—Step Meter Rate.

10-cent-per-kw-hr. rate and applies as far as the 10-cent rate applies, that is from 0 to 100 kw-hrs. From there on (point P_1) the 9-cent rate applies, which is represented by another straight line drawn from the origin under a correspondingly smaller angle to point A_9 (500 kw-hr., \$45). The figure shows clearly the resulting peak at P_1 which indicates how the bill suddenly drops as soon as we exceed the 100-kw-hr. mark; 100 kw-hr. are billed at \$10 and 101 kw-hr. at \$9.09. The same condition is repeated with the transcending of every one of the other steps (points P_2, P_3, etc., heavy outline).

[9] The Optional Power rate schedule of Newark, N. J., has as many as 42 steps. The Retail Power rate of Wilmington, Del., has 24 steps, and many schedules have a dozen steps or so.

[10] The Retail Power schedule of Albany, N. Y., is an example of a step meter rate with this stipulation.

The effect of this stipulation represented graphically is the cutting off of the sawtooth-like peaks of the charge curve by horizontal lines. (Compare the shaded area in Fig. 5.)

minimum guarantee of its own in such a way that the rates with the higher kw-hr. charges require lower guarantees and vice versa. (Compare the example in footnote 10 of Section 108.) This represents a step meter rate of the described variety, *provided* the customer chooses that one of the optional rates which results in the lowest total payment for his energy consumption. The customer may therefore have to pay more than under the equivalent step meter rate, but he can never be charged less.[12]

If a step rate contains the stipulation that the charges are never to be higher for a smaller energy consumption than for a larger one—no matter in which one of the above forms the stipulation is made—the customer can no longer decrease his bill by judiciously increasing his energy consumption. But he can increase his consumption in a considerable range without being charged for the increase. The drawback of the rate is mitigated, but not removed.

For some remarks on the theory of the step rate see also Insert XI.

---

[11] For instance, the General Lighting schedule of Lynn, Mass., charges:
10 cents per kw-hr. (net) for 1 to 228 kw-hr.
8 cents per kw-hr. (net) for 285 to 1800 kw-hr.
6 cents per kw-hr. (net) for 2400 and over.
No bill is made out larger than what would be obtained for a greater consumption at a lower rate.
It will be seen that 228 kw-hr. at 10 cents per kw-hr. cost the same as 285 kw-hr. at 8 cents per kw-hr., etc.
The step meter part of the General Lighting and Power schedule of Washington, D. C., is worded after the following fashion:
6 cents per kw-hr. for the first 3200 kw-hr.
$192 for 3200 to 3500 kw-hr.
5.5 cents per kw-hr. from 3500 to 4545 kw-hr.
$250 for 4545 to 5000 kw-hr.
5 cents per kw-hr. from 5000 to 7500 kw-hr.
$375 for 7500 to 8333 kw-hr.
etc. ....
This is obviously only another way of expressing the above stipulation.

[12] The Off-Peak Emergency Lighting and Power schedule of Des Moines, Iowa, for instance, provides the following optional rates:
3.1 cents per kw-hr. with guarantee 4,500 kw-hr. (that is $139.50)
2.9 cents per kw-hr. with guarantee 6,000 kw-hr. (that is $174.00)
2.7 cents per kw-hr. with guarantee 8,000 kw-hr. (that is $216.00)
2.4 cents per kw-hr. with guarantee 10,500 kw-hr. (that is $252.00)
2.2 cents per kw-hr. with guarantee 14,000 kw-hr. (that is $308.00)
2.0 cents per kw-hr. with guarantee 18,000 kw-hr. (that is $360.00)
etc.
This is evidently the same as the following step meter rate with a minimum charge of $139.50 (as above):
3.1 cents per kw-hr. for less than 6000 kw-hr.
2.9 cents per kw-hr. for 6000 to 8000 kw-hr.
2.7 cents per kw-hr. for 8000 to 10,500 kw-hr.
etc.
with the provision that no charge shall be higher for a lower number of kilowatt-hours than for a higher one. (See Fig 6.)

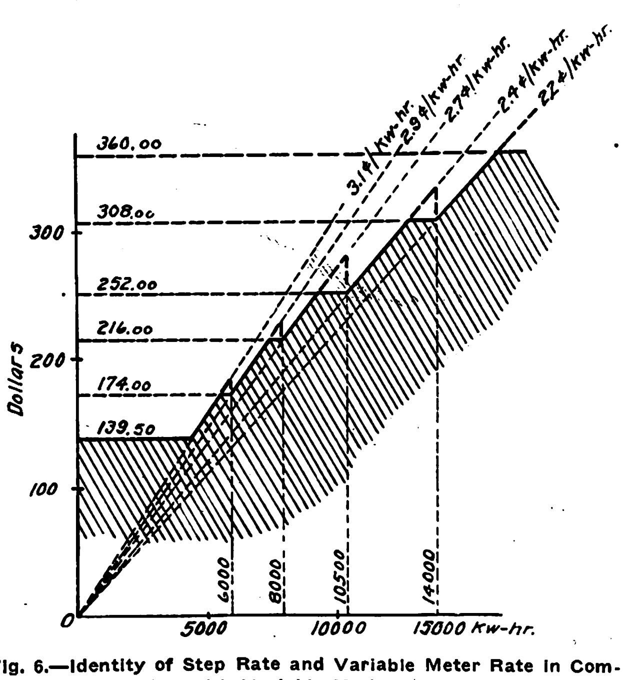

Fig. 6.—Identity of Step Rate and Variable Meter Rate in Combination with Variable Minimum Charge.

Insert X—Appendix to Section 114.

Reasons for the Desirability of Graduation of the Energy Charges With Pure Meter Rates.

(Graphic Interpretation.)

The problem of how and why the energy charge of a pure meter rate should vary with the energy consumption is much more readily interpreted by the curve which shows the total charges (customer's bill) as a function of the energy consumption than by the customary curve of the average charges per kilowatt-hour and the former curve gives a much better and more direct insight into the problem than the latter. It is easy to reduce the curve of the total charges to the curve of the average charges per kw-hr. (see Insert XIV) should this be desired, but it is not at all necessary. The total bill is really the primary function of the energy consumption and the average charge per kw-hr. is a secondary function, being

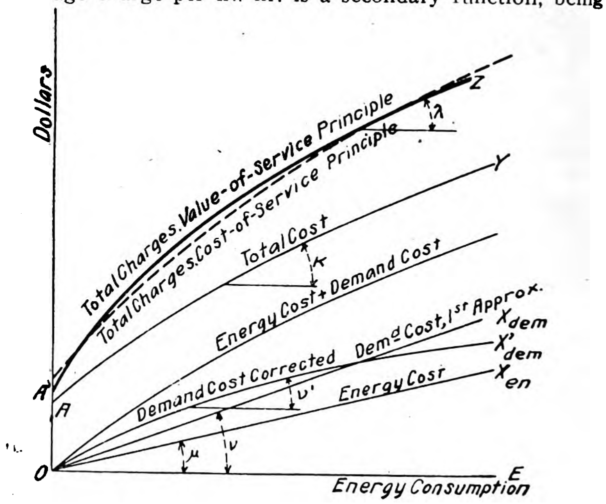

Fig. A (Insert X).

the total bill divided by the energy consumption. (The only exception to this is the straight meter rate where both functions may be considered to be of equal importance.)

As regards the shape of the curve of total charges, we have to remember that the total charge, i. e. the bill, is composed of cost plus profit.

The cost, as has been shown in Part I, is composed of the energy cost, the demand cost, and the customer cost.

The energy cost is proportional to the energy consumption and the curve representing this part of the cost with relation to the consumption is therefore a straight line OX_{en} (Fig. A) rising from the origin O of co-ordinates.[1]

As we are dealing at present with such rates only as do not contain any demand charge, we will have to base the entire cost of calculation on the kw-hr. as unit, that is, we will have to average the demand cost in some manner between the kilowatt-hours consumed. Assuming as an approximation that all customers have the same demand for every kilowatt-hour consumed (in other words, the same load-factor) the demand cost will also be defined by a straight line rising from the origin, OX_{dem} in Fig. A. The size of the angle ν at which it rises, depends upon the average load-factor; a large load-factor results in a small angle and vice versa. Now it has been explained (Section 115 of the main text) that large energy users on the average have a larger load-factor than small ones. Therefore the demand cost is not strictly proportional to the amount of energy consumed, but it increases less and less rapidly as we proceed on the curve from the small energy consumers to the medium and large ones. The demand cost will rise more rapidly for the small energy consumers than indicated by the straight line OX_{dem} and less and less rapidly as we proceed to the medium and large ones. The straight line OX_{dem} will therefore have to be corrected to a shape[2] of the type OX'_{dem}, steadily curving downwards.

Adding the ordinates OX_{en} and OX'_{dem} for every abscissa and adding further the constant customer cost as given by OA results in the curve AY as the curve of the total cost.

---

[1] The angle of elevation μ is obviously the larger, the higher the energy cost per kilowatt-hour is (kw-hr. cost per kw-hr.). Those of our readers who are familiar with elementary mathematics will understand that tan μ is proportional to the kilowatt-hour cost per kilowatt-hour.

[2] The angle of elevation ν of OX'_{dem} towards the horizontal becomes steadily smaller as the energy consumption increases and it converges towards a certain minimum ν'_{lim}, that means, although it always remains larger than that minimum, it approaches that minimum value steadily more and more the larger the energy consumption becomes.

For the energy consumption 0 this curve indicates a certain minimum value of cost—equal to the customer cost OA. The curve rises from the point A and the angle of elevation χ becomes smaller and smaller as the energy consumption increases.[3]

From the curve of the cost we arrive at the curve of the price (charges or total bill) by adding the profit as a certain percentage of the cost. Now it has been shown (Sections 97-99) that the value-of-service principle requires this percentage to be smaller at either end of the curve (that is, for the large and for the small consumers) than in the middle (medium-sized consumers). A constant percentage of profit added would result in the dotted curve[4] for the total charges (bills), whereas these charges under the value-of-service principle would be typified by the heavy line A'Z[5].

Insert XI—Appendix to Section 121.

Theoretical Remarks About the Step Rate—Inaccuracy—Size of the Steps—Size of the Energy Charges Design of a Step Rate.

The sudden reductions of the bill which take place with the step rate when the limit between two steps is exceeded, bring it about that, as we gradually proceed from the lower to the larger energy consumption, the bills are alternately larger and smaller than they ought to be. The same is indicated by the zigzag form of the curve (Fig. 5 of the main text and Figs. A to C of this Insert) which gives the actual amount of the bill (stepped off in vertical direction) for the

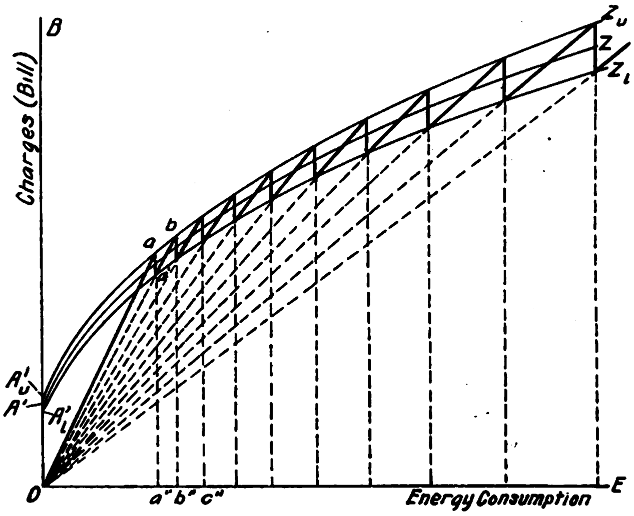

Fig. A (Insert XI).

varying energy consumptions (stepped off horizontally). This zigzag form which brings the curve of the actual bill alternately above and below the curve which shows what the bill ought to be theoretically (see the preceding Insert X) persists even if we stipulate that the bill shall never be greater than what would be billed for any larger energy consumption (Figs. D and E).

It seems logical to require that these periodic positive and negative deviations or inaccuracies should by a proper choice of the rate constants be limited to a certain percentage of the total bill in such a manner that at each and every cycle—that is, at each step of the schedule—the inaccuracy just touches this maximum percentage on the positive and on the negative side.

Supposing, for illustration, that we have given the curve of total charges $A'Z$ as we want them to be (see Fig. A) and assuming further the permissible percentage of inaccuracy at $\pm 5\%$, we draw one curve A'_uZ_u, the ordinates of which are 5% greater than those of the given charge curve $A'Z$ (Fig. A) and another curve A'_lZ_l with ordinates 5%

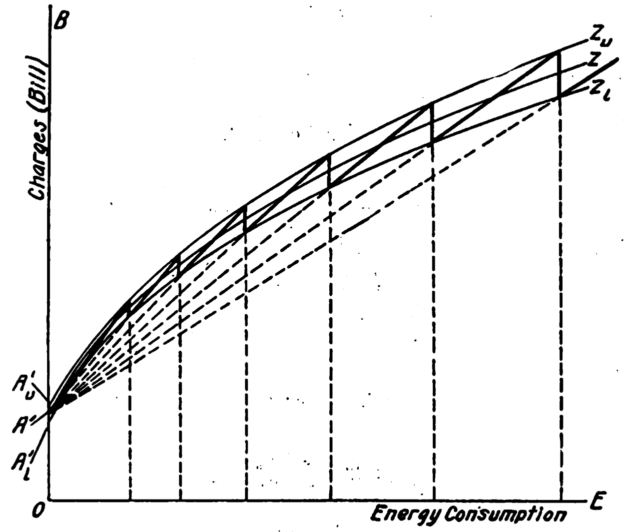

Fig. B.

smaller. Starting with a certain initial straight meter rate given by Oa, we drop a vertical line from the intersection point of that line with the A'_uZ_u curve. This vertical intersects the curve A'_lZ_l at a'; $a''a'$ is now practically 10% smaller than $a''a$. Connecting a' with O gives us the second step of the step rate $Oa'b$, etc.

The drawing Fig. A shows that with the typical shape of the curve of charges $A'Z$ the increments of the steps $a''b''$, $b''c''$, etc., become steadily greater and greater as we advance into the higher steps.

This does not apply, however, to the first step Oa'', as can be seen from Fig. A. Counting *backwards* from the larger energy consumptions to the smaller ones, we see that, in order to satisfy the requirement of a constant percentage change of the bill between steps, the steps would have to become smaller and smaller and finally to become infinitely small. In other words, we would never reach a first step. Therefore, the first step must of necessity exceed the limit of the given percentage of inacuracy, inasmuch as in the lower portions of that step the amount of the bill will be much smaller than permitted by that requirement. (For the energy consumption 0 the percentage inaccuracy will even become infinitely large, since the amount of the bill is 0 whereas it ought to be equal to the customer charge OA'). The size of the first step is not governed by the same law as that of the other steps.[1]

As regards the unit charges per kilowatt-hour it is easy to show that under the above requirement of a constant percentage reduction of the bill between steps the unit charges must decrease in a geometrical relation, which means that the ratio of the kilowatt-hour charge in a given step to the kilowatt-hour charge in the preceding step is constant or, in other words, the kilowatt-hour charge in any step can be found

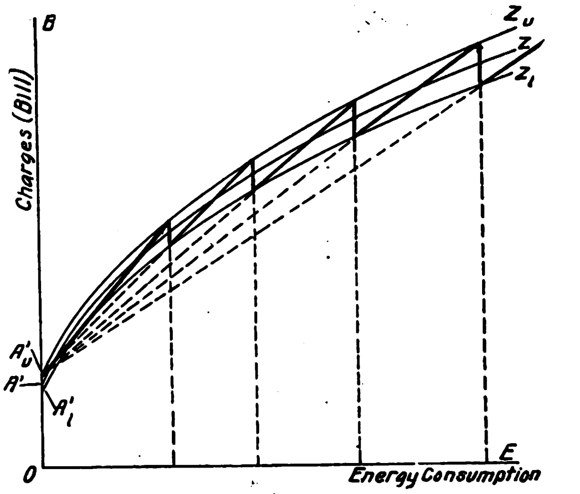

Fig. C.

[3] The angle of elevation K of the cost curve AY also converges towards a limiting value K_{lim} which is the larger the larger μ and the larger ν_{lim} is, $\tan K = \tan \mu + \tan \nu'$ and $\tan K_{lim} = \tan \mu + \tan \nu'_{lim}$.

[4] The angle of elevation λ is given by $\tan \lambda = (1 + p/100)$ $\tan K$ if p is the constant percentage of profit added and it converges towards λ_{lim} where $\tan \lambda_{lim} = (1 + p/100) \tan K_{lim}$.

[5] The electric company is generally interested in an increase of a customer's consumption only as long as such an increase brings about an increase in the profit from that customer in dollars and cents. In accordance with the value-of-service principle the percentage may be reduced incidentally to the increase of the energy consumption, but if—roughly speaking—the reduction of that percentage goes so far that the amount of the profit in dollars and cents remains stationary—not to say decreases—the electric service company will refuse to be interested in such additional business. For that reason the $A'Z$ curve will in every part of its course be steeper than the corresponding part (that is, the part with the same abscissa) of the cost curve AY. In other words, the increment of charges will always have to be larger than the increment of cost.

from the kilowatt-hour charge in the preceding step by multiplying the latter by a given constant percentage.[2]

To summarize: *The gradation of the energy charges is given by the percentage drop of the bill permitted between steps and the size of the steps is determined by the shape of the theoretical rate curve which is to be approximated by the step rate.*

Since the percentage should be constant by which the kilowatt-hour charge is to be reduced between steps, the numerical amounts of the reductions of the kilowatt-hour charges (in cents or fractions of cents) from one step to the next should become smaller as the kilowatt-hour charge itself becomes smaller, that is as the number of kilowatt-hours becomes greater.

However, for obvious reasons simple figures are desirable for the unit charges (either gross or net, see Section 110), that is either whole cents or multiples of half or quarter cents, or decimal figures of cents with one or two digits. In the latter case the second decimal is preferably a figure 5. In consequence of these limitations we have to be satisfied with graduating the unit charges by identical intervals, for instance half cents, over a number of steps and then change to a graduation of, let us say, quarter cents for the next few steps, etc. This will, of course, have the effect that the balance between the percentage drops at the various step limits will be more or less disturbed.

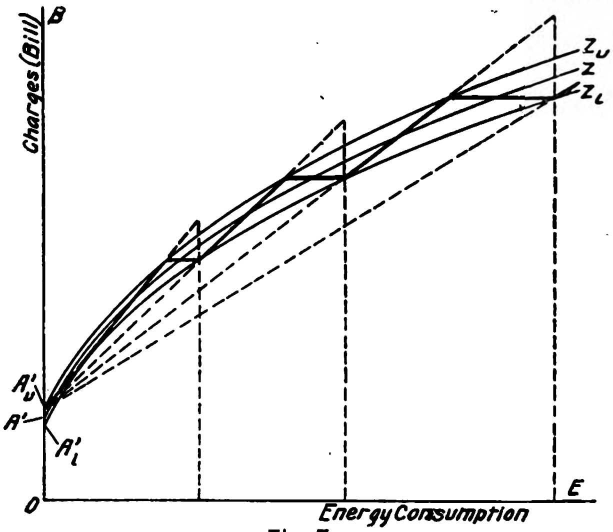

Fig. E.

The following table is an example, taken from practice, of a power step rate (1st and 2nd columns). The units of energy happen to be in this case horsepower-hours and not, as usual, kilowatt-hours. The third column gives the increment in the length of the respective step to the next following one, showing how these increments increase in size. The fourth and fifth columns show the decrements of the energy charges from the respective step to the next, in cents per horsepower-hour and per cent, respectively. In accordance with what has been said above, the percentage of the decrement of the unit energy charge is equal to the percentage decrement of the bill between the same two steps. The table shows that this percentage varies between the limits 5.55 and 10.34%. By strictly carrying out the principles outlined in this Insert, the percentage can be made never to exceed the limit of 9.09%[3] with the same number of steps and no finer gradation of the unit charges (multiples of 0.05 cent per hp-hr.). This is indicated in the three last columns of the table and is done by extending the 0.25 cent per hp-hr. and 0.15 cent per hp-hr. decrements of the unit charge a little further at the expense of the 0.2 cent per hp-hr. decrement.

[1]Minimum. [2]Maximum

[1] Where we have the customer charge OA' explicitly made in addition to the step meter rate, we can draw a line for the first step as a tangent from A' to the lower curve (Fig. B) and where this tangent intersects the upper curve we get the point a as the end of the first step. Then the rate in its first step will never deviate from the theoretical value by more than the percentage allowed for the inaccuracy. The subsequent construction from Fig. B is self-explanatory. The increments of the steps will be larger than if the customer charge is absent. Larger increments of the steps result in a smaller number of steps necessary to cover a given total range of kilowatt-hours and consequently—*ceteris paribus*—in a greater simplicity of the rate schedule.

We can further slightly increase the size of the first step and of the step increments (and thereby reduce the necessary number of the steps) if we take the amount of the customer charge not at its correct value OA' but enhanced by the permissible percentage of inaccuracy, that is, if we take the customer charge at OA'_u. A comparison of Figs. B and C will explain this without further words. In practice this means that it is better for the simplicity of a step rate with a customer charge to choose the latter too large than too small.

A stipulation that the charges shall never be larger for a smaller energy consumption than for a larger one (Section 120) will also increase the size of the increments of the steps; consequently the number of steps which are necessary to cover a certain range of kilowatt-hours will become smaller. This is shown in Fig. D, which is also self-explanatory. Fig. E finally shows a combination of that stipulation with a customer charge and demonstrates plainly the reduction in the number of steps.

[2] To explain this, let us suppose, for instance, that we have a rate where some one of the steps charges 6 cents per kw-hr. up to 800 kw-hr. and that the drop of the bill between every two steps is required to be 5% of the bill. The drop will then be 5% of (6×800); that means the bill for 800 kw-hr. calculated with the charge of the next following step (to be quite exact we would have to say: the bill for 801 kw-hr.) must be 95% of (6×800). The charge per kilowatt-hour in this following step will then be $\frac{95\% \text{ of } (6 \times 800)}{800}$ or 95% of 6 cents, that is 5% less than the charge in the original step.

For readers who are familiar with algebra: Call S_n the number of kilowatt-hours at the end of the n^{th} step and p the percentage by which the bill is to be reduced when we exceed the limit of the S_n^{th} kilowatt-hour, that is the limit between the n^{th} and the $(n+1)^{st}$ step. Let further c_n and c_{n+1} denote the kilowatt-hour charge in the n^{th} and $(n+1)^{st}$ step, respectively. The bill at the end of the n^{th} step is c_nS_n and at the beginning of the $(n+1)^{st}$ step it is $c_{n+1}S_n$. (To be quite exact we would have to say $c_{n+1}(S_n+1)$ but S_n is always very much greater than 1 so that we can set S_n for S_n+1). We have thus

$$c_{n+1}S_n = c_nS_n(1 - p/100)$$

S_n cancels out, indicating that neither the number of kilowatt-hours at which the step limit is located nor the number of steps is of any consequence, and we get

$$\frac{c_{n+1}}{c_n} = 1 - \frac{p}{100}$$

in other words, c_n and c_{n+1} have the same ratio to each other as the respective bills. The decrease from c_n to c_{n+1} is the same percentage as the decrease of the bills.

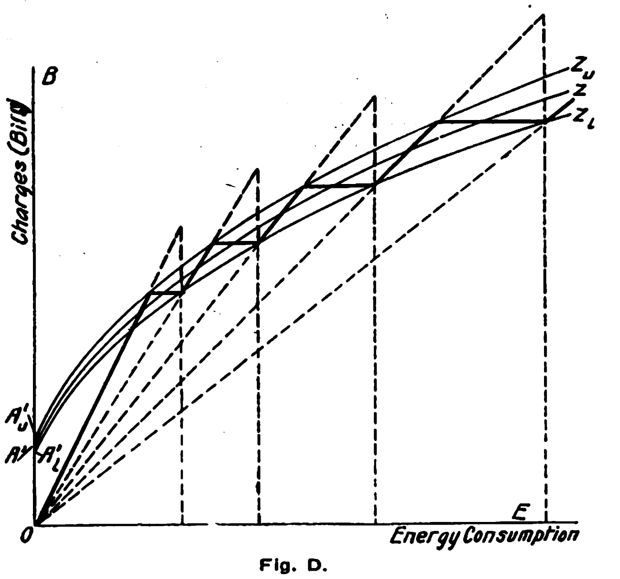

Fig. D.

[3]The first step is not counted for the reason given above.

(*To be continued.*)

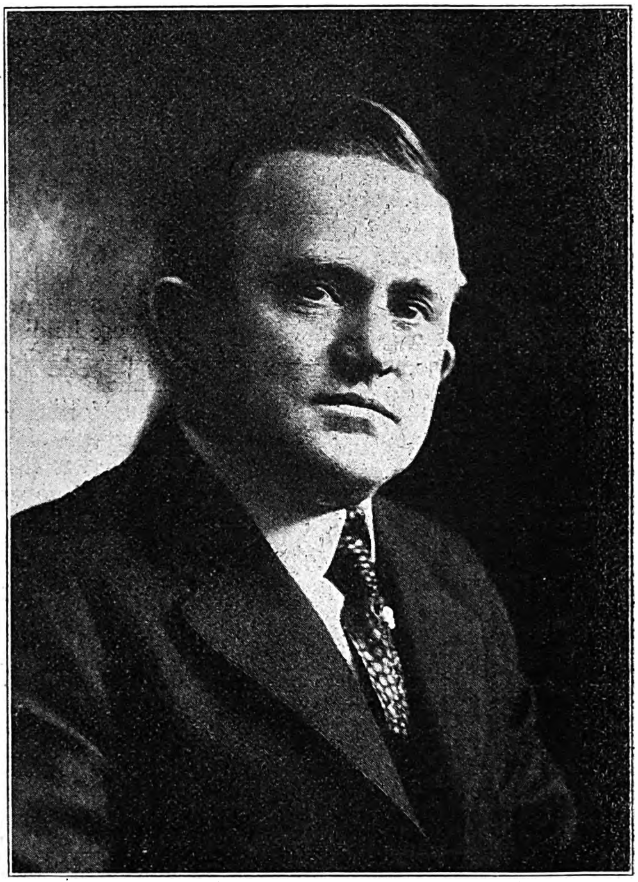
What Electricity Has Done to Help Humanity

The Extremely Varied and Indispensable Services Performed by Electricity in the Great War—Value of Niagara Falls Hydroelectric Development—Direct and Indirect Aid in Winning the War

By J. C. McQUISTON

Manager, Department of Publicity, Westinghouse Electric & Manufacturing Co.

FROM the mouth of a great gun behind the Allies' trenches in France went a shell screaming into the enemy's territory. Dig into the history of that shell and you will find it charged with electricity. From the moment when this powerful little agent of democracy was finally sent upon its mission, back to its very beginning, its trail is crossed and recrossed at a thousand points by electric currents.



J. C. McQuiston.

The guns that fired it, the motor truck that delivered it to the ammunition dump, the trains that brought it from the little French seaport to the trucks, the ships that carried it overseas, the tools that fashioned it, the metals and chemicals that went into its structure—touch the history of any of these factors in the production and progress of that shell, and you will feel the vibrating current of electricity.

And so with practically everything that entered into the waging and the winning of that terrible struggle.

"Ships will win the war," was the cry from many quarters. To almost every phase of ship construction and to ship operation you will find electricity made great contributions.

"Aeroplanes will win the war," came the word from many others. Without electricity we should have had no aeroplanes to help us win the fight.

"Food will win the war," was a popular shibboleth. What a story of electrical accomplishments is to be found in the story of food production.

What is there that man made or did for the cause of democracy and freedom over there or over here which did not, in some measure, depend upon the light, the heat or the power of electricity?

Consider in their broad divisions the various lines of activity that finally converged upon the great battleground. Agriculture, mining, lumbering, manufacture, transportation, communication—every one of these had reached its present stage of development with the immeasurable help of electricity.

The hydroelectric power development at Niagara Falls is perhaps as good a single illustration as any that could be given of the essential part electricity played in winning the war. The cheap electricity produced at Niagara Falls made possible the founding of the artificial-abrasive industry in the United States, and with the natural supply of emery and corundum from Asia Minor cut out by the war, where should we have been without Niagara's artificial grindstones, whetstones, and other grinding implements of carborundum and the like? In every plant where alloy and tool steels were used, Niagara Falls' abrasives helped to win the war. In the munitions plants, in the locomotive works, in the automobile factories, in the foundries, in the machine shops, you will find it did indispensable tasks.

Was there anything more necessary for success in the war than an abundance of high-grade steel? And considering no other phase of electricity's extensive participation in the making of steel, what would we have done without ferro-silicon, another product which comes almost entirely from Niagara where cheap electric power made the commercial development of the ferro-silicon industry possible? As a purifier, ferro-silicon entered into the making of practically all our shell steel as well as steel for divers other purposes.

And there is ferro-chronium, which gives to steel that hardness so necessary in the production of shells and likewise in the making of tools and other steel—it, too, is largely a Niagara Falls product.

Niagara Falls electricity gives us a great part of our tungsten and vanadium. And of the various alloys, what it does not help to produce directly, it contributes to indirectly through the production of aluminum. Think what a factor aluminum was in the winning of the war through its application to the motorcar, motortruck and aeroplane engine alone, and the electric power development at Niagara may truly be said to have made aluminum a commercial possibility.

It has been figured that between Niagara's alloys and abrasives every industry utilizing steel has multiplied its productive powers by three, and that if it had not been for these abrasives and alloys every motorcar factory in America could have reached but one-fifth of its war production.

Niagara's electricity gives us chlorine, one of the greatest life-saving agencies used in the war. For chlorine was one of the commonest and most effective disinfectants used in treating the wounded soldiers.

Niagara Falls' electricity gives us many of the materials from which picric acid and other explosives are made.

And all of this was but the contribution of a single electric power development.

To win the war food had to be produced in quantities sufficient not only to meet our own needs at home and the needs of our soldiers, but also in large part the requirements of our Allies. Electricity was a powerful agent in the maintaining and stimulating of food production.

The farmer fertilizes with chemicals obtained by electrical processes; he depends upon tools and machinery into the making of which electricity has already entered, and in many cases upon machinery, such as tractors, that requires electricity in operation.

In the converting of the farmer's wheat, corn, and oats into bread and cereal products, electricity plays a tremendous part. It helps to grind, to refine and to bake. It is an essential factor in the preparation and conservation of other foodstuffs, such as meat, fruit and vegetables, as a visit to a packing plant or any canning establishment will quickly demonstrate. Without electricity to help, we never could have met the demands for our food resources.

To win the war it was necessary for the Allies to have plenty of power and no lack of raw materials. An adequate supply of power meant an adequate supply of coal. Here again electricity was found to be of considerable help.

Go into almost any of our larger mines, and you will find that the coal in being wrested from the earth with the aid of electric drills, transported to the shaft of the mine under electric power, brought to the surface in hoists electrically operated, while electricity drives the pumps and does various other tasks. Moreover, the use of electric instead of steam power effects a saving of millions of tons of coal.

Electricity is indispensable in the mining and refining of those ores that constitute the raw materials of our iron. From its source to its final destination in any one of the thousands of manufactured iron and steel products that were essential to carrying on the war, you would be astonished at the frequency with which you would find electricity playing a part.

So with wood, with rubber and with other raw materials that went to the battlefront in so many different forms. In the actual manufacture of iron, steel, wood, rubber and other products, its light, its heat and its power were everywhere.

Then there was transportation—one of the most powerful of our instruments of war. Practically everything that was industrially produced had to be transported by rail or by water before it could be of service. What a strain the war had placed upon our transportation facilities everyone knows. Both on land and at sea, directly and indirectly, electricity accomplished wonders in promoting the handling of traffic with efficiency and dispatch.

Every train that moved over the rails represented the application of electricity at countless different points in its construction and operation. Rails, locomotives, cars—in the making of all of these electricity has had a part of no little consequence.

The dispatcher who directed the operation of the trains depended upon electricity to deliver his orders. Electric signals controlled the train's movements. In many cases, electric locomotives took the place of steam, saving coal and hauling heavier tonnage.

Electric interurban lines, by handling freight, relieved the tremendous strain heaped upon the railroads, while the importance of the fact that the country's urban street-car lines were increasing production by the saving of time must not be overlooked.

In the building and the operation of ships electricity played a bigger and bigger role every day, and today you will find great battleships equipped with electric drive, merchant ships propelled by electric power, vessels of all kinds lighted by electricity, protected by electricity and controlled by electricity.

Submarines are driven by electricity and require electric current for various other purposes. Without the electric spark in the engine, the aeroplane would be a dead thing. And this is true, too, of the motorcars, trucks, ambulances, motorcycles and other vehicles that were lending such a helping hand.

Rapid communication of all kinds of intelligence was another phase of war necessity that brought electricity into the foreground. The wireless, the telephone, the telegraph—how vital they were to our success and how vital to them was electricity.

Thus one could go on and on, deeper and deeper, into the maze in which one soon finds himself upon examining into electricity's part in the war. The ramifications are so extensive and the subject so closely related to so many activities that it is possible here to do little more than suggest its scope.

Was there another force so powerful in our war effort as this mysterious force of electricity? Is there another industry of which it can truly be said that it has done so much to help win the war as the electrical industry, which supplied the countless divers pieces of apparatus, appliances and instruments that made possible the widespread use of this force?

As electricity keeps the light shining in the torch of the Goddess of Liberty in New York harbor, so does it lend its potency to keep bright and clear the light of Liberty for all mankind.

ELECTRICAL CONTROL BY SOUND.

The control of electrical machinery by the sound of a whistle at any distance up to a mile was recently demonstrated in England. By the blowing of a whistle a small motor-car was started, directed to the right or left, and stopped by repeated sounds. The model was fitted with the essential batteries and no wires or wireless apparatus are claimed to have been used. Vibration alone was responsible, and the same results are claimed to have been accomplished by means of inaudible vibrations. The inventor, Capt. A. J. Roberts, an Australian flight captain, is said to have produced other inventions connected with wireless in the air and the control of torpedoes.

A New Form of Tank for Static Transformers

The Importance of Preventing Moisture from Entering Tank and Lowering Dielectric Value of Oil—How the Conservator Type of Tank Prevents This and Also Explosion Risk and Sludging of Oil

By W. S. MOODY

Engineer, Transformer Department, General Electric Co.

ENTRAPPED moisture is perhaps the greatest deleterious agent affecting high-grade insulation. The presence of an exceedingly small amount of moisture will reduce the dielectric strength of solid insulation to a mere fraction of its original value, by so changing the distribution of the dielectric stress as to cause a failure of what would ordinarily be a dielectrically strong structure.

In the early days indoor transformers were not even encased and outdoor transformers were placed in cases that were waterproof only under favorable conditions. As operating potentials increased, the necessity for a greater degree of protection against moisture was met by the use of oil and later by the impregnation of the fibrous insulation with moisture-proof compound previous to the immersion of the transformer in oil.

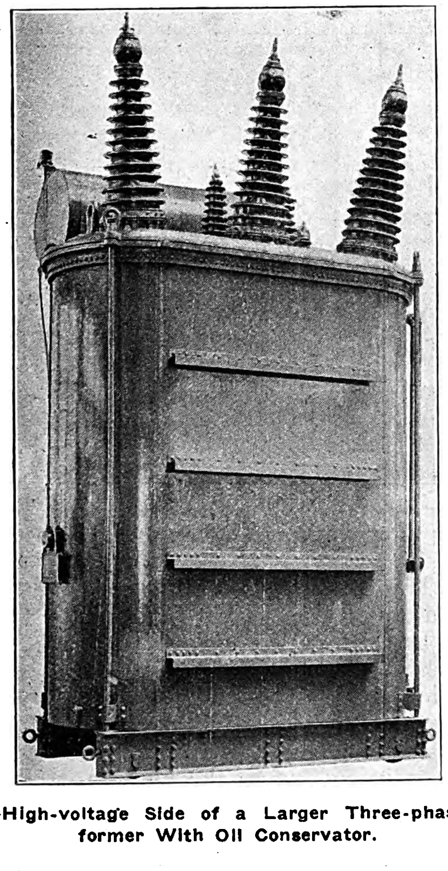


Fig. 1.—High-voltage Side of a Larger Three-phase Transformer With Oil Conservator.

The sensitiveness of oil to water has long been known, the effect on the dielectric strength being shown clearly in Fig. 2. Satisfactory transformer oil when shipped from the factory should stand a test of at least 22 kilovolts between 1-in. disks spaced 1/10 in. apart and is unsatisfactory for high-voltage or large transformers when the dielectric strength is less than 75% of this value; that is, when it is below 16½ kilovolts. By reference to the curve it will be noted that oil of the standard strength, that is, 22 kilovolts, should have not more than 8 parts of water in 1,000,000 parts of oil, and that the addition of 10½ parts of water, giving a total of 18½ parts per 1,000,000, will reduce the dielectric strength to the lowest permissible limit. With increasing capacity and higher voltage, the necessity of almost absolute protection of oil against moisture was appreciated. With the demand for outdoor installations the details in design of tank, cover and lead construction were developed to avoid the possibility of the entrance of snow, rain or merely atmospheric moisture.

Evidently the most completely effective method of accomplishing the necessary protection against moisture is to have the tank cover and terminals air-tight. This requires not only an expensive tank construction but also a large idle space air-filled above the oil level to limit the possibe internal pressure due to the expansion of the oil resulting from increase in temperature.

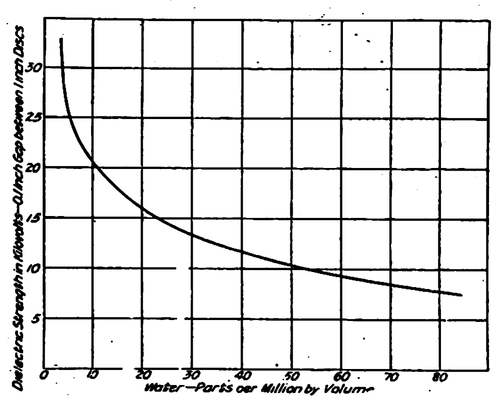

Fig. 2.—Effect of Water on Dielectric Strength of Transformer Oil.

Explosion Hazard.

Due to chemical action in the transformer oil, caused by arcing or static discharges or heavy overloads, combustible gases (mostly hydrogen and light hydrocarbons) are sometimes set free, and in the ordinary tank these gases mix with the air above the oil so that a highly explosive mixture may be formed. This gas may be ignited by sparks of a static or dynamic character occurring along the leads, causing a dangerous explosion. While all General Electric high-voltage leads are provided with grounded shields that make this impossible under ordinary circumstances, an abnormally low oil level may expose the transformer terminals, thus neutralizing the protection of the shields.

Sludging of Hot Oil.

Hot oil, even if carefully selected, will very slowly decompose when in contact with oxygen, and a precipitate will be thrown down. This decomposition or sludging, while it does not affect the dielectric strength of the oil, increases the viscosity and thus retards the transfer of heat from the core and coils to the cooling surfaces. Even more deleterious is the fact that the deposit settles on the coil surfaces, in the ducts and on the cooling coils. This acts as a heat insulator on all surfaces and also will in time clog up the ducts.

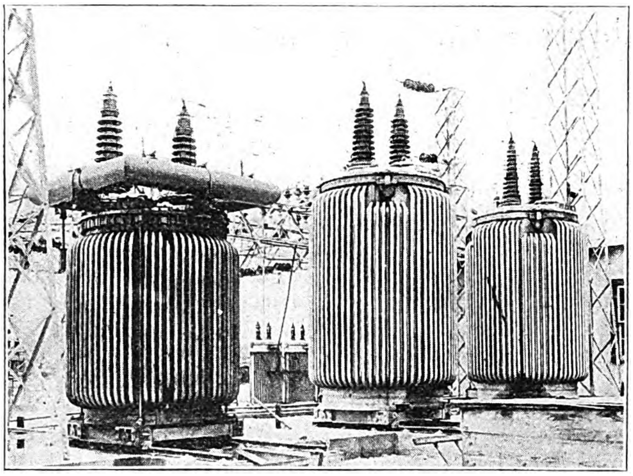

Fig. 3.—Initial Installation of Transformer Provided With Oil Conservator at Laurinburg, N. C.

The result is that the operating temperature gradually increases with consequent acceleration of the sludging. The remedy is found, first, in a method of oil refining that minimizes this action and, second, in a periodic renewal or filtering of the oil and thorough cleaning of the core and coil surfaces. The oil regularly supplied with General Electric transformers is of such a quality as to practically exclude sludging under normal conditions, yet continued service with occasional overloads will eventually produce sludge.

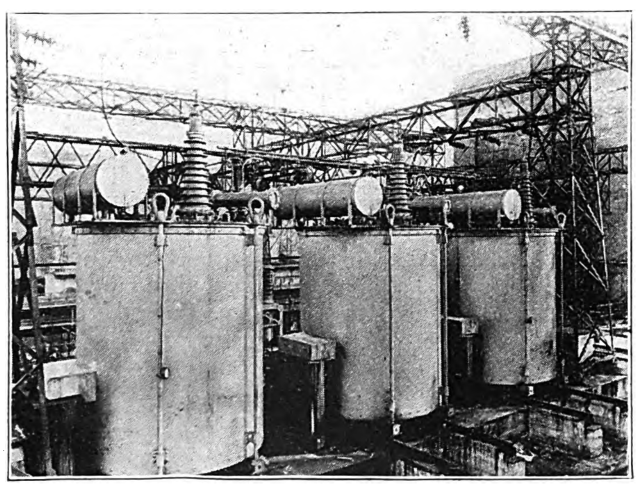

Fig. 4.—Transformers With Oil Conservators at the Windsor Power Plant of the American Gas & Electric Co.

An exhaustive series of tests has demonstrated that when air is not present the oil can be operated continuously at a temperature that would prove disastrous if air were present, with practically no sludge resulting. The results of one very severe test where the oil was subjected to a temperature of 130° C. for 18 days dmonstrated that when air was not present no sludge resulted—only a slight discoloration taking place, also that when air was in contact with the oil a heavy sludge was produced. This test is representative of many others and shows conclusively that for any permissible temperature sludging will not take place in oil so long as air is excluded.

Until recently, the most generally accepted solution of the problem provided for (a) the use of a tank substantially air-tight at all joints with a single vent or breathing point for the interchange of air between tank and the outside atmosphere, this opening being connected by a vent pipe to a chemical drying chamber to remove moisture from the air passing through it; (b) ground shields above the oil level, and (c) the operation with conservative temperature rise.

This construction, until recently the best available, has the following possibilities for improvement:

(1) An immediate indication of the oil-tightness of all joints, thus insuring absolute protection against the entrance of moisture.

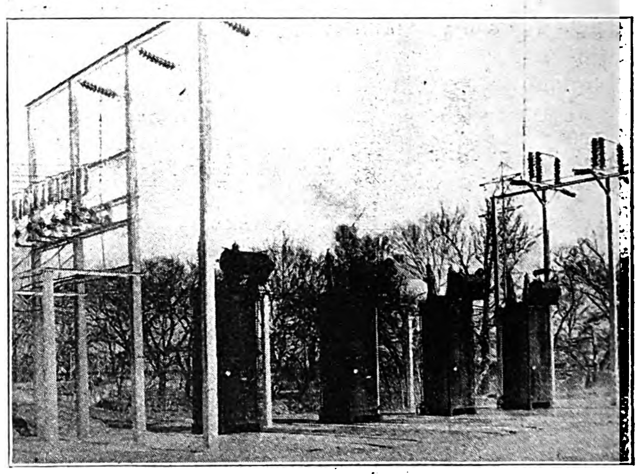

Fig. 5.—Outdoor Installation of Conservator-type Transformers of the Virginia Railway & Power Co., Richmond, Va.

(2) The elimination of all air space between the cover and the oil level.

(3) The reduction in the amount and temperature of the oil in contact with the air.

The indication of oil-tightness of joints will be a source of assurance to any operator of outdoor units. Elimination of the air space will insure protection against explosion due to the ignition of this atmosphere from corona or static between live parts and ground. The coolness of the air-exposed oil and the small surface in contact with the air will avoid the possibility of the oil sludging.

Oil Conservator Tank Construction.

These refinements in tank construction, which will materially reduce the possibility of failure even of apparatus as reliable as the best transformers, are all found in a valuable but simple addition to transformer tanks now extensively used by the General Electric Co. This device is sometimes called the "Oil Conservator." Figs. 1 and 4 show the general appearance of conservator-type transformers.

The engineers of this company have been testing this conservator construction in service during the past three years and are now generally recommending it for all large outdoor units. The conservator consists primarily of an auxiliary tank connected to the top of the main transformer tank by a suitable pipe and mounted somewhat above the level of the oil in the main transformer tank. When the auxiliary tank is supplied with oil the main tank and connecting pipe are completely filled and the only oil that comes in

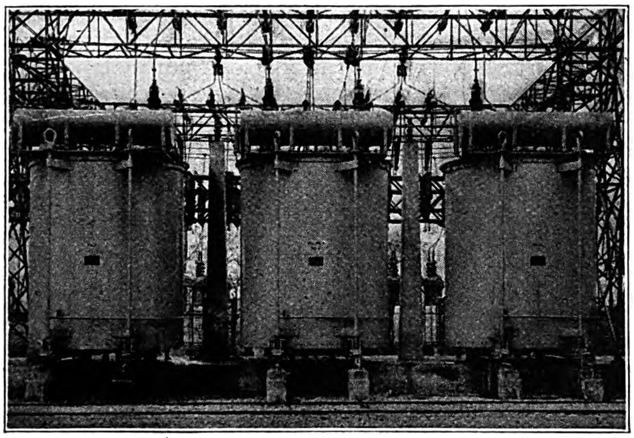

Fig. 6.—View of Transformer Bank No. 1 at Canton Substation of the American Gas & Electric Co.

contact with the air is that in the conservator. This is shown diagrammatically in Fig. 8.

The size of the conservator tank is governed by the expansion and contraction of the oil due to its changes in temperature. At the lowest operating temperature the oil must not contract so as to allow air to enter the main transformer tank, and at the maximum operating temperature the oil must not overflow the conservator. Transformer oil increases in volume about 4% with a temperature rise of 50° C. and this with other necessary allowances brings the volume of the auxiliary conservator tank to about 8% of that of the main tank. In practice, various refinements and

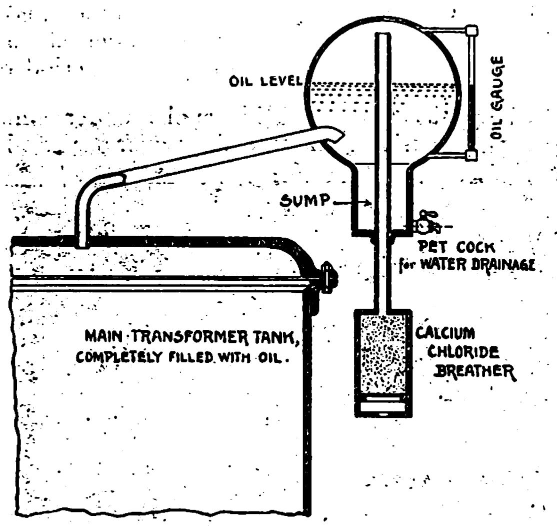

Fig. 7.—Diagrammatic Sketch of Oil Conservator Connected to Transformer Tank.

auxiliary devices are provided such as suitable oil gages, oil valves, chloride breather and sump.

Even a superficial consideration will show that this simple equipment fulfills the general requirements previously enumerated and a closer study reveals the fact that, even in detail, a better solution of the problems involved could hardly be desired.

Transformer Tank Completely Filled with Oil.

The fact that, except through extreme carelessness of the operator, the transformer tank will always be completely filled with oil has many advantages. The reduction in the necessary size of the tank and consequently of the bushings, has evident advantages. Elimination of the air space is of greater importance because with it is eliminated the chance of an explosive mixture of gas and air being trapped above the oil, for with the oil conservator any gas that may form immediately escapes into the auxiliary tank where there is, of course, no possibility of ignition.

Cool Oil in Contact With Air.

Since there is only one oil connection of limited size between the conservator and transformer tank, there is no circulation and the interchange of oil is limited to that due to the gradual expansion and contraction of the whole body of oil. The result of this is that the oil in the conservator is only slightly warmer than the outside air. To cite a typical test on a 95,000-volt conservator-type transformer of 3000-kv-a. capacity: the oil in the main tank reached a temperature of 73° C., while the oil in the conservator was only 38° C. Since the ambient temperature was 24° C., the temperature rise of the oil in the main tank was 49° C. against 14° C. for the oil in the conservator—three and a half times as great a rise. The importance of this on the sludging of oil can hardly be overestimated.

Figs. 3, 4, 5 and 6 are installation views that give some idea of the appearance of the conservator-type transformer in service. Fig. 3 is of especial interest as it shows the initial installation of the oil conservator in 1916 at Laurinburg, N. C.

RADIO CONTROL OF WIRELESS PROPOSED BY SECRETARY DANIELS.

Proposed Plan Calls for National Body to Supervise Private Stations.

A new policy for control and development of radio communication has been laid before Congress by Secretary Daniels.

It provides for maintenance of both naval and private stations, with the latter under control of a national radio commission, and proposes to open existing or new stations to general public correspondence at rates to be fixed by the Navy Department and Congress.

General public transoceanic correspondence through naval stations would not be permitted, however, except during temporary suspension of private service. Private radio stations would be licensed by the national radio commission and under its supervision.

CLEVELAND TO HOLD ELECTRICAL SHOW.

Plans are being made for holding an electrical show in Cleveland, Ohio, in February, 1920, according to an announcement by Matthias Turner, president of the Cleveland Electrical League. The early part of December was considered as a possible time for the show, but because of the rush of Christmas trade, February was selected. G. S. Milner of the Erner Electric Co. is chairman of the show committee.

IMPROVED EFFICIENCY OF MODERN PUMPING UNITS SHOWN.

Latest Installation at Minneapolis Water Works Also Shows Savings of Central-Station Service.

That the efficiency of centrifugal pumps is still improving and that under certain circumstances water works pumps can profitable be operated with central-station power is shown by the report of an acceptance test made upon the latest motor-driven pump installation at the Minneapolis water works.

The results of this test showed that in this pump installation a pump efficiency of approximately 86% was obtained and that the overall efficiency of the conversion of electric power to power measured in the water delivered averaged 82.48% over a period of nine months. A comparison of the costs of operating these pumps with the cost of operating the triple-expansion steam pumping units in the same station also shows the considerable saving obtained by the use of central-station service.

In May, 1911, the city entered into a ten-year contract with the Minneapolis General Electric Co., now the Northern States Power Co., by which that company agreed to furnish current at 2200 volts to operate two or more 20,000,000-gal. pumps against a dynamic head of 240 ft., based upon a pumping set of 72% overall efficiency, at a price of $4 per million gallons pumped, the understanding being that no current would be used between 4:15 p. m. and 6:30 p. m. on week days during the months of November, December, January and February. In November, 1916, a similar ten-year contract was made with the same company for the operation of a 30,000,000-gal. pump against the same head, and with the same pump efficiency, to be charged for at the same rate, with the provision that at a different dynamic head or efficiency the price per million gallons should be adjusted accordingly. It was also specified that the motor to be used by the city should be capable of starting the pump when primed and with the check or gate valve in the discharge closed, and of bringing the pump to full speed without drawing more than 150% of full-load current from the source of supply. In 1910 and 1911 two 20,000,000-gal. pumps were installed and in 1918 a De Laval pump.

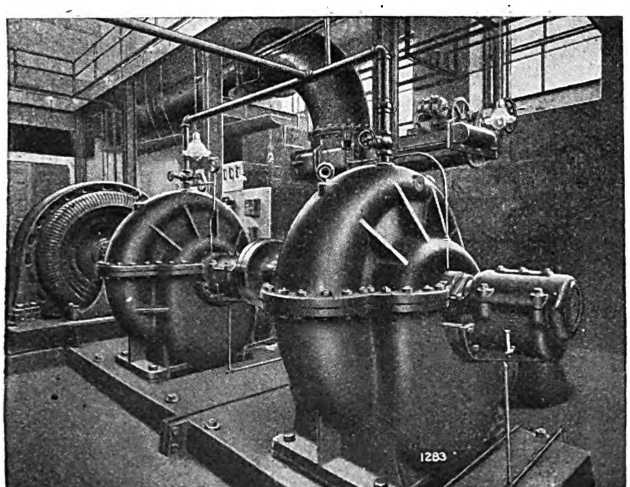
The latter unit consists of a General Electric 1800-hp., three-phase, slip-ring induction motor direct-connected to two De Laval 24-in. single-stage pumps mounted upon the same base plate and connected in series. The unit was specified to deliver 30,000,000 gal. per 24 hrs. against a total dynamic head of 250 ft. It was supplied by the Minneapolis Electric Equipment Co. and is installed at Pumping Station No. 4 in Northeast Minneapolis.

The official acceptance test was made in May, 1918. The discharge was measured by means of a Venturi meter, the capacity being calculated from manometer readings, while the discharge head was measured by two sets of calibrated gauges and the suction lift by means of a mercury column. The power supplied was measured by three sets of watt-hour meters, calibrated by means of a portable set of standard instruments reading during the official test under the conditions of current, voltage and power-factor obtaining. The portable set included two single-phase wattmeters, one polyphase wattmeter, one voltmeter, four ammeters and portable current and potential transformers. The test lasted 28 hours.

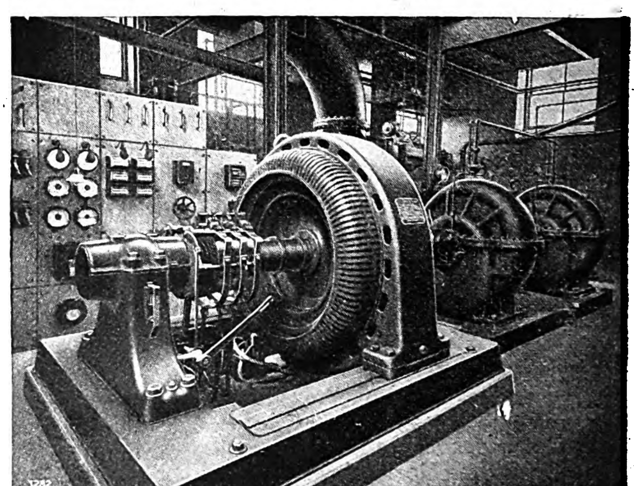
The results were as follows:

Total pumpage in 28 hrs.	37,719,500 gal.
Rate per 24 hrs.	32,331,000 gal.
Discharge head, average	235.13 ft.
Suction lift, average	16.43 ft.
Total dynamic head, average	251.56 ft.
Kw-hr. used	36,307.2
Combined efficiency of motor and pump	82.1%
Average line voltage	2,406
Power factor	90.0%
Motor efficiency under test conditions	95.5%
Slip of induction motor	1.1%
Temperature rise	33.5° C.
Starting current, percentage of full load current	113.0%

The contract of the city with the Minneapolis Electric Equipment Co. provided a bonus of $500 for each 1% efficiency exceeding 76% when pumping 30,000,000 gal. per day against a total dynamic head of 250 ft. The maximum bonus was limited to $2400. A penalty of $500 was provided for each 1% by which the efficiency might fall below 76% and the pump was not to be accepted if the overall efficiency fell below 72%. As the accompanying chart shows, 76% efficiency was exceeded at all loads tested, and the average combined efficiency, including the regular starting and other conditions incidental to a varying load in regular service, should not be less than 82.1% by more than 1%. The overall efficiency of 82.1% divided by the motor efficiency of 95.5% gives a pump efficiency of 85.97%. This is believed to establish a new record and is 6% higher than the results obtained in the tests on the pumps of another make installed by the City of Minneapolis under similar conditions. Service runs extending over a period of



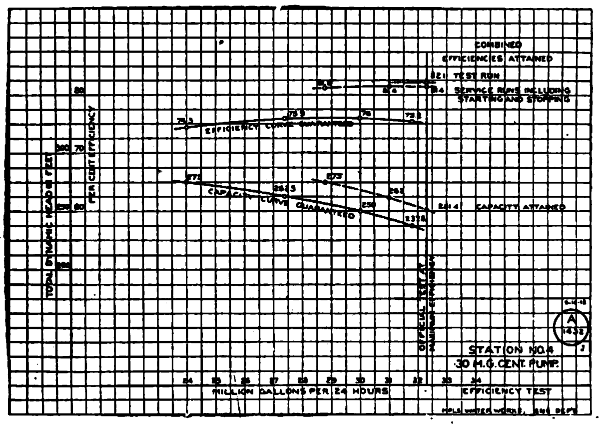
De Laval Motor-Driven Centrifugal Pump, 30,000,000-Gal. Capacity, Installed by the City of Minneapolis.



Motor End of Pump Unit Showing General Electric 1800-Hp. Motor.

three months show an excess of 5% over the efficiencies stipulated in the contract for various heads.

The test was accepted as correct by J. D. Marshall, of the Minneapolis Electric Equipment Co.; Wm. Salt of the De Laval Steam Turbine Co.; J. E. Jensen,



Head, Capacity and Efficiency Curves Showing Results of Tests on De Laval Pump.

supervisor of the Water Works Department, and E. C. York, engineer of Pumping Stations. The foregoing information is taken from the report of the official test by Prof. F. W. Springer of the University of Minnesota.

The following comparative operating data were obtained during the first three months after the test:

De Laval 30,000,000-Gal. Pump.

Gallons pumped	2,797,490,000
Power cost per million gal.	$3.63
Labor and supplies per million gal.	$2.27
Total cost per million gal.	$5.95
Head	253.06 ft.
Overall efficiency	81.4%

Another Type 20,000,000-Gal. Pump.

Gallons pumped	421,340,000
Power cost per million gal.	$4.15
Labor and supplies per million gal.	$2.27
Total cost per million gal.	$6.42
Head	250.57 ft.
Overall efficiency	72.3%

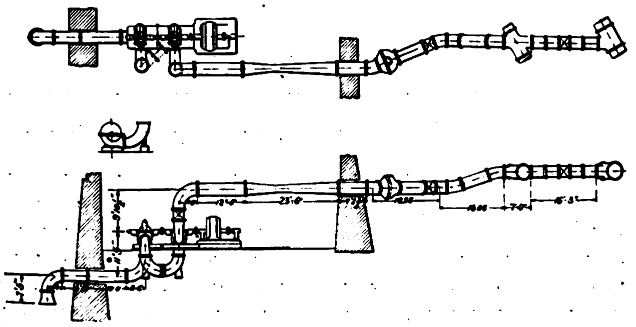
Similar records for the first nine months subsequent to the test are as follows:

De Laval 30,000,000-Gal. Pump.

Gallons pumped	6,526,350,000
Power cost per million gal.	$3.72
Labor and supplies per million gal.	$1.77
Total cost per million gal.	$5.49
Head	255.80 ft.
Efficiency	82.48%

Other Type 20,000,000-Gal. Pump.

Gallons pumped	1,771,930,000
Power cost per million gal.	$4.33
Labor and supplies per million gal.	$1.77
Total cost per million gal.	$6.10
Head	257.80 ft.
Efficiency	71.47%



Line Cut Showing Location of Pump and Force Mains, Minneapolis Water Works.

Figures are also available from two triple-expansion Holly A-frame pumps installed in the same plant in 1903 and 1904, and tested in September, 1904. These pumps have a capacity of 15,000,000 gal. per day each, and on test developed a duty of 162,000,000 ft. lb. per 1000 lb. of steam, reduction being made for slip. During 1908 the two steam pumps raised practically all of the water for the city, namely, 6,518,000,000 gal., against 250-ft. head. The cost of fuel, using Illinois screening at $2.07 per ton, was $3.01 per million gal., the cost of labor $3.33, and other pumping costs 35 cents per million gal., making a total of $6.75. The cost today, with coal at $4.93 per ton, would be approximately $12.74 per million gal.

BRITISH ASSOCIATION FOR ADVANCEMENT OF SCIENCE MEETS.

Necessity of Providing for Power Supply One of Important Questions Discussed.

Until September of this year the British Association for the Advancement of Science has not been able to hold its annual congress since 1916, owing to the attention of most scientific men being occupied in some way or other with the war. This year's gathering therefore provided an opportunity for experts to describe and engineers and scientists generally to discuss some of the great achievements or discoveries of the war period in connection with engineering, electrical, chemical and physical science generally.

The meetings were held at Bournemouth, one of the largest of England's south coast health and holiday resorts, from September 9 to 13, and they were attended by some of the most eminent of British scientists such as Sir Oliver Lodge, Sir Charles Parsons, Sir J. A. Ewing, Sir Robert Hadfield, Sir J. Larmor, Sir Hudson Beare, Sir R. Gregory, Prof. H. E. Armstrong, Dr. A. P. Fleming, Professor Andrew Gray, Prof. W. H. Eccles, Prof. J. E. Petavel; and by leading industrialists and economists such as Sir Hugh Bell, Sir Herbert Morgan, Prof. A. W. Kirkoldy, the Rt. Hon. F. Huth Jackson, and so on.

There was a brilliant address delivered by the president of the association, Sir Charles Parsons, on the evening of the opening day when between one and two thousand members assembled in the famous winter gardens. For discussion of reports and papers members divided off into different sections as usual. The proceedings were full of interest though perhaps there was no special sensation unless it was provided by the excellent accounts that were given of achievements in such matters as aviation, wireless telegraphy, tanks, military bridge construction, turbines for ship propulsion, and other war work.

Sir Charles Parson's Address.

The president, in his opening sentences, said that the meeting was being held at a time when, after a great upheaval, the elemental conditions of organization of the world were still in flux and they had to consider how to influence and mould the recrystallization of these elements into the best forms and most economic arrangements for the benefit of civilization. The British association was capable of exerting a great influence in guiding the nation towards advancement in the sciences and arts. Sir Charles reviewed some of the most important features of engineering advance during the last twenty years. The turbine figured prominently among these. During the 20 years immediately preceding the war turbogenerators increased in size from 500 kw. to 25,000 kw. and the consumption of steam decreased from 17 lbs. per kw.-hr. to 10.3 lbs. Ship construction, tungsten steel and investigations of gaseous explosions were mentioned. In regard to science and the war the speaker said that four years was far too short a time for much scientific invention to blossom to useful maturity, even under the forced exigencies of war and government control. In the past the great majority of new discoveries and inventions of merit had taken many years—sometimes generations—to bring them into general use. The work of the scientists during the war had perforce been directed more to the application of known principles, trade knowledge, and properties of matter, to the waging of war, than to the making of new and laborious discoveries; though in effecting such applications, inventions of a high order had been achieved, some of which promised to be of great usefulness in time of peace.

Sir Charles next discussed some of the important engineering developments made during the war such as tanks, aircraft, directional wireless with special reference to aircraft, emergency bridge construction and so forth. He particularized in regard to sound-ranging and listening devices.

In his section relating to electricity he referred to its rapid development in recent years in lighting, power transmission, in size of plants, etc. At the end of 1918 the central electric stations in the United Kingdom contained plant aggregating 2,750,000 kw., 79% of which was driven by steam turbines. The advantages and disadvantages of superstations were summarized and it was remarked that the greatest element in reducing the cost of electricity was the provision of a good load-factor. It was a far more important consideration than the size of the station. There was no golden rule to secure cheap electricity. The most favorable size, locality, and number of generating stations in each area could only be arrived at by a close study of the local conditions, but there was no doubt that, generally speaking, to secure cheap electricity a widespread network of mains was in most cases a very important, if not an essential, factor. The electrification of main line railways would no doubt result in a saving of coal; at the same time, the economical success would largely depend on the broader question as to whether the volume of the traffic would suffice to pay the working expenses, and provide a satisfactory return on the capital. Turning to consider the future, Sir Charles Parsons spoke as follows regarding the position of England:

"The nations who have exerted the most influence in the war have been those who have developed to the greatest extent their resources, their manufactures, and their commerce. As in the war, so in the civilization of mankind. But, viewing the present trend of development in harnessing water power and using up the fuel resources of the world for the use and convenience of man, one cannot but realize that, failing new and unexpected discoveries in science, such as the harnessing of the latent molecular and atomic energy in matter, as foreshadowed by Clerk Maxwell, Kelvin, Rutherford, and others, the great position of England cannot be maintained for an indefinite period. At some time more or less remote—long before the exhaustion of our coal—the population will gradually migrate to those countries where the natural sources of energy are the most abundant.

"The amount of available water power in the British Isles is very small as compared with the total in other countries. According to the latest estimates, the total in the British Isles is under 1½ million horsepower, whereas Canada alone possesses over 20 millions of which over 2 millions have already been harnessed. In the rest of the British Empire there are upwards of 30 millions and in the remainder of the world at least 150 millions, so that England herself possesses less than 1% of the water power of the world. Further, it has been estimated that she only possesses 2½% of the whole coal of the world.

"England owes her modern greatness to the early development of her coal. Upon it she must continue to depend almost exclusively for her heat and source of power, including that required for propelling her vast mercantile marine. Nevertheless, she is using up her resources in coal much more rapidly than most other countries are consuming theirs, and long before any near approach to exhaustion is reached her richer seams will have become impoverished, and the cost of mining so much increased that, given cheap transport, it might pay her better to import coal from richer fields of almost limitless extent belonging to foreign countries, and workable at a much lower cost than her own."

Sir Charles then went on to explain that "the average capital required to produce electrical power from coal is less than half the amount that is required in the case of water power. The running costs, however, in connection with water power are much less than those in respect of coal. Another interesting consideration is that the cost of harnessing all the water power of the world would be about 8000 millions, or equal to the cost of the war to England. Dowling has estimated the total coal of the world as over seven million million tons, and whether we appraise it at 25 cts. or more per ton its present and prospective value is prodigious. As coal is transportable long distances and, generally speaking, electricity is not so at present, therefore it seems probable that capital will in the immediate future flow in increasing quantity to mining operations in foreign countries rather than to the development of, at any rate the more difficult and costly, waterpower schemes. When, however, capital becomes more plentiful, the lower running costs of waterpower will prevail, with the result that waterpower will then be rapidly developed. As to the possible new sources of power I have mentioned molecular energy, but there is another alternative which appears to merit attention." Sir Charles referred to his proposal of 15 years ago regarding the sinking of a bore hole to a depth of 12 miles—ten times the depth of any shaft in existence, and later to the interesting phenomenon of intense pressure produced by moderate forces closing up cavities in water.

The chairman of the Mathematical and Physical Science Section in the course of his address quoted from his experience as a member of the British Ministry of Munitions, Inventions Department, for three years.

NEW BUSINESS OF BYLLESBY PROPERTIES MAINTAINS RATE OF INCREASE.

All Byllesby electric properties reporting for the week ended Sept. 29 show the following new business gains (net): 969 customers with 503 kw. of lighting and 1366 hp. in motors. New business contracted for but not yet connected includes 1812 customers with 677 kw. of lighting and 1315 hp. in motors. Electric energy output for the week was 9.7% greater than during the corresponding week last year.

Editorial Comment

Better Lighting of Highways

IT IS generally conceded that the lighting of our highways, especially those in the outlying country districts, is woefully inadequate. Of course, it takes time to provide proper facilities to cover the thousands of miles of main highways, let alone those of lesser importance. But with the increasing number of national and state highways and with the strides made in motor-truck and passenger-car transportation there comes a more insistent demand for better lighting to facilitate this traffic and help reduce the large number of accidents occurring at night.

Some progress has been made in automobile headlighting, but on the whole the attempt to light roadways by means of headlights without confusing and blinding drivers coming in the opposite direction is far from satisfactory. The numerous fatal and serious accidents on our roads at night show that the average headlight is by no means the ideal solution of the highway lighting problem.

From the technical standpoint the problem of lighting our highways presents almost no difficulties that have not already been solved satisfactorily in general street lighting. Use of suitable refractors permits the lighting units to be spaced at considerable intervals. On less traveled roads it may suffice to install only enough units to indicate the general lay of the road and illuminate dangerous spots and road signs.

But the problem is not so much a problem of furnishing suitable lighting equipment, installing it and keeping it in good operation as it is a problem of selling adequate highway lighting—of convincing the many county, town and village authorities involved that the need of good lighting is insistent and that the returns in the increased safety, utility and attractiveness of the roads warrant the investment and upkeep

In this case, as in others, it seems that the electrical industry must act as a sort of little father to the laymen—by telling and showing them what is good for them electrically. And so there remains a great deal of pioneer work, especially the central station's, yet to be done before highway lighting in this country is adequate.

Taking the Customer Into Partnership

TAKING the customer into partnership with the utility by the sale of stock to the former by the latter is not a new idea. It is an old idea long advocated in these columns, long followed by many far-sighted utilities with eminent success. But this old idea assumes a new significance these days, when so many new conditions have to be met and so many new and ominous indications are appearing upon the horizon of our industrial and social life.

Take the customer into partnership by selling him stock. Ownership of property is a safeguard against the demagog's denunciation of private ownership, the tirade against the "capital" and the "moneyed interests." Ownership of utility stock by the customer and the public is an anathema to the socialists' and the syndicalists' demand for municipal and state ownership. He who owns property is not given to advocating uncontrolled and radical changes in ownership and civic life. He does not become intoxicated with the idea of taking away from those that have to give to those that have not. He believes in live and let live. He has faith in the durable things of life.

Few factors are more powerful for civic growth than the street cars and the light and power utilities. Civic pride is closely interwoven with the progress and the ideals of these forces in our civic life. The citizen who owns stock in the local utility feels pride the more for a "white way" or electric sign and a scenic railway is the pride of the town. The citizen that owns stock in the local utility is a better citizen, the utility is the better and the city is the better.

What would happen to a strike where every patron owned stock, where every employe owned stock? Who would strike? Would there be a strike? Much is said these days about profit sharing, but the form of profit sharing that comes from stock ownership is the best and the soundest form of profit sharing, for the rise and fall of prosperity affects all alike, hence is equitable and basically sound. The viewpoint of the worker must necessarily be different when he knows his labor brings a reward other than a fee or stipend. The knowledge that his profits depend upon the profit of those for whom he works, of himself and others, is an incentive to honest service, loyalty and stability.

According to the report of the Committee on Sale of Company Securities to Customers and Resident Citizens presented before the annual convention of the National Electric Light Association at Atlantic City, slightly more than $40,000,000 worth of central-station securities, representing 48 companies, have been marketed locally among employes, customers and residents. This is, of course, only a drop in the bucket, but it is indicative of what might be done. Think you, in the localities where this utility stock is owned by the people, that the people are demanding the forfeiture of franchises, are goading these utilities to bankruptcy and harassing them at every turn? Do we fully realize that when the radicals and the socialists and those other scions of labor speak of capital they speak of the worker, of the widow and the thousands of the masses who have invested their dollars? These are "capital"; these are the ones whom the radicals would crush, in eliminating those to whom have been entrusted the dollars of the small investor.

Take the customer into partnership. Take the employe into partnership. Sell your stock, in its entirety, locally. To this extent we believe in public ownership. The sale of utility stock to customer, to employe and to local residents is a policy that is at once sound and wise. It is a policy that is extremely desirable at this time. It is a policy that creates a bulwark of good will in the community. And good will is needed now.

Influence of Extraneous Conditions on Transmission-Line Structures

THERE is often more than one way of doing a thing. Each may be a good way. Sometimes there is little difference in the different ways so far as concerns the results obtained. And yet one way is preferable because it may be safer, it may be cheaper, it may have longer life or may permit of being more quickly or more simply done. When all these factors are taken together, and balanced, that method whose summation comprises the greatest number of advantages with the fewest disadvantages is the best method. Circumstances alter cases, and some factor may carry special weight where some definite condition has to be met, whereas some other factor of little moment under the first condition may be the predominating factor where some totally different condition has to be fulfilled. It is the function of the engineer to weigh the pros and cons in each case, and decide or recommend accordingly.

In the design and construction of transmission lines conditions differ widely in different sections of the country, and sometimes along different sections of the same line. This is more especially the case in mountainous regions, where not only are long spans necessary, but wide variation in loading due to snow and sleet and temperature changes have to be contended with. Boggy country, rock formations are other factors that modify the form of construction used. Notwithstanding these facts, most transmission lines follow along each one much like another.

A closer inspection of these lines and a cursory study of local conditions may show, however, that there is some underlying condition to be met that influences the line in some manner. Elsewhere in this issue is described a form of installing poles for supporting a transmission line of the Western States Gas & Electric Co., that is of interest because none of the poles are embedded in the ground, but are purposely maintained on the surface, so as to get away from rapid butt rot. Each supporting structure utilizes two poles, each unit being guyed in four directions. The form of construction employed has been in use now for more than ten years, and has been found entirely satisfactory for carrying two circuits over long spans, and rugged country and where a high rate of butt rot has to be guarded against. Another rather unique installation presented in these pages some time ago was a case where the overhead steel grounded conductor and the two telephone lines were so installed across a long span that when the emergency arose any one of them could be employed for a phase conductor at 60,000 volts. In this instance, of course, it was a matter of arranging the conductors and jumpers at the anchor towers.

In our last issue, brief mention is made on page 622 of a form of line construction employed in Alabama during those days when it was urgent to construct a transmission line for immediate use, while at the same time foregoing the use of steel because of its high price and relative scarcity. At the same time the line was to be of a permanent nature. The manner of satisfying all these three requirements, rapidity of erection, conservation of steel and reasonably long life, was obtained by adopting what has been called a composite pole.

The composite pole consists of a steel tower braced to and supported by a wooden structure. In this way considerable steel was eliminated without seriously interfering with the permanency of the line, since the life of the line is determined by the life of the joints where the steel section is bolted to the wooden support, and these can be renewed as deterioration makes necessary. The wood-steel structures erected by the Alabama Power Co. are expected to have a life of not less than ten years, and when replacement of the steel-wood joints becomes necessary, or the wood supports are replaced by those of steel, the work can be carried on without service interruptions and excessive cost.

Transmission-line structures have undergone many changes, and different designs have been evolved to meet the many and varied conditions that obtain. So too, line insulators have kept pace with progress, the most radical being perhaps that of changing over from the pin to the suspension type several years ago. Today the suspension type insulator is standard for all transmission potentials of 60,000 volts and above, although it is often used for considerably lower pressures, where high factors of safety electrically and mechanically and similar requirements have to be met.

Although transmission lines have been quite well standardized, and one line looks much like another, there is still ample opportunity for ingenuity in both design and erection. Economy in first cost and operation and safety at all times are always of prime importance. Every innovation or practice that increases the safety, durability and immunity from trouble of a line, lowers the initial and after costs and adds to the flexibility is worth while. And the more engineers know about conditions existing in systems other than their own, and how those conditions were met, the better prepared are they to meet new problems as they arise.

Proposed Reorganization of Jovian Order — Time and Place Set for N. E. L. A. Annual Convention Next Year

IMPORTANT PROPOSALS TO COME BEFORE JOVIAN CONVENTION.

Meeting in Chicago Next Month to Consider Revision of Name, Objects and Scheme of Organization—To Be Called National Electrical Board of Trade.

Mention was made in our last issue of the call for a convention of the Jovian Order to be held at the Hotel Sherman, Chicago, on Nov. 5 and 6. It is the general feeling of those interested in the order that it can be revived and reorganized on greatly broadened lines, subordinating to their proper place the social features heretofore so predominant, and developing the constructive business features. In line with these ideas, it is proposed to present to the convention for approval a comprehensive program of reorganization, the chief features of which are the following:

That the name of the Jovian Order be changed to that of "National Electrical Board of Trade."

That the organization, policy, plan of action, and objects and purposes of the National Electrical Board of Trade be so framed, by a revision of the existing Jovian constitution, that they wil be in complete harmony with all that the name implies.

That the suggested revision of the Jovian constitution be prepared by a Committee on Constitution appointed by the Seventeenth Jupiter, who shall, before drafting such revision, carefully survey the organization plans under which are now operating in other channels bodies similar to that of the contemplated National Electrical Board of Trade; as examples, the United States Chamber of Commerce and the International Association of Rotary Clubs.

That the Committee on Constitution (or a separate committee appointed by the Seventeenth Jupiter) shall also survey the needs of the electrical industry (with relation to the possibilities for service to meet those needs inherent within such an organization as outlined here), and shall prepare a standard of performance for the National Electrical Board of Trade, which shall include in specific detail the proposed activities of the board, and a budget covering the cost of operation for its first year and which if accomplished by the board will justify for it a continuance of necessary support from individual members, local boards and the electrical industry as a whole.

That the following suggested activities for the National Board be carefully analyzed by the committee and included, in the practical detail of their application, in the standard of performance, if they are found to be sound and feasible:

1. Public relations.
2. Relations between employer and employe.
3. Trade ethics.
4. Electrical merchandising.
5. Community advertising.
6. Salaried field representatives.
7. Trade data.
8. Foreign trade bureau.
9. Interrelations between electrical associations (hereinafter more definitely outlined).
10. Educational speakers' bureau (a corps of capable men to address monthly evening meetings of local boards).
11. Employment bureau.
12. A monthly publication.
13. Accident and health insurance.
14. Electrical expositions (possibility of traveling exhibits).
15. The Henry L. Doherty plan for the "conservation of human energy."

That the revised constitution and standard of performance be presented for the consideration of and action by a special meeting of the Jovian Order, called for the earliest date consistent with the requirements of the present Jovian constitution.

That the revised constitution provide practical means to permit of two classes of individual memberships, to-wit: One class of members who are also members of local Electrical Boards of Trade and whose dues to the National Board will therefore be paid by such local boards, as hereinafter noted; the other class, individuals who are not members of any local boards and who shall pay dues direct to the National Board, on the same membership classifications as outlined for local board dues.

That both classes of individual members in the National Board shall enjoy equal rights in so far as they deal in a direct line with the National Board, including the holding of national membership credentials inviting the enjoyment of the courtesy of visitors' privileges in all local boards.

That the fundamental scheme of organization as now existing in the Jovian Order be retained—to repeat, that of a vast individual membership whose interests and efforts are held in and invested by a great chain of local chapters, clearing through a central body, which shall have advisory and in proper measure supervisory powers in those matters affecting all local chapters.

That the ideal development shall not fall short of an individual membership of not less than 100,000 desirable, eligible men, working with and through local chapters established in every city and town capable of supporting an active electrical organization, no matter how small it may be.

That all of the present useful activities of the Jovian Order be continued in this evolution of that body, for this plan shall not in any sense be construed as destructive, but in every respect a constructive building upon the excellent foundation heretofore created through years of earnest Jovian endeavor.

That to emphasize the suggestion that one of the major activities of the National Electrical Board of Trade shall be the interrelations between electrical associations, attention be called to the following:

There are vital problems in the internal affairs of the manufacturing, jobbing, contracting, utility and other branches of the industry, each of which interest only indirectly the other branches, in which those other branches could be of small assistance and which are capably handled by the separate associations maintained by those groups.

Also, there exist questions of great moment to all branches, to the entire industry, which should be acted upon by all associations as a unit with standardized policies and methods, to insure harmony, effective results and avoidance of a duplication of effort; there is nonexistent today for such united effort any vehicle completely meeting the need.

As one example of the usefulness of such an agency may be cited a destructive condition generally considered as the problem of the public utility alone but which in reality strikes at the heart of the earning power of every man drawing his income from the field of electricity. This condition is that of the feeling and expression of criticism, suspicion and resentment manifested by press and public in far too many communities and one of the most potent sources of trouble in the industry. It operates directly and indirectly against progress and growth of utilities by inciting unfair, restrictive legislation, cutting down revenue and making necessary capital wary and difficult.

That to remedy that condition should be the fight of every electrical man and association is surely obvious, because, when central stations, street railways and telephone and telegraph companies, the great purchasers of electrical apparatus and supplies, are expanding and prospering, then all down the line, in every branch of the industry, "Business is good." Quite the reverse when the utilities are harassed and depressed to the point of stagnation and retrenchment.

In a great majority, if not in all instances, public distrust is the result of gross ignorance of the policies, basis of earnings, methods of operation, ideals and official personnel of utilities.

The remedy for ignorance is education. Therefore, the whole electrical industry, each man in it, through a standardized, far-reaching plan of action adopted by all electrical associations, should be saturated with educational, preventive and protective propaganda to be by him spread broadcast to the public by every possible means.

This is only one example of the need for a clearing-house for electrical associations; there are many more.

To supply in a satisfactory manner the required agency it is suggested that the revision of the Jovian constitution provide that there be nominated and elected (in a democratic manner representative of all individual members) as the controlling body of the National Electrical Board of Trade, what will be in effect and possibly in name a board of directors, in which shall be included three members selected from each association maintained by each of the recognized groups or branches of the industry, chosen with the approval and co-operation of the respective associations. There shall also be included in this governing body one or more members-at-large and such other members as a thorough study of the plan suggests.

This plan not only furnishes the common ground of contact for all associations, but fairly places in the hands of each branch its share of the control of the National Board, which draws its support from the entire industry.

That the National Electrical Board of Trade be financed by the dues of individual members paid direct to it by those members who are not also members of any local board; also, by payments made quarterly or semiannually by each local board, the amount based on a per capita tax for each member of such board; this local board payment to constitute payment in full for membership of both the local board and each of its members in the National Board.

That the per capita tax for the first year shall be in the sum of $2; at the expiration of that period the tax to remain at $2 or be increased or decreased in harmony with the quality and extent of the service rendered by the National Board, the cost of that service and the gross revenue of the National Body.

That the matters covered herein and as enlarged and made more definite through the procedure and committees recommended be submitted at the earliest possible time as a complete plan, capable of supplying a greatly needed instrument, to the more important electrical interests by a committee named by the Seventeenth Jupiter, with the request that those interests immediately underwrite the necessary operating expense of the National Board during the period in which the plans are being put into effect, these underwriting payments to be repaid in the event and when this reorganization project shall be established on a self-supporting basis.

That the present Jovian constitution be amended to permit action upon constitutional amendments at special meetings called in accordance with the provisions of the constitution.

MISSOURI STATE ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS HOLDS ANNUAL MEETING.

Seventeenth Annual Meeting Taking Place This Week in St. Louis.

The Missouri State Association of Electrical Contractors and Dealers held its seventeenth annual convention at the American Annex Hotel, St. Louis, Mo., Oct. 17 and 18, respectively. The first session was devoted to association business and to the presentation of a paper by R. E. Stewart, of the Stewart Electric Co., St. Louis, on the important subject of "Wiring of Old Houses." The second session on Friday consisted of an address by William L. Goodwin on "The Goodwin Plan." Friday evening the contractors were invited to a dinner given in their honor by the Electrical Board of Trade of St. Louis.

At Saturday morning's session Samuel Adams Chase, of the Westinghouse Electric & Manufacturing Co., made an address on the vital importance of co-operation of the contractor-dealers with the different electrical interests and their effect on the contractor-dealer. A paper on "Cost Finding and Accounting," lack of which may lead to bankruptcy, a proper system of which only can lead to success, was presented by J. A. McShane.

In the afternoon A. Penn. Denton read a paper explaining the objects and aims of the Bureau of Education and Research. Arthur Brandt, Frank Adam Electric Co., read a paper on "Electrical Merchandising." "Operation of Electrical Repair Shop and Sale of Used Electrical Machinery" is the title of a paper presented by Fred E. Briner, of the C. J. & F. E. Briner Electric Co., and two other papers of interest to contractors and dealers given were "Operating a Contractor Business in the Residence Section of a City" by Samuel J. Burke, Burke Electric Co., and "Desirability of Having Electrical Contractors Affiliate, as Associate Members, of the National Fire Protection Bureau" by George Dose.

ELECTRIC CLUB GIVES LUNCHEON IN CONNECTION WITH CHICAGO ELECTRICAL SHOW.

Samuel Insull Makes Address on Development of Electrical Industry, Giving Broad Summary of Conditions Existing in Electrical Field.

Tuesday, Oct. 14, was Electric Club day at the Electrical Show being held at Chicago, Ill., and at a luncheon attended by over 300 members Samuel Insull, president of the Commonwealth Edison Co., Chicago, was the principal speaker.

Mr. Insull first paid a tribute to the members of the electrical fraternity in the army and at home who helped win the war, and said such organizations as the Electric Club of Chicago rendered invaluable assistance.

"The Development of the Electrical Industry" was Mr. Insull's subject and he touched upon it only in a broad way. The capital of electrical manufacturing companies in this country is estimated at $750,000,000, with a yearly turnover of $600,000,000, while the capital of central stations is estimated at $2,750,000,000 with a turnover about the same as that of the manufacturers. Inasmuch as the success of the industry is greatly dependent upon the success of the central stations, and in view of the fact that central stations require such large capitalization for corresponding turnover it is necessary that the stability of the latter be preserved. This can be accomplished by allowing them legitimate profits, secured through intelligent regulation by state commissions. Team work within the industry is also necessary to make central-station stability permanent.

Most utilities, such as electric railway companies, encountered financial difficulties during the war and the situation has not been relieved to any great extent. The nature of their business has made central stations more fortunate in this respect, although much distress has been caused by unfair regulation by public service commissions, resulting in a marked loss of stability by these central stations affected and making it difficult fof them to obtain capital for needy purposes. Stress should be laid upon this situation so that central stations will receive fair regulation, enabling them to make a profit so that investment in them will be stimulated. In this way only can funds be secured to make the line extensions that are needed and which are necessary to the success of the electrical industry as a whole. Mr. Insull said he was sounding no note of alarm, but that increasing labor and material costs made just regulation of utilities imperative and relief was necessary.

In reviewing the development of the industry, statistics on central-station progress were given. Aug. 1, 1919, marked the twenty-fifth anniversary of the opening of the Harrison street power station (now dismantled) of the Commonwealth Edison Co. When first opened it was considered the most modern of any in this section of the country. Its total capacity was one-half that of turbines now purchased by the company. Its total output covering 24 years of operation, about 550,000,000 kw-hr., is less than that of either the Fisk or Quarry stations for one year. The company's maximum load at the time the station was first installed was 6000 kw., while last December it was 400,000 kw. The number of customers has increased from 4000 to 400,000.

In closing, Mr. Insull appealed to those present, as citizens and in the interests of business, to make a concerted effort toward stamping out radicalism and all elements that tend to injure the security and stability of business.

VAIL LIBRARY THIRD LARGEST ELECTRICAL LIBRARY IN U. S.

One of the most notable collections of electrical literature in this country is the Vail Library. It comprises about 20,000 volumes, which includes books on electricity, magnetism, electrical engineering, electrochemistry, electrometallurgy, electrotherapeutics, world expositions and electrical congresses. The collection was originally made in England and was purchased in 1912 by Theodore N. Vail, president of the American Telephone & Telegraph Co., who gave it to the Massachusetts Institute of Technology. It has been cataloged and brought up to date by the addition of about 1000 new books. The institute has given a large room in the main building for the Vail Library, which is open to the public as well as the students for reference and research.

MASSACHUSETTS INSTITUTE WIDENS ELECTRICAL ACTIVITIES.

Need for Research, Application and Other Factors Necessitate Raising Endowment Fund of $10,000,000.

"We have reduced ourselves to a one-tenth-of-a-second world," says Prof. Arthur E. Kennelly, director of the Research Laboratory of Electrical Engineering at the Massachusetts Institute of Technology. One of the greatest achievements of the war, according to Professor Kennelly, was getting around the world by radio. Many times messages were sent successfully from Carnabon in North Wales to Sydney, New South Wales, which is practically at the antipodes. These signals in all probability arrived at the antipodes in less than one-tenth of a second trom the time they started. That means that all our radio communications in the future are necessarily compressed within a period of time which is less than the antipodal period of one-tenth of a second.

The evident result of that shrinkage, the Technology professor believes, will be to force us into close international touch, and this will render necessary a readjustment of our international relations. We will have to maintain an international language, an international system of weights and measures—the metric system—and a code of international law. The League of Nations is just the beginning of the consequences that will have to be thought about as a result of the close electrical communication throughout the world.

The Massachusetts Institute is raising a $10,000,000 endowment fund this autumn to keep abreast of the times, and Professor Kennelly believes this move is justified along many lines. The war has brought about a remarkable development in all branches of applied science and the Institute of Technology needs new apparatus in her laboratories and new blood in her teaching staff to give the students the sort of training they ought to have. In Professor Kennelly's own field, electrical work of all sorts is advancing so fast that it takes the best they can do to keep up with it. Reading and laboratory work—the accomplishments of the research laboratory for one year—furnish the material for teaching in the next. Already electrical courses are given at Technology that would not have been possible had it not been for the laboratory work of the preceding year.

Professor Kennelly is giving a new course on electrical communication this year, a course made necessary and possible by reason of the experience gained in the war, where all kinds of electrical signalling were resorted to under stress. A special group of students is being assigned to it from the Signal Corps of the United States Army. They will study the principles of telegraphy, telephony and radio, together with the numerous methods, both practical and theoretical, that are involved.

Radio and radio methods are coming to be introduced more and more generally into electrical communication in civil life. In radio telephony a very small amount of the energy inside of matter is released so that mankind is just commencing to unlock the enormous stores of energy within matter, very much greater than the energy released by coal in burning. All studies made in the laboratory at any time would be of incalculable value to industry if the secret of unlocking that energy could be revealed. It would probably be unfortunate, howeve, if we did succeed in releasing it all at once.

ELECTRICAL MANUFACTURERS HOLD SECTION MEETINGS.

Many Sections of the Associated Manufacturers of Electrical Supplies Hold Sessions at the New York Headquarters and Also One in Chicago.

On Oct. 14 to 16 of this week many of the important sections of the Associated Manufacturers of Electrical Supplies held regular meetings at the headquarters of this association, 30 East Forty-second street, New York City. Over 300 manufacturers were in attendance. Each of the sections holding a meeting was strongly represented by delegates from its particular group. The general progrems of each of the section meetings included earnest discussions on practical details of manufacturing and marketing electrical supplies. Among the sections which met in New York City were the following: Signaling Apparatus; Lamp Receptacle and Socket; Industrial Lighting Fixture; Snap Switch; Attachment Plug; Outlet Box; Fuse; Knife Switch; Insulating Materials; Panelboard and Switchboard; Molded or Formed Insulation; Line Material and Air Circuit-Breaker. The Heating Appliance Section held a meeting in Chicago on Oct. 14.

N. E. L. A. Selects Pasadena for Next Convention

Convention Will Be at Hotel Huntington May 18-21, Inclusive—M. H. Aylesworth Made Executive Assistant to the President—Other Important Association News

PASADENA, pre-eminent among the beautiful cities of Southern California, was selected as the seat of the next annual convention of the National Electric Light Association. It will be a four-day gathering from May 18 to 21, inclusive, and will have many distinctive features to mark it among the notable meetings held by this influential organization.

Decision as to the time and place of the next convention was reached at a meeting of the Executive Committee of the association held in New York on Oct. 2, at which President R. H. Ballard, of Los Angeles, presided. The Hotel Huntington was selected as the headquarters of the convention. Mr. Ballard obtained an agreement with the hotel to reserve it for the exclusive use of N. E. L. A. members, and stated that if the accommodations at this hotel are not sufficient for all who wish to attend, the western delegates will stay at other hotels in Pasadena so as to give the preference as to the Hotel Huntington's facilities to delegates from distant parts of the country.

Matters relative to the next convention were not the only ones decided at the committee meeting referred to. The presence of President Ballard made it possible to reach conclusions on a number of other very important features, one of these involving the selection of an administrative director of the assocciation's affairs, M. H. Aylesworth, of Salt Lake City, being chosen for this important position. On account of the importance of the matters considered at the meeting, the following condensed report abstracted from the minutes will no doubt prove interesting to all central-station men.

Geographic Sections.

As chairman of the Committee on Geographic Sections, appointed at the last meeting of the Executive Committee, R. J. McClelland reported that the committee had agreed upon a division of the country into geographic sections and presented a map of the United States showing the proposed divisions which had the approval of Vice-President Bump.

President Ballard stated that what he had in mind for the Executive Committee was merely a tentative approval of the plan of dividing the country into geographic sections, that the report of Mr. McClelland's committee might be received and published in the *Bulletin* as representing the best judgment of the committee, subject always to the desires of the members living in the existing and proposed sections. The committee would thus have an opportunity to check up with the members the arguments for and against large and small geographic sections. The adoption of the report along those lines would not commit any section to any definite boundaries. Mr. Ballard added that in order to get an idea of the opinion of the committee's plan in different parts of the country, a number of telegrams have been sent out and very enthusiastic replies have been received from a number of men resident in different sections of the country.

Mr. Ballard reported that the Public Policy Committee had appointed a committee consisting of W. W. Freeman, chairman; Joseph B. McCall and Frank W. Smith to confer with the Committee of One Hundred of the Electric Railway Industry.

Appointment of Mr. Aylesworth as Executive Assistant to the President.

President Ballard advised the committee that he had discussed with the Public Policy Committee the employment of a man to act in an executive capacity with title of assistant to the president and to be located at headquarters. He had suggested the name of M. H. Aylesworth, of Salt Lake City, Utah, and his qualifications and recommendations had been discussed with the Public Policy Committee, with the result that the members of this committee were of the opinion that the employment of Mr. Aylesworth in this capacity would be of benefit to the association and they recommended his employment. Mr. Ballard advised the Executive Committee of the work Mr. Aylesworth had done in the past, stating that the four vice-presidents had all met him, and were favorably impressed with his record and general qualifications for the position. John A. Britton, chairman of the Public Policy Committee, spoke in favor of the creation of the new position and the employment of Mr. Aylesworth. On motion it was voted to authorize President Ballard to engage Mr. Aylesworth as assistant to the president.

Mr. Bump suggested that Mr. Sewall be continued as acting secretary for the present, leaving it to Mr. Aylesworth to make his own organization. The president appointed Mr. Sewall acting secretary and on motion the appointment was confirmed.

T. C. Martin's health having improved, the president, with the concurrence of the Public Policy Committee, recommended his appointment as advisory secretary of the association, devoting part of his time only to association affairs on matters referred to him by the president or his representative, and that in consideration of Mr. Martin's valuable services to the association in the past in the active duties of secretary, this position be offered to Mr. Martin for life. On motion it was voted to approve the president's recommendation. On motion the president was authorized to appoint a committee to draw up suitable resolutions memorializing the splendid work which Mr. Martin has done for the association and the industry at large, these resolutions to be spread upon the records and an illuminated copy to be sent to Mr. Martin. President Ballard then appointed J. W. Lieb, Charles L. Edgar and Henry L. Doherty as this committee.

Mr. Ballard then called upon Mr. Britton, chairman of the Public Policy Committee, to address the Executive Committee, and Mr. Britton made an inspiring address, dwelling upon the wonderful possibilities for good work ahead of the association.

Convention Plans.

On motion it was voted to hold the 1920 convention in the Hotel Huntington, Pasadena, Calif., from May 18 to 21, inclusive. President Ballard stated that the hotel will be reserved for the exclusive use of N. E. L. A. members, and that if accommodations are not sufficient for the entire convention, the western delegates will stay at the other hotels in Pasadena.

President Ballard outlined his plans for the Pasadena convention, confining the general work to morning sessions at which the most important subjects of the national special sections will be presented, the afternoons to be devoted to such parallel meetings of the sections as may be absolutely necessary. Mr. Ballard asked the members of the Executive Committee to write him of any ideas or suggestions they may have regarding the convention plans.

It was voted to appoint George W. Elliott as master of transportation to arrange for special trains, etc., for the nearly 2000 members that may attend.

Committee Chairmanships.

President Ballard reported that Franklin T. Griffith, president of the Portland Railway, Light & Power Company, of Portland, Ore., had accepted chairmanship of the Committee on Water Power Development; that S. M. Kennedy, general agent of the Southern California Edison Co., of Los Angeles, had accepted chairmanshop of the Committee on Service, and that Lee H. Newbert, manager of the commercial department of the Pacific Gas & Electric Co., of San Francisco, had accepted the chairmanship of the Committee on Co-operation in the Industry, all of which appointments were confirmed by the Executive Committee. Mr. Ballard also reported that M. S. Sloan, president of the Brooklyn Edison Co., had agreed to act as chairman of the Committee on Electrical Resources of the Nation, which appointment was confirmed.

Chairman F. A. Birch, of the Company Sections Committee, reported that there were 23 active sections at the present time and that the committee is devoting special attention to the old sections that are inactive or have disbanded, in an effort to induce them to reorganize. A personal visit will be made during the year by some member of the committee to each of the active sections. Mr. Birch emphasized the great value of company sections not only to the individual members, but to the management of the companies on account of the many subjects which the sections can discuss of common interest.

President Ballard reported that Charles B. Scott, H. J. Burton, and Wills Maclachlan had represented the association at the Public Utility Section of the National Safety Council at its congress held in Cleveland, on Oct. 1 to 4.

President Ballard referred to the convention of the Illuminating Engineering Society to be held in Chicago, Oct. 20 to 23, and stated that a number of Commercial Section committee meetings are to be held in Chicago during this same week, thus assuring cooperation as some of the commercial members will undoubtedly attend sessions of the society.

The Convention City.

A keen competition for the honor of holding the convention was participated in by five cities of the southern part of California, these being Los Angeles, Santa Barbara, Riverside, San Diego and Pasadena. The invitations from Pasadena took the form of a telegram to the Executive Committee from all of its civic bodies. The choice fell to Pasadena, because of its excellent hotel accommodations; the fact that it is only nine miles from Los Angeles, the metropolis of the extreme Southwest, and because the Hotel Huntington, beautifully situated in the San Gabriel valley, can provide quiet and restful hospitality for those who attend the convention.

The Executive Committee is in receipt of telegraphic advices from Pasadena that the Maryland

Hotel Huntington, Pasadena, Cal., Where the 1920 Convention of the National Electric Light Association Will Be Held—The San Gabriel Valley, the Sierra Madre Range and Mount Wilson in the Background.

and Green, both large tourist hotels, will reserve sufficient rooms to accommodate the overflow of visitors who cannot be cared for at Hotel Huntington.

Pasadena, known as the crown city of the San Gabriel valley, is world-famed as a summer and winter tourist resort, and the home city of many millionaires, authors, artists, and celebrated people. It lies almost directly beneath Mount Wilson, and the mountains of the Sierra Madre Range from a crescent to the north. In every direction the wonderful automobile roads for which southern California is renowned, lead out through labyrinths of orange groves and down to the Pacific and a dozen of its famous seaside resorts.

President Ballard has received wire advices from Los Angeles, his home city, that the civic bodies of Pasadena and the several large electric corporations which operate in the Southwest will co-operate with the committee of the organization in providing entertainment for the tourists and their families, which will make their visit to southern California an event of unprecedented pleasure.

The Executive Assistant to the President.

M. H. Aylesworth, the newly appointed executive assistant to the president of the association, fills a newly created office with duties amounting to those of operating executive of the association.

Mr. Aylesworth is a young man, a lawyer by profession, being a graduate of the University of Colorado and University of Wisconsin ('06). He has, however, been closely identified with public utility matters most of the time since his graduation. He was for four years chairman of the Colorado Public Utilities Commission; subsequently, and until his present appointment, he was in charge of public relations and public policy work for the Utah Power & Light Co., the Utah Light & Traction Co., and the Western Colorado Power Co., having the position of assistant to the vice-president and general manager.

During the war Mr. Aylesworth was chairman of the Fifth Regional Committee of the National Committee on Public Utility Conditions.

Campaign to Nationalize Work of the Association.

The ambition of the new administration will be to bring into the association every electrical utility in the United States. A vigorous campaign will be instituted to nationalize the work of the association more than heretofore, especially in view of the numerous and difficult after-war problems of the utilities, and to bring its influence into every geographical section of the country. Mr. Aylesworth is a strong advocate of concentrating on service to the public in such a manner as to increase understanding of the business of a public utility among the people at large.

Mr. Aylesworth comes to his new position—he has only been in harness a few days—thoroughly in accord with Mr. Ballard's slogan, "Everybody works." Preparations have already been made since his coming to association headquarters in the Engineering Societies Building to enlarge these quarters and make them adaptable to the campaign work in view. The association has taken an entire floor and this is being rearranged throughout. A very attractive feature will be a large members' room with desks and stenographic facilities. It is hoped that representatives of any of the member companies who will come to New York will make this room their headquarters.

ELECTRIFIED TRAINS TO SEATTLE IN A FEW MONTHS.

Final Arrangements Being Made to Complete C. M. & St. P. Electrification from Othello to Seattle.

All of the heavy work of electrifying the Chicago, Milwaukee & St. Paul railway from Othello to Seattle, Wash., has been completed, but there are innumerable small tasks to be completed to make it possible to handle electric locomotives at all points and to insure operation without a break. None of the remaining jobs is large in itself, but in the aggregate they involve considerable labor and expense, arrangements for which were recently completed by General Manager Earling while in the East.

It is not expected by the company to operate freight trains through to Puget Sound by electricity before the middle of November and the complete electrification of the line will not be finished before January.

Electric locomotives have been in operation west of Othello over the Saddle Mountains for more than a month.

ELECTRIC TRUCK VETERANS STILL IN SERVICE.

Interesting Exhibits at New York Electrical Show Demonstrate Serviceability of Electric Trucks.

That the electric truck gives long years of service was very convincingly shown by the Automobile Bureau of the New York Edison Co. in an exhibit at the New York Electrical Exposition which closed Oct. 4.

Two trucks, one with a 16-year and the other with a 14-year service record, were on view, while a statistical chart showed the number of electrics of all ages that were in service on Jan. 1, 1919.

The 16-year old truck was a lamp wagon used for delivery purposes by the electric light company. The 14-year old vehicle was lent to the exposition by Aitken, Son & Co.

On the statistical chart it was shown that there are now 2044 electrics of at least 5-year service; there are 980 8-year-olds, 221 in the 10-year class, 106 that are 13 years old, 33 in service 15 years, 25 in service 16 years, 11 in service 17 years and 2 that are 18 years old.

The exposition's electric-vehicle display included trucks, a fire engine, passenger cars, industrial trucks, a tractor and storage batteries.

ELECTRIC HEATERS PROVE TO BE GOOD SELLERS IN MINNEAPOLIS.

Sixty-six Electric Heaters Absorbed by Public During Week as New Customers Are Connected Up.

The sales department of the Minneapolis General Electric Co. reports the sale of 66 electrical heaters during the week ended Sept. 29. During the same week the department secured 489 new electric customers with 287 kw. of lighting and 189 hp. in motor equipment.

Net gain in connected load includes 304 customers with 262 kw. of lighting and 565 hp. in motors. Electric energy output for the week was 35.7% greater than for same week previous year.

Commercial Practice

Dayton's Successful Electric Iron Campaign—Store Lighting —Reduction of Fog Electrically—It Pays to Advertise

CHART DRAWN BY PACIFIC GAS & ELECTRIC CO. PROVES ONCE AGAIN THAT "IT PAYS TO ADVERTISE."

Relation Between Advertising and Sale of Utility Stock Emphasizes Value of Maintained Publicity.

It has often been stated that "it pays to advertise." In fact, it is a truism accepted everywhere by practically everybody. The accompanying chart shows in

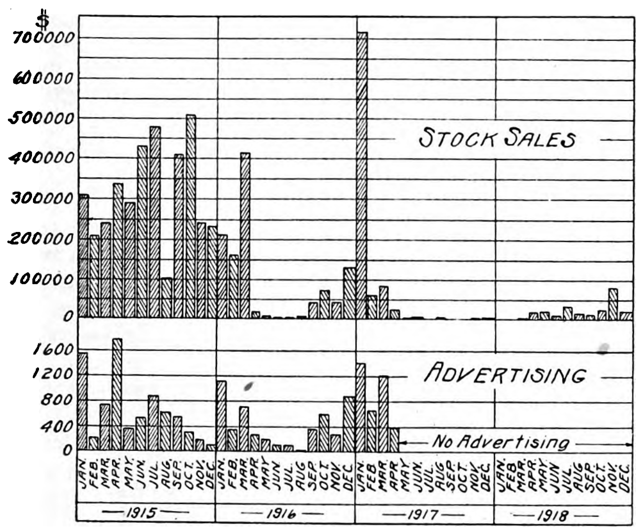

Chart Showing Relation Between Advertising and Stock Sales, Showing Manner in Which Stock Sales Fluctuate With Advertising.

a very interesting and illuminating manner the influence that advertising exerted upon the sale of stock in the case of the Pacific Gas & Electric Co.

The Pacific Gas & Electric Co. has been one of the prominent companies to take to that very sound policy of selling its stock to its employes and its patrons. The company introduced its present policy about June, 1914, and since that time has proved again and again that such a policy is sound basically and advantageous from every aspect. In these days when there is such commotion going on among demagogs for state and municipal ownership, and when bolshevism is creating so much noise, the ownership of property is one of the factors that enables such movements to fail. Ownership in utility stock creates interest and allays friction; it puts a stop once and for all to the cry of municipal ownership and makes the stock owner realize that the term "capitalist" applies to anyone who has one dollar or more in the bank or owns a lot or employs labor to work for him.

The Pacific Gas & Electric Co. has found, as so many other utilities have found—and as the Government has found since inaugurating its campaigns for War Savings Stamps and its Victory and Liberty Loans—that the public will subscribe when sound investments are properly presented. To sell stock to the utility patrons as well as to the employes is sound business, and many are the utilities that could do still more to take the customer into partnership.

IRON CAMPAIGN BY DAYTON POWER & LIGHT CO. PROVES SUCCESSFUL.

Co-operation with Dealers and Canvassing Methods Mark Merchandising Campaign in Dayton.

The electric flatiron—often called the "glad iron"—is one of the most popular electrical devices with the women folk at home. It is also well at the top of the list when it comes to the load-factor of the various individual electrical appliances, being used oftener and longer than most current-consuming devices. Flatiron campaigns are inaugurated by central stations for the above reasons; the flatiron is a good and easy seller, and, when sold, it is a very satisfactory consumer of current.

When the Dayton Power & Light Co. launched a flatiron campaign in Dayton and some of the surrounding settlements it expected to obtain good results. But it accomplished a great deal more than it had hoped. The campaign lasted one month, of thirty-one days, and was launched at a time when conditions were in favor of success.

At the commencement, and just previously, the company carried on a certain amount of advertising, but comparatively little, stating what it was to do. At the same time the company's high school students' co-operative school was started, by which high school students made a house-to-house canvass for the sale ot flatirons. The accompanying illustrations show the form of card employed by these students when

canvassing from house to house. For the campaign the Dayton company sold a G. E. iron for full retail price of $6.50, giving also as a premium a Rid-Jid folding ironing board. The terms called for a deposit of 50 cents when the customer made the contract and got the iron, and thereafter $1 per month, payable at the time when the electric light bill was paid.

The population of Dayton is about 165,000, and the number of flatirons sold amounted to 1206. In Wilmington, a nearby settlement of 500 persons, 145 irons were sold; in Piqua, with a population of 15,000, some 130 irons were sold, while Xenia with 10,000 persons absorbed 100 irons. During the campaign, and because of it, the company found that there were more than 300 irons that had been sold at different times to customers but were not being used, because they were in need of some small repair such as broken cord, broken terminal clips or open circuit. About the same proportion of defective irons were collected from outlying settlements. These irons were taken up, removed to the repair shop of the company where they were repaired and returned to their respective owners ready for work. The result was that approximately 1500 electric irons were made active consumers of current, 300 being irons that had previously done little toward load building, hence were of as little use to their owners as to the utility.

During the campaign, the Dayton Power & Light Co. found that many of its customers were interested in many electrical appliances other than flatirons, or

in addition to them. In cases of this kind the company notified electrical dealers and contractors throughout the city. In this way the names of more than one hundred prospective purchasers of electric washing machines, vacuum cleaners, toasters, etc., were brought to the attention of the local contractors. It is policies such as this that breeds friendliness on the part of electrical dealers toward the central station, resulting in reciprocity and general benefit.

After the above-mentioned campaign had closed, and the results obtained determined, it was found that in practically every case of the one hundred interested parties whose names had been forwarded to the dealers, each had purchased the device in which they had previously stated they were interested, in some instances making additional purchases besides. In this way the electric iron campaign might also be called an appliance campaign. But then, when an electric iron is sold it nearly always leads to the sale of other electrical appliances too.

PRECIPITATION OF TAR FOG BY ELECTRICITY PROVES SUCCESSFUL.

According to a communication presented by G. Davidson to the Canadian Mining Institute, the Cottrell process of electrical precipitation is able to deal with the crude gases produced in the distillation of coal, wood and petroleum, even at the high temperature used in modern industrial processes, while the usual methods of tar fog removal in extractors require cooling of the gases. Cleaner distillates were obtained with electric precipitation. The treater chamber used consisted of an iron pipe, 15 ft. high and 12 in. in diameter, provided with fused quartz insulators; approximately a million cubic feet of gas was passed through the heater per day, and the heater required about 2.5 hp. or 3 hp.

STORE AND INDUSTRIAL LIGHTING CAMPAIGNS SUCCESSFUL.

University of Ohio Establishes Educational Course on Industrial Lighting Practice.

Reports from several central-station companies indicate that in a number of cities "better store lighting" campaigns are meeting with excellent results. Storekeepers and owners of establishments having large interiors have been found readily responsive to the advantages of skillfully planned artificial lighting arrangements. It is likely that considerable time will be devoted this winter to the subject, which is made interesting by many improvements completed in lighting practice and in the essential equipment for it by the laboratory and research departments of the large electrical manufacturing concerns.

The Ohio State University, recognizing the practical importance of this phase of central-station service, has established, through its electrical department, a course of 12 lessons on industrial lighting practice. In this course the essential fundamental principles are taught and the best established practice is described, partly through the medium of trade literature and technical bulletins of the lighting equipment manufacturers. The application is illustrated through practical problems, in such a way as to give the student a definite conception of the best methods of treating lighting problems.

JAPANESE CENTRAL STATION INSTALLS TWO LARGE TURBINE UNITS.

Two 25,000-kw. steam-driven turbine units of Westinghouse make, which will complete the largest steam-driven electrical installation in the Far East, are now being erected at Osaka, Japan, for the Osaka Electric Light Co.

Located in an extensive industrial district, this company furnishes light and power to street railways, steel works, shipbuilders, copper-refining plants, paper mills, electrochemical installations and other industries.

It is noteworthy that in 1908 the Osaka company installed three steam turbine units of 3000 kw. each. In 1910 two more units of like capacity were added, and in 1911 two 5000-kw. units. The 25,000-kw. units now being installed will bring the capacity of this plant up to 100,000 hp.

SECTION MEETINGS OF IRON AND STEEL ELECTRICAL ENGINEERS.

The Association of Iron and Steel Electrical Engineers will hold the following section meetings: Pittsburgh, Oct. 25, Chatham Hotel, review and discussion of papers at the recent St. Louis convention; Philadelphia, Nov. 1, Engineers' Club, paper on "Electrical Cleaning of Gases as Applied to the Blast Furnace," by N. H. Gellert and K. V. Laird.

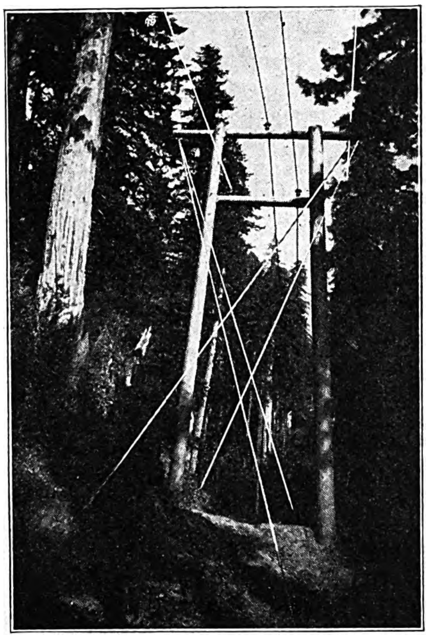
Operating Practice

Special Line Structures—Peculiar Transformer Trouble —Electric Furnace Leads—Mercury Arc Rectifier Tubes

SPECIAL LINE CONSTRUCTION FOR LONG SPANS AND RUGGED COUNTRY.

Pole Setting Adopted by Western States Gas & Electric Co. Proves of Long Life.

Around Eureka, Calif., the Western States Gas & Electric Co. is employing a very interesting form of pole setting for carrying its high-tension transmission lines over mountain ranges and rough country. In building the line in question, and at the time the construction was carried out, it was impossible to secure anything except native timber, redwood. As native timber planted in the ground would completely rot out at the ground line in about three years the company adopted the form of pole setting shown in the accompanying illustration.



Double-Pole Setting That Overcomes Pole Rot and Handles Long Spans Conveniently.

At first a line about one mile was erected, there being two poles set on top of the ground and guyed four ways, as shown. No part of the pole enters the ground, the base of the pole being given sufficient foundation to prevent this even under weight. The form of construction shown has been in vogue now for ten years and to date absolutely no trouble has occurred; it has not even been necessary to tighten any of the guy wires. As it became necessary to reconstruct old lines, this same form of construction has been followed.

The Western States Gas & Electric Co. states that the cost of the two-pole structures is about two and one-half times as much as a single-pole structure. On the other hand, as the spans range from 150 ft. to as high as 3600 ft., with an average of probably 600 ft., this form of construction has been found cheaper than a single-pole installation built for 650-ft. spans. Much of the country traversed is most rugged, passing over several mountain ranges, and the company recommends the above form of construction for this class of work.

RESIDUAL MAGNETISM CAUSE OF UNCOMMON STARTING TROUBLE.

Saturation of Magnetic Circuit Causes Current Rush in Starting 2000-Kw. Synchronous Converter.

By F. B. Johnson.

A 2000-kw. synchronous converter for supplying railway load was connected to a bank of three 750-kv-a. transformers. It was the custom to always start this machine from the alternating-current end by means of one-third and two-thirds starting taps on the transformers. In attempting to start this machine one day a peculiar trouble developed. The primary oil circuit-breaker of the transformers was closed with the starting switch in the customary one-third tap position. The machine did not start up, however, as the relays on the high-voltage side of the transformer bank operated and opened the circuit-breaker.

The alternating-current starting switch was opened and the oil circuit-breaker closed and opened four times. On the first trial the overload relay in one phase of the transformer bank operated, and on the second and third occasions the overload relay on another phase operated, in the second case opening the oil circuit-breaker. On the fourth trial the relays did not operate. The starting switches were then closed and the machine started up and shut down several times, the alternating-current and field break-up switches always being left closed until the machine had come to rest.

The following explanation solves the above-mentioned trouble and is undoubtedly the correct explanation. When the oil circuit-breaker controlling the transformers is opened, the circuit is usually broken at the zero value of the current wave. Because of its retentivity, the iron remains magnetized to some value, which may be as high as 70% of the normal. When the transformer oil circuit-breaker is again closed, the current in part of the first cycle may tend to magnetize the iron in the same direction as that in which it is already magnetized; or it may magnetize it in the opposite direction, depending upon the point of the current wave at which the circuit is closed. When the former occurs, saturation of the iron results, and a current that may be several hundred per cent of the normal value flows. This is the condition that caused the repeated operation of the overload relays above referred to every time the circuit to the transformers was closed.

As to the method of prevention, when the load has been taken off a synchronous converter if the equalizer switch is opened (where converters are operating in parallel) before the oil circuit-breaker controlling the transformer bank is opened, while the alternating-current running knife switches and the field break-up switches are left closed until the machine comes to rest after the circuit-breaker has been opened, the residual magnetism in the cores of the transformers may be reduced to a very low value. This procedure allows gradual diminishing voltages to be generated in the armature of the synchronous converter, hence the magnetization of the transformer cores to die down. Following the above procedure in shutting down large synchronous converters will enable starting difficulties due to residual magnetism as described above to be eliminated.

EFFECT OF CONDUCTOR ARRANGEMENTS UPON INPUT TO ELECTRIC FURNACE.

Shortening of Conductors Necessitating Rearrangement of Furnaces Increases Input from 1500 Kw. to 2500 Kw.

Every operator of the electric furnace is familiar with the effect of low power-factor and the part played by conductor arrangements in holding back energy input to a furnace, hence rate of melting. The effect of inductance is specially marked on 60-cycle

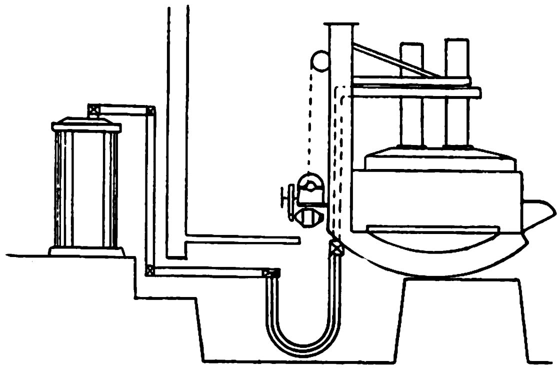


Fig. 1.—Arrangement of Conductors That Limited Input to 1500 Kw.

circuits, so much so that in some quarters 25 cycles is advocated for the very large furnaces.

In one recent instance, as brought out in the report of the Electric Furnace Committee, A. I. & S. E. E., a 15-ton electric furnace obtained its supply through 3000 kv-a. of transformer capacity. The arrangement of transformers, furnace and conductors was as shown in Fig. 1. With this layout it was found impossible to get more than 1500 kw. into the furnace because of

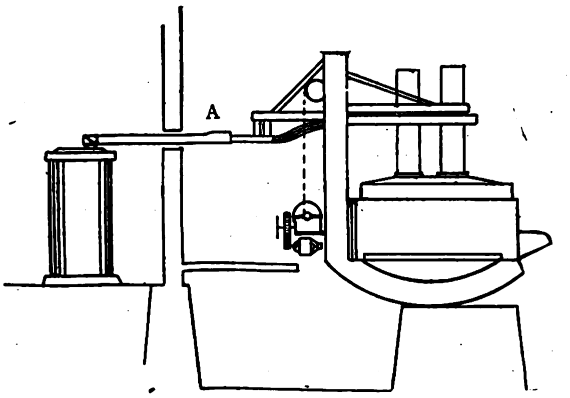

Fig. 2.—Arrangement of Conductors That Enabled Input of 2500 Kw. to be Obtained With Improved Power-Factor.

heating in the conductors. The power-factors were also extremely low. As the limitation to power input was obviously due to the heating and voltage drop resulting from the conductor arrangement, it was decided to modify the existing arrangement.

The furnace was rebuilt to reduce heating troubles in the furnace itself. The conductors were re-arranged as shown in Fig. 2, thereby reducing their over-all length very materially. At "A" a special form of disconnect switch was installed by which conductor length was still further reduced, since the length of flexible conductor ordinarily required when the furnace was tilted was no longer needed. With the arrangement shown in Fig. 2 it was found possible to secure an input to the furnace of 2500 kw. while the power-factor, voltage regulation and efficiency were all materially improved.

VARIATION IN LIFE OF RECTIFIER TUBES INDEX OF OPERATING AND CIRCUIT CONDITIONS.

Experiences of Southern California Edison Co. With Tubes for 2275 Magnetite Arc Lamps.

The question is frequently asked as to what may be considered as being the average life of mercury arc rectifier tubes. It seems to be the general experience that the life of mercury arc rectifier tubes varies quite widely, the causes being partly that the same care is not always given different tubes differently located; all tubes are not, perhaps, of the same quality, and the different classes of service and condition of circuits have different effects upon tube life.

During the year ending July 1, 1919, the Southern California Edison Co. states that the average life of tubes used for supplying its magnetite series street lighting system was 754 hours. There were 2275 series magnetite lamps altogether in service during the year on the company's various street lighting circuits and on this basis the average cost of rectifier tubes for the year was $3.29 per lamp.

The company has found that there is a very wide discrepancy as to tube life in different substations, which means, of course, that the average cost per lamp per year chargeable to deterioration of arc rectifier tubes also varies widely. The average life of tubes obtained in different substations or districts ranged all the way from 205 hours to 1852 hours. This great variation indicates that it pays to give mercury arc rectifier apparatus careful attention and that the circuits should be kept as free as possible from grounds and other causes of surges and wide current fluctuations.

WIRELESS TELEPHONES FOR GEORGIA RAILWAY & POWER CO.

Plans have been made by the Georgia Railway and Power Co. by which communication between their power plants, between substations and power plants and along their transmission lines can be carried on by wireless telephony. The company operates a very extensive transmission system employing high voltage, and the use of the wireless telephone will eliminate those forms of trouble that usually occur when a transmission line is in trouble, and that make the telephone inoperative when most needed. It is proposed that some of the patrolmen's trucks be also equipped with wireless, to facilitate communication and location of trouble.

Contractor-Dealer

Sterling Electric Co.'s Sales Record—Suggestions for Merchandising Appliances—Novel Washing-Machine Display

SALES GOAL FOR YEAR IS REACHED IN EIGHT MONTHS.

Minneapolis Electrical House Succeeds So Well in Attaining Sales Figure That It Sets New Mark for Year.

One of the methods that has been used to great extent by sales managers, especially those of manufacturers, has been to set a "bogey" on sales over a given period. Each salesman is allotted a certain quota of sales, the whole to make up the bogey that has been set. Of course, the underlying scheme is that the bogey gives the sales department a goal for which to strive and makes an incentive for greater sales results.

It has remained, however, for an electrical concern to have its sales department to strive not only for bogey but increase its efforts to equal what is known in golfing parlance as "par" figures. Beginning Jan. 1 of this year the Sterling Electric Co., Minneapolis, Minn., set a bogey of $1,000,000 for its sales during 1919, and used in this connection the motto, "We are growing as you have seen, until our goal is $1,000,000 for 1919."

Believing that it would be necessary to extend its efforts to reach this goal, the sales department endeavored to get ahead of the monthly quota and keep ahead. These efforts were so well directed and gained so much momentum that it became apparent in the six months' period that bogey for the year would be reached away ahead of time. Then came the incentive to see how soon this would be accomplished, with the result of a little less than eight months' time. This was followed by setting a new or "par" figure of $1,500,000 for the year and changing the slogan to "For 1919 we've already put that $1,000,000 through, so we've raised the goal to $1,500,000 to do."

In recognition of the successful efforts in reaching bogey figures the company gave what it called a "Million Dollar Party" to its 230 employes, providing the entertainment for the occasion. The company announced its success in advertisements in the daily newspapers; and in a personal letter to its customers thanked them for their help in making such a showing possible. The letter read as follows:

Mr. John Brown, City.

Dear Sir: Believing in the prosperity of the great Northwest, we set out to do $1,000,000 business for 1919.

We are pleased to announce that in just eight months we have gone over the top.

We have now raised the goal to $1,500,000 for the year.

Without your past co-operation we would not have reached our $1,000,000 mark. Without your future co-operation we will not attain the $1,500,000 goal.

We, therefore, thank you for the part you have played in our past success. We trust that our future service will warrant your patronage.

With your co-operation we can announce at the end of the business year that the $1,500,000 has been reached.

In exchange for your support we offer "Service and Satisfaction with Every Transaction."

Yours for Success,

STERLING ELECTRIC CO.,

W. H. Vilett, President.

Setting a bogey and reaching it are two different things. But the enthusiasm generated by the company enabled its employes to attain the original goal so easily that there hardly remains any doubt but that the new goal will be reached.

BOSTON CONTRACTORS AND DEALERS MEET.

The Boston district of the Massachusetts State Association of Electrical Contractors and Dealers held a meeting Oct. 16 at the City Club, Boston, at which George H. Guest, manager of the electrical appliance department of Bryan & Marsh Co., Boston, and C. E. Greenwood of the Boston Edison Company were the principal speakers.

"Million Dollar Party" Given by Sterling Electric Co., Minneapolis, Minn., to Its Employes After Sales Goal of $1,000,000 for 1919 Was Reached in Less Than Eight Months.

Merchandising Suggestions for the Electrical Dealer

Advantage of Featuring Single Articles in Window Display—Fearing Department-Store Competition—Making Preparation for Christmas Trade—Planning the Sales of Electrical Appliances as Holiday Gifts

THERE is a tendency among dealers to make their window displays appear flat by showing a large number of articles at the same time. This is only natural, because the major portion of the line consists of small devices. Unless a good-sized article, such as a washing machine or a range, is featured, it doesn't seem logical to devote the entire display space to one, or even two, articles, and the dealer is tempted to show samples of everything he sells so those who stop to look at his display won't miss anything. The nature of the dealer's business may demand just this sort of thing, but as a general rule it is better to have displays concentrated on a single article or not more than two or three closely associated articles. The reason is that the mixed display is not so apt to leave a distinct impression on the onlooker's mind as a featured display.

A good example of this principle is given by the accompanying illustration, which shows a window display by the Commonwealth Edison Co.'s Adams street electric shop, Chicago. If window displays were given titles this one would be called "Autumn—and Electrical Appliances" because there is a suggestion of autumn in the whole display. This effect is secured partly by the basket of seasonal flowers but mostly by the colorings of the background and furnishings. Rich, light brown draperies and lamp shades are contrasted with the dark brown upholstered furniture, the blending of colors giving unmistakably an autumnal tone.

In such a setting the use of the vacuum cleaner is forcibly suggested for fall cleaning; likewise the use of an electric radiator for tempering the chilly mornings that come this time of year.

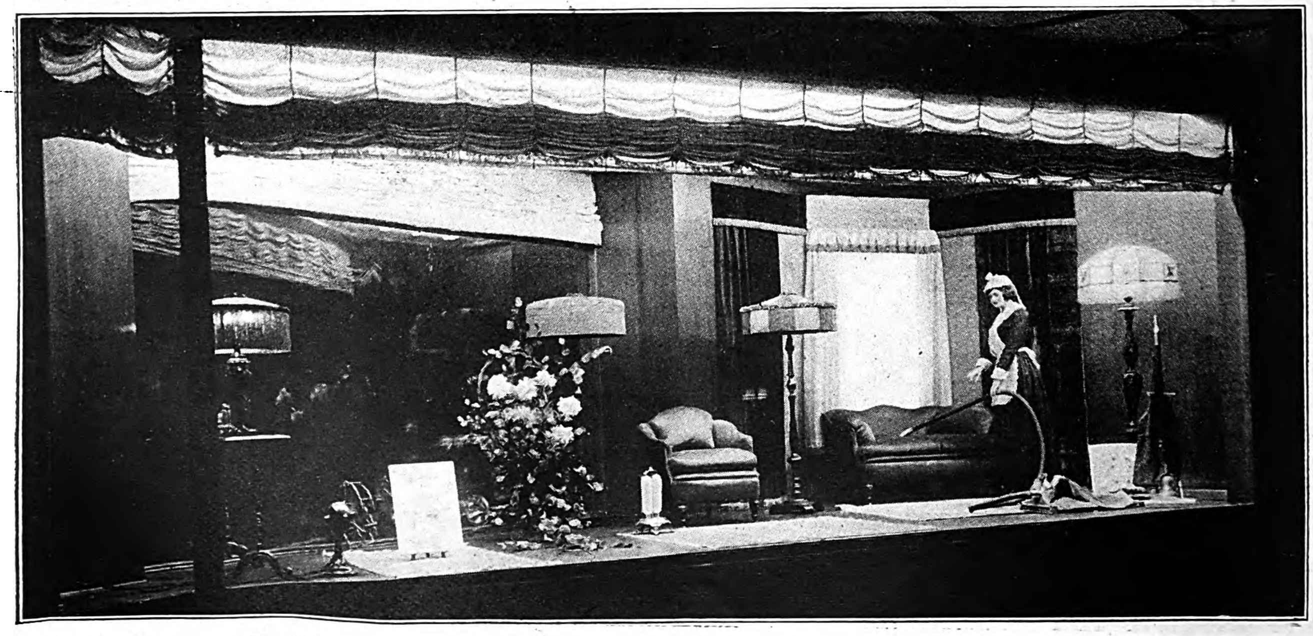
This display is another good testimonial to the fact that featuring an article or two against a suitable background is better than cluttering window space with a lot of devices, no one of which attracts particular attention.

Fearing Department-Store Competition.

Not long ago the writer was talking to an electrical contractor and dealer who happened to be in a pessimistic mood. Chief among his burdensome troubles was an ingrown fear that the department stores were going to corral all the business in electrical appliances and that competing electrical dealers would eventually have to close up shop. His attitude was partly due to the fact that his store was on a side street, a block away from the heavy traffic of the main shopping thoroughfare, and the crowds that didn't pass his door made him feel, particularly on gloomy days, that he didn't have much chance to get business. He figured that the crowds would never come his way, and as long as his contracting business paid pretty well he would be content to take what appliance business he got and rail away at the department stores for taking what he didn't get.

On entering the store we noted that the window display space was devoid of everything but a few lamp cartons, two small motors and several flashlights. The interior of the store was poorly lighted and there was a confusion of show cases, tables, shelving and desks that would nearly baffle any customer trying to make a purchase.

It is hardly believable that such a poor merchant could have the temerity to criticize others, but we

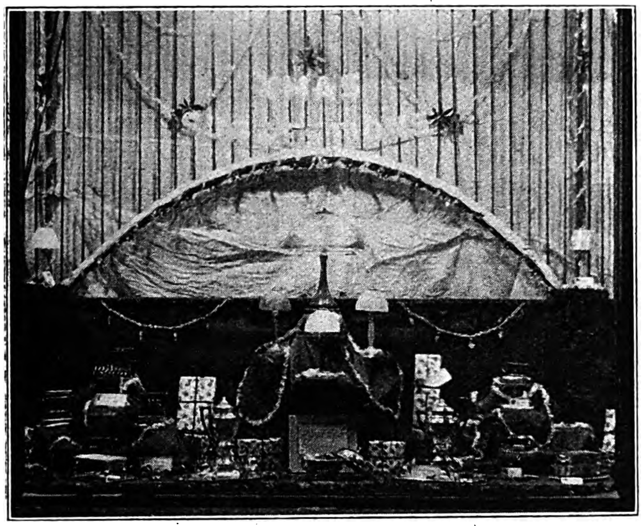


Display in Commonwealth Edison Co. Electric Shop Illustrating Principle of Featuring Small Number of Closely Associated Articles at Same Time.

suppose it was because he was envious of those who were more progressive. Fortunately the number of dealers of this kind is growing less every year, and of course there is a correspondingly smaller number who think they have anything to fear about the competition of the department stores.

Preparing for Christmas Trade.

About 75 per cent of holiday shopping is done in the two weeks preceding Christmas; and this is in spite of all the efforts made to have the public do its Christmas shopping early. The condition is one that probably always will exist, and is one that greatly concerns the electrical dealer in his plans for Christmas trade.



Now Is the Time to Begin Planning Christmas Displays—This One Was Made to Catch the Eyes of Those Who Didn't Know What Kind of Presents to Give.

It generally works out this way: The dealer puts in a stock or orders enough ahead so that he believes he can easily take care of his trade for the season. During November and the early part of December sales will increase, but they do not feel the impetus of Christmas buying. Then sales come on with a rush, the dealer's shelves are cleared of this and that article, and customers are disappointed or are compelled to buy substitutes. This story has been repeated year after year with little variation, much to the detriment of dealers who are slow to admit that too conservative a buying policy is wrong. It is a detriment to the whole industry as well.

When a dealer's stock is pretty well sold out, of course he must feel some satisfaction in having a good season. But it is also an indication that advantage has not been taken of all the sales possibilities.

The solution of the problem is for dealers to do what they advise the public: "Do your Christmas buying early." A large stock of staple electrical appliances suitable for gifts is bound to make any dealer look to turnover and devise plans for producing sales during the early part of the Christmas shopping season. Timely window displays, newspaper advertisements, gift suggestion booklets and circular letters to prospective customers are methods that can be used to make November an intensive selling period as well as December.

Successful merchants in other lines do most of their buying six months ahead of season and quite a large portion of their stocks is carried over from season to season. It would seem that the electrical merchant could afford to do his buying at longer range, especially because most electrical articles are saleable the year around. But if dealers do not find it possible to do their buying for holiday trade six months ahead of time, at any rate they should see the error in having a hand-to-mouth policy regarding buying and selling Christmas goods. Then trade conditions will be relieved for them as well as the jobbers and manufacturers.

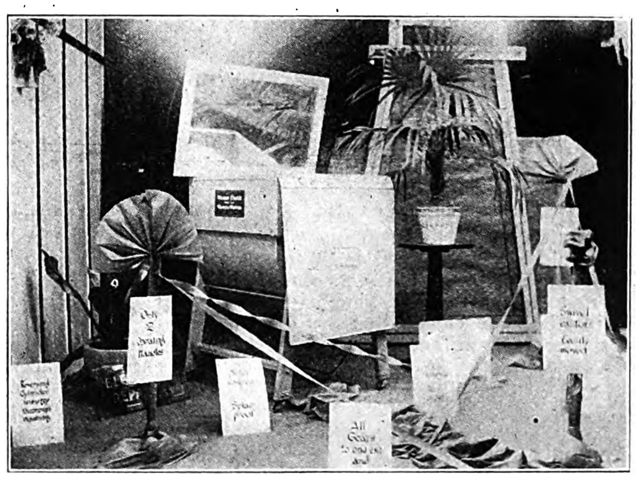
Last year a certain electrical dealer worked out a gift suggestion plan that brought very satisfactory results. In October he started the preparation of a booklet giving a complete list of suggestions for holidays gifts. Such work usually takes two to four weeks, so that he had them ready for distribution the middle of November. This dealer didn't attempt to secure a list of prospective customers, but mailed one of the booklets to his regular list of patrons. His theory was that any customer pleased with an electrical device he was using would be likely to purchase or recommend it or one of the other suggested articles for gift purposes.

Newspaper advertisements featuring electrical gift suggestions were a part of the plan. These were linked with appropriate window displays.

Working out this plan took quite a bit of thought and effort, but a comparison of the season's sales with those of the preceding year showed such a large increase that the plan is being tried again this year.

NOVEL WINDOW DISPLAY SELLS MANY ELECTRIC WASHERS.

Cleanliness is associated with the electric washing machine, and with this idea in mind the Electric Sales & Construction Co. of Cleveland recently had a window that fairly shone with cleanliness and light. The floor was of blue crepe paper with a deep border of white. Screens of brown stood in the background, in front of each being a graceful palm. In the center was a washing machine, behind which was a mirror tilted at an angle so that from the outside of the window the operation of the machine might be observed. Several poles were twined with blue crepe paper, flaring out into a fan-shaped arrangement at the top, while strips of blue paper ran from one to another. Fastened to each pole was a neat card of grey, lettered in blue and white, which told of the advantageous points of the machine.



Washing Machine Display Which Brought Out the Idea of Cleanliness in Connection with Washers.

New Appliances

Unique Features in New Push-Button—Controlled Starting Switch for A. C. Motors and in Swiveling Attachment Plug

Alternating-Current Motor-Starting Switch Operated by Push Button.

It is permissible to start induction motors up to and including 5 hp., and in some localities up to and including 7½ hp., by merely connecting the motor to the power circuit. Small induction motors can be started under these conditions without injury.

In the past it has been customary to start these motors by simply closing a knife switch, or switch similar to a knife switch. For those who wanted something better, it was possible to buy a switch which would short-circuit the fuses while the motor was starting, and then after the motor had come up to speed, the operator could make a second motion with the starting switch that would insert the fuses in the motor circuit to be used while it was running.

A new device for this kind of work has just been developed by the Electric Controller & Manufacturing Co., Cleveland, Ohio, to make the starting of these motors foolproof. It is known as the "A. C. Starting Switch," and is operated by a push button. It is inclosed in a steel box as shown in Fig. No. 1, with conduit connection for all wires. A neat, compact push button arranged for conduit connection, as shown in Fig. 3, is supplied, for starting and stopping the motor. Fig. 2 shows the starting switch with the cover of its box open.

Particular attention is called by the manufacturer to the two wires extending the length of the slate on the left-hand side. These wires give overload protection of the inverse-time-element type, both while the motor is starting and while it is running. The principle used is one entirely new in motor-starting practice. These two wires are stretched and the operating value of this overload protection is adjustable by changing the tension of the wire. If too much current is being taken by the motor, these wires will expand, causing the small contact at the bottom to open and this will in turn de-energize the magnet coil and cut the motor off the power line. It is then necessary to push the start button before the motor can again be started. This same principle is used in ammeters and gives an extremely accurate overload protection, at the same time giving the inverse-time-element feature.

There are no laminations used in any part of this alternating-current starting switch. It is only necessary to push the start button to start the motor, and it is only necessary to push the stop button to stop the motor.

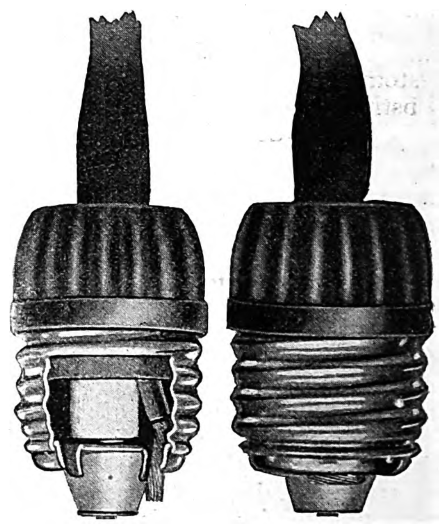
New Cutler-Hammer Swivel Plug.

A new swivel attachment plug has been developed in the specialty department of the Cutler-Hammer Manufacturing Co., Milwaukee, Wis. The design of this new plug is such that several distinct advantages are provided. It is shipped completely assembled and need not be taken apart in order to wire. The work of attaching these plugs is further reduced because there are no binding screws to loosen and untighten. In fact, no screws are used in the construction.

The accompanying illustrations show some of the advantages of the plug and the ease with which the wires may be connected to it. It consists of an inner and outer member which revolve on each other. The wires are connected to the inner member, while the outer member comprises the ordinary screw shell and a knurled head made of heat-proof molded insulation. In wiring, two wires are stripped an equal length, about three-eighths of an inch; one is pushed into a center opening of the inner member and the other through any one of four concentric openings of the same member. By means of a stationary soldering iron, one wire is sweated in the center opening, while the other, after being turned over into a groove on the inner member, is soldered to it. The entire operation, it is claimed, requires much less time than is necessary to wire up any other type of plug, as demonstrated by actual test.

After being attached to a cord there is no possibility of the parts becoming separated when being unscrewed from a socket. This is a very desirable feature when the plug is used under a small shade or where a good grip on the plug cannot be secured. This new plug when shipped to the electric appliance manufacturer, reaches him in one complete piece. It cannot become disassembled nor a portion lost in shipment or in distribution. Trouble and losses due to difference in the number of the component parts on hand are thus avoided.



Two Views of New Swivel Attachment Plug With Quickly and Easily Soldered Connections, Eliminating Binding-Screw Troubles.

Trade Activities

General Electric Leases American Conduit Business—Appleton Electric Extends Manufacturing Facilities—Catalogs

Horace G. Cooke, who has withdrawn from the Connersville Blower Co. after 20 years of service as eastern representative, has announced the organization of Horace G. Cooke, Inc., to engage in designing and marketing a complete line of rotary compressors, gas exhausters, and pumps for the National Marine Engine Works, Inc. The executive and sales offices will be located at 50 East 42nd street, New York City.

Beardslee Chandelier Manufacturing Co., Chicago, is sending a letter to the trade in which is illustrated and described a new and attractive line of portable lamps, and presents to dealers an unusual profit-making opportunity for the fall trade. Owing to fluctuating market conditions and the enormous demand for portables, the company urges that dealers place their orders immediately to insure delivery for the holiday season.

Mechanical Appliance Co., manufacturer of Watson electric motors, with factory and main offices at Milwaukee, Wis., has recently opened up new offices in Buffalo and St. Louis. W. C. Winterroth, formerly connected with the Chicago office, will be located at 318 Prudential building, Buffalo, as district sales manager for western New York. The St. Louis office will be in charge of L. F. Mahler, who has been recently appointed district sales agent for St. Louis and adjacent territory. His office is located at 1039 Syndicate Trust building, St. Louis.

Moran & Hastings Manufacturing Co., 16-18 West Washington boulevard, Chicago, has prepared a new circular which illustrates and briefly describes the "Raymo" adjustable fixture. It is especially adapted to the office, store or factory, and provides a uniform distribution of illumination without glare. It is of excellent construction, pleasing in appearance and has been designed for use with 100, 200 or 300-watt Type C Mazda lamps. This unit has been adopted by many of the country's most prominent industries and has given complete satisfaction wherever installed, according to reports received by the company.

Jackson & Moreland Organize.—Dugald C. Jackson and Edward L. Moreland announce that after their absence in France in the Corps of Engineers, United States Army, they have now resumed their practice as consulting engineers under the firm name of Jackson & Moreland with offices at 387 Washington street, Boston, Mass. They will carry on the practice formerly conducted in association with William B. Jackson under the firm name of D. C. & Wm. B. Jackson. William Jackson has temporarily retired from the firm in order to look after other interests. Associated with the firm is Arthur L. Nelson, who will give particular attention to the design and the supervision of construction of power plants and transmission systems.

Gould Manufacturing Co., Seneca, N. Y., manufacturer of rotary, triplex and centrifugal pumps, has opened a district sales office in Detroit at 804 Dime Bank building. E. B. Gould is in charge.

Multiple Fuse Co., New York, has established a branch office in Cleveland, Ohio. E. C. Newman, who has been appointed district manager of the Cleveland branch, will make his headquarters at 30 Euclid Arcade.
